PRAEFATIO.

Hoc volumine sexto Annalium (continuationis meae tertio) cyclum quinquennalem, annos 1851—1855 amplectentem denique absolvo.

Spero fasciculos sequentes nunc brevissimo tempore sequuturos, tum clarissimi Reichenbachii Orchidearum recensionem, tum clarissimi Anderssonii Graminearum collectanea exhibentes nec non indicem generalem generum, specierum et synonymorum orbis totius peracti.

Quod Cyperacearum collectanea attinet, quae una cum Graminibus hoc in opere curare promisit amicus Anderssonius, sed aliis gravioribus laboribus, adhuc sollicitatus nondum suscipere potuerit, maxime lugeo, sed spero illa de Cyperaceis elaborata in sequente lustro cum commentariis de ejus familia recentioribus ab auctore supra citato in lucem postea proditura. Alia ommissa et errata si forte lectores benigni animadverterint, mecum communicent, ab iis instanter peto, ut falsa emendentur desiderata autem in novo cyclo postea rite exhibeantur. Denique facere non possum quin et in exordio hujus voluminis finalis gratias denuo agam viris

celeberrimis botanicae scientiae ejusque fautoribus illustrissimis, qui vel consilio vel libris epistolisque vel aliis doctrinae praesidiis suppeditatis in conficiendo hoc opere me adjuverunt.

Quo primo loco grato animo me obstrictum puto viro illustrissimo summoque moderatori rerum ecclesiasticarum et institutionis publicae, Regis ministro de Bethmanno — Hollwegio, deinde professoribus celeberrimis Schlechtendalio, Al. Braunio, Asa Grayo, Fenzlio, Regelio, Lemaireo, Ondemansio, Gussoneo, Bungeo; doctoribus ornatissimis Buhseo Rigaensi, Hansteinio, Garckeo, Karsteinio, Berolinensibus, Oerstedio Havniensi, Peyritschio Vindebonensi, F. Müllero Melbournensi, nec non viris praeclaris Van Hootteo Bruxellensi, Verschaffeltio Gandaviensi Lespinasseo et Perriero, Francogallis caet. caet.

Ita et hunc tomum Annalium fautorum benevolentiae commendo, quorum erga me benignitas maximum mihi erit incitamentum ut semper novo impetu ad orbem denuo suscipiendum et feliciter persequendum strenue conferam ingenii vim ac diligentiam. —

Scripti Berolini Nonis Augustiis anni 1861.

Subclassis II. **HELOBIAE** Meisn.

Ordo VII. FLUVIALES Vent.

(Knth. en. III. 111. 590. — Walp. Ann. III. 504.)

LEPILAENA J. Drumm. (*Najadeae?*)

Harvey, new genera of W. Austral. plants, in Kew garden misc. VII. 57.

Fl. monoici, terminales v. pseudo-axillares, solitarii v. cymosi. Masc. solitarii v. terni; flos med. nudus, lateralis spatha membranacea bipartita absconditi, brevissime pedicellati. Perigonium minutum, trisquamosum, squamis obtusis. Antherae 3 monadelphae, sessiles, marg. arctissime cohaerentes, biloc., extrorsae, longitud. dehisc.; pollen sphaericum: — Foeminei (in) furcis ramor. solitarii, nudi, pedunculati, pedunculo fructifero elongato. Perig. triphyllum, foliol. acutis. Ovaria 3, libera, dorso carinata, facie contigua, dem. pedicellata, unilocularia; ovulum unic. pendulum. Drupae v. abortu pauciores.

Herba aquatica, Ruppiae facie. Caulis dichotomus. F. angustissima, b. vaginantis, minutiss. serrulata, acuta.

1. **LEPILAENA AUSTRALIS** J. Drum. — Hab. In coloniarum fluviis Australiae occid.

PHYLLOSPADIX Hook.

Endl. n. 1659/1 p. 1368.

1. **PHYLLOSPADIX SCOULERI** Hook. — Hook. fl. bor. Am. II. p. 171. tab. 186. — Cfr. Ruprecht Pilz. a. d. nördl. Th. d. st. Oceans p. 8. tab. I. et II. descript. pl., p. 8 — p. 11. — In lapidib. ad litus Californiae superioris, haud procul ab ostio fluminis Slavjaenka, leg. Wossnessensky 1840.

ZOSTERA L.

(Knth. en. III. 115.)

1. **ZOSTERA SERRULATA** Targ. — A. Bertolonii fl. Ital. tom. X. p. 5. — Foliis elongatis, duas lin. latis, superne serrulatis, integrisve.

Cymodoce aequorea König (Kunth en. III. p. 118).

Legi in Laguna Veneta. Perennis.

2. **ZOSTERA NANA** Ten. (A. Bertol. fl. Ital. tom. X. p. 7). — F. angustissime linearib., 1/2 lin. latis; 1-nerviis, integris; spadice foemineo superne nudo.

(*Z. nana* Roth (Knth. en. pl. III. p. 117. 2).?)

Legi Venetiis ad S. Georg major. Perennis.

ZANICHELLIA Micheli.

(Walp. Ann. I. 766. — Knth. en. III. 123.)

1. **ZANICHELLIA CYLINDROCARPA** Körnicke Mss.

Florum capitulo longissime pedicellato, efoliaceo; nucibus longe cylindraceis, teretibus, dorso non elevato obtusis, rectiusculis, subsessilibus, stylo elongato filiformi terminalis.

In Australia felice leg. Ferdinand Müller n. 52 (Hb. Berlin.). — *Zanichellia Preissii* Ferd. Müller in pl. exsicc. ab ipso collect., nec Lehmann. — Caulis in aqua fluitans, tenuissimus, reliquis hujus generis speciebus similis. Florum capitula demum pedicello 2—5 lineas longo stipitata, basi bracteis (2?) sed non foliis cincta. Nuces 1—3, flavescences, nitidae, pluries longae quam latae, fere 1 lineam longae et circiter $\frac{1}{6}$ lineam latae. Styli tenues, longitudine nucem aequantes, versus apicem in stigma majusculum ampliati. — Differt a *Zanichellia Preissii* Lehm. nucibus flavescens (non brunneis), longioribus et pro ratione angustioribus (in *Z. Preissii* Lehm.) nucibus, quum longitudine $\frac{1}{2}$ lineam parum superent et latitudine $\frac{1}{3}$ lineam aequent, duplo non sexies longiores quam latae sunt; florum capitulo efoliaceo (non praeter bracteas foliis cincto). A reliquis speciebus florum capitulo longe pedicellato, nucibus teretibus, notis aliis dignoscitur.

Ordo VIII. JUNCAGINACEAE Lindl.

(Knth. III. 141. 593. — Walp. Ann. III. 506.)

MAUNDIA F. Müller.

Fragm. phytogr. 1858. p. 22.

Flores hermaphroditi. Sepala 2—4 squamea persistentia. Antherae 8—12 disco irregulari stipitem brevissimum germinis ambienti adnatae uniloculares extrorsum longitudinaliter dehiscentes. Germina 3—4 angulo interiore connata. Styli nulli. Stigmata linearia verticem germinum marginantia glabra, carpodia 3—4 monosperma apice tantum disjuncta et subrostrata, dorso costis duabus marginata. Semen ex apice loculi pendulum cylindraceum.

Herba erecta, paludes Australiae orientalis subtropicae incolens, glabra, Triglochium majorum facie, radice ramosa fibrosa, foliis paene semiteretibus, scapis monostachyis.

Genus hinc Triglochium et Cynogetonem (cui Triglochium dubium R. Br. pertinet), inde Aponogetonem et Ouvirandram attingens, suavi memoriae Joannis Maund, M. D., viri benignitate et doctrina praestantis, scientiae et amicis suis numerosis nunc praematura morte erepti, pia mente sacratum.

1. MAUNDIA TRIGLOCHINOIDES F. Müll. l. c. — In paludibus prope Durando, originem versus fluvii Brisbane. Hill & Mueller. — Herba ulnaris v. paucipedalis. Folia longitudinem scapi subaequantia, semunciam circiter lata supra leniter subius valde convexa, apicem versus compresso-trigona. Scapi aphylli. Spicae multiflorae 2—4'' longae, floribus demum remotiusculis. Sepala carnosae subrotunda breviter unguiculata circiter 1'' longa, duo laterali-inferiora duo altera laterali superiora, sed frequenter oblitterata. Antherae ochroleucae subbiseriatae $\frac{1}{2}$ '' longae, breviter acuminatae. Fructus sessiles circiter 4'' longi, alis dorsalibus angustis incurvis basi breviter in angulum carpodia jungentem productis. Semina matura hucusque ignota.

TRIGLOCHIN L.

(Knth. en. III. 142. 393. — Walp. Ann. III. 506.)

1. TRIGLOCHIN MUCRONATUM R. Br. l. c. p. 343. — Sonder in Linn. XXVIII. p. 224. — Rivolibay (Dr. F. Müller).

T. Neesii Endl. ! Plant. Preiss. II. p. 51. est forma *T. mucronati* R. Br. in solo arenoso enata, cujus folia tenuiora sunt; carpella non differunt. — *T. racemosum* Endl. ! l. c. est status nondum evolutus Antherici semibarbatii R. Br. !

CYCNOMETON

Endl. gen. suppl. I. 1664!

1. **CYCNOMETON HUEGELII** Endl. Iconogr. t. 73. — In rivis Gawler et Tonunda, Nov., Dec. (Dr. Behr); in fluvio Torrens, Nov., nec non in flumine Yarra et paludibus adjacentibus (Dr. F. Müller).

„Folia fluitantia, spicae emersae.“

Scapus 2—3-pedalis. Folia $\frac{1}{2}$ —1 poll. lata. Spica florifera 2—3-pollicaris, fructifera racemosa spithamæa. Nuculae ut in sequente saepe subspiraliter tortae.

2. **CYCNOMETON LINEARE** Sond. in Linn. l. c. p. 225.

Radice tuberosa, tuberibus pedicellatis, foliis linearibus scapum aequantibus, spica florifera multiflora, fructifera racemosa laxa, pedicellis nuculas compressas falcatas subaequantibus, stylis demum recurvis intus stigmatosis.

Triglochin lineare Endl. in Pl. Preiss. II. p. 54.

In stagnis et locis inundatis rivum Plenty-creek versus (Dr. F. Müller); Van Diemensland (Stuart). — Tubera minora pisum aequantia, majora magnitudine nucis avellanae. Vaginae laceratae. Folia scapum aequantia, in nonnullis speciminibus longiora, in aliis breviora, a basi plana, 1—1½ lin. lata. Scapus pedalis vel altior, teretiusculus. Spica florifera 1—2-pollicaris, floribus approximatis, sessilibus, demum remotiusculis, breve pedicellatis. Perigonii foliola 6, suborbicularia, circ. $\frac{3}{4}$ lin. alta. Antherae posticae, subsessiles, loculis oblongis. Ovaria 6, libera, sessilia, compressa, subfalcata, dorso convexa. Stylus recurvus, latere interiore stigmatosus. Nuculae (semimaturae) circ. 1½ lin longae (quam in *C. Huegelii* dimidio minores), glabrae, pedicello aequilongo vel subbreviori, patulo, ebracteato insidentes.

Ordo IX. ALISMACEAE L. C. Rich.

(Knth. en. III. 146. — Walp. Ann. III. 506.)

BALDELLIA Parl.

Parlatore nuovi generi e spec. di piante monocotyled. 1854 p. 57.

Alismæ spec. Linn. sp. pl. p. 487 et auctor. Flores ♀. Perig. 6-phyllum, phyllis exteriorib. calycinis minorib. persistentib., interiorib. corollinis deciduis. Stam. 6, per paria phyllis perigonii interioribus opposita hypogyna. Filam. subulata subadscendentia. Antherae ellipticae, ap. emarginatae, b. bifida affixae erectae biloculares, loculis subdiscretis, latere secund. longitud. dehiscentibus. Pollen sphaericum, subangulatum. Ovaria plurima, supra receptaculum globosum capitato-congesta, distincta, 1-locularia 1-ovulata. Ovulum basilare campylotropum. Styl. terminalis brevissimus c. ovario continuus persistens. Stigma simplex, superne et introrsum papillosum. Carpidia tot quot ovaria, capitato-congesta, distincta, laterib. concava, facie ventrali canaliculata, ap. stylo persistente rostellata dorso tricostrata, subcoriacea, unilocularia, monosperma. Semen basilare, erectum, unienato-complicatum. Testa membranacea, tenuis, Embryo exalbuminosus, homotropus, extremitate radiculari infera.

1. BALDELLIA RANUNCULOIDES Parl. l. c.

Alisma ranunculoides Linn. l. c. et auctor.

Hab. In locis paludosis inundatis et in fossis in aqua lente fluente. A Succia usque ad Neapolin, in Africa bor., in Algeria. — Fl. Junio - Julio.

ALISMA Linn.

(Walp. Ann. I. 769.)

Parlatore nuovi generi e specie di piante monocotyled. 1851 p. 58.

1. ALISMA ACANTHOCARPUM Ferd. Muell. — Fragm. phytogr. 1858 p. 25.

Petiolis articulatis folio multo longioribus, foliis ovato-cordatis obtusis, sinu baseos angustissimo, paniculae ramis subangulatis, bracteolis lanceolatis acuminatis, carpidiis 2—10 magnis spinosis, siccis dorso indistincte quadricostatis.

In stagnis ad flumen Victoriae ejus ostium versus. Herba erecta 2—4'. Scapus teres inferne angulatus superne striatus. Petioli inferne teretes superne teretiusculi striati. Vaginae hyalino-membranaceae integerrimae. Folia pleraque 3—5" longa, 13-nervia utrinque nitidula, nervis venisque subtu prominentibus, lobis obtusis. Involucri foliola demum revoluta. Petala 3 alba late ovata acuta circiter 3" longa. Stamina 6. Filamenta alba subulata petalis breviora. Antherae 1/2" longae ovatae dorsifixae virides. Pollen ochroleucum. Styli subulato - setacei circiter lineam longi. Carpida ovato - reniformia, spinis duabus apicali - lateralibus conicis patentibus, 2—3 brevioribus dorsalibus inaequalibus armata.

2. ALISMA OLIGOCOCCUM F. Muell. l. c.

Petiolis inarticulatis folio parum longioribus, foliis cordatis obtusis, sinu baseos angusto, paniculae ramis acute angulatis, bracteolis lanceolato-subulatis, carpidiis binis vel variis pluribus inermibus, siccis dorso obscure quadricostatis et minutim tuberculatis.

In paludibus prope Moreton Bay, W. Hill. Ad flumen Victoriae ejus originem versus; in vicinia sinus Gulf of Carpentaria. — Praecedenti propinqua.

Hydrospöndylus Hasskarl Fl. 1842. Beiblatt II. 33.

Flores monoici (vel dioici?). Masc. spatha sessilis, subglobosa, in vertice bivalve rumpens, muricata, uniflora. Flos breviter pedicellatus. „Sepala tria, obovata; petala tria, linearia; stamina tria; filamenta brevia, filiformia; antherae subgloboso-reniformes“ (Roxb. Hassk.). Fem. Spatha sessilis, tubulosa, ore bidentato, uniflora. Flos sessilis. Tubus perianthii filiformis, elongatus. Sepala tria, obovato-oblonga; petala tria, minora, lineari-obovata. „Stylus longissimus in tubo perigonii inclusus, nec adnatus, capillaris“ (Hassk.). Stigmata tria, filiformia, tertiam partem sepalorum aequantia. Germen inferum, lineari-oblongum, uniloculare; placentae parietales tres. Gemmulae 2—7, inferiores pendulae, superiores adscendentes; vel rarius omnes pendulae, anatropae. „Fructus bacca (?) cylindrica, unilocularis, gelatina impleta; semina pauca („3—7“ Rich.,

„5“ Hassk.), superiora erecta, inferiora inversa. Embryum exalbuminosum, rectum“ (Rich.). — Herba submersa. Caulis teres, cellularum conductricum fasciculo centrali unico, ductuum aëreorum cyclo unico vel duobus, inter ductus aëreos et cuticulam stratis cellularum unico — quatuor interpositis. Folia verticillata, bina — octona, sessilia, uninervia, dentata, dentibus cellula apicali maxima, brunnea, antrorsum curvata, utrinque 8—31, cellulis 3—8 supra marginem prominentibus; cellulae marginales chlorophyllum gerentes, nec vel paululum tantum longiores et tenuiores quam cellulae disci. Stipulae binae, intrafoliaceae, oblongae vel oblongo-lanceolatae, margine papillis linearibus 5—9. Folium basale rami unicum, amplexicaule, ovatum, nervo medio unico, dorso ad axim primarium verso. Radices filiformes, axillares, saepe fasciculatae. — Contentus cellularum rotat. Flores masc. denique a pedicello soluti ad superficiem aquae ascendunt et casu adiuti foemineos foecundant. Hiemem in statu gemmarum oblongarum bulbiformium peragit.

Patria: Europa orientalis, Asia (Indiae ambae orient., China, Java), Nova Hollandia Africa (Insula Mauriti). — Species unica.

ELODEA Richard.

(Ex Mém. de l'Institut l. c. p. 4. in Michaux Fl. bor. americ. 1803. I. p. 20.) ch. ref.

Elodes est nomen generis ejusdam Hypericinearum ab Adansonio (Fam. a. 1763. II. 444). datum, non Elodea, ut Nuttall (genera of North-Am. plants II. 242) false asserit, hinc nomen „Elodes“ Adans. generi illi, quod Nuttall Elodeam vocavit, restituendum. Pro nomine „Elodes“ a cl. Spach 1836. (Suit. à Buff. V. 363) dato propono nomen „Tripentas“. Elodea Jack (Hook. Journ. of bot. 1834. I. 371. ff.) synonyma est cum „Tridesmos“ Hook. et Arnott (Bot. of Beech. voy. p. 172) secundum Hookerum (Journ. of bot. l. c. p. 372).

Elodea et *Anacharis* Richard in Michx. Fl. bor. am. l. c. 1803 et in Mém. de l'Institut l. c. 1812 p. 68 et 69. — *Udora* et *Anacharis* Endl. gen. 1836—40. 1206 et 7; Meisner gen. 1836—43. I. 366. II. 284; Chatin Anat. comp. 1856. p. 24. 26. — *Apalanche*, *Anacharis* et *Egeria* Planchon Ann. and Mag. of nat. hist. 1848. p. 47 ff.; Ann. d. sc. nat. III. ser. XI. tom. 1849. p. 73 ss.

Flores vel polygami, vel dioici, vel hermaphroditi, singuli — terni e spatha axillari, sessili, ovata vel lineari, tubulosa, ore bilobo, lobis deltoidibus erumpentes. Flos masc. vel sessilis, tempore foecundationis solutus et libere natans, vel longe tubo perianthii filiformi pedicellatus, non solutus. Sepala tria, ovalia; petala tria, subcircularia — ovato-oblonga; stamina 3, 6, 9 cum petalis et inter se alternantia. Antherae oblongae, filamentum vel brevissimo, vel antheram 1—1½ longitudine superanti. Rudimenta stigmatum trium rariora. Fl. fem. germen inferum, oblongo-lineare, uniloculare, placentis parietalibus tribus; gemulae 3—21, orthotropae (non „anotropae“ Endl.), micropyle sursum versa, vel sessiles, vel funiculo brevi fullae, integumentis duobus (non „unico“ Chat.). Tubus perianthii elongatus, filiformis; sep. et pet. ut in fl. masc., tamen minora. Rudimenta filiformia staminum sterilia tria vel nulla. Stylus unus. Stigmata tria, linearia, apice incrassata, biloba vel emarginata. Fl. hermaphroditus ut femineus, tamen antheris 3, 6 (et ultra?). Fructus capsula (bacca?) „oblonga, subtrigona, cavitate simplici, oligosperma. Semina cylindrico-oblonga. Embryum exalbuminosum, rectum, inversum“ (Rich.).

Herbae aquaticae, perennes, submersae. Caulis fasciculo centrali cellularum conductricum unico. Radices adventitiae filiformes, simplices, e nodis orientes. Folia deltoidea, ovalia, oblonga vel linearia, verticillata, sessilia, medio nervo unico e cellulis conductricibus formato, serrulata, serraturis minutis, rectis, antrorsum versis, cellula unica supra marginem prominentibus, vel rarissime dentata. Ad basin ramorum folia basalia duo, lateraliter, deltoidea, haud amplexicaulia. Stipulae binae, intrafoliaceae, minutae, haud coloratae, ovatae vel suborbiculares, integerrimae. — Patria America boreal. et austr. temperata et tropica. In Angliam, Scotiam et Hiberniam species boreali-americana immigravit.

Inquirendum de natura styli, quem autores vel cum perigonii tubo connatum (Endl., Bab., Hook. et Arnott) vel liberum (Humb. et Bonpl. in Elod. granat.) referunt. Inquirendum de speciebus flore hermaphrodito, num flores dioici et polygami exstent; de speciebus flore dioico, num flores hermaphroditi inveniantur; de floribus Elodeae canadensis, num aliis in regionibus tantum dioici, nec hermaphroditi (e. g. prope St. Louis), aliis in regionibus flores hermaphroditi, nec foeminei, nec masculi (e. g. prope New York) reperiantur. Inquirendum tum de fructu fere omnium specierum et denique in plantis vivis de vasis spiralibus, quum mihi contigerit ea sub puncto vegetationis in Elodeae canadensis anglicae caule invenire.

Floribus polygamis; masculo antheris 9, in spatia uniflora ovata vel ovato-elliptica, tempore foecundationis soluto; flore hermaphrodito antheris 3, 6 (vel ultra?); petalis tribus, sepala tria longitudine subaequantibus vel paululum superantibus; antheris flavis; filamentis in fl. masc. saepius subnullis, in flore hermaphrodito antheram longitudine subaequantibus; stigmatibus petala fore bis superantibus; foliis lineari-lanceolatis, plus minus versus apicem attenuatis, acutis, vel rotundato-acutis, 4—6''' longis, $\frac{1}{2}$ — $\frac{3}{4}$ ''' latis, serrulatis, ternis, rarius quaternis; seriebus 2—4 marginalibus cellularum folii $1\frac{1}{2}$ —2 longitudine cellulas disci superantibus et chlorophyllo pauperioribus.

Planta hermaphrodita:

Flores dioici. Masc. Spatha sessilis, ovata, axillaris, solitaria, multiflora, floribus pedicellatis. Sep. tria, ovalia; petala tria, sepalis angustiora et breviora. Stamina 3, sepalis opposita. Filam. ananthera 3 (v. 2, v. 4), linearia, petalis opposita. Fem. Spatha sessilis, axillaris, solitaria, oblonga, uniflora. Germen inferum, uniloculare, placentis tribus parietalibus, gemmulis 3—39, orthotropis, erectis, funiculis obliquis gemmulas longitudine fere aequantibus; integumenta duo. Tubus perianthii filiformis, elongatus. Sepala tria, ovata; petala tria eis paululum angustiora, ovata; filam. ananthera 3 („6“ Harv. Endl.). Stigmata 3, filiformia, bipartita. Fructus capsula ovata, membranacea, unilocularis, 3-polysperma. Semina erecta, cylindrica, basi funiculo coriaceo-incrassato. Embryum exalbuminosum, rectum, extremitate radiculari supera (non „infera“ Harv., Endl.).

Herbae aquaticae, submersae. Caulis ramosus, fasciculo centrali cellularum conductricum unico, strato vaginali magis incrassato incluso. Vasa spiralia nulla (?). Folia sparsa, hinc inde duo vel tria eadem fere in altitudine posita, linearia, uninervia, dentata. Folia basalia ramorum duo vel tria membranacea in vaginam connata. Stipulae binae ovals, acutae, minutissimae, albidae, parëuchymaticae, vasis et cellulis conductricibus destitutae, integerrimae v. apice papillis 3—4 brevibus. — Plantae Africanae.

1. **LAGAROSIPHON MUSCOIDES** Harvey l. c.

Foliis sensim attenuatis, acutissimis, serrulato-dentatis, 4—7½“ longis, ½“ latis; seriebus cellularum 4—5 marginalibus chlorophyllo destitutis; dentibus acutissimis, utrinque 43—62, angustis, curvatis et antrorsum versis, rarius rectis, cellula unica supra marginem folii prominentibus; internodiis ad 2“ longis, plerumque brevioribus; stipulis ovalibus, sensim in apicem attenuatis, integerrimis; gemmulis 3—4.

TRIANEA *) Karsten in Linn. XXVIII. 424.

(Hydrocharidea Endl. 1210. 1. Trib. II. b. Ovarium uniloculare stigmata 6.)

Flores diclines in eadem stirpe vel dioici. Masculini spatha pedunculum brevem terminans, floribus pedicellatis, pedicellis inaequalibus, bracteatis. Perigonium sexpartitum marcescens, laciniis calycinis oblongis, firmioribus, corollinis lanceolatis margine revolutis. Stamina 6, biseriata interiora paulo minora, filamenta brevia basi connata; antherae basifixae, cordatae, acutae, longitudinaliter birimosae; pollen globosum glabrum; ovarii rudimentum nullum. — Feminini pedunculis nudis bractea solitaria fullis. Perigonii superi limbus trifidus, lacinae sepalis maris similes, deciduae. Stamina sterilia sex, per paria laciniis perigonalibus opposita vel tria iisdem alterna. Ovarium uniloculare; ovula plurima, placentis parietalibus sex, vix conspicuis affixa, horizontalia, bichlamydea, atropa; stigmata sex profunde bipartita glanduloso-hirta, decidua. Fructus —?

1. **TRIANEA BOGOTENSIS** Karst. l. c. — Herba perennis acaulis stolonifera in planitie Bogotanae aquis lente fluentibus obvia; folia conferta, longe petiolata, oblonga nervosa crassa plano-convexa, subtus spongioso-reticulata; petiolo basi dilatata subvaginati ligula hyalina instructa; flores masculini pauci (tres) longe pedicellati in umbellam parvam dispositi; bractee hyalinae pedunculos amplectentes; pedunculi erecti longiusculi foliis breviores; perigonium viridescens, sepalia rubro-nervosa.

Tribus **VALLISNERIEAE**.

(Endl. gen. pl. p. 161.)

VALLISNERIA Micheli.

Charact. emend.: Parlatore, Bullet. de l. soc. bot. de Fr. II. p. 303.

Fl. dioici masc. (Vallisnerioides Mich.). Spatha scapum breviss. terminans, ovata, bivalvis, valvis connat., ab ap. erumpentib., caduca multiflora. Fl. breviss. pedicellati, supra receptac. conicum spadiciforme congesti, c. pedicellis articulati et ab illis mox et facile separabile. Perigon. colorat., tripartit., laciniis obovatis, concavis, obtusiss., aestiv. valvatis. Stam. 2, perigonii laciniis ima b. inserta iisq. alterna. Fil. filiformia. Anth. subglobosae, b. fixae, locul. contiguas. Pollen laeve, globos. Staminodium 1, breviss., laciniis perigonii alternum. Foemin.: Spatha scapum longiss. filiformem, spiralem terminans, tubulosa, ap. bifido-lacera. Fl. solitarius sessilis. Perig. calycini tubus c. ovario adnatus, limbo 3-partitus, laciniis aequalib., ovatis, concavis, obtusiusculis. Staminodia 3, linear. brevia, perig. phyllis opposita. Ovarium perigonii tubo adnatum, cylindricum 1-loc. Ovula plurima, ovalia adscendentia, orthotropa! funiculo longiusc. Stylus brevis, crassus. Stigmata 3, maxima, ovalia, profunde bifida, int. pubescentia. Fr. subbaccatus, cylindricus, perigonii limbo coronatus, 1-ocularis. Semina plurima, cylindrica, ascendentia v. subrecta, testa membranac. fusca, longitudinalit. striata. Embryo semini conformis, exalbuminosus, extremitate radiculari infera, hilo proxima.

SARNA Karst. in Linn. XXVIII.

gen. nov. Rhizanthearum Endl. 725. 1.

Flores diclines, bracteati. Perigonium verticillis duobus, tetrameris, alternantibus, decussatim imbricatis ovario adnatis. Masc. Stamina plurima, columnae centrali, pileo hemisphaerico margine ciliato coronatae biseriatim sub apice adnata; antherae sessiles, uniloculares, extrorse dehiscentes; pollen simplex, globosum, glabrum. Feminini: Ovarium subinferum uniloculare multiovulatum, ovula spermophoris quatuor parietalibus in medio ovarii ampliatis funiculis longis affixa anatropa, bichlamydea; stylus carnosus, brevis apice truncatus, stigmatosus, pervius. — Fructus baccatus carnosus, unilocularis, phyllis perigonalibus, tectus. Semina plurima exalbuminosa, minuta, angulata; testa reticulata crustacea, nucleum arcte cingente; embryo globosus aequabilis.

Plantulae parasiticae, ramis plantarum dicotylearum insidentes, aphyllae; flores solitarii e cortice protuberantes globosi magnitudine pisi minoris, bracteis quatuor suborbicularibus, phyllis perigonalibus similibus fulti, sepala petalaeque rubro-fusca, cum ovario connata eique insidentia; fructus carnosus fuscus.

1. **SARNA CAULOTRETI** Karst. l. c.

Sepala petalaeque semidiscoidea obtusa basi lata ovario adhaerente, ei aequalia carnosiuscula margine eroso-ciliata; antherae 48 contiguae semiglobosae.

Locis calidis hyeme imbribus copiosis humectatis Venezuelae usque 1000 metr. altitudine Caulotreti truncos scandentes habitans.

2. **SARNA INGAE** Karst. l. c.

Sepala petalaeque lanceolata obtusa, basi lata ovario insidentia, stigma superante, scariosa, margine integra vel apice erosa.

Ramis Ingae specierum insidens, in fluminis Cauca valle prope oppidum Popayan observata.

1641. THALIA Linn.

THALIAE SPECIES

in horto regio botanico Berolinensi cultae auctore H. Steudner, in ind. h. Berol. 1857.

Genera: Canna, Amomum, Costus, Alpinia, Curcuma, Kämpferia et Thalia a Linnaeo jam (in systemate vegetabilium) in familiam naturalem, quam Scitamineas appellavit, congregata sunt. Heliconia autem et Musa, genera tam propinqua, ob staminum

fertilium numerum propterque rationes sexuales in systemate ab illis longe ei separandae erant. Illustr. R. Brown (Flinder's voyage p. 575; verm. Schr. I, p. 97; prod. Fl. Nov. Holl. p. 307; verm. Schr. III., p. 163) *Cannam L.*, *Marantam L.*, *Thaliam L.*, *Phrynium Willd.* et *Myrosma L. fil.* (genus postmodum remotum), quae ab aliis Scitaminearum generibus anthera uniloculari differunt, segregavit et Cannearum sive Marantearum familiam constituit. Equidem virum cl. C. Koch (Berliner allgemeine Gartenzeitung 1857, p. 141) sequens hanc familiam aut potius subfamiliam finibus angustioribus accuratius includam, *Canna*, germine triloculari, polyspermo et stylo recto, acuminato remota. *Marantaceis* ita circumscriptis genus *Calathea* quoque a cel. G. F. W. Meyer (primitiae Fl. Essequib. 1818) constitutum, recte adnumeratur. Cl. Sonder (neue allgem. deutsche Gartenzeitung von E. Otto, Hamburg 1819, tom. V, p. 225) *Stromanthem* addidit, genus quod a *Thalia L.* nihilo differt et sicut *Goepertia N.* ab *E.* et *Peronia De Cand.* abdicandum est. Quod ad numerum et dispositionem partium floris attinet cl. Lestiboudois (Mém. de la Soc. des Sciences, de l'Agricult. et des Arts de Lille 1823 et 1824; Annal. des Sciences nat. 1829 p. 123) primus erat, qui florem in tota Scitaminearum familia ad eundem typum ac in aliis Monocotyleis constructum esse demonstravit. Deinde eum sequens ill. Nees ab Eesenbeck de *Maranta arundinacea* et *Thalia dealbata* in *Linnaea* (1831, t. VI, p. 303) praeclare disputavit. E *Marantacearum* familia, strictiori sensu circumscripta, *Linnaeus* duas solum species, *Marantam arundinaceam* et *Thaliam* geniculatam cognovit. *Maranta Galanga L.* *Alpiniae* species est. In diagnosi *Thaliae Linnaeus* fructum secundum *Plumierum* drupam nucleo biloculari praeditam esse contendit, qui error sine dubio originem inde traxit, quod in sectione transversali embryonis, hippocrepidis instar curvati, cavitas duplex apparet. Contra cl. Roscoe (Monandrian plants of the Order Scitamineae, Liverpool 1828) errorem eo ortum esse contendit, quod *Plumierus*, sectione transversali duorum juxtapositorum florum facta, unum tantummodo germen loculis duobus animadvertere sibi videbatur.

Calyx trisepalus. *Corolla* brevissime tubulosa, laciniis exterioribus tribus subaequalibus, interiorum duabus anterioribus basi angustatis, tertia maxima labellum aut nectarium auctorum referente. *Staminodia* bina, alterum cum labello connatum, alterum cucullatum. *Filamentum* petaloideum, bilobum, lobo altero subfilamentiformi, antherifero. *Germen* inferum, triloculare, loculis duobus posterioribus dissepimentorum crassissimorum (receptaculi N. ab E.) pressione evanescentibus, tertio fertili. *Ovulum* solitarium, anatropum.

Maranta differt staminodio cucullato, bilobo, germineque uniloculari; *Phrynium* contra et *Calathea* germinis loculis tribus fertilibus. — *Herbae* perennes, subcaules seu caulescentes, rhizomate saepissime tuberoso. *Petioli* vaginantes, a latere compressi, ad apicem tumidiusculi. *Foliorum* lamina oblonga, subobliqua, oblique cuspidata. *Inflorescentia* thyrsum distichum, secundum vel spicam bracteis bifariam dispositis, simplicem vel compositam proferens. *Bractee* ramulum brevissimum aut longiorem, bi- aut pluriflorum involucentes aut fulcrantes, virides vel coloratae. *Bracteolae* pellucidae. *Flores* breviter pedicellati vel subsessiles. *Sepala* 3, nonnunquam colorata. *Styli* pars suprema cum stigmate subtrilobo perforato-concavo aut crateriformi sub anthesi a staminodio cucullato involuta, postea labello apposita. *Germen* triloculare, sed mox pseudo-uniloculare, monospermum, loculis duobus axin versus sitis inanibus, demum evanescentibus, postice dissepimentis tribus incrassatis, corpus trigonum crassum ovulum versus concavum et persistens formantibus impletum.

Sect. I. THYRSO CONFERTO.

1. *Bracteis viridibus, imbricatis, ramulis abbreviatis sub-8 floris.*

1. *THALIA SETOSA* C. Koch Berl. allgem. Gartenz. 1857, p. 258; *Phrynium setosum* Rosc. Mon. plants 14, t. 107; *Maranta setosa* A. Dietr. spec. plant. tom. I, p. 23.

Petoli graciles, erecti, pilis hirtis rufescentibus, punctis insidentibus vestiti, superne asperi. Margines vaginacei dimidium petiolum occupantes. Tumor viridis. Lamina lineari-oblonga. Bractee lanceolatae, superne et margine pilis rigidis fuscis praeditae. Corolla alba, superne lilacina. Germen superne setis brunneis nitidis vestitum.

Petoli bipedales. Foliorum lamina patentissima, imo subreflexa, inferiorum 15 poll. longa, 6 poll. lata, oblonga, superiorum 15 poll. longa, 5 poll. lata, lineari-oblonga, glabra. Bractee virides, ramum abbreviatum circumdantes. Sepala oblonga, erecta, dorso medio virescentia, versus apicem margine fimbriata. Corolla albido-lilacina, medio lutea. — Cl. Roscoe (l. c.) ex errore capsulam trilocularem et trispermam esse dicit. Habitat in Brasilia.

2. *THALIA SELLOI* C. Koch Berl. allg. Gartenzeit. 1857, p. 258 (nondum descripta); ? *Maranta compressa* A. Dietr. spec. plant. tom. I, p. 22.; *Maranta Selloi* hort.

Petoli patuli, undique hirti. Tumor petiolo vix crassior, flavescens. Lamina lato-oblonga, Margines vaginacei dimidio petiolo longiores. Bractee ovatae, margine pilis fulvis obsitae. Labellum albidum. Germen adpresse pilosum, apice annulo fulvo-piloso cinctum.

Foliorum lamina lato-oblonga, 12 poll. longa, 5—6 lata, erectiuscula, nervo medio subcanaliculato. Bractee ramum abbreviatum fulcrantes, omnino involucrantes. Sepala margine ad partem superiorem ciliolata, dimidiam corollam albam, interiore parte auream superantia, viridi-pellucida. Flores brevissime stipitati, 4 lin. longi, tubo 1½ lin. longo. — Habitat in Brasilia?

3. *THALIA LUSCHNATHIANA* C. Koch Berl. allg. Gartenzeit. 1857, p. 258 (nondum descripta); *Maranta Luschnathiana* hort.

Petiolus gracilis, erectus, dorso et versus apicem undique hirtulis, ceterum glaberrimus. Margines vaginacei dimidium petiolum vix attingentes, hirtuli. Tumor petiolo crassior. Lamina foliorum inferiorum ovato-oblonga, superiorum oblonga. Germen pilis longis instructum.

Petoli 2—2½ ped. longi. Foliorum lamina 12 poll. longa, 6 lata, glabra. — Patria?

2. *Bracteis coloratis, ramulis abbreviatis bifloris.*

4. *THALIA GLUMACEA* C. Koch Berl. allgem. Gart. Zeit. 1857, p. 163; *Maranta glumacea* hort.

Foliorum lamina oblonga, breviter petiolata, supra fascia longitudinali dilute virescenti notata, ceterum intense viridia, pilis adpressis fulvis subvelutina, subtus pallide viridia, pilis prostratis remolis adpersa. Thyrsus compositus, 24—30 florus, bracteis oblongo-lanceolatis, flavescentibus. Germen pilis fulvis, adpressis vestitum.

Lamina foliorum reflexa aut horizontaliter patens. Petiolus per totam longitudinem vaginis instructus, pilis adpressis vestitus, 2 poll. longus. Tumor viridis, supra densissime pilosus, subtus glabriusculus. Folia 3—4 poll. longa, 1½—2 lata. Scapus radicalis pauciramosus. Rami bractea compressa, ancipiti fulcrati. — Patria?

5. *THALIA LEPTOSTACHYA* C. Koch Berl. allg. Gart. Zeit. 1857, p. 258 (nondum descripta); *Maranta leptostachya* et *Maranta speciosa* hort.

Glaberrima. Petiolus gracilis, pallide virescens. Tumor viridis. Margines vaginacei dimidium petiolum vix attingentes. Foliorum lamina oblonga, patentissima. Bractee roseo-flavescentes, paene omnino involventes. Germen pilis albido-fulvidis, accumbentibus vestitum.

Foliorum lamina 12 poll. longa, 3 lata, glaberrima, nitens. Inflorescentia simplex, secunda, pedunculo communi tenui e petiolorum membranis vaginaceis egrediens. Bractee flores omnino fere involventes, basi mox soluti et caduci. Flores 5 lin. longi, tubo corollino 1½ lin. longo, 1 lin. lato.

6. *THALIA LINKIANA* Steudn. *Phrynium compositum* Lk. in hort. Berol.; *Thalia composita* C. Koch Berl. Allg. Gart. Zeit. 1857 p. 258; *Maranta composita* hort.

Petioli crassiusculi, patentes, dorso puberuli, marginibus vaginaceis triente parte brevioribus, fimbriatis. Tumor petiolo tenuior, antice atro-violaceus, postice flavescens. Lamina patens, denique horizontalis, foliorum inferiorum ovato-lanceolata, superiorum ovato-oblonga. Inflorescentia composita e spiculis pluribus, distichis, oblongis. Bracteae rubescentiflavidae, pellucidae. Corolla albo-violascens. Germen glaberrimum.

Petioli $1\frac{1}{2}$ ped. longi, crassiusculi, lamina 15 poll. longa, sub medio 5 poll. lata, glaberrima. Bracteae involventes, lanceolatae. Flores albi, apice violascentes, bracteis paullulum minores, 5—6 lin. longi, $2\frac{1}{2}$ —3 lin. lati. Sepala oblongo-lanceolata, pellucida, corolla duplo minora. Corollae laciniae exteriores oblongae, albae; interiores duae angustiores, albae, apice violascentes. Germen glaberrimum pedicelli crassitudine.

Sect. II *SPICA LAXA, SPICULIS MULTIFLORIS.*

1. *Acaules:*

7. *THALIA DEALBATA* Fras. opusc. Lond. c. tab. aen. del. a Sowerby; *Th. dealbata* Rosc. Linn. Trans. tom. VIII. p. 340; Ait. hort. Kew ed. II, tom. I, pag. 3; bot. Mag. tab. 1690; R. Brown. Prodr. Fl. Nov. Holl. p. 307; R. Brown. verm. Schr. tom. III, p. 163; Röm. et Schult. syst. veg. tom. I, p. 18 et 559; mant. I, p. 9; Spreng. syst. veg. tom. I, p. 8; Smith in Rees Cyclop.; Rosc. Mon. pl.; *Peronia stricta* de Cand. in Redouté Lil. tom. VI, tab. 342; Röm. et Schult. syst. veg. tom. I. p. 18; *Maranta dealbata* A. Dietr. spec. plant. tom. I, p. 24.

Folia longe petiolata. Lamina oblongo-lanceolata, glaberrima. Spica paniculata scapo longissimo insidens, bracteis orbiculato-ovatis, lividis, pulverulentis. Corolla purpureo-violacea. Germen glabrum.

Scapus pulverulentus, folia longe superans, 4—6 ped. altus. Foliorum lamina $1-1\frac{1}{2}$ ped. longa, glaberrima. Tumor petiolo longo vix crassior. Spiculae 20—30 florum. Sepala ovata, livido-purpurea, tenera. Laciniae corollae exteriores sepalis quadruplo longiores, livido-purpureae, interiores margine atro-purpureae. — Habitat in Carolinae meridionalis lacubus.

2. *Caulescentes.*

8. *THALIA LUTEA* Steudn. ? *Maranta lutea* Jacq. coll. tom. IV, p. 117; ic. var. tom. II, tab. 70; Willd. enum. tom. I, p. 5; Spreng. syst. veg. tom. I, p. 8; ? *Maranta Jaquini* Röm. et Schult. syst. veg. tom. I, p. 559; mant. I, p. 8; add. I, p. 70; Nees et Mart. n. act. ac. Leop. tom. XI, p. 25; A. Dietr. spec. plant. tom. I, p. 18.

Caulis ramosus, glaber. Petiolorum margines vaginacei dimidio petiolo longiores, glaberrimi. Petioli dorso puberuli, pallide virescentes, tumore intensius viridi. Lamina ovato-oblonga, patentissima. Spica paniculata e spiculis alternis, distichis, luteo-aurantiacis composita. Corolla albida. Germen superne annulo fulvo-piloso cinctum.

Foliorum lamina ovato-oblonga, 15 poll. longa, 6 poll. lata, patentissima, zona media puberula. Bracteae involventes, oblongae, luteo-aurantiacae, subpellucidae. Sepala flava. — Habitat ad Caracas.

9. *THALIA SANGUINEA* Lem. jard. fleur. III, tab. 268; *Stromanthe sanguinea* Sond. neue allg. deutsche Gart. und Blumenzeitg. v. E. Otto. Hamburg 1849, p. 225. — Fl. des serres VIII. t. 785.

Caulis glaber. Folia breviter petiolata, patentissima, oblongo-linearia vel oblonga, subtus purpurascens. Spica paniculata, disticha, sanguinea, bractea communi fulcrata. Flores 10 et ultra bracteis geminis insidentes. Germen pilis adpressis albidis vestitum.

Caulis 2—3 pedalis, subteres, purpurascens. Petiolorum margines vaginacei puberuli, tumorem petiolo crassiorem subattingentes, 4—5 poll. longi. Lamina glabra, supra intense viridis, nitens, subtus purpurascens, 12 poll. longa, 2—3 lata. Bractea lanceolata, purpurascens. Bracteolae oblongae. Sepala sanguinea, ovata, concava, leviter striata. Laciniae corollae exteriores albae, purpureo-punctatae, interiores

albae. *Staminodium cucullatum*, purpureo-striatum, vix prima juventute stylum retinens. — *Phryn. sanguineum* Hook. bot. mag. t. 4646. — Habitat auct. Sond. in Ind. orientali.

Stromanthe spectalis Lem. jard. fleur. tom. IV. tab. 401 vix a *Thalia sanguinea* differre videtur. Specimina in horto botanico Berolinensi culta nondum floruerunt. Sectio transversalis germinis in icone data loculos 4 sistit, qui error dissepimento crasso triplici ortus est.

1642. **MARANTA** Blum.

(Walp. Ann. III. 606.)

Subgen. *Saranthe* Rgl. et Kecke. — Ind. sem.-h. bot. Petrop. 1857.

Inflorescentia spiciformis, cristata, densa; bracteae oppositae dense imbricatae, secundae (ad alterum latus conversae ibique flores foventes); staminodia duo externa satis parva, non labelliformia; calyx in fructu persistens bracteis communibus inclusus; semina arillo instructa. — Folia marginibus parallelis, ex apice rotundato-obtuso vel obtusiusculo, breviter acuminata. Rami florales apice spicam unam vel duas vel plures paniculatas gerentes. Bracteae distichae sed in unum latus ad modum spicularum *Cynosuri* cristati L. conversae, et flores 2 vel plures qui in unum latus spectant foventes. Flores parvae vix e bracteis eminentes, bracteolati. Petala et staminodia basi infra medium connata superne convoluta in tubum breviusculum latiusculum; illa appressa, aequalia; staminodia limbo parvo subarrecto. Staminodia duo externa subaequalia breviuscula, tertium medium intus callo crasso ornatum, quartum intimum cucullatum stigma obtegens.

Hoc subgenus spicis confertis, bracteis imbricatis distichis sed ad modum *Cynosuri* cristati unilateraliter conversis, floribus vix eminentibus, tubo brevi latiusculo staminodiis duobus externis subparvis insigne complectitur quinque species habitu etiam affines, quarum tres per hortos longe lateque divulgatae sunt. — Primo intuitu generi *Calathea* quidem haud assimile sed differt tubo corollae brevi quam germine crassiore (nec tenui gracili elongato), staminodiis externis duobus (nec uno), anthera libera (nec a medio ad basim cum appendice filamenti parva petaloidea connata). Praeterea accedit, quod (monstrante specimine Riedeliano M. Luschnathianae spontaneo et aliis cultis) specimina uberius enata in apice rami floriferi praeter spicas proferunt folia et ramos iterum spicigeros, atque folia accuratius inspecta et forma et colore et splendore magis ad *Maranta arundinaceam* L. et species affines accedunt. — Nomen e vocibus „σάρκος scopa“ et „ἄνθος flos“ compositum propter flores in spicam compositam unilateralem congestos ad modum scopae setis constructae (Germanis: Handfeger). — (Cfr. supra genus *Thalia*.)

1. **MARANTA** (*Saranthe*) **SETOSA** A. Dietr. (cfr. supra *Th. setosa* K. Koch.)

Phrynium setosum Rosc. Scit. tab. 41. — *Maranta secunda* Hort. Edinb.

Foliorum vaginis et spicarum pedunculis et bracteis chartaceis viridibus persistentibus lanceolatis longe acuminatis inferioribus ubique reliquis margine et a medio ad apicem setosis; spicis geminis vel pluribus aggregatis.

Icon Roscoeana quoad plantam totam optima! Pili setosi flavescens praesertim ad vaginarum et bractearum margines densi et longi. Folia parallelo-oblonga ex apice obtuso vel obtusiusculo subito breviter acuminata, lamina usque 16 pollices longa et usque 4 poll. et 7½ lineas lata. Ramus florifer setoso-hirsutus. Spica (si tres) infima pedicellata, pedicello ¾—1 pollicari; media sessilis et basi bractea reliquis longiore suffulta; summa breviter pedicellata; 1½—2 pollices longae, 1¼ pollicem latae. Bracteae erecto-patentes, circiter pollicares. Bracteolae communes binos flores includentes late ovatae, acutiusculae, dorso bialatae, alis pilosis purpurascens, ceterum glabrae, membranaceae, hyalino-albidae. Bracteolae speciales minores ovales,

acutiusculae et dorso uni-alatae vel obtusae et exalatae, glabrae, membranaceae, hyalino-albidae. Germe obovato-cylindricum, pilis appressis longis vestitum, flavidulum. Sepala 3 libera, corollam longitudine aequantia, acutiuscula, apice cucullata, pilis longis arrectis praesertim versus apicem vestita, concava, membranacea, pellucida, albida margine purpurascens. Petala cum staminodiis infra medium ad basim usque in tubum calyce plus dimidio breviora, gemina, ovata, obtusa, arrecto-pilosa, navicularia, membranacea, hyalino-albida, staminodiis appressa, marginibus se non tegentibus. Staminodia superne in tubum vix limbatum convoluta; duo externa aequalia, spathulato-obovata, rotundato-obtusa, albida. Staminodia interna cum stamine fertili 3; extimum callosum duobus externis vix brevius sed paulo latius, late ovatum obtusissimum callo magno in medium floris porrigente saturate flavo instructum et praeterea in loco alio callose incrassatum, margine albidum medio flavum; intimum inaequilaterum, spathulatum, fere unguiculatum ad alterum latus auricula parum deflexa instructum, flavidum, stylum cucullato-obtegens. Stamen fertile: Anthera libera; appendice petaloidea illam aequante, oblonga, albida apice flavida, filamentum usque ad basim antherae adnata. Stylus rectangulariter infractus, demum incurvatus, stomate truncato.

2. MARANTA (*Sarante*) LUSCHNATHIANA Rgl. et Kcke. (cfr. supra *Th. Luschnathiana* K. Koch.)

Foliorum vaginis et bracteis chartaceis viridibus persistentibus ovatis acutis margine strigilloso-setosis, spicarum pedunculis glabris; spicis plerumque geminis, raro solitariis.

Caulis perbrevis. Folia distiche cespitosa, longe pedunculata, basi vaginata. Vaginae margine flavescenti-setosae ceterum cum pedunculis pilis flavescentibus subsetosis hirtellae vel puberulae, usque pedales. Petioli compressiusculi, paulo infra laminam articulo-incrassati, supra a vagina usque ad articulum sulco instructi, usque 20 pollicares et longiores, articulo supra linea hirtella instructo vel glabro 1—2 pollicari. Lamina parallelo-elliptica, ex apice rotundato breviter apiculata, basi rotundata breviter producta, glaberrima, nervo medio supra sulcato subtus prominente, supra obscure viridis, subtus pallidior 7—12 pollices longa, $3\frac{3}{4}$ — $6\frac{1}{2}$ pollices lata. Ramus florifer e medio progrediens, setoso et sparse pilosus demum glabrescens, basi foliis involutus, medio nudus vel folio instructus, apice folium et spicas geminas proferens, usque ad apicem spicae summae $1\frac{1}{2}$ pedes superans. Spicae geminae, usque ad $1\frac{3}{4}$ pollices longae $1\frac{1}{4}$ pollice paulo latiores, summa brevius pedunculata vel subsessilis, pedunculo glabro spicae inferioris usque $2\frac{1}{2}$ pollicari vel multo breviora. Foliolum summum basim spicarum vaginans interdum ad vaginam redactum. Bractee ovatae acutae margine flavescenti-setosae ceterum glabrae, distichae sed in unum latus conversae ibique in axillis flores circiter 4 foventes, in altero latere steriles, invicem se amplectentes et arcte appressae, virides, circiter 1 pollicem longae, basi $\frac{1}{4}$ pollicem latae. Flores subsessiles, omnes et singuli bracteolis involuti. Bracteolae communes lato-ovatae, leviter retusae, apiculatae, membranaceae, dorso alis duabus membranaceis rigido-pilosis ornatae, albidae. Bracteolae speciales oblongae, acutiusculae, a medio ad apicem margine rigido-pilosae, naviculares, membranaceae, hyalino-albidae. Germe inferum obovato-cylindricum, pilis appressis strictis praesertim apice vestitum, albidum, uniloculare, uniovulatum et corpusculo placentario instructum. Sepala corollae appressa eamque fere totam involventia, bracteolis specialibus similissima. Petala infra medium ad basim usque in tubum calyce plus dimidio breviora, gemina, ovata, obtusa, apice cucullata, glabra, navicularia, membranacea, hyalino-albida, staminodiis appressa, marginibus se tegentibus. Staminodia superne in tubum vix limbatum convoluta; duo externa aequalia obovata, rotundato-obtusa, albida, reliquis paulo longiora. Staminodia interna cum stamine fertili 3, extimum callosum late-obovatum, rotundato-obtusum, intus callo magno in medium floris porrigente saturate flavo instructum, margine albidum medio flavum; intimum inaequilaterum, spathulatum, unguiculatum, ad alterum latus auriculatum

auricula lata parum deflexa, albidum, stylum cucullato-obtegens. Stamen fertile: Anthera libera; appendice petaloidea illam fere aequante oblonga albida apice flavida, filamento usque ad basim antherae adnata. Stylus apice rectangulariter infractus, stigmatibus truncato. Fructus membranaceus unilocularis monospermus. Semen truncato-ovale, tuberculatum, arillo biligulato instructum. — Marantae setosae A. Dietr. valde affinis sed optime distincta pilositate evidentius minore praesertim bractearum, foliis brevioribus et latoribus, bracteis ovatis acutis (nec lanceolatis acuminatis). — E Brasilia verisimile a cl. Riedel et Luschnath missa.

3. MARANTA (*Saranthe*) LEPTOSTACHYA Rgl. et Kcke. (cfr. supra *Th. leptostachya*).

Foliorum vaginis margine inferne pubescentibus ceterum cum spicae pedunculo bracteisque albedo-membranaceis glabris; spicis solitariis.

Caulis perbrevis. Folia longe petiolata, basi vaginata. Vaginae margine pilis flavescenscentibus pubescentes ceterum glabrae usque 8 pollicares. Pedunculi compressiusculi, apice articulo-increassati, supra a vagina usque ad articulum vix sulcati, usque 19 pollicares, articulo 1—1½ pollicari. Lamina oblongo-elliptica, marginibus subparallelis apice subito breviter acuminata, basi obtusiuscula breviter producta, glaberrima, nervo medio supra sulcato subtus prominente, supra obscure viridis et nitida subtus pallidior, usque ultra pedem longa et usque ultra 4 pollices lata. Ramus florifer inconspicuus, foliis multo brevior et occultus, glaber, apice vaginam (non folium) et spicam solitariam terminalem rarissime duas gerens, usque ad apicem spicae 9 pollicaris. Vagina pedunculum spicae 3¼—4¼ pollicarem longe involvens, glabra. Spica 1½—1¾ pollices longa, usque ¾ pollicem fere lata. Bractee ovales, obtusae, basi barbulate ceterum glabrae, distichae sed in alterum latus conversae ibique in axillis flores binos foventes, in altero latere steriles et superiores tantum basi se amplectentes inferiores remotiusculae, tenui-membranaceae, subpellucidae, albidae, usque ½ pollicem longae et 4½ lineas latae. Flores bracteis communibus duabus vel una involuti, breviter pedicellati, pedicellis basi connatis. Bracteolae late ovatae, obtusae, glabrae, membranaceae, hyalino-albidae, exterior laevis, interior oblique carinata; si una adest, tum interior. Germen obovato-cylindricum appresse pilosum, flavum, uniloculare, uniovulatum, corpusculo placentario instructum. Sepala 3 oblonga, acuta, glabra, trinervia, membranacea, hyalino-albida, corolla plus duplo breviora, sese invicem marginibus non attingentia. Tubus floris brevis germine lator. Petala 3 aequalia, oblonga, obtusa, glabra, membranacea, hyalino-albida, cum staminodiis superne in tubum convoluta. Staminodia duo externa subaequalia, obovata, rotundato-obtusa, leviter retusa, glabra, albida. Staminodia interna cum stamine fertili 3; extimum lato-obovatum, obtusissimum leviter emarginatum, callo magno intus porrigente flavo instructum, margine albidum medio flavidum; intimum inaequaliter spatulatum, ad alterum latus auriculatum, auricula lata paulo deflexa, inferne flavum, stigma cucullato-obtegens. Stamen fertile: Anthera libera; appendice oblonga usque ad basim antherae filamento adnata flavida demum albida quam anthera longiore. Stylus apice primum rectangulariter infractus demum incurvus, stomate truncato. Bractee una cum floribus non foecundatis decidunt. Si flores foecundantur, verisimile bractee etiam persistunt. Marantae setosae A. Dietr. et Luschnathianae Rgl. et Kcke. bractee, ne foecundatis quidem floribus, semper persistunt. (Kcke.)

4. MARANTA? WARSCEWICZII Planch. — Fl. des serres IX. tab. 939. 940. — Planta aculis facie Calathaeae Zebrinae sed omni parte minor, f. fasciculatis, infimis squamaeformibus, perfectis longiuscule petiolatis, petioli supra basin dilatata semivaginantem teretibus, limbo oblongo (6—10 pollicari) brevit. et acute cuspidato marg. integro leviter repando-undulato supra glabriusculo laete viridi fasciis arcuatis pinnatum dispositis obscurioribus ornato secus nervum medium fascia viridi flava marginibus erosa picto subtus sicut petioli molliter velutino violascenti-purpureo, caeteris... ignotis ideoque genus valde dubium. — Maranta Warszewiczii hortul. — L. Mathieu

(Walp. Ann. III. 606.)

1. PHRYNIUM EXIMIUM C. Koch et Bouché. — C. Koch in app. ind. sem. hort. Berol. 1855.
Maranta eximia L. Math.

Acaule, rhizomate crasso; petiolus brevis, apice tumidiusculo glaberrimo excepto villosus; folii lamina oblonga, supra glaberrima, nitens, fasciis transversis albescentibus instructa, subtus velutina, rubro-brunnea; scapus brevis, ferrugineus; sepala pellucido-membranacea, tubo corollino duplo breviora; stigma obliquum, membranula auctum; germen apice truncatum, setis ferrugineis coronatum.

Species a cl. peregrinatore a Warszewicz e tropicis Americae regionibus introducta et primo in horto Mathieviano culta habitu cum *P. zebri* Rose. (*Calathea zebria* Lindl.), foliis contra subtus velutinis coloratis cum *P. Warszewiczii* Klotzsch convenit. — Scapus radicalis, brevis, apice geniculatus et bractea lanceolata a spica ovata distante praeditus, pilis ferrugineis horizontalibus hirsutus; bracteae spicae inferae ovatae, acuminatae, ad superiorem partem sensim attenuatae, omnes pilis ferrugineis dense vestitae, inferiores 6-, superiores 4 florum; flores gemini, bracteis primariis et secundariis pellucido-membranaceis fulcrati, posteriores prius, anteriores serius evoluti; germen ovatum, apice truncatum, setis ferrugineis coronatum, 3 loculare, dissepimentis crassis et ovulis basilaribus stipite crasso brevi ab apice lato ad basin sensim attenuato praeditum; sepala lanceolata, bracteis vix longiora, tubo corollino vix pollicem longo duplo breviora; corolla infundibuliformis, alba, laciniis aequilongis, tribus exterioribus ellipticis, extus villosis, duabus interioribus oppositis latis oblongis, lateralibus incurvis, ideoque convexis; labellum dimidio brevius, lateribus convolutum, ab initio totum stylum includens, ad apicem latere altero inflexum, altero in appendicem aristiformem transiens; filamentum basi cum labello connatum, latum, apice bilobum, lacinia exteriori antheram gerente: stylus denique circumnatus; sigma late perforatum. — Folia petiolo longiora, pedalia et longiora, 6 poll. lata, nervis lateralibus parallelis numerosis et fasciis alternis saturate viridibus et albescentibus percursa. Membranae petioli villosi vaginaceae margine involutae.

2. PHRYNIUM VARIANS C. Koch et Mathieu in ind. sem. hort. Berol. 1855.

Heliconia aut *Phrynium discolor* Hort.

Acaule, rhizomate crasso; petiolus elongatus, pilosus, variegatus; lamina folii elliptica, glaberrima, subtus brunnea; scapus brevis, declinato-adscendens, more spicae pilis ferrugineis omnino vestitus; sepala membranacea, corolla duplo breviora; germen apice fulvo-hirsutum.

Cl. peregrinator indefessus a Warszewicz hanc quoque speciem ex America tropica in Germaniam attulit. Foliorum indole ad *Stromanthen sanguineam* Sond. accedit, sed petiolis variegatis longissimis valde singularis est. — Scapus semipedalis, teres, ad basin declinato-adscendentem folio bracteaeformi, infra brunneo, cartilagineo et pollicari, supra medium contra folio minore, herbaceo, ovato-lanceolato, amplexicauli, vix poll. longo, pagina inferiore pilis ferrugineis dense vestito praeditus; bracteae ovato-lanceolatae, apice elongato postremo recurvae, in pagina superiore glaberrimae, nervoso-striatae; bracteolae primariae bracteis oppositae, oblongae, secundariis lanceolatis duplo latiores, pellucido-membranaceae; flores gemini; sepala anguste lanceolata, corolla duplo breviora; tubus corollinus gracilis, laciniis tribus

exterioribus angustis triplo quadruplove brevioribus; ovarium apice fulvo - hirsutum, 3 loculare; ovula tria stipite basilari crasso insidentia.

3. PHRYNIUM TRIFASCIATUM *) hort. — C. Koch in app. sem. hort. Berol. 1854.

Acaule; periodice vegetans; folia obovata, basi sensim attenuata, subtus pubescentia, supra glaberrima, fasciis tribus albescens praedita; inflorescentia radicalis, capitato-spicata, disticha; corollae lacinae exteriores anguste ellipticae, interioribus obovato-cuneatis breviores; labellum minimum concavum, parte superiore geniculatum, altero latere biappendiculatum, altero basi cum filamento connatum; germen glaberrimum.

Folia pedalia, superne 5 poll. lata, apice rotundata, pallide virescentia, petiolo gracili antice canaliculato, ad partem inferiorem latiori insidentia; bracteae involucrantes concavae, dorso rotundatae, bracteae propriae dorso planae, exteriores bi-, interiores tri-angulatae; bracteolae lanceolatae, dorso carinatae aut alatae, sepalis lanceolatis breviores; corollae lacinae exteriores flavae, 5-striatae, interiores aureae; labellum flavum, concavum, apice lacinula membranacea clausum, altero latere biappendiculatum, appendice superiore calcariformi, altero basi cum filamento demum lato et petaliformi connatum; stylus cum stigmatibus labello plane inclusus, apice incurvus; stigma laterale breviter tubulosum, perforatum; ovarium 3-loculare; ovula basi placentae columelliformis trigonae inserta. — Species per plures jam annos in hortis europaeis culta, ut videtur, nondum descripta, fasciis foliorum distincta, caeterum accedens ad Phr. grandiflorum Rosc. (Phr. lutescens hortorum).

4. PHRYNIUM? FLORIBUNDUM Lem. — Lem. jard. fl. tab. 189. — Petiolis longe vaginantibus, compressis latere fissis dein breviter cylindricis, ap. subinflato-indurato, lamina lanceolata aut obovata inaequilateri supra nitida nervato-costata infra glaucescenti, scapo robusto lateraliter exserto subancipiti ap. unifoliato, spica densa composita, spathis (veris) amplis imbricatis alternis congestis spiculam unam (v. ex alternatione duas) ferentibus, spicula unaquaque 8- (v. amplius) flora, bracteis 3-4 alternatis tubuloso-circumvolutis, flore sessili gemino simul hiante, unoquoque 2-1 bracteolato tubuloso; calyce... Cor. exserta... filamento petaloideo stylum infra amplexante, anthera laterali... Stylo crasso circinato, stigmatibus cucullato(?)... Ovario triloculari... Ovulis solitariis... ex ap. pendulis...? (ex sicco! quoad flores). — Hab. Serra la Piedade (Minas Geraes) de Jonghe.

Ordo XVI. MUSACEAE *Agardh.*

(Walp. Ann. III. 607.)

1647. **HELICONIA** *Linn.*

(Walp. Ann. III. 607.)

1. **HELICONIA DASYANTHA** C. Koch et Bouché, ind. sem. h. Berl. 1854.

Folia oblonga, acuminata, glaberrima, petiolo rubro-maculato insidentia; pedunculus communis basi paene horizontaliter geniculatus, glaberrimus; spathae 5—7 concavae, pluriflorae; perigonii sepala 6 in tubum conniventia, 3 exteriora mollioribus pubescentia, 3 interiora in unum apice interdum 3 lobum connata; nectarium trulliforme.

Caulis saepe 5-pedalis; pedunculus erectus, 2—3-pedalis, glaberrimus, nudus; folia $2\frac{1}{2}$ ped. et ultra longa, 8 poll. lata, petiolo a latere compresso, antice canaliculato, $1\frac{1}{2}$ —2 poll. longo insidentia; spathae oblongae, rubrae, patentes; perigonium luteum, sepalis lateralibus angustioribus, 3 interioribus in unum connatis (lacinia vaginiformis Rich.) labellum quasi referentibus; stamina 5 fertilia, longitudine perigonii aut vix longiora; stylus cum stigmatibus perigonio paululum aut vix brevior; nectarium (i. e. stamen sextum, lacinula quinta Rich.) quintuplo sepalis brevius. — Species elegans, ad *H. brasiliensem* Hook. et acuminatam Rich. accedens, sed pedunculo communi basi horizontaliter geniculato haud aegre discernenda. Patria ignota. — Regel Gartentfl. IV. tab. 198.

2. **HELICONIA PULVERULENTA**; Hook. in bot. mag. tab. 4685.

F. oblg. tenui-acuminatis marginatis b. cordatis subf. albo-pulverulentis, spathis ternis coloratis (coccineis) folio bracteali concolori breviorib., fl. (parvis, albis) spatha triplo breviorib. pallide viridescens. sepalo nano oblongo submucronato.

H. pulverulenta Lindl. bot. reg. t. 1648.

Patria adhuc ignota (Brasilia? Ins. Dominica?).

Icon addenda.

Ordo XVII. BURMANNIACEAE Bl.

(Walp. Ann. III. p. 608.)

PTYCHOMERIA Benth.

Burmanniaceae e trib. *Dictyostegae*.; Bentham Kew garden. misc. VII. p. 14.

Perianthium infundibulare, tubo longo sub ap. demum circumscisso, limbi decidui laciniae 3 exteriores latae patentes subtrilobae, lob. laterilib. alaeformib. ante anthes. inflexis, 3 interiores parvae v. nullae. Stam. versus ap. tubi 3, cum limbo decidua, filam. breviss., anther.

bilocularib., loc. distinctis, connectivo subdilatato inappendiculato. Ovar. in fundo perianthii adnatum 1-loculare, placent. parietalib. multiovulatis. Stylus ap. trilob., lobis incrassato-dilatatis supra nonnunquam bicornutis v. biaristatis. Capsula subglob., perianthii tubi parte persistente coronata, ap. ad maturitatem irregulariter rupta. Semina angulato-glob., verrucosa, embryo exalbuminoso.

Herbae annuae inter f. emortua in silvis Brasiliae crescentes, coloratae v. hyalinae. F. et bractea squamaef., cauli concolora. Infloresc. Burmanniae; cyma nempe terminalis bifida, pedicellis secus ramos simplices erectis recurvisve brevib. unifloris, nunc in capitula contracta bract. saepe conspicuis imbricatis, nunc laxa squamis bractealib. minutis v. omnino inconspicuis.

§ 1. *Diplomeria*. — Laciniae perianthii interiores 3 parvae dentiformes. Bractea saep. squamis caulinis submajores.

1. PTYCHOMERIA FIMBRIATA.

Humilis rigida, squamis ovatis lanceolatisve, cyma subcapitata, florib. sessilib. bracteisq. orbiculatis imbricatis, perianthii laciniar. exteriorum lobo medio fimbriato.

Herba 3—4 p., albescens. Squamae c. 2 l. lg., concavae, latitud. variables. Cyma prim. glob. — capitata, dem. lateralit. excrescens, pollic. lata. Bract. amplae, perianthii tubum aequantes, c. fl. arcte imbricatae. Perianth. c. 4 l. lg., post limbum delapsum 2 l., b. levit. 3-costatum; laciniar. exteriorum lob. med. latus, ap. incrassatus et dorso appendiculis linearib. fimbriatus, lateral. membranacei, lacin. inter. in sinus parvae, latae, crassiusculae. Antherar. loculi discreti obovoidei. Styli lobi dilatati, inappendiculati. Placentae 3, ovul. numerosiss. Semina pauca (saep. 2 tantum vers. ap. cujusve placentae) maturescunt. — In silvis dictis Coatingas ad flum. Uaupés pr. Panuré.

2. PTYGHOMERIA CAPITATA. — Benth. l. c. p. 15.

Humilis. rigidula, squamis angustis, cyma globoso-capitata, fl sessilib. bracteisq. lato-ovatis acutis imbricatis, perianthii laciniar. exterior. lobo medio nudo.

Herba albesc., habitu P. fimbriatae affinis, sed paulo altior et tenerior, squamis angustiorib. Florum capitul. non dilatatum. Bractea ovato-lanc. v. fere orbiculatae, ap. acutatae, perianthio fere aequales; hujus laciniar. exterior. lob. medius crassiusc. sed non appendiculatus; laciniae interiores parvae ovatae. — In silvis inter fol. emortua pr. Panuré ad fl. Uaupés.

3. PTYCHOMERIA CYMOSA. — Benth. l. c. p. 15.

Rigidula, squamis ovatis, cyma divaricata, bract. ovatis oblongisve pedicello breviorib., perianthii imberbis laciniiis intimis minutis, styli lobis longe et tenuissime biaristatis.

Herba $\frac{1}{2}$ ped. v. paulo altior, in vivo tota violac. siccitate flavicans, simplex v. subramosa. Squamae concavae, 1— $1\frac{1}{2}$ l. lg. Cyma terminalis, primum subcapitata, ramis dem. divaricatis usq. ad 1— $1\frac{1}{2}$ p. excrescentib. Bractea lato-ovatae 1— $1\frac{1}{2}$ l. lg. hyalinae. Pedic. erecti 2 l. lg. Fl. aperti 5 l. longi, post limb. delapsum vix ultra 2 l. Perianth. ext. violac., int. album; laciniae exterior. latae, lobo medio integro, lateralib. vix angustiorib. alaeformib. tenuib. obliquis, denticulatis; interiores minimae, dentif. vix conspicuae. Styli lobi incrassato-dilatati, supra aristis 2 setaeformib. ultra lineam longis appendiculati. Caps. subglob., $\frac{1}{2}$ diam., levit. 3-costata. Sem. subglobosa. — In silvis flum. Uaupés et in montibus silvosis ditionis Maracay-boensis.

§ 2. *Aplomeria*. Laciniae perianthii inter. omnino deficientes. Inflor. laxa, bract. minutis v. nullis.

4. PTYCHOMERIA DIVARICATA. — Benth. l. c. p. 16.

Filiformis, squamis minutis, cymae bifidae ramis divaricatis plurifloris, bracteis minimis clavato-peltatis, styli lobis ap. brevissime bicornib.

Herba albesc., $\frac{1}{2}$ ped. v. interd. fere ped., simplex v. subramosa. Fl. albi ext. punctis violac. colorati, secus ramos 1—3 p. horizontales cymae gracilis regulariter dissiti, erecti. Pedic. ovario vix longiores. Bract. minimae crassiusc., substipitatae, nigrae-Perianth. et stamina P. cornutae. Styli rami ap. pariter appendiculati, sed cornua latitudinem lobor. non excedunt. — Species vulgatissima in littorib. fl. Uaupés, flores odorem emittunt gratum, ei Primulae nostrae haud dissimilem.

5. **PTYCHOMERIA CORNUTA.** — Benth. l. c. p. 16.

Filiformis, squamis minutis, cyma laxa paucifl., pedicellis elongatis, bracteis minimis angustis, styli lobis ap. longe bicornibus.

Herba tenella, pallida v. subpurpurasc., 3—6 p. Fl. albi in cym. laxam terminal. 3—7 fl. dispositi, addito interd. ramo axill. uno alterove 3—5 floro. Pedic. ovario 2—3 plo longiores. Perianth. tubus gracilis, 3 l. lg., limbi lacinae latae tenerr. lobis lateralib. post explication. vix ab intermedio distinctis. Anth. in summo tubo subsess. locul. disjunctis, connectivo tenui. Styli lobi incrassato-dilatati, cornubus subulatis c. lin. longis e fauce perianthii exsertis. Caps. ovoidea, seminib. e quaq. placenta plurimis subglob. — In silvis flum. Uaupés.

6. **PTYCHOMERIA MUTICA.** — Benth. l. c. p. 16.

Filiformis, squamis minutis, cyma laxa pauciflora, pedicellis elong., bract. parv. ovatis, styli lobis inappendiculatis. — Varietates adsunt 2, colore distinctae, in altera atropurpureo, in altera cinnabarino. Perianth. int. albescit.

In silvis flum. Uaupés. — A Pt. cornuto tantum colore et appendicibus styli deficientib. differens.

7. **PTYCHOMERIA TENELLA.** — Benth. l. c. p. 17.

Filiformis, squamis minutis, cyma pauciflora, fl. subsessilib., bracteis minimis nullisve, styli lobis inappendiculatis.

Herba albesc. 3—6 poll. Cymae irregul. interd. ad spic. simplic. interruptam 2—6 florum reductae. Fl. fere 4 l. lg. v. in var. β . minores tenerrimi. — In silvis fl. R. Negro pr. Barra et var. in ditone Serra da Gama dicta ad fl. R. Negro et ad ostium R. Uaupés.

1213 $\frac{3}{5}$. **CYMBOCARPA** Miers in Linn.

Perianthium tubulosum, ovario adnatum, superne liberum: limbo sexfido, laciniis tribus alternis minoribus, post anthesin deciduo.

Stamina tria laciniis interioribus (minoribus) perigonii opposita, inclusa; filamentis brevissimis, antherarum loculis disjunctis transversim dehiscentibus. Ovarium gibboso-trigonum, uniloculare, placentis tribus parietalibus, pluriovulatis, ovulis anatropis. Capsula unilocularis, latere unico ad angulum superiorem tantum dehiscent. Semina numerosissima, scobiformia, testa reticulata nucleum vix superante; embryo homogeneous, acotylis, exalbuminosus.

Planta austroamericana tropica in silvis humidis parasitica inde a linea aequatoriali in utrumque hemisphaerium usque ad tropicos migrans.

1218 $\frac{5}{9}$. **NEPHROCODUM** Turcz.

(Cfr. *Cryptonema* Turcz. in Walp. Ann. III. 608.)

1. **NEPHROCODUM MALLACCENSE** Turcz. (cfr. Walp. Ann. III. 608. *Cryptonema*.) — Observationes. Turcz. Bull. de Moscou XXVI. I. 287. Nomen genericum *Cryptonema* in Bull. de la soc. des natur. de Moscou tom. XXI. p. 590. n. XX. ad designandum

genus Burmanniaceum a me adhibitum, propter nomen antiquius *Cryptonema Agardhii* (algae marinae impositum), necessarie mutandum est atque propter formam reniformem locularum antherarum hoc genus *Nephrocodum* vocandum. *Cryptonema Malaccensis* mea est ergo *N. Malaccense*.

1218/6. **BENITZIA.**

Karsten in Linn. XXVIII. 420.

Flores primarii antherarum abortu feminini posteriores hermaphroditi. Perigonium tubulosum inferne ovario adnatum superne liberum, limbo infundibuliforme trilobo demum circumscisse deciduo, dentibus accessoriiis conicis totidem inter lobos, lobis tridentatis aestivatione induplicato-valvatis. Stamina tria fauci inserta, laciniis alterna inclusa; antherae connectivo ampliato, crasso, carnosio, dorso affixae, loculamentis disjunctis introrse horizontaliter dehiscentibus, sub anthesin stigmati adhaerentes. Pollen globosum laeve. Ovarium inferum uniloculare, placentis parietalibus tribus e carpidorum marginibus introflexis, carnosio formatis, undique ovulis anatropis, funiculis brevibus impositis, tectis. (Corpuscula duo, ovulis magnis anatropis similia, cujusvis spermophori apicem terminant.) Stylus teres, stigmata tria, appendiculis longis bicurva, crurium apicibus laevibus dentium lateralium loborum perigonii adglutinatis in alabastro complicatis. Fructus capsularis tubo perigonalis coronatus, sexcostatus, polyspermus, parietibus e costis spermophorisque persistentibus solutis et deciduis, irregulariter fatiscens apertus. Semina minuta, testa crustacea, scrobiculata embryonis acotyli exalbuminosi telae cellulosae adnata.

1. **BENITZIA SUAVEOLENS.** Herba carnosia parasitica, caulis subpedalis filiformis erecti pars inferior hypogaea 4—6" longa, phyllodiis squamaeformibus dense imbricatis, stolones filiformes ramosos stipantibus donata: pars superior epigaea simplex vel rarius ramosa, foliolis minutis in spiram quincunciatam dispositis remotis, albida vel rubescens; inflorescentia cymosa terminalis; flores odorati, albi, trimeri in bracteae axilla pedicellati nutantes, dentes laterales lobo medio perigonalis minores; antherae flavescentes; stigma croceum appendiculis filiformibus, longissimis, albis. — Sylvas montanas humidias provinciae Caracas et St. Marthae, 5000—6000' altitud. habitans.
2. **BENITZIA POEPPIGIANA** Karst. l. c. — *Dictyostegia Poeppigiana* Kl. — Herbarium generale berolinense. Herbula tenera 6—8-pollicaris Benitziae suaveolenti similis, phyllodiis squamaeformibus minimis; floribus erectis bracteolatis in cyma bicurvi dispositis. — Ad ostia Amazonae collecta a cl. Poeppig.

STENOMERIS Planchon.

Planchon in Ann. sc. nat. ser. III. 18. p. 319.

Perianthium pyriforme-urceolatum, tubo ovario adhaerente, fauce contracta intus annulo prominulo aucta, limbi 6-partiti laciniis levit. biserialis, subaequalib., subulatis, acutissimis, haud introflexis, aestivatione marginib. anguste imbricatis (?). Stam. 6 sub fauce inserta, fere 1-seriata, laciniis perianthii opposita inter se conformia et libera, connectivor. appendicib. stigmati adhaerentib. introrsum vi deflexa, filam. brevia; connectiva anguste cuneata, anthera ratiore, ex ap. truncato appendicem subulatam stigmati cohaerentem exserentia; antherae biloculares connectivi eis latioris faciei internae (ob situm connectivi supinum quasi externae) adnatae, inter se parallelae contiguaeque, rima longitudinali dehiscentes. Ovar. (inferum) oblongum, trigonum, triloculare, loculis angulo interno pluri-ovulatis; ovula biseriata (?) adscenden-

tia, anatropa (?). Styl. crassus obverse pyramidato-tripterus, ap. trilobus, lob. compressis, bilobulatis, intus in longum stigmatosis (?), ubique versus b. appendicib. staminum punctum adhaerentiae praebentib. Fructus (haud plane maturus) siccus membranaceus, indehiscens (?); in herbario vittam longissimam (fere pedalem) flexuosam simulans, revera tripterus, trilocularis, loculis versus angulum internum hinc inde seminiferis. Sem. (immatura) lin-oblonga, more generis Pini alata, quoad structuram internam haud nota.

Herba (v. frutex?) scandens, habitu et facie Dioscoreae v. Smilacis, ecirrhusa, glaberrima, exsiccatione tota nigrescens. F. alterna, petiolata, cordata, cuspidata, ovata, integerr., arcuatim 7-nervia, nervulis transversis reticulata, rigide membranacea, nitida. Cymae axillares vage divisae laxae multiflorae, folio longiores v. breviores. Fl. pedicellati (pedicellis hinc inde bracteolis subulatis stipatis) circ. 8—10 lin. longi.

Species unica:

1. **STENOMERIS DIOSCOREAEFOLIA**. Naud. l. c. — Hab. Luzonia Phillipinarum; Cuming, n. 875, in herb. Hook. — (Thismieae, Miers, sect. Stenomerideae Naud.)

1219. **BURMANNIA** *Lim.*

(Walp. Ann. I. 812.)

1. **BURMANNIA TENELLA** Benth. — Bentham Triurideae and Burmanniac. collect. by Mr. Spruce, in Kew gard. misc. VII. p. 13.

Filiformis, f. squamaeformib. minutis linearib. appressis, florib. solitariis v. in cyma bifida paucis dissitis, perianthii angulis alatis.

Herba $\frac{1}{2}$ ped. caule simplici v. rar. diviso. Squamae paucae in parte inf. omnes appressae, vix lin. long. Fl. albidus, laciniis apicalib. luteis, magnitudine B. biflorae, nunc solitarii, nunc terni lateralib. longe pedicellatis, nunc rarius pluries secus ramos cymae bifidae subsessiles, remoti; alae oblong., angulo exteriore acuto-ascendente. Antherar. connectivum ap. cornub. 2 brevib. b. membranula obovata appendiculatum. Caps. triloc. et semina omnino Burmanniae. — In silvis arenosis per longitudinem fl. R. Uaupés.

Ordo XVIII. IRIDEAE *R. Br.*

(Walp. Ann. III. 610.)

DIERAMA *C. Koch.*

(Genus novum Iridearum.)

Perigonium corollinum, infundibuliforme, tubo brevi, laciniis oblongis, aequalibus, erectis, basi macula oblonga nectarina iunctis; stamina 3, tubi margine inserta, erecta, inclusa; antherae oblongae, apice curvato-conniventes, basi bifidae, filamentum emarginatura insidentes; germen ovatum, vix trigonum, spatha arida, nervoso-striata, apice profunde laciniata, maculas nectarinas cingente inclusum; stylus filiformis, stigmatibus 3 linearibus.

Nomen generis a forma perigonii, infundibulum repraesentante, derivatum. Habitu ad *Moraeam*, floribus ad *Geissorhizam* accedit, inflorescentia autem praesertim *Diasiae* simile, quacum ramis inflorescentiae capillaribus convenit. Rhizoma horizontale, breve, constans e pluribus bulbis solidis maxime compressis persistentibus, inter quos radicae longae carnosae erumpunt.

1. *DIERAMA ENSIFOLIUM* C. Ktch et Bouché.

Fasciculus foliorum basi anceps, scapo brevior; folia lineari-ensiformia, elongata; scapus apice ramosus, ramis capillaribus curvatis; flores in pedicellis brevissimis sessiles, tenues, parvi.

Fasciculi foliorum cum iis *Iridis sibiricae* congruunt, quibus vix breviores sunt; folia basi equitantia, viridia, $1\frac{1}{2}$ —2 ped. longa, 3—4 lin. lata, apice sensim attenuata, nervoso-striata; rami inflorescentiae nigricantes, medio recurvati, floribus violaceo-purpureis obsiti.

GALATHEA Liebm. nov. gen. *Iridearum*.

Ind. sem. h. bot. Haun. 1855.

Perigonium corollinum superum hexaphyllo-partitum, laciniis ext. 3 majoribus patentibus demum reflexis lato-lanceolatis obtusis caeruleis disco barbato luteo lineis maculisque fuscis notato, laciniis int. 3 minoribus spatulatis convolutis apice revolutis rotundato-bilobis lamina coerulesa striata disco flavo fusco-maculato, pagina superiori pubescente. Stamina 3 basi perigonii inserta; filamenta libera subulata, antherae lineares basifixae, loculis connexivum marginantibus longitudinaliter dehiscentibus stigmatis lobis dorso per totam longitudinem arcte adglutinatis. Pollen ellipticum ochroleucum. Ovarium inferum oblongo-prismaticum triloculare. Ovula plurima in loculorum angulo centrali biseriata. Stylus brevis filiformis. Stigma dilatatum trifidum, lobis erectis trigonis apice bifidis, laciniis subulatis basi dorso transverse appendiculatis, appendicibus parvis cucullatis. Capsula coriacea oblongo-prismatica basin versus attenuata glabra loculicide trivalvis, valvis 3 striatis fuscis. Semina obovato-angulata apice truncata longitudinaliter dense sulcata nigricantia. Raphe umbilicum basilarem chalazae apicali incrassatae jungens. Embryo axilis albumine corneo brevior.

Herba perennis brasiliensis, radix fibrosa, rhizoma subnullum, folia biseriata ensiformia equitantia ancipite tenuiter nervata glauca. Scapus compressus anceps biflorus. Flores unilaterales spatha diphylla cincti, spatha inferiore flores longe superante, superiore longitudine florum. Flos singulus spathella diphylla compressa ancipite cinctus, magnus speciosus.

1. *GALATHEA SPECIOSA* Liebm. — Hab. in sylvis pr. Rio de Janeiro. — Folia 3-pedalia 2" lata. Scapus 2' longus, $1-1\frac{1}{2}$ " latus. Spathae universalis folium inf. 12" longum, $1\frac{1}{2}$ " latum, folium sup. $4\frac{1}{2}$ " longum, 9" latum. Spathellae 3" longae, 5" latae. Perigonii lacinae ext. $1\frac{3}{4}$ " longae, 1" latae; lacin. int. $1\frac{1}{2}$ " longae, 8" latae. Stylus et stigma 9". Antherae 4", filamenta $1\frac{1}{2}$ —2". Ovarium 3—4". Capsula 12—14" longa, valvae 3—4" latae.

Obs. *A Cypella* Herb., cui proximum est genus nostrum, differt: stigmatis lobis bifidis nec trifidis, filamentis liberis, antheris dorso stigmatis adglutinatis, scapo compresso ancipiti, rhizomate subnullo. *A Tigridia* Juss. differt: perigonio usque ad basin fesso, filamentis liberis, stigmatis laciniis dilatatis trigonis bifidis appendiculatis, scapo ancipiti

Nomen genericum olim in plantis Irideis applicatum iterum restituo. *Galathea Salisb.* = *Vioussucyia Roche*, *Galathea* Herb. = *Amaryllis* L. (*Nerine* Herb.)

WUERTHIA Regel.

Regel Bot. Ztg. 1851. p. 595.

Perig. corollinum superum, tubo gracili filiformi superne vix dilatato; limbo 6-partito, hypocraterif., lacin. subaequalib. deinde recurvo-patentib. Stam. 3, tubo perig. inserta; fil. subulata, erecta, ap. recurva, exserta. Anth. lineares dorso supra b. affixae. Ovar. infer., obtuse trigonum, 3 locul.; ov. plurima in loculor. ang. centrali biseriata. Styl. filiformis; stigm. 3, linearia, complicato-carinata recurva. Caps. . . .

Herba rhizomate bulboso, reticulato-tunicato, ex Nova-Holland. austr. F. lin., ensata, rigida, nervosa. Caulis erectus, simplex teres, laevis. Fl. spicati, magni, speciosi, intra spatham bivalvem membranaceam solitarii, sessiles. — Genus c. genere Sparaxi valde propinquum.

1. **WUERTHIA ELEGANS** Rgl. — Regel in Bot. Ztg. 1851. p. 595. — Herba speciosa 2 ped. et ultra. F. 1½ ped. 2—3 lin. l. laete viridia. Scapus simplex v. ramosus. Fl. magni albidii, lilacini v. rubicundi; laciniis perianthii ovato-oblongis. Spatha germen includens, phyllis ovatis, superne sphacelatis, integris v. partitis. — Sem. leg. cl. Würth. pr. Port. Adelaide.

1239. **ANTHOLIZA** Linn. Parl.

Parlatore nuovi generi e specie di piante monocotyled. 1854. p. 53.

Perig. corollinum superum irregulare, tubo longo recurvo, inferne stricto subcontorto, dein latiusculo cum limbo sensim continuo, limbo sexpartito, laciniis valde inaequalib., lacinia media superiorum omnibus longiore, erecta. Stamina 3, ap. partis tubi constrictae inserta, laciniis duob. lateralib. superior. et lacinia media inferiorum opposita. Filam. filiformi-subulata. Antherae lin-oblongae, ap. obtusae, b. profunde bifidae ibiq. affixae, extrorsae longitudinaliter dehiscentes. Pollen ellipticum utrinq. acutum laeve. Ovar. inferum oblongum, superne saepe strictum et subincurvum, obtuse subtrigonum, subsexcostatum, ap. floris 6 nectarifluis praeditum, triloculare. Ovula plura (sub 8), obovato-oblonga in loculor. angulo centrali a b. ad medium affixa biseriata subdescendentia, anatropa.

1226. **XIPHION** Tournef. Parl.

Parlatore nuovi generi e spec. di piante monocotyl. 1854. p. 43.

Xiphion Tournef. et *Iridis* spec. ejusd. auctoris; *Iridis* species Linn. et auct., *Xiphium* et *Iridis* species Mill. dict. — (Cfr. Walp. Ann. I. 817.)

Perigonium corollinum, superum irregulare, tubo brevissimo v. subnullo, subglobo, conico v. subcylindrico, limbo 6-partito, laciniis subinaequalibus, exterioribus majorib. horizontalib. v. subreflexis, b. canaliculatis, imberbibus, interiorib. erectis v. erecto-patentib., b. versus sensim angustatis, ap. saepe emarginatis. Stam. 3, b. laciniarum exteriorum inserta. Filam. lin-subulata, plana. Anth. lineares, longae apicatae, b. bifida affixae, extrorsae, longitudinaliter dehiscentes. Pollen subglobosum v. ellipticum et utrinq. obtusum, laeve. Ovar. inferum, oblongum triquetrum v. subsexcostatum, triloculare. Ovula plurima, obovata biseriata, in loculor. angulo centrali affixa, subhorizontalia, anatropa. Stylus brevis v. brevissimus triquetrum, strictus, liberus. Stigmata 3, petaloideo-dilatata, supra carinata, subtus canaliculata, ap. bilabiata, labio superiore majore bifido, inferiore breve v. brevissimo, subbifido v. integro. Caps. membranacea oblonga, obtuse triquetra v. sexangulata

ap. angustata v. acuminata, ap. loculicide trivalvis, trilocularis. Sem. pauca, subglobosa v. compressiuscula, aut plura, compressa, testa crassiuscula, laevi hilo minuto. Embryo rectus, cylindricus, albumine subcartilagineo duplo brevior, extremitate radiculari hilo proxima.

CROCOSMA *Planchon.*

Fl. des serres VII tab. 702. p. 161.

Perigonium corollinum superum, tubo angusto longiusculo incurvo ap. vix ampliato, limbi subregularis, 6-partiti laciniis oblongis stellatim patentibus b. nec gibbosis nec poriferis, interiorib. paulo majoribus. Stam. 3 infra faucem perigonii tubo inserta, laciniis perigonii interioribus opposita inter se subaequidistantia (non hinc deflexa), filam. longis gracilibus erectis, antheris oblongo-linearibus b. bifidis, dorso infra medium affixis. Ovar. oblongum triloculare. Ovula in loculo quoque circ. 10--12 angulo interno biserialiter horizontaliter affixa, anatropa. Stylus filiformis ap. trifidus, divisuris anguste lingulatis ap. eroso-stigmaticis. Caps. (ex cl. Hook.) subglobosa spatha persistente longior, triloba trilocularis, oculis saep. abortu 3-spermis. Sem. globosa laevia.

Herba perennis, Ixoidea glaberr.; rhizomate bulboso-tuberoso, caule virgato erecto, simpliciter, ancipiti - compresso, ap. in spicam ramosam b. nudam abeunte, inferne folioso; f. collateralib. ensatis gramineis late linearib. acutissimis planis (non plicatis) nervosis, florib. in spica ramosa sessilibus distichis majusculis croceis, singulis b. spatha bivalvi cinctis, spathae valvis subaequalib. scariosis acutis integris (nec ap. fimbriatis). — (Char. generis e specim. exsicc. Dregeano elicitus). — Diff. ab *Ixia* tubo perianthii incurvo limboque non plane regulari, a *Tritonia* fauce perigonii non ampliata a *Geissorhiza* laciniis perigonii b. non poriferis, ab *Hesperantha*, sicut ab omnibus praecedentibus capsula triloba, oligosperma nec plus minus prismatica, polysperma. —

1. **CROCOSMA AUREA** Planch. l. c. -- Nomen haustum ab odore crocoideo quem flores siccati aqua tepida infusi exhalant.

Tritonia aurea Pappe ms. in herb. Hook. — Hook. bot. mag. tab. 4335. (Walp. Ann. I. 833. 1. et III. 613 n. 3).

GYNANDRIRIS *Parl.*

Parlatore, nuovi generi e specie di piante monocotyled. 1854. p. 49.

Sisyrinchium Tournef. p. 365.

Iridis spec. Linn. sp. pl. 59 et pl. auct.

Moreae spec. Ten. fl. Nap. 4 p. 10; Ker in bot. mag. tab. 1407.

Diaphane Salisb. in transact. of the hort. soc. 1 pag. 304 ubi nomen tantum.

Perigonium corollinum superum irregulare, tubo longo filiforme, ovarium continuante, limbo 6-partito, laciniis inaequalib. a b. ad medium caniculatis et pilis brevib., crassis barbatis, interiorib. minoribus, erectis, basin versus sensim angustatis et canaliculatis. Stam. 3, stylo et stigmatibus totidem adglutinata, et facile separabilia. Filam. b. c. parte styli suprema columnam cylindricam inter lacinias perigonii sitam efformantia. Antherae extrorsae, biloculares, longitudinaliter debiscentes. Pollen ovato-ellipticum utrinque acutum laeve. Ovarium inferum, triquetrum lin., triloculare. Ovula in oculis pauca, ovata obtusa biserialia subhorizontalia, anatropa. Stylus perigonii tubo adnatus superne tantum liberus et inter lacinias situs, cylindricus. Stigmata 3, petaloideo-dilatata, bilabiata, labio superiore maximo, bifido, inferiore brevissimo etiam bifido. Capsulam non vidi.

Generis nomen indicat coadunationem staminum cum pistillo.

1239. **GLADIOLUS** Linn.

(Walp. Ann. III. 612.)

1. GLADIOLUS ALEPPICUS Boiss. — Boissier diagn. XIII. p. 13.

Gl. fibris tunicarum radicalium parallelis dense stipatis parce anastomosantibus areolis angustissimis foliis elongatis anguste linearibus superne longe attenuato-acuminatis 10—15 nerviis nervis parallelis inter se valde approximatis subaequalibus, floribus in spicam secundam approximatis, bracteis lanceolato-linearibus interiori dimidio breviori, perigonii rosei laciniis obovato-spathulatis basi longe attenuatis omnibus apice rotundatis superiori basi valde incurva, lateralibus duabus labii superioris et infima labii inferioris aliis brevioribus, antheris filamentum aequantibus aut eo sublongioribus, capsula ovata sexsulcata apice compressa, seminibus apteris.

Hab. in agris prope Aleppum Kotschy pl. Alepp. Kurd. Nr. 86. — Planta sesquipedalis folia inferiora fere pedalia 2—2 $\frac{1}{2}$ lineas lata. Flores 6—7 magnitudinis eorum G. communis. Antherae circ. 7 lineas longae ab omnibus generis speciebus Europaeis statim dignoscitur foliis ut in Gl. Persico duobusque sequentibus nervis aequalibus parallelis contiguis percursis dum in Gl. pallustri, G. imbricato, G. segetum etc. nervi pauciores sunt et intermediis aliis crassior basin versus subita curvatione ad laterem interiorum folii aectitur. Gl. Persicus Boiss. eodem caractere foliorum donatus a Gl. Aleppico quantum ex speciminibus siccis dijudicare queo differt floribus minoribus subdistichis vix recurvis, perigonii laciniis oblongo-rhombeis acutiusculis, antheris filamento multo brevioribus. In eo insuper bractee dilatatae et abbreviatae

sunt et tota pars superior plantae sub lente tuberculato - pruinosa sed hi characteres, minus firmi videntur.

2. *GLADIOLUS ATROVIOLACEUS* Boiss. — Boissier l. c. p. 14.

Gl. fibris tunicarum radicalium parallelis dense stipatis parce anastomosantibus areolis subindistinctis, foliis glaucis cauli aequilongis vel longioribus linearibus acuminatis 10—12 nerviis nervis parallelis subaequidistantibus, floribus 3—7 in spicam brevem secundam approximatis ob tubum valde curvatum horizontalibus subcernuisve atroviolaceis, bracteis lanceolatis attenuato-acuminatis margine anguste scariosis exteriori tubum perigonii superanti, interiori tertia parte breviori, perigonii laciniis oblongo-spathulatis acutiusculis superioribus valde curvata, tribus labii inferioris caeteras paulo superantibus, antheris filamento suo subbrevioribus apice attenuato-mucronatis, stigmatis laciniis a basi ad medium linearibus glabris dein subito in laminam spathulatam papillosam dilatatis, capsula . . .

Hab. in Persia, circa Ispahan Aucher Nr. 5352, ad Teheran inter segetes Kotschy pl. Pers. bor. Nr. 28. — Pulchra species floribus in spicam brevem confertis valde incurvis *G. imbricatum* referens sed ob foliorum nervationem in sectione *G. Persici* et *G. Aleppici* collocanda, ab utroque colore et curvatione florum, spica conferta antheris mucronatis distincta. Pedalis, folia $1\frac{1}{2}$ —2 lineas lata, flores eis *G. imbricati* paulo majores, antherae circiter 5 lineas longae.

3. *GLADIOLUS HALOPHILUS* Boiss. et Heldr. in pl. Anatol. exs. 1847. — Boissier l. c. p. 14.

G. fibris tunicarum radicalium crassis reticulatis areolis oblongis ellipticisve, foliis glaucescentibus anguste linearibus rigidis cordatis infimo caulem aequanti vel superanti caeteris brevioribus angustioribus, nervis 4—6 crassis aequidistantibus, floribus 1—5 spicam laxiusculam terminalem secundam formantibus, bracteis crassiusculis glaucescenti-rubellis elliptico-linearibus in mucronem acuminatum scariosum abeuntibus inferiori tubum corollae aequanti interiori subbreviori, perigonii rosei tubo incurvo laciniis obovatis obtusis lateralibus brevioribus, antheris incurvis filamento quarta parte brevioribus, stigmatis lobis sursum sensim spathulato-dilatatis, capsula . . .

Hab. in salsis hyeme inundatis planitiebus Koniah Isauriae in via inter Koniah et montem Karadagh (Heldr.). Fl. Junio. — Pedalis, folia inferiora lineam vel rarius sesquilineam lata, caetera multo angustiora. Flores illis *G. palustris* fere majores. Species foliorum nervatione praecedentibus approximanda ab eis foliis angustis duris, fibris radicalibus crassis areolatis, bracteis longe scarioso-acuminatis distinctissima.

4. *GLADIOLUS KOTSCHYANUS* Boiss. — Boissier l. c. p. 15.

Gl. fibris tunicarum radicalium parallelis dense stipatis anastomosantibus areolis augustissimis, foliis latiuscule linearibus longe acuminatis 5—6 nerviis nervis inaequaliter distantibus medio crassiori curvato, spicis subdistichis densis, bracteis linearibus cucullatis acuminatis late scarioso-marginatis inferioribus longissimis, perigonii tubo valde curvato laciniis omnibus ovato-spathulatis rotundatis basi longe attenuato-stipitatis labii superioris brevioribus, inferioris duabus lateralibus praesertim elongatis, antheris filamento eis fere duplo longiori suffultis, stigmatis lobis basi glabris supra medium subito in laminam ovatam ciliatam dilatatis, capsula ovata trigona apice non compressa, seminibus anguste alatis.

Hab. in Mesopotamia inter Suereck et Diarbekir Kotschy pl. Mesopot. Nr. 163. — Planta bipedalis. Folia 3—4 lineas lata. Flores in spica 6—8 magnitudinis eorum *G. palustris*. Perigonium e sicco basi intense violaceum versus laciniarum peripheriam pallescere videtur. Antherae $3\frac{1}{2}$ lineas longae. Affinis *G. Illyrico* qui differt peri-

gonii labiis subaequilongis, laciniis rhombeo-oblongis, tubo breviori. An tamen hujus speciei forma Orientalis sit ulterius inquirendum.

5. *CROCUS KOTSCHYANUS* C. Koch. (*Inocromydon* C. Koch in Linn. XXI, 632). — Ind. sem. h. Berol. 1853.

Bulbus e vertice et basi compressiusculus, tunica brunnea rimis inaequalibus denique soluta leviter striata vestitus. Folia sub anthesi autumnali nulla, proximo vere erumpentia. Perianthii infundibuliformis limbus basi extus flavescens, ceterum dilute coeruleus; lacinae oblongae, obtusae, nervis 5—7 coeruleis longitudinalibus et basi macula aurea bicrurali instructae, organa sexualia paene duplo superantes. Antherae elongatae, angustae, basi sagittatae, filamentis aureis quadruplo longiores. Stylus gracilis trifidus, laciniis aureis.

C. nudifloro Sm. et *C. sativo* L. proximus, sed per omnes partes minor. Cl. peregrinator Th. Kotschy hanc speciem in montibus Tauri detexit et hortulanus Erfordiensis Moschkowitz et Siegling bulbis impertivit, qui cum horto botanico nuper communicavit. (C. K.)

6. *CROCUS HERBERTIANUS* Koernike. — Tunica parallelo-fibrosa; foliis hyperanthiis; floribus 1—2 autumnalibus; petalis quam sepala duplo fere minoribus, obtusiusculis, tubuloso-imbricativis. — Bulbi subglobosi. Tunicae autumnis tenuissimae, fibris parallelis compositae, fusciscentes. Vaginae infimae obtusissimae, mediae cuculato-acutae, summae obtusissimae et retusae, omnes appressae et albae. Folia

vere sequente egrediuntur. Longitudo plantae a bulbo usque ad apicem floris 10—11-pollicaris. Scapus brevis, 1—2-florus, apice vagina (spatha) tenui-membranacea albidata tota inclusa ornatus, $2\frac{1}{2}$ —4 linearis. Pedicelli circiter 7-lineares. Germen ad basin vagina reliquas superante cinctum. Tubus lilacino-albidus. Faux glabra, pallide lilacina. Sepala 3, rhombeo-ovata, obtusiuscula, apice breviter retusa, valde concava, fere rectangulariter patentia, lilacina, concoloria, rarius (morbosa) albidostriata, circiter 17 lineas longa, $14\frac{1}{2}$ lineas lata. Petala 3, sepalis dimidio fere breviora et angustiora, erecta, tubuloso-imbricativa, ovata, obtusiuscula, retusa, albidolilacina, versus apicem nervis 3 paullo obscurioribus leviter striata, $10\frac{1}{2}$ lineas longa, 8 lineas lata. Stamina 3, petalis paullo longiora; antherae basi patenti-sagittatae, demum introrsae, flavae, filamentorum parte libera multo longiores, 10—11-lineares. Stylus usque ad medium antherarum trifidus. Stigmata multifida, antheras parum superantia, lilacina. — A Croco banatico Gay (iridifloro Heuff.) proximo differt praesertim petalis obtusiusculis, nec acuminatis, porro sepalis petalisque pro ratione longitudinis latioribus, qua re flos habitum alienum prae se fert; denique antheris petala paullo superantibus (nec quam ea brevioribus) stigmatibusque quam antherae parum (non multo) longioribus. — A Cr. Kotschyano C. Koch differt stylo multifido lilacino (nec trifido aureo) aliisque notis. — Colitur in horto regio Berolinensi, Croci iridillori minoris nomine olim designatus.

7. CROCUS DISCOLOR Reuss. — Reuss, Kwetna Slowenska 1853. — Oestr. W. Bl. 1854 p. 405.

Spatha biphylla; perigonii faux laevis. Stigmata trifida, laciniis infundibuliformibus, valde fissis, perigonium longitudinem vix aequantibus, Fibrillae tunicae bulbi piliformes, reticulum formantes ostiis angustis.

2. In pratis alpinis Slawoniae Apr. Maj. (An C. variegatus Hoppe?).

8. CROCUS PESTALOZZAE. — Boissier l. c.

Cr. bulbi vaginis cartilagineo-membranaceis fuscis laevibus. foliis synanthiis flores superantibus lineari-setaceis rigidulis margine scabridulis superne 5 nerviis subtus linea alba angusta percursis, floribus 1—3, spathae diphyllae phyllis pellucidis obtusis, perigonio (e sicco) albedo basi flavescenti laciniis oblongis obtusis, staminibus perigonio tertia parte brevioribus stigmati aequilongis, stigmatibus aurantiacis lineariibus superne subdilatis plicato-carinatis apice truncatis integris.

Hab. in Bithynia prope Bolu, Pestalozza. — Folia 2—5 pollices longa lineae $\frac{1}{2}$ lata, flores minores eis Cr. Boryi cui inter omnes florum coloratione tunicarumque structura magis congruit sed Cr. Boryi differt foliis abbreviatis trinerviis, spathae phyllis acutis, stigmatibus multifidis.

9. CROCUS CANDIDUS Clarke. — Boissier diagn. pl. n. XIII. p. 17.

Cr. tunicis radicalibus tenuissime intertexto-fibrillosis, foliis synanthiis flores aequantibus strictis lineari-setaceis utrinque concoloribus, spatha pellucida diphylla phyllis acutissimis longiori saepe bifida, perigonii (e sicco albi) laciniis oblongis obtusiusculis, staminibus perigonio dimidio brevioribus, stigmatibus antheras superantibus intense aurantiacis multifidis.

Hab. in Ciliciae montibus Aucher n. 2129. — Planta 4 pollicaris, flores 1—3 magnitudinis eorum C. biflori. Affinis praesertim C. Boryi et C. laevigato B. et Ch. ab utroque differt tunicis non laevibus membranaceis sed e fibris tenuissimis angulo fere recto intertextis constantibus. Brevi descriptioni plantae Clarkianae omnino convenit.

10. CROCUS AUCHERI Boiss. — Boissier diagn. pl. nov. XIII. p. 16.

Cr. tunicis radicalibus . . . , foliis synanthiis latiusculis tubum floris aequantibus inferne margine parce ciliatulis, bulbo 1—3 floro, spathae diphyllae phyllis subaequalibus acuminatis longitudinaliter plicatis, perigonii crocei tubo elongato, fauce nuda, laciniis oblongis, antheris peri-

gonio tertia parte brevioribus, stigmatibus antheras aequantibus ultra medium 2—3 partitis laciniis tenuissimis apice vix incrassatis integris.

In Asia minori circa Guenive Aucher n. 5349. — Habitus omnino *Cr. aurei* a quo et affinis foliis ciliatulis, stigmatibus setaceo-multifidis nec apice incrassatis crenatis statim dignoscitur. Habeo specimina ex Argolide ab amiciss. Spruner missa huic speciei foliorum latitudine et spathae forma omnino consentientia sed in eis antheras stigmataque nimia compressione destructa non videre licuit.

11. **CROCUS THESSALUS** Boiss. et Spruner. — Boissier diagn. XIII. p. 17.

Cr. tunicis radicalibus stipatim fibroso-intertextis areolis angustissimis, foliis synanthiis flore paulo brevioribus linearibus brevibus superne albo-vittatis, spatha diphylla ahyllis subaequalibus pellucidis, perigonii rosei laciniis oblongis obtusiusculis, staminibus corolla dimidio brevioribus, stylo longe tripartito, stigmatibus antheras subsuperantibus apice dilatato denticulatis.

Hab. in monte Aeta Thessaliae (Spruner). Floret verisimiliter vere. Planta florifera 2—3 pollicaris, folia per anthesin abbreviata latitudinis eorum *Cr. verni*. Flos colore Colchicum autumnale referens in genere parvus. E grege specierum stylo profunde tripartito stigmatibus non multifidis donatarum. Inter eas *C. variegatus* a nostra differt flore duplo majori variegato, tunicis radicalibus reticulatis. *C. Imperati* eadem florum magnitudine et colore, stigmatibus profunde fimbriatis; *C. versicolor* stigmatibus subintegris, tunicis radicalibus membranaceis; *C. Pallasii* foliis hirtis stigmatibusque integris.

12. **CROCUS** . . . n. sp., G. Belke, *Bullet. de Mosc.* 1853. XXVI. I. p. 162. — Perianthio subcampanulato corollam tubulosum formante; laciniis sex obovato-lanceolatis, obtusis, tribus integris, -tribus vero apicibus obsolete emarginatis, pallide violaceis; singulis macula apicali subcordiformi, obscure violacea notatis. Nervo medio, simplici, per totam longitudinem lacinae transeunte; nervis basalibus brevibus, numerosis. Tubulo longissimo, supra colorato, infra vero ex virescente-albo, in scapo desinente. Staminibus stigmatibus brevioribus, luteis, basi undique glabris, non barbatis. Stigmatibus aurantiis profunde tripartitis; laciniis subtubulosis, lacerato-crispis. Spathis duabus albis, tubulum et scapum amplectentibus. Foliis duobus, rare tribus, lineari-lanceolatis, laete viridibus; nervo medio glabro, albo, per totam longitudinem folii, lamina non exclusa, transeunte, pagina inferna costam prominentem utrinque unicanaliculatum formante. Scapo unifloro, brevi vix quintam partem longitudinis tubuli corollae aequante. Bulbo supra basin nodoso-circumscisso interne albo, solido; tunica filamentosa. Altitudo 5—11 pollicem. Floret vix unam septimanam; primo vere inter 28. Februarii et 25. Martii. Kamsenic — Podolski.

Hab. in deserto Buchare et Kermine m. Mart. fl. Species c. sequente ab omnibus mihi notis facillime distincta laciniis perigonii etiam interioribus barbatis, praeter J. Susianam cujus laciniae internae ungue hirsutae dicuntur, in hac vero laciniae interiores latiores. — Rhiz. repens abbreviatum; caet.

5. IRIS FILIFOLIA Bge. l. c. p. 330.

J. (Hexapogon) rhizomate repente articulado, scapo 1—2 floro, f. filiformibus subcurvatis, scapum multo superantibus, spathis submembranaceis acuminatis, fl. pedicellatis; perigonii tubo vix exserto limbum subaequante, laciniis exterioribus oblongis late denseque interioribus angustioribus parcissime barbatis, caps. trigona, acuta.

Hab. in deserto argillaceo inter Tsbakir-ata et Nasarbai-Chuduk, caet. — Fl. Apr. et Majo. — A praecedenti proxime affini distinguitur f. caulinis multo longioribus angustioribus, caet.

6. IRIS SOGDIANA Bge. l. c. p. 331. — Hort. Dorpat. in Linn. 1850. p. 206.

J. (Xyridion) caule subquadrifloro tereti foliis brevioribus, spathis vegetis acutis carinatis; carina ciliolato-scabra, fl. (lilacinis) pedicellatis, pedicello tereti, ovario longe rostrato, corollae tubo obconico brevi, laciniis perigonii exterioribus patentibus spathulatis, interioribus erectis obovato-oblongis emarginatis, capsulae in rostrum aequilongum attenuatae ovatae hexagonae faciebus alternis angustioribus, seminibus utrinque planis integumento lateribus laxè corrugato-lucido.

Habit. haud procul Kermine pr. Melik; m. Aug. specimina fructu maturo; in horto sub finem Junii mensis floret.

I. spuriae et *nothae* affinis, ab utraque differt caule foliis brevioribus, floribus multo minoribus; ab *I. spuria* insupera capsula longe rostrata, ab *I. notha* pedicellis teretibus nec triquetris, capsulae angulis alternis approximatis, ab *I. halophila* et *Güldenstaedtii* florum colore distinguenda.

7. IRIS DIERINCKII Hort. Berol. — Ind. h. Berol. 1853. (Xyridion Tausch.)

Rhizoma horizontale, crassum, annulatum; folia radicalia et caulina ensiformia, 1—1½ pedalia, apice sensim attenuata, lanceolata, nervosa, sed nervis minime prominentibus, margine angusto pellucida, pruina subglaucescente oblecta. Caulis foliosus, teres, simplex, biflorus. Spatha bivalvis, viridis, sed margine et apice marcescens, ovarium obtuse trigonum attingens. Tubus perigonii brevis, crateriformis, ovario triplo brevior; lacinae exteriores recurvato-horizontales, lamina oblonga, superne violaceo-coerulea, obscure violaceo striato-reticulata, disco luteo ovato praedita, unguem brunneo-striatum aequante; lacinae interiores erectae violaceo-coeruleae, obovato-spathulatae, obscure coeruleo-striatae, stigma albidocoeruleum apice incurvum et irregulariter dentato-serratum aequantes.

Sub hoc nomine allata, forte Africae borealis aut Europae austro-occidentalis civis, Iridi spuriae L. affinis, sed omnibus partibus minor. Florum habitu atque colore magis ad I. sibiricam L. accedit, sed rhizomate horizontali haud aegre distinguitur. (C. K.)

8. IRIS TRIGONOCARPA A. Br., C. K. et Bouché. — In ind. sem. h. Berol. 1853. (Eremiris Spach.)

Rhizomate breviter repente stolonifero stuposo; foliis ensiformibus anguste linearibus strictis; caule folia rhizomatis superante 2—3 folio, 1—3 floro; spatha e vaginis binis oblongis exteriori acuta, interiori obtusa; flore terminali brevius, lateralibus longius pedicellatis; perigonii tubo brevissimo, limbi laciniis exterioribus leniter recurvatis, lamina oblonga ungue dilatato brevior et non multo latiore, interioribus erectis paulo brevioribus anguste ellipticis, basi in unguem brevem attenuatis; ovario trigono, lateribus depressis, fructu triquetro, angulis acute carinatis, lateribus medio canaliculatis vix tumidis.

Species e seminibus sibiricis in horto culta, I. sibiricae et fructus structura praesertim I. prismatica Pursh (caroliniana Hort. nonn.) affinis, sed humilior et laxius caespitosa, rhizomate stolonifero ab utraque distincta. — Rhizoma breviter repens, adscendens, foliorum rudimentis elongatis, laceris, fuscis stuposum, passim stolones emittens 1—3 pollicares, linea vix crassiores, horizontales vel oblique descendentes, apice denuo adscendentes et in rhizomata foliifera incrassatos. Folia viridia, vix glaucescentia, 1—2 lineas lata, nervis elevatis lineata, tenuissime marginata et margine vix pellucida. Caulis 1—1½ pedalis, rarius altior, saepius flexuosus, teres. Vaginae involucri (spathae) fusciscentes, vix pollicares. Pedicellus floris terminalis vix semipollicaris, florum lateralium 1—1½ pollicaris. Flores iis Iridis sibiricae paulo minores; perigonii lacinae exteriores albo et coeruleo variegatae, apice intensius coeruleae; interiores violaceo-coeruleae. Stigmata laciniis interioribus aequantia, late-linearia, leniter recurvata, pallide coerulea - violacea, apice incurva et dentata. Fructus quam in I. sibirica minor, minus tumidus, basi et apice magis attenuatus. (A. Br. et C. K.)

9. IRIS (*Pogoniris*) JUNONIA Schott et Kotschy. — Schott in Oestr. bot. W. Bl. 1854. p. 209. — Foliis subarcuato-ensiformibus, a medio dilatato basin versus angustatis, ap. acuminatis, utriusq. elevato-striatis glaucescentibus; caule foliis altiore ramoso (2-pedali); spathis bractescentibus supra ½ scariosis; latis obtusis, perigonio longe et crasse tubuloso; sepalis exterioribus arcuatim recurvis, late oblongo-obovatis, ap. rotundatis, b. versus late cuneato-angustatis, barba intense lutea ad exitum pallente barbatis, ad ½ usque pallidissimis, externe sanguineo punctato-striolatis, interne venis remotis interrupte dichotomis patentibus et patentissimis, ferrugineis, notatis, reliqua parte apicali ex purpureo violascentibus, sensimq. pallidioribus; sep. interioribus erectis, arcuatim conniventibus, unguiculatis, ungue ¾ pollicari externe viridi, interne ex flavo pallescenti, c. lamina rotunda ovali, ap. retusa, b. repentino contracta, disco concaviusculo; 2½ poll. lato, 2½ p. longo, pallide et amoene violaceo infima basi patentissime ferrugineo-venoso, externe sanguineo-punctato-striolato; filamentis

inferne sparse et pallide sanguineo-punctatis, antheris (apertis) lanceolato-linearibus. b. sagittatis, ap. acutiusculis; ovario tubo brevioribus; stigmatibus albis. Tere bipollicaribus, $\frac{2}{3}$ pollicis latis, oblongis, b. versus lineam extrorsum arcuata angustatis, arcuatis; fornicatis, appendicibus lacerato-incisis majusculis, c. stigmatum parte costali pallide violascentibus. — Odor floris suavis. — Hab. in Tauro Ciliciae (Kotschy).

10. IRIS SUBBARBATA Joo. — Mittheilg. d. siebenbürg. Vereins 1851. II. p. 98. — F. linearibus glaucescentibus rectiusculis, infimis falcatis, caule subcompresso plurifloro brevioribus, germine rostrato hexagono. Laciniae exteriores divergentes, expansae, ungue angusto, concavo, subito contracto c. barba flava exigue prominula, flavo, venis purpureis lineato in laminam ovatam obtusam violaceam venis saturationibus lineatam desinentes; interiores erectae obovato-lanceolatae emarginatae, crispae c. stigmatibus concolores violaceae. Spatha acuta marginibus membranaceis marcescentibus. Caps. oblonga inaequaliter hexagona. F. caulina breviter foetida. Rhizoma tumidulo-annulatum rubro-fuscum. — In collibus gramínosissimis; siccis transylvanicis Claudiopolitanis, apricis.
11. IRIS STYLOSA Poir. var. *angustifolia* Boiss. et Heldr. — Boissier diagn. pl. nov. XIII. p. 15.

Planta plerumque humilior 5—8 pollicaris, folia spatha angustiora $\frac{1}{2}$ —1 lineam lata margine manifestius scabrida, caeterum omnia speciei. Hab. in Antica (Heldr.), Argolide (Spruner), Achaia (Boiss.), Rhodo, Cypro, Creta (Heldr.), Caria (Pinard).

12. IRIS SUAVEOLENS Boiss. et Reut. (Sect. *Barbatae*.) — Boissier l. c. p. 15.

I. pumila, foliis ensiformibus glaucescentibus subfalcatis caule foliis breviori unifloro spathae bivalvis valvis vix inflatis subaequilongis perianthii tubo paulo brevioribus vel ei aequalibus, externa interiori duplo latiori tota herbacea margine vix membranacea dorso subalato-carinata, interiori apice membranaceo-scariosa, perianthii tubo tereti obscure trisulcato limbo triente longiori livide virescenti, laciniis virenti-ochroleucis basi extus virentibus exterioribus cuneato-oblongis apice rotundatis leviter emarginatis in medio limbi reflexi macula ovata livide caeruleo-violacea instructis, barba concolore, laciniis interioribus paulo latioribus oblongis apice obtuso emarginatis margine undulato-crispis basi subito in unguiculum contractis, stigmatibus oblongo-spathulatis cristis semiovatis apice acuminatis latere exteriori denticulatis.

Hab. in planitiibus Bulgariae prope Kustendje (Boiss.). Inde relata fuerunt rhizomata ex quibus plantam coluimus descripsimusque. — Caules 3—5 pollicares, folia primum brevia tandem circiter pedalia. Flores fragrantissimi eis I. pumilae dimidio minores. Odor florum eum Asperulae odoratae exsiccatae referens. Affinis I. pumilae differt floribus minoribus odoratissimis, perianthii laciniis inter se subinaequalibus constanter ochroleucis exterioribus macula ovata notatis, spatha vix inflata praeter apicem subscariosum tota herbacea valva exteriori dorso carinato-alata.

MADVIGIA *Liebm.*

Liebm. in horto acad. Haun. — Ann. sc. natur. IV. tom. II. p. 373.

Perigonii superi sexpartiti laciniaé exteriores 3 calycinae erectae-carinatae, ovatae, acutae, tubo trigono duplo breviores, extus parce furfuraceae, hyalinae, interiores petaloideae usque ad basin liberae et annulo epigyno insertae nudae albae, exterioribus duplo longiores elongato-lanceolatae, deorsum longe attenuatae, aestivatione convolutiva patulae. St. 6, 3 cum petalis connata et longe decurrentia, 3 libera annulo epigyno inserta. Filamenta petalis parum breviora teretia, superne incrassata glabra alba. Anth. dorso affixae introrsae lineares b. bifidae erectae, demum subhorizontaliter arcuatae biloculares, longitudinaliter dehiscentes; pollen albidum. Ovar. inferum triloculare. Ovula plurima in placenta e loculorum angulo centrali prominula, horizontalia, anatropa. — Stylus longitudinem staminum aequans, exsertus, teres, superne incrassatus. Stigmata 3 subpetaloide recurvata. canaliculata margine papilloso-fimbriata, alba.

Genus a Bromelia differt: staminibus 3 liberis, 3 c. petalis connatis, filamentis superne incrassatis, stylo longo tereti clavato, stigmatib. subpetaloideis, canaliculatis recurvis. (Genus in honorem viri celeberrimi F. N. Madwig prof. philol. dicatum.)

1. **MADVIGIA DENSIFLORA** Liebm. l. c. — Subcaulis stolonifera. F. dense rosulata vaginanta coriacea patulo-reflexa, lato-linearia, longe acuminata, acutissima, energia, subcanaliculata, margine undulata aculeato-denticulata, dentib. parvis falcatis subhyalinis, supra glabra nitida, subtus albo-furfuracea. Flores dense fasciculati in axillis foliorum superiorum sessiles, inflorescentia prolifera. Flos spatha hyalina arcte appressa vaginante lanceolata acutata suffultus, albus. — Sub nomine Bromeliae humilis olim ab horto Utrechtiano accepimus.

ANOPLPHYTUM *Beer*

Bromel. p. 16. 167 et 205.

Calyx inferus; petala erecta, calycem duplo superantia et longiora, tubum clavatum (postremo solum?) referentia; stamina hypogyna; germen superum, pyramidale, in stylum trigono-filiformem attenuatum; stigmata brevissima, erecta; ovula pluriserialia, apice rotundata, basi calva, teretia; capsula (sine dubio) loculicida.

Cl. Beer hocce genus secundum habitum constituit, foliorum inermium causa nomen Anoplophyti i. e. plantae inermis ei tribuens. Proxime accedit ad Encholorion, quod, ut Puya a Pitcairnia, seminibus, nec non caulibus compressis discrepat. Tillandsiae genuinae speciebus sepala spiraliter convoluta, 2 altius connata sunt, dum Caraguaetae species filamentis cum petalis ad maximam partem connatis distinguuntur.

1. ANOPLOPHYTUM STRAMINEUM C. Koch in ind. sem. h. Berol. 56.

Folia densissima, creberrima, arcuato-recurvata, glaberrima; scapina sensim minora, patula, denique bracteiformia, adpressa; florum fasciculi sub 5 flori, pedunculo crasso insidentes, distantes; petala erecta, ad basin nuda, straminea, paululo stamina et stylum superantia.

Sine dubio eadem planta ac cl. Beerii A. vittatum (Tillandsia vittata Hort.), sed foliorum vitiae in nostro specimine omnino deficient, quare nomen mutavi. — Patria regiones tropicae Americae australis, unde cl. Linden eam accepit et in hortos Germaniae distribuit. — Planta nunc in horto Leon. Reichenheim florens foliis creberrimis et dense dispositis conum obversum praebet et fortasse postremo caulescit. Tota planta glaberrima et inermis. Folia late linearia, plane canaliculata, ad superiorem partem lanceolata, sesquipedalia, ad basin pollicem lata, supra virescentia, subtus interdum rubescentia, saepe punctis albis vix conspicuis lineata. Scapus inferne foliis minoribus, patentibus et patulis, ad medium et superne bracteiformibus, lanceolatis, in cuspidem longam attenuatis, adpressis vestitus cum inflorescentia fasciculato-spicata bipedalis et longior, glaberrimus; bracteae virescentes, patentes, lanceolatae, inferiores fasciculos florum superantes, superiores multo breviores, ad basin latiores; flores congesti, sessiles, bracteola oblonga vix semipollicari fulcrati, summus simulque posticus primus florens. Calyx obtuse trigonus, trisuleus, sepalis concavis, oblongis, in sulcis margine sibi incumbentibus; petala erecta, cuneato-oblonga, in stipitem a calyce inclusum, latum attenuata; filamenta late linearia; antherae supra basin affixae, ab initio erectae, postremo volubiles, ad basin sagittatae; loculi superne inanes.

PORTEA Hort. Belg.

Koch in ind. sem. h. bot. Berol. 1856.

Calyx superus, sepalis ultra medium connatis, urceolum referentibus apice aristatis; petala erecta, tubum formantia, longe exserta, ad basin (semper?) squamigera, cum staminibus annulo calycis urceolum infra medium cingenti inserta; stamina 3 opposita ad majorem partem cum petalis connata, 3 alterna libera; stigmata 3 in capitulum oligocyclum spiraliter contorta; placentae ovulis pluriserialibus, loculos omnino fere replentia; germen elongatum, saepe medio ventricosum.

Genus proximum Billbergiae et Hoplophyto, habitu et bracteis magnis coloratis conveniens, sed sepalis supra medium connatis et germine elongato bene distinctum.

1. PORTEA KERMESINA Hort. Belg.

Turiones adscendentes, squamis aridis obsiti; folia viridia, crebra, basi late amplectentia, ad marginem brunneo-virescentem serris sursum directis brevibus munita, apice cucullato, viridi-brunneo; scapina bracteiformia, erecta, scapum brevem totum tegentia; panicula thyrsoida, ovato-oblonga; bracteae magnae, oblongae, apice rotundatae, sed cuspidate brevi instructae, ramos geniculatos furfuraceos simplices cum floribus subsessilibus omnino involventes; petala ad basin squamis binis instructa.

Scapus erectus, cum thyrso 6—8 pollicari, lineari-oblongo pedalis et longior, albifurfuraceus. Folia bracteiformia glaberrima, viridi- aut dilute-brunnea, vaginarum clausurarum modo adpressa, sed apice subbrunneo, patentissimo aut recurvo, vix

semipollicari instructa. Bracteae concavae, nervoso-striatae, inferiores viridi-, superiores intense carneaе, fere 2 poll. longae, $1\frac{1}{2}$ poll. latae; bracteolae pollicares et longiores, carinatae, concavae, carneaе, uno latere supra medium marginem angulum obtusum exhibente. Germen columnare, medio paululum ventricosum, dilute furfuraceum, 8—10 lin. longum, $2\frac{1}{2}$ lin. latum. Ovula quadriseriata, anatropa, apice appendice lanceolato-filiformi curvatulo praedita, placentae bilobae insidentia, locula plane replentia. Sepala ultra medium connata, alba, superne saepe magis minusve carneo-tincta, ex apice obtuso aut emarginato arista 3 lin. longa carnea instructa. Petala angusta, elongata, sepalis fere duplo longiora, annulo infra medium calycis urceolum cingenti cum staminibus paululum brevioribus inserta; antherae oblongo-lineares, infra medium filamentum adnatae, postremo volubiles. Stylus filiformis cum stigmatum capitulo ovato, tricyclo petalorum longitudine. — Planta sine dubio tropico-americana in horto Reichenheimiano floruit et postremo calescere videtur. Habitu maxime convenit cum *Billbergia Queneliana* Brongn. (fl. d. serr. t. 1028) et formam obconicam exhibet. Quoad inflorescentiam *Billbergiae fastuosae* Beer (*Pitcairniae fastuosae* Morr. in Ann. de Gand III, t. 161) quoque similis est.

PLATYSTACHYS C. Koch. Ind. sem. h. Berol. 1856.

(Novum genus *Bromeliacearum*.)

Perigonium duplex, exterius (calyx) sepalis pergameneis aequalibus a bractea inclusis convexis, interius (corolla) petalis linearibus in tubum spiraliter subconvolutis, apice tantum patulis; stamina 6 filamentis spiraliter tortis; antherae initio erectae, serius ad basin incumbentes, basi sagittatae; germen superum, pyramidatum, trisulcum, sensim in stylum attenuatum; stigmata 3, linearia, patentia; placentae integrae, multiovulatae; ovula anatropa, oblonga, apice cuspidate curvato praedita.

Genus inter *Puyam* et *Tillandsiam* ambiguum, ab utraque filamentis spiraliter tortis et ovulis nec compressis, ut in priore, nec muticis, ut in posteriore, discrepat. Spica complanata cum nonnullis speciebus *Tillandsiae* e. g. *T. maculata* congruit, quae, aequae ac aliae quaedam, forsitan huc referenda est. Pedicellus crassus, vertice planus etiam aliis *Tillandsiae* speciebus proprius est.

1. **PLATYSTACHYS CYANEA** C. Koch et Sello l. c.

Allardtia cyanea Dietr. in Berl. Gartenz. XX, 241.

Spica composita, complanata; flores biseriatim, bractea pergamenea paene omnino inclusi; sepala oblonga, acuta, petalis cyaneis duplo breviora; folia ligulato-lanceolata, inermia, basi dilatata.

Folia inferiora rosacea, pedem longa et ultra, $1-1\frac{1}{2}$ poll. lata, basi latiora et concavo-canaliculata, medio saepe recurvata, margine integra, magis minusve undulata, glaberrima, nuda, viridia, caulina sensim minor, superne bracteas referentia; caulis 2—3 ped. altus, nudus, spica composita paniculata terminatus; bracteae rubescentes, supra concavae, calycem et duas partes (e tribus) corollae includentes; flores parvi, 8—10 lin. longi, $2-2\frac{1}{2}$ lin. lati, pedicello brevi crasso insidentes (disco hypogyno turbinato connati A. Dietr.); sepala subconvoluta, petalis cyaneis erectis duplo superata; stamina petalis paululum breviora, antheris initio erectis, serius magis minusve incumbentibus; germen receptaculo plano angustius, pyramidatum, trisulcum, sensim in stylum stamina longitudine aequantem attenuatum; stigmata 3 linearia, patentia; placentae integrae multiovulatae; ovula anatropa, oblonga, apice cuspidata. — Planta ab indefesso peregrinatore de Warszewicz in Guatemala detecta, ab A. Dietrich *Allardtia* nomine ut genus proprium proposita est; at *Allardtia* nomen jam antea a cl. Decaisne *Rubiacearum* genere tributum est.

PHYTARRIZA Vis.

Visiani in Memorie dell' J. R. Istituto Veneto di Scienze Lettere ed Arti. V. (1855) p. 340.

Perianthium liberum sexpartitum, laciniis exterioribus calycinis arcte spiraliter convoluto-imbricatis, aequalibus, b. coalitis; interioribus petaloideis liberis, unguibus elongatis erectis b. nudis, lamina reflexo-patente. Stam. 6 hypog., filamentis lanc-linearibus paulo supra b. sagittato-emarginatam filamentis insertis, erectis, polline ovali. Ovarium liberum trisulcum triloculare, ovulis plurimis lin-oblongis in angulo loculorum centrali secus axim ovarii aggregatis horizontalibus. Stylus pyramidatus trisulcus obtuse trigonus. Stigma profunde trifidum, lobis crassiusculis brevissimis complicatis puberulis. Caps. coriacea triangularis trisulca oblongo-linearis ap. acuminata, loculicide trivalvis, valvis endocarpio mox secedente duplicatis navicularibus, marginibus introflexis septa constituentibus. Sem. plurima lin-clavata stipitata, stipite pilis longis papposis denticulatis cincto, fundo capsulae inserta.

Diff. a *Tillandsia* L. laciniis perianthii exterioribus aequaliter divisis, nec duabus altius connatis: interioribus distinctis liberis nec b. in tubulum convolutis connatisve; antheris erectis nec incumbentibus et stylo pyramidato nec filiformi. Magis vero discrepat a *Pourretia* R. et Pav. praeter antheras erectas et stylum pyramidatum, stigmatibus brevissimis crassis nec linearibus.

1. **PHYTARRHIZA DURATII** Vis. c. ic. l. c. color.

Syn. *Tillandsia Duratii* Vis. ill. in Nuovi saggi dell' Acad. di Padova vol. V. p. 271. — *Tillandsia? Duratii* Vis. in orto bot. di Padova descr. ed illustr. p. 148.

Planta omnis argenteo-aut cinereo-lepidota, arrhiza, f. inferioribus lanc-subulatis crassis canaliculatis inermibus, subt. convexis carinatisve, patulis recurvis aut circinatis, caule florifero multo brevioribus, caulinis bracteaeformibus adpressis brevissimis, panicula terminali contracta compressa e spiculis 3—6 floris bracteatis pedunculatis, fl. alternis distichis approximatis 1-bracteatis sessilibus. Fl. pallide violacei *Mathiolam incanam* redolentibus. Floret in calidario mense Majo. Hab. . .

MACROCHORDION de Vriese gen. n.

Hort. acad. Lugd. Batav. pl. rar. ann. 1854.

Perigonii hexameri lacinae exteriores calycinae subaequales, glabrae, convexae, subcarnosae, ap. coriaceae; interiores petaloideae exterioribus multo longiores, angustiores, ap. erectae, interne squama latiore multisetosa instructae; stamina 6, 3 cum petalis alterna, epigyna, libera, sursum conniventia, filamentis, filiformibus elongatis antherisque incumbentibus, bilocularibus, basifixis instructa; 3 petalis adnata, e medioq. setarum exorta, iis accumbentia et filamentis destituta, anther. imperfecte bilocularibus erectis. Ovar. 3-loculare, locul. inaequalibus, f. carpellaribus. b. tumida jam in statu immaturo secedentibus. Ovula indefinita, e loculis a longissimo funiculo umbilicali pendula. Styl. brevissimus; stigmata 3 breviss., petaloidea, acuta. Caps. abortu 1-locularis. Semina plurima elliptico-ovoidea, rhaphe fere circulari instructa. Spermodermis exterior cornea, fusca; embryo parvus in albumine magno, farinoso.

Sunt herbae Americanae tropicae, terrestres scapigerae, spadiciflorae; spathis coloratis, roseis, v. fuscis; f. lato-ligulatis, linearibus, spinosis.

1. **MACROCHORDION TINCTORIUM** de Vriese.

F. elongatis, linearibus, lato-canaliculatis, ap. revolutis, margine dentatis, dentibus nigris, acute pungentibus; bracteis (spathis) acutis, dentatis; spica

spadiciformi, fl. spiralter dispositis, rhachi carnosae lanuginosae alte immersis; petalis saepe vix emergentib.; atris, vix in ap. inflorescentiae flavis. —

Billbergia tinctoria. Mart. in Roem. et Sch. VII. 2. 1256. Schult. fl. in Mart. Fl. Brasil. ined. — *Bromelia tinctoria* Mart. Reise Bras. II. 554 et in Buchner rep. — *Brom. melanantha* Bot. reg. tab. 756. — *Billberg-tinctoria* Mart. Cfr. Morren in ann. d. l. soc. roy. d'agric. et d. bot. d. Gand n. 2. 1847. p. 55.

HOPLOPHYTUM Beer Brom. p. 22.

(Knth. ind. sem. h. Berol. 56.)

Calyx superus, sepalis apice aristatis; petala erecta, tubum sub apice plerumque constrictum referentia, staminibus stylisque longiora; stigmatum capitulum laxè oligocyclum; germen inferum, breve; ovula anatropa, apice rotundata, locula plane replentia; fructus baccatus.

Habitus *Billbergiae*, quacum species pleraeque antea conjunctae erant. *Hoplophytum* a *Billbergia* praesertim differt petalis angustioribus, erectis, nunquam apice patentibus aut recurvatis et ovulis apice exappendiculatis, rotundatis. Inflorescentia saepe paniculata, raro spicata, floribus unicoloribus ornata.

1. HOPLOPHYTUM COELESTE C. Koch l. c.

Billbergia coelestis Hort. Reichenh.

Folia punctis albis passim conspersa, apice triangulari pungente, margine serris parvis brunneis munita, scapina bracteiformia, erecta, adpressa, albo-carnea, lanugine detersibili aequè ac scapus dense vestita; panicula viridi-brunnescens, superne floribus solitariis, sessilibus, patentissimis obsita; sepala apice arista aequilonga et utrinque appendice ovata nitente praedita, aequè ac germen lanugine detersibili vestita; petala basi nuda.

Folia patentia, mox retrorsum arcuata, viridia, majora $1\frac{1}{4}$ — $1\frac{1}{2}$ ped. longa, $1\frac{1}{4}$ —2 poll. lata. Scapus erectus, strictus, cum panicula 6—7 poll. longa et ad basin 2— $2\frac{1}{2}$ poll. lata pedalis et longior, inferne viridis, superne viridi-brunnescens. Ramuli paniculae horizontales, breves, cum floribus plerumque 4 alternis sessilibus vix 1— $1\frac{1}{4}$ poll. longi, lanuginosi. Germen obtuse et obscure trigonum, pallide virescens, 3 lin. longum, $2\frac{1}{2}$ —3 lin. latum, triloculare, ovulis anatropis, subclavatis, triquadriserialibus; sepala basi connata, ovata, germinis longitudine, viridi-brunnea; petala erecta, sepalis, duplo, staminibus et stylo paululo longiora, elongato-clavata basi nuda. Stigmata 3 styli longitudine, inferne distanter, superne approximate spiralia et capitulum formantia.

Species sine dubio ex America tropica in Belgium allata, nunc in horto Reichenheimiano culta, *H. nudicauli* C. Koch (*Billbergiae nudicauli* Lindl. ad tab. 1060 nec tab. 203) affinis, quae inflorescentia simplici et bracteis majoribus differt. *H. purpureo-roseum* Beer Bromel. p. 135 (*Billbergia purpureo-rosea* Hook. bot. mag. tab. 3304) multum discrepat inflorescentia magis ramosa, ramis geniculatis et floribus roseo-purpureis.

2. HOPLOPHYTUM NUDICAULE C. Koch l. c.

Bromelia nudicaulis L. cod. Nr. 2268. — *Billbergia nudicaulis* Lindl. in bot. reg. ad tab. 1068. — *Billbergia pyramidata* Beer Bromel. p. 123. — *Hoplophytum lanuginosum* Beer Bromel. p. 138. — *Billbergia lanuginosa* Hort. Hamb. — ? *Tillandsia unispicata* Arrab. fl. lumin. III., t. 124. — ? *Hoplophytum unispicatum* Beer Bromel. p. 138.

Folia elongata, lurido-viridia, apice rotundato sed acutiusculo, ad marginem serris nigris majoribus munita, scapina bracteiformia, elliptica, erecta, superiora intense rosea; scapus lanugine albo detersibili vestitus, spica simplici terminatus; flores solitarii, inferiores soli bractea magna

rubenti fulcrati, germine pubescente, sepalis flavo-viridibus, glabris; petala lurido-lutea, ad basin squamigera.

Haec species inflorescentia simplici et floribus lurido-luteis haud aegre ab affnibus speciebus distinguenda saepe cum aliis commutata est, quamquam a Linnaeo ad Bromeliam nudicaulem suam icon facillime cognoscenda e Plumieri libro (plant. amer. fascic. a Burmannio edit. tab. 62) jam citatur et a cl. Hookero in libro suo „exotic flora“ tab. 143 planta denuo optime descripta ipsaque depicta est. Cl. Lindley antea nomine Billbergiae nudicaulis aliam plantam in diario „botanical register tab. 203“ in medium protulit, quam postea ipse (in eodem diario ad tab. 4068) a Billbergia pyramidali sua (Bromelia pyramidali Sims.) non diversam esse pronuntiavit. In monographia Bromeliacearum nunc a cl. Beerio in lucem edita autor Billbergiam nudicaulem Lindleyi, ut primo nominatam, hoc nomine servat, Plumieri plantam vero ut speciem novam nomine Billbergiae pyramidatae constituit, dum Bromeliam pyramidalem Hookeri cum suo Hoplophyto unispicato (Tillandsia unispicata Flor. Flumin.) conjunxit. Ante aliquot annos denique ab horto botanico Hamburgensi nomine Billbergiae lanuginosae planta pervulgata est, quae a nostro Hoplophyto nudicauli nullo modo differre videtur, et quam cl. Beer nomine Hoplophyti lanuginosi in monographia sua descripsit.

B. thyrsoida hort. non Mart.

An nov. genus, Jonghea Lem.

3. BILLBERGIA LONGIFOLIA C. K. et Bouch. ind. sem. hort. Berol. 1851.

Billbergia rhodocyanea Hort. nonn.

Folia glabriuscula, erecto-patula, viridia, serris parvis distantibus obsita; scapus parce floccosus, foliis bracteisformibus apice patulo excepto adpressis, amplexantibus, albo-roseis praeditus; sepala intense rosea, glabra, sed ad apicem albo-farinosa; petalorum lamina longe revoluta, rubro-violacea; squamae fimbriatae ad basin petalorum.

Sub nomine *B. rhodocyaneae* in hortum introducta, foliis nudis aut ad partem inferiorem dorso vix farinosis, rarissime transverse fasciatis, elongatis, fere aequilatis ad apicem solum lanceolatis, 3 ped. saepe longis $1\frac{1}{4}$ — $1\frac{1}{2}$ poll. latis, erectis, supra medium recurvato-patentibus ab affinis sectionis *Jongheae* haud aegre discernenda. *B. thyrsoida* Mart. praeterea bracteis et floribus lateritiis, *B. pyramidalis* Lindl. foliis ad partem inferiorem brunneis differt. — Scapus albus, superne virescens, nudus aut superne sub bracteis subfarinosus. Flores sessiles; sepala ovato-oblonga, carnosula, 5—6 lin. longa, 3 lin. lata; petala parte tertia suprema revoluta, 15—16 lin. longa, 4 lin. lata; ad basin albida, medio sordide rubescentia, ad apicem contra rubro-violacea, ad latus utrumque paginae inferioris a basi ad medium callo, ad basin postremo squama biloba praedita; stamina aequilonga, petalis paululo longiora, exserta, antheris angustis infra medium dorsi insertis; stylus albus, trigonus, linearicolumnaris, stamina vix superans; stigmatum capitulum pentacyclum, ovatum, violaceum; germen columnare, hexagonum, pallide roseum, farinosum; placentae binae, lineares, e medio centro egredientes, basin et apicem loculorum non attingentes; ovula tri- (in quoque loculo sex-) serialia, superposita, anatropa, ad apicem lanceolata appendice instructa, horizontalia aut inferiora pendula.

II. *Cernuae.*

4. BILLBERGIA MORELIANA Ad. Brgn. in Portef. des Hort., revue Hortie. III. 82. — Paxton fl. gard. III. p. 21. pl. 77. — K. Koch ind. sem. h. Berol. 1856.

F. ligulatis canaliculatis obtusis albo-fasciatis vers. b. spinoso-dentatis cauli aequalib., caule glabro squamis magnis petaloideis laxis distanter vestito, racemo multifloro recurvo glabriusculo, bract. coloratis dorso minutissime lepidotis florib. fasciculatis longioribus, sep. oblongis obtusis

mucronatis membranaceo-marginatis ovarioque laevib., petalis revolutis calyce multo longiorib., staminibus longe exsertis.

B. Moreliana (vera) Lem. jard. fl. tab. 271. — *B. zebrinae* var. an potius *Billbergiarum* species distincta. — Patria ignota. — *Gärtn. mag. of bot.* III. (1851) p. 33. tab. I. c.

5. BILLBERGIA PULCHERRIMA C. K. et Bouch.

? *Billbergia Moreliana* Beer nec Paxt. et Lindl.

Turiones ascendentis; folia patentia-recurvata, supra laete viridia, ad basin et subtus albo-punctata; scapus infra medium cernuus; flores solitarii, patentes, inferiores bracteis magnis amoene rubris longioribus fulcrati, superiores nudi; petalorum basi squamigerorum lamina revoluta, violaceo-coerulea, ad basin flavo-virescens, rubro-violaceo marginata.

Folia rigida, pergamenea, nitida, lingulata, sesquipedalia et longiora, basi pollicem lata, ad marginem serris sursum curvatis, parvis, crebris armata. Scapus parce floccosus aut glabriusculus, cum inflorescentia lanugine alba deterrenti vestita 15—18 poll. longus, foliis bracteiformibus erectis, oblongo-lanceolatis, apice virescente vix serrulato et basi semi amplectenti exceptis, glabris, amoene rubris, bipollicaribus et longioribus obsitis. Germen pallide virescens, cum sepalis ovato-oblongis, ad apicem rotundatis paululo longioribus, pollicare, farinoso-floccosum. Petala sepalis duplo triplove longiora, parte inclusa flavescens; squamulae binae lacero-multifidae ad basin petalorum et deinde utrinque callus longitudinalis medium petalum attingens. Stylus triangularis filiformis, cum stigmatum capitulo laxe 2—2½ cyclo paululo staminibus brevior. Loculi germinis ad basin inanes. Placentae bifidae, lobis divergentibus. Ovula quadriseriata, anatropa, horizontalia, stipitata, apice appendice lanceolata brevi praedita. — Nomine *B. Morelianae* tres species diversae in hortis coluntur, quarum una a cl. Brongniart in horto botanico Parisiensi denominata, sed nondum descripta est. Primus *Billbergiam Morelianae* in lucem edidit. cl. Lindley et in Paxtoni diario „flower garden“ III. tab. 77 depinxit. Huic plantae nomen *Billbergiae Morelianae* servandum est. Aliam plantam cl. Lemaire in diario suo „jardin fleuriste“ Tom. II. tab. 138 *Billbergiae Morelianae* nomine descripsit atque depinxit, inflorescentia erecta distinctam, quam postea ipse (Tom. III. tab. 271) erroneam agnovit. Haec a cl. Beer in *Bromeliacearum* monographia nomine *B. amabilis* significata est. Tertia denique species a cl. Beer nomine *B. Morelianae* descripta et horto botanico communicata est, quam a Morelio ipso accepit ideoque veram plantam esse putat.

6. BILLBERGIA LEOPOLDI Hort. belg.; K. Koch l. c.

Turiones erecti; folia praesertim dimidio inferiore albo-fasciata, ceterum punctis albis creberrimis obsita; scapus gracilis, pallide viridis, cernuus; bracteae anguste ellipticae, cinnabarinae, subtus minus, supra magis argenteo-lepidotae; panicanula laxa, spiciformis; sepala glaberrima, roseo-cinnabarina, apice cuspidato patente; sepalorum ad basin squamigerorum lamina azurea, denique ad calycem usque revoluta.

Folia erecta, superne recurvata, lingulata, ad apicem subito acuta, 2½ ped. longa, 2 poll. lata, serris ad marginem munita. Scapus foliis bracteiformibus anguste ellipticis, 5 poll. longis, 8—10 lin. latis, nervoso-striatis, cinnabarinis, argenteo-lepidotis obsitis. Panícula cernua, 8—10 poll. longa, 2½—3 poll. in diametro, pedicellis brevissimis, aequae ac rachis, griseo-pruinosis. Pedicelli inferiores floribus 3—4 sessilibus praediti, vix pollicem longi. Bracteolae lato-ovatae, arido-membranaceae, trinerves, 2½—3 lin. longae et latae. Germen sulcato-striatum, bracteola duplo triplove longius, pallide virescens, glaberrimum. Sepala oblonga, glaberrima, roseo-cinnabarina, apice coeruleo, breviter apiculato, patente, longitudine germen fere duplo superantia, petalis autem duplo breviora; quae 1¼—1½ poll. longa, 4 lin. lata, parte inferiore calyce inclusa sulphurea, medio rubra, ceterum azurea. Stylus columnaris, triquetus, cum stigmatum capitulo triciclo coeruleo stamina paululum superans, longitudine sepalorum. Loculi germinis basi et apice inanes. Ovula quadri-

serialia, funiculo brevi crasso insidentia, horizontalia, anatropa, apice rotundata, nec appendiculata. — Species pulcherrima, affinis *B. Morelianae* Lindl. in Paxt. fl. gard. III. tab. 77 et Lem. in jard. fleur. III. tab. 271 (nec II. tab. 138), quae tamen floribus 3 et 4 fasciculatis sessilibus, nec pedicello communi insidentibus discrepat; *B. Wetherelli* Hook. (dubia Hort.) inflorescentiam simplicem floribus solitariis et turiones procumbentes, demum adscendentes habet. Patria mihi ignota, sine dubio America tropica.

7. *BILLBERGIA WETHERELLI* Hook. — Hook. bot. mag. tab. 4835. — Koch l. c.

F. cartilagineis lato-ligulatis obtusis c. acumine b. latioribus concavis circumvolutis marginib. obscure spinuloso-serratis, scapo folior. vaginis inclusis, rhachi tomentosa spicaque densa exsertis nutantibus, bracteis universalib. amplis coloratis coccineis, petalis (ap. purpureis) spathulatis intus versus basin lin. duabus membranac. subfimbriatis et ad bas. squamis duabus fimbriatis.

Species missa e Bahia a Mr. Wetherell.

8. *BILLBERGIA GLYMIANA* de Vriese. — Hort. acad. Lugd. Batav. pl. rar. ann. 1854.

F. lato-linearib. canaliculatis, acutis apice reflexis, remote nigro-spinosis, scapum fere aequantib.; pedunculo longe et late bracteato; bracteis pulchre roseis; racemo multifloro nutante; fl. sessilib., elongatis; sep. fere cinnabarinis, oblongis, acutis, mucronulatis; petalorum (sepala 2—3 superanturum) unguib. viridib., laminis dem. revolutis, cyaneis, tandem violaceis; stigmatate spirali.

(Jaarb. d. Kon. Ned. Maatsch. v. Tuinb. 1853. p. 37.) — Dixi in honorem expertissimi cultoris Ultrajectini C. Glym. — Patria l. c. non adjecta. — (Linnaea XXVI. p. 756.)

— K. Koch in ind. sem. h. Berol. 1856; in horto botanico culta nondum floruit, sed *B. Wetherelli* proxima et vix diversa mihi videtur.

9. *BILLBERGIA VIRIDIFLORA* H. Wendl. in Otto et Dietr. Gart. Z. 27. maj. 1854, — Fl. d. serres X. tab. 1019—1020.

F. longis, anguste ligulatis, arcuatim reflexis canaliculatis, longe acuminatis b. et ap. integerrimis medio remotiuscule spinuloso-serratis (in spec. Van Houtt. fere per longitudinem totam serratis), scapo folium subaequante, bracteis floccosis, racemo elongato simplici nutante; fl. solitariis remotis, longe pedunculatis, pedunc. subhorizontalib., laciniis perigonii glabris nitidiusculis, subpruinosis, viridibus. — Wendl.

Patria specialis adhuc ignota. — Floruit in horto Herrenhausen pr. Hanover.

10. *BILLBERGIA IRIDIFLORA* Nees et Mart. in nov. act. acad. Leop. Carol. nat. cur. XI. 16. — K. Koch l. c.

Folia atro-viridia, interne purpurea, ad marginem undulata; scapina bracteiformia, corallino-rubescens; scapus infra medium cernuus, glaber-rimus; flores distantes, patentissimi, solitarii, omnes bracteis corallino-rubescensibus fulcrati; petalorum lamina coerulea, minus recurvata.

11. *BILLBERGIA ZEBRINA* Lindl. — K. Koch. l. c.

Folia pauca, canaliculata, subtus, interdum etiam supra, transverse albo-vittata, ceterum viridia, scapina bracteiformia, rosea; scapus lanugine albo-floccoso deterrenti dense vestitus, infra medium cernuus; flores sessiles, distantes, solitarii, calyce et sepalis albo-floccosis; petalorum lamina paululum revoluta; viridi-lutea; squamulae ad basin petalorum binae.

III. Remotiflorae.

12. *BILLBERGIA VITTATA* Hort. nec Beer (*B. Moreliana* Lem. jard. fleur. II. t. 138., *B. amabilis* Beer Bromel. p. 118., *Tillandsia Moreliana* A. Heftr. in Gard. mag. et bot. III. p. 33 c. ic.) K. Koch l. c.

Folia basi canaliculata, erecta, transverse albo-vittata, ceterum viridia, scapina bracteiformia, magna, sordide rosea; scapus glaber, panicula spiciformi glaberrima terminatus, pedicelli inferiores 2—3, superiores 1-flori; gemen rubrum; sepala rosea, ad apicem patulum coerulea; petalorum lamina paululum revoluta, coerulea ad basin rubra.

13. BILLBERGIA LIBONIANA de Jonghe. — Flore d. serres X. tab. 1048. p. 195. — Surculosa, f. pseudo-radicalibus, ligulatis acutis mucronatis marg. serrulatis supra laete viridibus subt. furfuraceo-albidis, scapo plus minus nutante nunc suberecto lanuginoso ap. paucifloro bracteis scariosis linearib. obsito, florib. spicatis dissitis, calycis glaberrimi aurantiaci bractea longioris laciniis lineari-oblongis tubo ovario adnato longioribus, petalis calyce duplo et ultra longioribus late spatulato-linearibus inferne albidis ap. saturate caeruleis b. pilosis intus lamina ap. bifida adnata a b. ultra medium extensa duplicatis.

B. Liboniana de Jonghe Journ. d. hort. prat. mars. 1851, c. icone, Lem. jard. fleur. III. 197.

14. BILLBERGIA PALLESCENS C. K. et Bouch. ind. sem. h. Berol.

Billbergia pallida Hort. nonn. — ? *Billbergia amoena* Beer Fam. cl. Bromel. 122.

Folia utrinque pallide viridia, glaberrima, ad marginem serris parvis brunneis armata; scapus glaberrimus, erectus, pauciflorus; bracteae cerasino-rubrae, supremae minimae; petala virescenti-flava, lamina rubrescenti, superne revoluta et coerulea, ad basin squamula lacera utrinque praedita,

Folia inferiora breviora, superiora longiora, pedem longa, $1\frac{1}{4}$ — $1\frac{1}{2}$ poll. lata, usque ad basin fere late canaliculata, in cyathi formam disposita, nitidula coriaceo-pergamenea, lingulata, apice obtuso. Scapus foliis brevior, pennae anserinae crassitie, virescenti-albus, foliis bracteiformibus sub 3, internodia saepe longitudine duplo superantibus, ellipticis, cerasino-rubris, $2\frac{1}{2}$ poll. longis, 10 lin. latis obsitus. Flores 3—6, sessiles aut inferiores pedicello brevi insidentes, interdum bini, plerumque solitarii, bipollicares et longiores. Gemen pallide virescens, 12-sulcatum, semipollicare, calyce pallide stramineo, apice erecto coeruleo, obtuse trigono paululo brevius. Petala lineari-oblonga, ad partem inferiorem albescentia, ad superiorem virescenti-flavida, apice summo patulo, post anthesin revoluta, coeruleo. Stigmatum capitulum laxe sesquicyclum, cum stylo filamentis longius, sed petala subaequans; loculi germinis basi et apice inanes; ovula anatropa, ad apicem appendice lanceolata recurvata instructa, biserialia. — In horto botanico diu nomine *Billbergiae pallidae* culta, foliis nitentibus, glaberrimis, nec punctis albis creberrimis longitudinalibus obsitis et bracteis cerasino-rubris, nec roseis multum a *B. pallida* Lindl. act. reg. t. 344 discrepat, quae ab autore ipso a *Tillandsia amoena* Lodd. bot. cab. t. 78 non diversa esse dicitur. *Billbergia Liboniana* de Jonghe germine et calyce intense rubris haud aegre distinguenda est. Porro in horto *Billbergiae* species nomine *chlorocyanae* occurrit, quae an a planta de *Vrieseana* hujus nominis differat nescio. A nostra *B. amoena* Lindl. (*pallida* Lindl.) nonnisi inflorescentia ramosa differt, quam ob rem pro varietate habere, qualem cl. Loiseleur in *Herbier général des amateurs* Tom. V. tab. 345 nomine *Pitcairniae discoloris* jam depinxit.

15. BILLBERGIA AMOENA Lindl. in bot. reg. ad tab. 1068 (*pallida* Lindl. bot. tab. 344. Beer Bromel. p. 121, quoad syn. cit., *Tillandsia amoena* Lodd. bot. cab. t. 76). — K. Koch ind. sem. h. Berol.

Folia supra sordide, subtus punctis albis densissimis canescenti-viridia, scapina bracteiformia, rosea, patula; scapus glaber, virescens, parviflorus; flores solitarii, patentes aut patuli, inferiores bracteis magnis roseis, superiores contra minutis fulcrati, germine et sepalis glaberrimis, flavo-virescentibus; petalorum lamina inferne rubescens, superne coerulea, revoluta.

β. pedicellis plurifloris. *Billbergia chlorocyanea* Hort. (et? de Vr.) *Pitcairnia discolor* Loisel. in Herb. génér. de l'amat. IV. t. 335. (*Billbergia discolor* Beer Bromel. 121 inflorescentia cernua differt).

16. BILLBERGIA MEYENDORFII Regl. hort. bot. Petrop. 1857. — Petalis basi nudis scapo subnullo. — Planta speciosa caule abbreviato, 1—2 pollicari, dense folioso. Folia nitida, glaberrima, patentia, ligulata, spinuloso-serrata, acuta v. ex apice obtuso acuminata, basi latiore caulem amplectentia et margine nuda, 1½—2 ped. longa, 1—1¼ poll. lata: folia superiora (floralia) minora et omnino sanguinea v. basi apiceque sanguinea et medio viridia. Thyrsus capitato-spiciformis sessilis immersus, bracteatus; bracteis linguiformibus, concavis, membranaceis, apice cucullato-obtusis, albis et apicem versus virescentibus, 1½ poll. longis, calycem aequantibus. Flores breviter pedicellati. Calyx superus, profunde tripartitus, albidus et apicem versus viridis, laciniis se invicem tegentibus, ligulatis, erectis, rotundato-acutis, pollicem longis. Corolla 1½ poll. longa, calycem superans, petalis subcarnosis, unguiculatis erectis, acutis, unguibus albis, calycem aequantibus, basi nudis, limbo caeruleo. Stamina tubum aequantia; antheris oblongo-lanceolatis, dorso affixis. Germen inferum, stylo staminum longitudine, stigmatibus tribus spiraliter tortis. Patria Brasilia. Affinis *B. cruenta* Bot. Mag. tab. 2892. — Habitus omnino *Nidularii*. — *Billb. cruenta* l. c. differt: foliis latioribus, 3 pollices latis, transverse zonato-pruinosis, involucriantibus, apice tantum sanguineis; bracteis ovatis herbaceis, inferioribus calyce longioribus, petalis basi interiore squamiferis. — *Nidularium splendens* H. Hambg. *Bromelia Carolinae* Orig. Gartenflora tab. 211. — *Bromelia Carolinae* Beer (Fam. der Brom. p. 29), differre videtur foliis 1½ ped. longis, 2½ poll. latis, floribus ½ poll. longis. (Rgl.)

17. BILLBERGIA CHLORO-CYANEA de Vriese. — Hort. acad. Lugd. Batav. pl. rar. 1854.

F. elongatis, canaliculatis, marg. minute ac remote aculeatis, imo mucronulatis; scapo erecto, racemoso, laevissime roseo; bract. pulcherrime incarnatis, lanc., ap. angustato-acuminatis; fl. juniores superantibus, adulti subaequantibus; fl. binis in pedunc. communi complanatis, quor. alter sessilis, rectus, alter pedicello ovarium floris sessilis aequanti insidens et incurvus; calyx corolla ½ brevior, viridis, laciniis ap. caeruleis; corollae viridis laciniis ap. cyaneis, revolutis; staminib. exsertis; stylo stamina longe superante, stigmatibus trifido.

Brasilia? — (*Linnaea* XXVI. p. 755).

18. BILLBERGIA QUESNELIANA Ad. Brong. — Fl. d. serres X. tab. 1028. p. 157.

Caule elongato erecto dense folioso, f. rigidis patentibus recurvisq. b. dilatatis canaliculatis, externe transverse albo-subzonatis, ap. acutis marg. dentibus tenuibus dentatis serrato-aculeatis, superioribus in bracteis sensim mutatis scapo adpressis lanc-acutis, fl. in paniculam coarctatam spiciformem cylindricam digestis, bract. ovatis integerrimis, tranverse plicatis b. convolutis externe roseis lanugine alba inspersis flores subocculantibus, sepalis erectis obtusis roseis, petalis conniventibus oblongis concavis obtusis ap. coeruleo-violaceis. — Ad. Brong.

B. Quesneliana Ad. Brong. in Ann. Sc. nat. 2 ser. XV. p. 372 et velins du mus. ann. 1841. (fig. ined.) — *Quesnelia rufa* Gaud. voy. de la Bonite, Atl. et hortulan.

E Guiana gallica in hortos introducta a Quesnelio.

19. BILLBERGIA? POLYSTACHYA. — Paxton fl. gard. III. p. 33. pl. 80.

F. canaliculatis spinoso-dentatis ap. recurvis b. ventricosis scapo brevioribus, spica conica polystachya farinosa, bract. subrotundis acuminatis arcte imbricatis.

Planta Brasiliiana, *Billbergiae rhodocyaneae* affinis.

Icones addendae.

1305. **PITCAIRNIA** *Hérit.*

(Walp. Ann. III. 621.)

SYNOPSIS SPECIERUM GENERIS PITCAIRNIAE

auctore C. Koch, ind. sem. h. Berol. 1857.

L'Heritier de Brutelle, in Britannia annis 1786 et 1788 moratus, in horto Guil. Pitcairni, medici celebri, Bromeliaceam quandam vidit, quam merito typum novi generis sistere perspexit et in honorem possessoris Pitcairniae nominavit. Primaria haec Pitcairniae species in Heritieri sermo anglico, anno 1788 edito, sub nomine *P. bromeliaefoliae* illustrata est.

Pitcairniae genus propter singularem pistilli conformationem Bromeliacearum tribum propriam repraesentat, quae carpophyllis singulatim clausis, sed inter se vix concretis, hinc pistillo tripartibili distincta est. Accedit ut pedunculus apice incrassatus vertice in foveam excavetur, quacum pars inferior carpophyllorum immersa concresecit, quam ob rem Pitcairniae germen semi inferum esse et postremo in capsulam tripartibilem mutari dicitur.

Pistilli indole duo inprimis genera Bromeliacearum Pitcairniae accedunt, alterum a cel. Schultes filio in systemate vegetabilium a patre et Roemero inchoato a. 1830 sub nomine *Brocchiniae* propositum, alterum a me ipso in appendice ad ind. sem. hort. Berol. a 1854 sub nomine *Platystachydis* descriptum. Utriusque una tantum species hucusque cognita est, sed verisimile est complures Tillandsias inflorescentia complanata praeditas ad *Platystachydis* genus amandandas esse, neque vero omnes, ut cl. Beer in monographia sua Bromeliacearum mere ex habitu censet. *Brocchinia* et *Platystachys* enim non solum habitu a *Pitcairnia* differunt, quum prior staminibus inter se et cum perigonio ad medium usque connatis, posterior staminibus spiraltiter contortis distinguatur.

Porro cl. A. Brongniart, Bromeliacearum monographus peritissimus, genus *Pitcairniae* affine sub nomine *Neumanniae* proposuit. Species ab auctore huic generi adscriptae cum aliis quinque, quas ipse adieci, singulari habitu gaudent, folijs scilicet Maidi similibus, inflorescentia dense spicata, bracteis magnis coloratis plurifariam dispositis et floribus omnino sessilibus; gravissimum autem ex sententia auctoris discrimen, ovula tenuissima basi apiceque appendice filiformi praedita, minoris momenti esse videtur, quum et *Pitcairniae* species nonnullae ovulis tenuioribus longissime appendiculatis ornatae sint, quod jam Ruiz et Pavon viderunt, qui semina *Pitcairniarum* ab ipsis propositarum „utriusque seta longa aucta esse“ dicunt. Habitus quoque differentia paululum vacillat, quum *P. densiflora* Brongn., ipsaque *P. Altensteinii* Lem. *Neumanniae* accedant. Nihilominus *Neumanniae* genus, ad interim et usquedum omnes *Pitcairniae* species quoad ovulorum structuram diligenter examinatae sint, servabo.

Genera, quae cl. Beer in monographia Bromeliacearum sua a *Pitcairnia* sejunxit, *Phlo-mostachydem*, *Cochlopetalum* et *Orthopetalum*, non admitto. *Phlo-mostachys* quidem habitu singulari distinguitur, sed differentiae gravioris momenti, e floris fructusque indole petendae, desunt. Reliqua duo, ne habitu quidem singulari gaudentia, in varia petalorum directione nituntur. *Orthopetalo* scilicet petala sunt erecta, *Cochlopetalo* apice revoluta, *Pitcairniae* sensu Beerii restrictae corolla subgaleata, quae notae in nonnullis speciebus ambiguae, in aliis non satis accurate indicatae, ita ut, Beerii generibus acceptis, de multis speciebus dubium restaret, quo in genere quaerendae sint.

Denique cl. Lemaire in diario suo „Jardin fleuriste“ (II. 127) *Lamproconi* genus promulgavit, in quo *P. Altensteinii* Lem., *densifloram* Brongn. et undulatam Scheidw. col-

locavit. Hujus quoque generis character distinctivus certus et definitus frustra quaeritur et cl. Lemaire ipse habitu magis quam notis essentialibus ductus esse videtur.

In appendice catalogi seminum anno praeterito editi Pitcairniae species in sectiones sex distribui, quas hic accuratius constitutas denuo propono.

I. LAMPROCONUS.

Turiones inermes; folia disticha, elongata, basi canaliculato-concava, ceterum maidiformia (i. e. laxa, remote undulata, medio late canaliculata), omnino inermia; spica densissima, bracteis latis calycem obtegentibus praedita; flores tenues, erecti; petala basi squamigera.

1. PITCAIRNIA ALTENSTEINII Lem. (fl. d. serr. II. descr. ad tab. 162; *P. undulata* Scheidw. fl. d. serr. II. t. 162; *P. undulatifolia* Hook. bot. mag. t. 4241; *Puya Altensteinii* Klotzsch in Lk., Kl. et O. icon. pl. rar. hort. Berol. I. t. 1; *Lamproconus Altensteinii* Lem. in jard. fleur II. t. 127; *Phlomostachys Altensteinii* Beer Bromel. 43.)

Folia nuda aut subtus passim punctis albis conspersa, scapum superantia; bracteae amoene rubicundae, calycem superantes; spica brevis, ovata; petala albo-flavescentia (nec rubentia ut cl. Tenore ait).

β. *gigantea*. Nullo modo, excepta magnitudine, a specie genuina differt. (*Puya macrostachya* A. Dietr. in O. et Dietr. allg. Gartenz. XVI. p. 146; *Puya Altensteinii* β. *gigantea* Hook. bot. mag. t. 4309; *Lamproconus giganteus* Lem. jard. fleur. II. ad tab. 127; *Phlomostachys Altensteinii* β. *gigantea* Beer Bromel. p. 46.)

2. PITCAIRNIA DENSIFLORA Brongn. (in hortic. univ. VI. p. 228. c. ic.; *P. aurantiaca* Ten. ind. sem. hort. bot. Neap. a. 1855).

Folia passim punctis albis conspersa, scapum superantia; petalo lateritio-aurantiaca.

Clariss. Tenore hanc plantam sub nomine *P. aurantiaca* in indice sem. hort. bot. Neap. a. 1855 hisce verbis describit: F. inermib. loriformib. undulatis scapo tripedali longiorib.; spica strobiliformi bract. foliaceis imbricatis pallide virentib.; fl. semisuperis; perig. sexpartiti laciniis 3 exteriorib. calycinis persistentib. pubesc. albo-virentib., 3 interiorib. petaloideis croceis convolutis ap. galeatis incumbentib., b. squama bifida instructis; staminib. annulo perigyno insertis.

II. MAIDIFOLIAE K. Koch l. c.

Turiones inermes; folia undique directa, saepe elongata, ad basin canaliculato-concava aut petiolata, ceterum maidiformia, omnino inermia interdum denticulata; spica densiuscula, bracteis plerumque latis, calycem attingentibus praedita; flores flavescentes, rarissime rubentes, latiusculi, oblique hiantes, subringentes; petala apice lata.

3. PITCAIRNIA FUNKIANA A. Dietr. (in O. et Dietr. allg. Gartenz. XIX. p. 337; Reg. Gartenfl. III. t. 113; *P. macrocalyx* Hook. bot. mag. t. 4705; Beer Bromel. p. 52; *Puya Funkiana* Hort. Lind.; *Phlomostachys Funkiana* Beer Bromel. p. 47).

Folia nitida, omnino nuda, caulina denique bracteaeformia, subtus albido-furfuracea, scapum longitudine aequantia; spica anguste pyramidalis, laxiuscula, bracteis flavo-virentibus, calycis apicem non attingentibus praedita; flores denique refracti, flavidi. K. Koch. l. c.

Clariss. Hooker plantam sub nomine *P. macrocalyx* hisce verbis describit: F. radicalib. longissimis lanc. acuminatissimis inferne longe attenuatis vaginantib. glaberr. submembranac. costatis inermib. caulinis sensim minorib., caule elongato subfurfuraceo-lanato tereti, racemo laxiusculo, fl. (albis) patentib. demum reflex., bract. ovatis concav. acuminatis calycem longitudine aequantib., pedicell. brevissimis, calycis (flavi) ampli sepalis ovatis, acuminatis, appresso-conniventib., pet. oblongo-lin-spathulatis

subtortis b. esquamosis, ovario supero. — Ex America meridion. prov. Venezuela, in hortos translata.

4. PITCAIRNIA ZEIFOLIA C. Koch l. c. (app. ad ind. sem. hort. bot. Berol. a. 1854 p. 11.)

Folia petiolata, nitida, etiam caulina omnino nuda, scapum aequantia aut ab eo superata; spica laxiuscula, anguste pyramidalis, bracteis rubicundo-flavescentibus, calycis apicem attingentibus praedita; flores patentes, flavidi.

Auctor anno 1854 l. c. plantam hisce verbis adumbrat:

Folia radicalia longissima, maxime acuminata, basi in petiolum vaginantem canaliculatum attenuata, duriusculo-membranacea, glaberrima, margine subrevoluta-undulata, caulina sensim minora, omnia inermia; caulis elongatus, simplicissimus, superne pallide virescens; bractee concavo-convolutae, ovato-lanceolatae; flores pedicello brevi et crasso insidentes; calycis triangulati sepala oblonga, concava, longitudine bractearum; petala elongata lineari-oblonga, contorto-convoluta, medio recurvata, longitudine staminum annulo perigyno vix manifesto insertorum.

Planta a cl. de Warszewicz in Guatemala collecta, 3 pedalis; folia radicalia flaccida, supra opaco-, subtus pallide et nitenter viridia, 2—2½ ped. longa, medio 2 poll. lata, caulina sensim minora, suprema ad squamam caulem arcte includentem elongato-lanceolatae longe cuspidatae redactae; bractee patulae, pollicares, inferiores virides, superiores, apice excepto, viridi-cinnabariniae; flores elongati, recurvati, virescenti-albidi; stigmata oblonga, spiraliter torta, exserta; germen triloculare, triangulare; placentae centrales bifidae, ovulis horizontalibus teretibus dense obsitae. (Germen e carpellis tribus inter se connatis compositum est, placentae revera marginales ideoque, marginibus carpelli e centro in loculum protensis et secedentibus, bifidae.)

5. PITCAIRNIA VIRESCENS C. Koch l. c. (*Puya virescens* Hook. bot. mag. t. 4991.)

Folia basi dilatato-ventricosa, lineari-lanceolata, breviter et tenuissime acuminata, a scapo superata; spica laxiuscula, subcomposita, bracteis ovato-lanceolatis, flavo-virentibus praedita; flores patentes, pallide luteo-virescentes.

6. PITCAIRNIA RECURVATA C. Koch l. c. (*Puya recurvata* Scheidw. in O. et D. allg. Gartenz. X. p. 275).

Folia petiolata, elongata, supra nitida, subtus albido-furfuracea, a scapo elongato foliis lanceolatis bracteeformibus adpressis obsito superata; spica laxiuscula, anguste pyramidalis, bracteis roseis, arcte adpressis instructa; flores denique recurvati, albo-straminei.

7. PITCAIRNIA SUAVEOLENS Lindl. (bot. reg. t. 1069) Koch l. c.

Folia lineari-ensiformia, acuminata, submaidiformia, supra laete virentia, subtus albido-furfuracea; scapus glaberrimus; spica laxiuscula, pubescens, bracteis ovato-lanceolatis pedicellos superantibus onusta; sepala papyracea, flavo-virentia; petala lutea, basi squamigera.

8. PITCAIRNIA SULPHUREA Andr. (bot. repos. t. 244., *P. bracteata* var. *sulphurea* Ker in bot. mag. t. 1416) Koch l. c.

Folia flavida, mox recurvata, subtus albido-furfuracea, a scapo flocoso-furfuraceo foliis bracteeformibus onusto superata; bractee lanceolatae; ciliatae; flores pedicellati, patentes, sulphurei; petala basi squamigera.

Specimina in horto sub hoc nomine culta differunt foliis a medio ad apicem subtiliter denticulatis et a basi patenti-recurvatis. An diversa? Affinis *P. xanthocalyci* Mart., quae folia duplo longiora, supra medium recurvato-dependencia habet.

9. PITCAIRNIA XANTHOCALYX Mart. (ind. sem. hort. bot. Monac. a. 1848. adn. p. 4).
— Koch l. c.

Folia subtus albido-furfuracea, supra medium recurvato-dependencia, laxa, subtiliter denticulata, scapo parce floccoso foliis lanceolatis obsito superata; bracteae lanceolatae; flores pedicellati, patentes, ochroleuci.

In descriptione Martii folia integerrima dicuntur, quae autem in specimine ipso ex horto botanico Monacensi accepto etiam supra medium denticulata. Habitu convenit cum *P. sulphurea* horti Berolinensis, sed folia duplo longiora, patentia, superne eleganter recurvata, imo dependencia.

10. PITCAIRNIA UNDULATA Scheidw. (in O. et D. allg. Gartenz. X. p. 275; Lem. hort. univ. VI. p. 134 c. ic. *Lamproconus undulatus* Lem. jard. fleur. II. ad tab. 127). — Koch l. c.

Folia insigniter petiolata, oblonga, lata, planiuscula (quam ob rem nomen minus aptum), subtus argenteo-furfuracea, caulina omnia bracteaeformia, scapum subaequantia, erecta; spica laxiuscula, rubicunda, bracteis pallide virentibus calyce minoribus instructa; flores intense rubri.

Species pulchra, habitu singulari et floribus rubris ab hac sectione alienis gaudens, foliis petiolatis Neumanniae similis, sed quum ovula appendicibus careant Pitcairniis adnumeranda.

III. ARMIGERAE.

Turionum folia margine deorsum spinescentia, caulina inferiora basi patula, late canaliculata, sursum vel interdum deorsum spinescentia, ceterum lineari-lanceolata, margine planiuscula, interdum submaidiformia, nunquam laxa; spica laxa, bracteis angustis, plerumque pedicellum superantibus, rarissime latis praedita; flores angustiores, plerumque oblique hiantes, interdum, petalis inter se aequalibus, erecti, rubescentes, rarius albi aut violacei.

A. Petala ad basin squamula instructa.

11. PITCAIRNIA BRACTEATA Ait. (hort. Kew. ed. 2. II. p. 202; bot. mag. tab. 2813; *P. Gireoudiana* Dietr. in allg. Gartenz. XXI. p. 105). — Koch l. c.

Folia subpergamenea, supra nitida, subtus albido-glaucescens-furfuracea, ad basin tantum fusco-spinescentia, a scapo floccoso-furfuraceo superata; spica capituliformis, bracteis magnis imbricatis calycem paene superantibus instructa; petala lurido-rubescencia, basi squamula crenata vestita.

P. latifolia Red. Lil. tab. 73 et 74 et Wendl. hort. Herrenh. t. 3, quae vulgo ad *P. bracteata* Ait. citatur, — Koch l. c. — ab hac discrepat inflorescentia elongata bracteisque multo minoribus et aut speciem propriam constituit, aut ad *P. latifoliam* Ait. reducenda est, a qua praesertim floribus sessilibus differre videtur. — *Pitcairnia bracteata* Ait. var. *fulgens* Regel Gart. Flor. 1853. p. 450. — Caule bracteisque glabris. — In horto bot. Zuriaco florens.

12. PITCAIRNIA DECAISNEI C. Koch l. c. (*P. fulgens* Dne. in O. et D. allg. Gartenz. XIX. p. 26).

Folia lorato-lanceolata, submaidiformia, laxa, patenti-recurvata, denique dependencia, basi spinoso-dentata, subtus albido-furfuracea, scapum floccosum aequantia; spica densa, bracteis magnis glabris calycem paene omnino tequentibus instructa; sepala carinata; petala erecta, fulgidorubra, basi squamula lunulata instructa.

13. PITCAIRNIA LATIFOLIA Ait. (hort. Kew. ed. 1. p. 401; bot. mag. tab. 856). — Koch l. c.

Folia carnosulo-pergamenea, patentia, supra laete viridia, medio latiora, ad basin spinescentia, supra medium remote serrulata, subtus

minus furfuracea; spica lineari-oblonga, bracteis plerumque pedicellos breves subaequantibus instructa; flores approximati; sepala aurea; petala rubra, basi squamula integerrima vestita.

14. PITCAIRNIA PLATYPHYLLA Schrad. (in Blumenb. p. 26. tab. 3; *P. latifolia* Andr. bot. repos. tab. 322). — Koch l. c.

Folia membranaceo-pergamenea, erecto-patentia, supra laete viridia, subtus albido-furfuracea, ad basin spinescentia, ceterum integerrima; panicula subthyrsoidea floribus distantioribus; bractee mediae pedicellis breviores; petala rubra, basi squamula integerrima vestita.

15. PITCAIRNIA ALBUCAEFOLIA Schrad. (in Blumenb. p. 24 tab. 3. et in pl. rar. hort. Goetting. fasc. 1). — Koch l. c.

Folia patenti-recurvata, submaidiformia, laxiuscula, supra viridia, subtus albido-furfuracea, ad basin spinescentia, scapum furfuraceum subaequantia; spica subpyramidalis, bracteis pedicellos superantibus praedita. laxa; petala basi squamula apice dentata onusta.

16. PITCAIRNIA INTEGRIFOLIA Gawl. (in bot. mag. tab. 1462; *P. graminifolia* hort. nonn. neque vero hort. bot. Berol.). — Koch l. c.

Folia patenti-recurvata, linearia, supra viridia, subtus albido-furfuracea, basi tantum parum spinescentia, scapo floccoso-furfuraceo breviora; spica ramosa, laxiuscula, lanuginosa; bractee pedicellos superantes; petalorum squama dentata.

P. decora A. Dietr. (allg. Gartenz. XV. p. 352) e descriptione differt foliis supra nitidis, interdum passim furfure albo conspersis, latioribus, spica simplici pyramidalis, densiflora; e speciminibus in horto botanico cultis vix nisi spica pauciramea et squamulis bipartitis aut geminatis ad petalorum basin a *P. integrifolia* differre videtur,

17. PITCAIRNIA FURFURACEA Bot. mag. (tab. 2657; *P. intermedia* hort. ex p.). — Koch l. c.

Folia elongata, a basi recurvato-dependencia, margine planiusculo toto remote spinoso-dentata, supra nitida, subtus albido-furfuracea, scapum subfurfuraceum subaequantia; spica remotiuscula, simplex aut basi ramo uno alterove praedita; bractee pedicellos superantes, glabriusculae; germen glabrum; petala basi squamula rotundata instructa.

18. PITCAIRNIA RAMOSA Jacq. (eclog. p. 154. nec hort. nonn. *P. furfuracea* Jacq. p. 117, tab. 79; *P. intermedia* hort. ex p.; *P. Skinneri* hort.)

Folia patenti-recurvata, ad basin et saepe ad apicem margine spinoso-dentata, supra viridia, subtus albido-furfuracea, a scapo furfuraceo superata; bractee furfuraceae, pedicellos aequantes; germen denique glabrum; petala basi squamula instructa.

Specimina in horto Berolinensi culta folia ad basin tantum spinescentia habent, ceterum cum icone Jacquini conveniunt.

19. PITCAIRNIA AFFINIS C. Koch l. c. (*P. pruinosa* hort. nec H. B. et K.; *Pourretia magnispatha* hort. nec Coll.).

Folia patenti-recurvata, subtus densissime, supra sparse albido-furfuracea, planiuscula, ad basin spinescentia, scapum floccoso-furfuraceum subaequantia; racemus densiusculus, floribus ad basin saepe binis aut ternis; bractee pedicellos superantes; germen glabriusculum; petala basi squamula parvula iustructa.

P. ramosa hort. differt tantum foliis supra rariori furfure vestitis, magis erecto-recurvatis. Flores mihi ignoti.

20. PITCAIRNIA BROMELIAEFOLIA l'Her. (sert. angl. p. 7. tab. 11; Schneev. ic. IV, tab. 11). — Koch l. c.

Folia erecto-patentia, superne vix recurvata, supra nitida, viridia, subtus albo-furfuracea, plana, a basi supra medium spinescentia, scapum plerumque superantia; bracteae pedicellos flores aequantes superantes; spica glaberrima; petalorum squamula truncata, crenata.

P. bromeliaefolia Red. (Lil. tab. 75; *P. Redouteana* Beer Bromel. p. 57) folia latiora habet, iis *P. latifoliae* similia. In horto nostro specimen colitur, quod forsitan cum hac congruit. *P. bromeliaefolia* bot. mag. tab. 824 et bot. reg. tab. 1011 foliis margine toto spinoso-dentatis, rigidioribus discedit.

21. PITCAIRNIA ANGUSTIFOLIA Ait. (hort. Kew. ed. 1. p. 401; *P. tomentosa* Dietr. Nachtr. z. Gärtnerlex. VI, p. 305; Beer Bromel. p. 64). — Koch l. c.

Folia erecto-patentia, rigida, vix recurvata, linearia, supra nitida, viridia, subtus albido-furfuracea, undique remote curvato-spinescentia, scapo plerumque breviora; spica, densiuscula, tomentosa; bracteae pedicellos patentes superantes; petalorum squamula bifida.

22. PITCAIRNIA REDOUTEANA R. et S. (syst. veget. VII, 2. p. 1243; *P. angustifolia* Red. Lil. tab. 76; Beer Bromel. p. 64).

Folia erecto-patentia, rigida, vix recurvata, angustissime linearia, concava, supra nitida, viridia, subtus albido-furfuracea, undique remote spinescentia, scapo plerumque breviora; spica saepe ramosa, laxiuscula, tomentosa, bracteae pedicellis patentibus breviores.

23. PITCAIRNIA CARICIFOLIA Mart. (in R. et S. syst. veget. VII. 2. p. 1242, Koch l. c.

Folia patenti-recurvata, laxiuscula, anguste linearia, supra glabra, subtus albido-furfuracea, basi crebro-spinescentia, ad apicem denuo dentibus pungentibus remotis praedita, scapum floccoso-furfuraceum superantia; spica pauciflora, laxa, tomentosa; bracteae pedunculos erectos paulo superantes; petalorum squamula irregulariter dentata.

24. PITCAIRNIA HUMILIS Ten. (ind. sem. hort. Neap. 1855). — Koch l. c.

Folia erecto-patentia, rigida, vix recurvata, linearia, supra nitida, subtus albido-furfuracea, margine toto spinoso-serrata, scapo subbreviora; spica pauciflora; bracteae minimae, pedicellis calycem longitudine aequantibus multo breviores; petalorum squama bifida.

P. caricifoliae simillima esse videtur. — Clarissimus Tenore l. c. plantam hisce verbis adumbrat: — *F.* linearib. canaliculatis, scapo subped. breviorib., denticulato-spinosis; fl. racemosis; racemo laxo paucifl.; pedunc. subpollicarib.; perigonii semisuperi laciniis 3 exteriorib. calycinis fusco-rufis, 3 interiorib. petaloideis subconvolutis coccineis, calyce triplo longiorib., b. squama bifida instructis. — Patria...

25. PITCAIRNIA JACKSONI Hook. (bot. mag. t. 4540). — Koch l. c.

Folia erecto-recurvata, rigida, subulato-ensiformia, carinata, subtus albo-furfuracea, supra medium (in icone a basi ad apicem) spinescentia spica floccoso-furfuracea, laxiuscula; bracteae pedicellos patentes aequantes aut superiores superantes; squamula petalorum bifida, serrata.

In horto botanico nostro species nomine *P. Kegelianae* (e horto botanico Halensi allata) colitur, quae medium fere inter *P. Jacksoni* et *P. caricifoliam* tenere videtur, ad priorem paulo magis accedens, a qua differt foliis minus rigidis, non carinatis. K. Koch l. c.

Clarissimi Hookeri plantae descriptio loco supra citato haec est:

F. subulato-ensiformibus carinatis subt. albo-furfuraceis supra medium spinoso-serratis, scapo simplici, pedicellis patentibus calycibusq. farinosis, sepalis obtusis, corollae curvatae petalis lin-oblongis subtortis longitudine staminum intus squamosis squama bifida serrata, stigmatib. ciliatis.

A. cl. Jackson e Guatimala in hortos introducta.

26. PITCAIRNIA ECHINATA Hook. (bot. mag. t. 4709). — Koch l. c.

Folia elongata, patenti-recurvata, rigida, ubique margine spinescentia, supra medium lanceolata, subtus parce albido-furfuracea; inflorescentia racemosa (racemoso-paniculata?), laxa; bractee pedicellum subaequantes; sepala flavo-virescentia, uncinato-glandulosa, petalis albidis duplo superata.

Descriptio clar. Hookeri l. c. verbis ipsissimis haec est: F. radicalib. elong. lanc. acutissimis striatis subt. parce farinosis spinuloso-serratis inferne attenuatis semi-cylindraceutis (magis spinosis), caule parce folioso longissimo pulverulento-tomentoso ap. laxe racemoso-paniculato multil., sep. setis mollib. flavo-virescentib. ap. uncinato-glandulosis echinatis, pet. albis calycem fere duplo superantib., staminib. styloq. inclusis. — Lem. jard. fl. IV. tab. 407. — Fl. d. serres VIII. tab. 847. p. 257. — Verosimiliter sp. ex Mexico in hortos allata.

27. PITCAIRNIA LONGIFOLIA Hook. (bot. mag. tab. 4775). — Koch l. c.

Caulescens; folia longissima, e lata basi amplectente et pubescente lanceolata, supra viridia, subtus albido-furfuracea, toto margine remote spinescentia; spica composita, floribus secundis; bractee pedicellos aequantes; petala basi squamigera.

Descriptio auctoris ipsius haec est:

Caule erecto elongato simplici dense annulato, f. longissimis (4 ped.) e lata b. amplexanti striato pubescente lanceolatis acuminatissimis supra b. insigniter attenuatis viridib. spinuloso-ciliatis, panicula terminalis ramis racemosis, fl. secundis, pedicellis bracteolatis, sep. subulatis viridib. corolla coccinea triplo breviorib., petalis convolutis coccineis apicibus unilateralibus b. intus squamosis, staminib. styloque subexsertis corolla paulo brevioribus.

Planta ex agro Limensi a Guilh. Nation ad hort. Kewensem missa, quo in loco floruit in tepidario m. Decbr. 1853.

28. PITCAIRNIA LANUGINOSA R. et P. (fl. peruv. III. p. 35, tab. 258; *Orthopetalum lanuginosum* Beer Bromel. p. 70). — Koch l. c.

Folia sibi invicem incumbentia elongato-ensiformia, ad basin spinos-serrata, supra incana, subtus lanuginosa, scapum ad basin foliosum deinde squamis adpressis vestitum aequantia; spica lanuginosa; bractee ovatae, concavae, pedicellum brevem superantes; petala apice erecta, subaequalia, violacea, basi squamula truncata quinquedentata instructa.

29. PITCAIRNIA PULVERULENTA R. et P. (fl. peruv. III. p. 36, tab. 259; *Orthopetalum ferrugineum* Beer Bromel. p. 71). — Koch l. c.

Folia imbricata, numerosa, elongata, ensiformia, inferiora petiolo canaliculato spinoso-serrata instructa, minutim dentata, supra glaberrima, incana, subtus pulverulenta, scapo longo inferne tantum folioso, superne pulverulento breviora; spica composita, floribus secundis, breviter pedicellatis; bractee ovatae; petala erecta, coccinea, ad basin squamula brevi 2—3 crenata praedita.

Ad P. longifoliam Hook. spectat.

30. PITCAIRNIA MORITZIANA C. Koch et Bouché l. c. (ind. sem. hort. Berol. a. 1856, app. p. 4).

Folia a basi patenti-recurvata, laxiuscula, lineari-lanceolata, supra glabra, opaco-subvelutina, subtus albido-furfuracea, basi spinescentia, scapo tenui-floccoso breviora; spica simplex, pubescens; bractee inferiores pedicellos adscendentes superantes; squamula petalorum parva aut obsoleta.

Huic speciei a cl. Moritzio e Guatemala introductae proxime accedunt florum colore: P. xanthocalyx Mart. et suaveolens Lindl., utraque autem folia basi non spinescentia

habet. Præterea huic flores brevius pedunculati sunt et bracteae multo longiores. *P. xanthocalyx* minor et indumento magis sericeo, nec floccoso, sed tamen deterrenti prædita. — *P. Moritziana* foliis umbraculi modo distributis jucundae faciei est, habitu ad *Cordylinem* umbraculiferam, Goepf. accedens. Folia angusto-elongata, supra medium latiora, ad basin rigidiora et canaliculata, ad apicem contra laxiora et sensim attenuata, margine magis minusve undulata. Quum flores examinati non plane evoluti fuerint singularum partium descriptionem prætermittam.

31. PITCAIRNIA WARSZEWICZIANA Klotzsch (in Beer Brom. p. 66). — Koch l. c.

Caulis basi bulbiformis; folia patenti-recurvata, angusta, saepe submaidiformia, glabriuscula, basi spinoso-serrata, scapo foliis bracteaeformibus erectis instructo floccoso breviora; spica albido-tomentosa; bracteae lanceolatae, adpressae; petala pallide coccinea, ad basin squamula incisa margine libera instructa.

P. Karwinskianae Schult. proxime accedit, sed petalis squamigeris et foliis magis spinosis diversa esse dicitur. Utriusque specimina in horto nostro culta vix differre videntur, sed *P. Warsz. floriferam* nondum vidi.

B. Petala basi nuda.

32. PITCAIRNIA ASTEROTRICHA P. et E. (nov. gen. et sp. pl. II, tab. 158). — Koch l. c.

Folia ensiformia patenti-recurvata, supra nitida, glaberrima, subtus albido-furfuracea, spinoso-serrata, scapo elongato purpurascens breviora; spica composita, fulvo-lanuginosa, ramis bracteis serratis latis fulcratis; flores subsecundi; bracteae pedicellos superantes; petala purpurea.

33. PITCAIRNIA ALTA Hassk. (Retzia II, p. 5.).

Folia anguste linearia, canaliculata, patenti-recurvata, supra saturate viridia, subtus albido-furfuracea, basi spinescentia; scapus lanugine densa floccosa nec deterrenti vestitus; bracteae lineari-lanceolatae, glabriusculae, a pedicellis longitudine superatae; petala coccinea.

34. PITCAIRNIA FERRUGINEA R. et P. (fl. peruv. III, p. 36; *Pourretia ferruginea* Spreng. syst. veg. II, p. 23).

Folia sibi invicem incumbentia, ensiformia, longa, subtus ferrugineo-tomentosa, undique margine spinosa; spica maxima, decomposita, ferrugineo-tomentosa; pedicelli remoti, bracteas ovatas triplo superantes, apice recurvi; flores nutantes; petala subpurpurea, elongata.

Nescio an *Melinonia ferruginea* Brongn. (nondum descripta?) eadem planta sit. Specimina juvenilia et nondum florifera, quae in horto coluntur, habitu differre videntur.

35. PITCAIRNIA PANICULATA R. et P. (fl. peruv. III, p. 36. tab. 260; *Pourretia paniculata* Spreng. syst. veget. I, 81).

Folia sibi invicem incumbentia, ensiformia, patenti-recurvata, supra incana, subtus pulverulenta, serrato-aculeata, scapo pulverulento declinato paulo breviora; spica maxima, decomposita, pulverulenta; bracteae pedicellis breviores; petala punicea, apice reflexo-patentia.

36. PITCAIRNIA VIOLACEA Brongn. (in Ann. de Fl. et Pom. I, p. 116.)

Folia patenti-recurvata, graminea, supra canaliculata, glabriuscula, subtus albido-furfuracea, scapo glabro breviora, margine toto spinosodentata; spica composita, glaberrima; bracteae a pedicellis brevibus longitudine superatae, parvae; sepala dilute viridia, petalis erectis azureis (ex icone) pluries superata.

Icon inflorescentiam subdisticham representat, ideoque planta fortasse *Platystachidis* species.

37. PITCAIRNIA KARWINSKIANA Schult. (in R. et S. syst. veget. VII, 2. 1237; *P. ringens*

Klotzsch in Lk., Kl. et O. icon. pl. rar. hort. Ber. II, p. 63. tab. 65; *P. Montalbensis* cat. Lind. in O. et Dietr. allg. Gartenz. XIX, p. 138).

Caulis basi bulbiformis; folia patenti-recurvata, angusta, saepe submaidiformia, glabra, basi pauciserrata, scapo foliis bracteaeformibus erectis floccosis instructo breviora. Spica pubescens, densiuscula, simplex; petala roseo-coccinea; bracteae ovato-lanceolatae, pedicellum superantes aut aequantes.

Species singularis, aequae ac *P. Warszewicziana* Kl. in patria periodica, calido tempore aestatis bulbum relinquens.

38. PITCAIRNIA VALLISOLETANA Lex. (in R. et S. syst. veget. VIII, 2. p. 1238, ex errore *Vallidolitana* Ann. de Gand III, p. 412).

Caulis basi bulbiformis; folia ensiformia, angustissima, ultra basim margine spinoso-serrata, superiora incana, subleprosa (albido-furfuracea?); scapus articulatus (?), incarnatus, incurvus; flores alternatim spicati; bracteae laevigatae, ovatae, coccineae; petala rosea.

39. PITCAIRNIA SPLENDENS Warsz. (in O. et Dietr. allgem. Gartenz. XIX, 176; *P. fulgens* ibidem p. 137).

Caulis basi bulbiformis; folia patenti-recurvata, denique dependentia, lineari-lanceolata, glaberrima, basi spinoso-serrata, scapo parce floccoso paene duplo longiora; spica densa, floccoso-tomentosa; bracteae magnae, imbricatae, tomentosae, calyces saepe aequantes; sepala lanceolata, carinata; petala splendido-scarlatina.

Forsan eadem ac *P. Warszewicziana* Klotzsch, quae petalis squamigeris differre dicitur.

— *P. pungens* et *pruinosa* H. B. et K. nov. gen. et sp. pl. II, p. 294 et 295 ob semina reniformia aut planiuscula ab hoc genere alienae et forsitan *Puyae* adnumrandae sunt. — *P. distacacia* Beer (*Bromel.* p. 58; *Tillandsia distacacia* Fl. Flum. III. tab. 141) ob germin inferum *Billbergiae* species est.

40. PITCAIRNIA IRIDIFLORA Hort. Loud. (*Beer Bromel.* p. 51.)

Folia angustissima, canaliculata, erecta, rigidula, scapum humilem longe superantia, spinescenti-serrulata; spica densa: bracteae rigidae, erectae, longae, vix furfuraceae; petala lateritia.

Species mihi ignota, dubia, *P. angustifoliae* Ait. forsitan accedens.

IV. ACAULES Koch l. c.

Turionum folia angustissima deorsum spinescentia, patentissima, inferiora in caule bulbiformi saepe latiora, in spinam desinentia, saepe ciliata, reliqua elongata, sublinearia, integerrima, saepe canaliculata: spica densissima, subcapitata, pauciflora, subsessilis, bracteis majusculis; flores rubentes, subringentes.

41. PITCAIRNIA EXSCAPA Hook. (*bot. mag.* tab. 4591). — (*Walp. Ann.* III. 621 n. 2).

Folia caulina inferiora coriacea, vaginiformia, ovato-lanceolata, in acumen subpungens attenuata, cetera rigida, lineari-elongata, canaliculata, integra, glaberrima, viridia, nitentia, erecta, interdum superne recurvata; bracteae lanceolatae, exteriores cum calyce hirsutae, spinis apicularibus nigro-fuscis intermixtis; petala coccinea, basi squamigera.

Specimina horti nostri foliis caulinis inferioribus angustissimis, patenti-recurvatis, margine deorsum spinescentibus ab icone discrepant. Turionum folia spinescentia sunt. Koch l. c. — *Cl. Hookeri* plantae descriptio haec est: Caule brevissimo pseudo-bulboso, f. fere omnino radicalib. lin - elongatis tenuissime longissime acuminatis integris, vaginis inflatis, marg. superne ciliato-asperis, spicis radicalib. capitatis ovatis imbricatis bracteatis subsessilib., bract. lanc-acuminatis exteriorib. calycibusq. hirsutis, spinis acicularibus nigro-fuscis intermixtis, petal. lin - oblongis galeato-curvatis b. intus nectariferis. — Patria Nova Granada. — *P. suaveolenti* propinqua.

42. PITCAIRNIA MORRENI Lem. (in jard. fleur. III. tab. 291; *Puya longifolia* Morr. in Ann. de Gand II. tab. 101; Paxt. flow. gard. I. tab. 86; *Pitcairnia Morrenii* et *longifolia* Beer Bromel. p. 67).

Folia inferiora coriacea, vaginiformia, ovato-lanceolata, pungenti-acuminata, nonnisi turioni proxima margine deorsum spinescentia, cetera rigida, lineari-lanceolata, canaliculata, integerrima, glaberrima, viridia, nitida, erecto-patentia, interdum superne recurvata; bracteae ovato-lanceolatae, sublanatae; petala coccinea, basi squamigera.

An *P. exscapa* Hook. et *Morrenii* Lem. satis diversae? — K. Koch l. c.

Descriptio plantae cl. Lamairii in diario suo supra citato haec est:

Acaulis f. biformib., exteriorib. b. dilatata bulbum falsum efformantibus, dein lin-subulatis marg. pinnatifido-aculeatis nigricantibus; interiorib. longe linearibus elongatis canaliculatis marg. laevib. ap. obtusiusculo, racemo sessili, sepalis lineari-lanceolatis carinatis, petalis in tubum hinc fissum convolutis ap. subregulariter subpatulis; staminib. subexsertis, antheris linearibus rectis, stylo exserto, stigmatib. spirali convolutis.

Lem. ex cl. Lindl. et ex fig. operis ejus citati hic mutuata. — Hab. America centralis.

43. PITCAIRNIA HETEROPHYLLA Beer (Bromel. p. 65; *Puya heterophylla* Lindl. bot. reg. XXVI. tab. 71).

Folia inferiora coriacea, vaginiformia, ovato-lanceolata, in acumen longum attenuata, margine deorsum spinescentia, cetera tenera, angusta, a medio ad basin et apicem attenuata, integerrima, parcissime pruinosa, opaco-viridia, erecta; bracteae lanatae, calycibus breviores; petala intense rosea, basi squama duplici instructa.

44. PITCAIRNIA LIEBMANNI C. Koch l. c. (*P. exscapa* Liebm. ind. sem. hort. Haun. a. 1848, p. 12.)

Folia inferiora cartilaginea, vaginiformia, lanceolata, costata, in acumen longissimum subulatum abrupte attenuata, margine spinoso-dentata, cetera lineari-lanceolata, graminea, integerrima, (? glaberrima); sepala lanceolata, subulata, carinata, lepidoto-lanata; petala rosea, basi nuda.

45. PITCAIRNIA CERNUA Kth. et Bouché (ind. sem. hort. Berol. a. 1848. p. 12.) Koch l. c.

Folia inferiora coriacea, vaginiformia, lanceolata, in acumen longissimum recurvatum attenuata, margine deorsum spinescentia, reliqua rigida, lineari-elongata, canaliculata, superne planiuscula, supra passim furfure albido parce conspersa, erecta, superne interdum recurvata; spica densa, tereti-oblonga, subcernua; bracteae lanuginosae; petala cinnabarinococcinea, supra basin saccato-excavata.

P. monstrosa Beer (Bromel. p. 68) certe varietas monstrosa, nec species propria est.

V. INERMES.

Folia turionum brevissima, reliqua elongata, carnosula, plerumque isomorpha, omnia integerrima; spica simplex, rara composita vel thyrsoida; bracteae lanceolatae; flores angusti, erectiusculi, rubentes, pedicello brevi erecto-patenti insidentes; petala plerumque basi nuda.

46. PITCAIRNIA FLAMMEA Lindl. (in bot. reg. tab. 1092).

Folia erecta, basi quasi caulem inferne brunnescentem formantia, supra medium laxiuscula, recurvato-dependencia carnosula, supra glabra, subtus albido-furfuracea; scapus glaberrimus; bracteae pedicellum glaberrimum coccineum superantes; sepala anguste lanceolata, coccinea; petala sanguinea, erecta.

47. PITCAIRNIA OLFERSII Lk. (Verhandl. d. Ver. z. Bef. d. Gartenb. VII. p. 363. t. 3).

Folia erecta, basi quasi caulem inferne brunnescentem formantia, supra medium laxiuscula, recurvato-dependentia, carnosula, supra glabra, subtus albido-furfuracea; scapus glaberrimus; bracteae pedicellos vire-scentes glaberrimos superantes; sepala lanceolata, aequae ac petala recta scarlatina.

Vix specie differt a *P. flammea* Lindl. — *P. l'Herminieri* hort. Par. eadem planta esse videtur, sed foliis latioribus paululum discrepat.

48. PITCAIRNIA CINNABARINA A. Dietr. (in allg. Gartenz. XVIII. p. 202).

Folia erecta, quasi caulem inferne brunnescentem basi formantia, supra medium recurvata, planiuscula, carnosula, glaberrima, supra intense viridia, subtus punctis crebris brunnescentibus praedita, scapum glaberrimum superantia, juniora omnino aut ad basin brunnea; bracteae pedicellos paululum superantes; sepala lanceolata, dorso carinata, ut petala rectiuscula cinnabarina.

49. PITCAIRNIA AUSTRALIS C. Koch l. c. (app. ad ind. sem. hort. Berol. a. 1856).

Folia erecta basi quasi caulem formantia, supra medium recurvata, glaberrima, carnosula, supra et subtus viridia, a scapo glaberrimo superata; bracteae inferiores medio recurvatae, pedicellos elongatos adscendentes paulo superantes; sepala lanceolata, ut petala vix ringentia rubentia.

Descriptio plantae auctoris anno 1856 l. c. data haec est:

Turionum squamae integerrimae, adpressae; folia glaberrima, dilute viridia, infra medium canaliculata, supra plana, sensim in cuspidem attenuata, recurvata; scapus tenuis, glaberrimus; bracteae anguste lanceolatae, inferiores floribus longiores; petala rubentia, subringentia, basi nuda; stigmatum capitulum lineari-oblongum, tricyclum, ex antheris emergens.

Ex horto botanico Parisiensi introducta est. Folia elongata, 2—2½ ped. longa, medio 1¼ poll. lata, basi marginibus inflexis scapum ambeuntia, initio erecta, deinde recurvata, supra medium lanceolata. Scapus 2 ped. longus, inferne foliis minoribus erectis, lanceolatis, sensim minoribus obsitus. Spica semipedalis, floribus sub 20, pyramidalibus praedita, glaberrima. Bracteae inferiores patentes, medio recurvatae, elongatae, lineari-lanceolatae, ceterae sensim minores, superiores denique pedicello adscendenti roseo semipollicari vix longiores eique accumbentes. Sepala basi inter se et germine adnata. Germen ovato-pyramidale, trigonum, trisulcum, sensim in stylum superne rubrum et stamina superantem attenuatum; stigmatum capitulum rubrum, lineari-oblongum, tricyclum. — Cum *P. rubicunda* C. Koch, id quod jam supra dixi, ejusdem sectionis est, sed major, minor tamen quam *P. flammea* Mart. et *Olfersii* Lk. Folia *P. australis* paululum rigidiora, supra didimium arcu rejiciuntur, nequaquam laxe superpendent, ut in illis, quibus etiam petala basi squamigera sunt. A *P. rubicunda* denique discrepat defectu lanuginis detersibilis.

50. PITCAIRNIA FULGENS Rev. hort. (a. 1836 Janv.; Dietr. n. Nachtr. z. Lex. d. Gaert. u. Bot. VII. p. 44).

Rhizoma ramosum; turiones violacei; folia lineari-lanceolata lorata, acuminata, scapo flavescenti-viridi breviora; spica simplex, bracteis lanceolatis, angustis, coloratis; petala splendide scarlatina.

Species ante multos annos Parisiis culta, nobis plane ignota, quae turionibus coloratis ad *P. cinnabarinam* A. Dietr. propius accedere videtur.

51. PITCAIRNIA NUBIGENA Planch. (fl. d. serr. VII, tab. 847).

Folia supra medium recurvata, plana, utrinque glaberrima, intense viridia, elevato-nervosa, vaginis petiolaribus puberula, scapo lana floccosa

decidua sparse vestito, apice glaberrimo superata; racemus pyramidalis; bractea angustae, pedicellos vix aequantes; sepala lanceolata, carinata, rubida; petala inferne albida, ceterum amoene coccinea, basi intus squama duplici instructa.

Koch l. c. — Planch. l. supra citato hisce verbis plantam describit:

F. linearilanc. acuminatissimis ap. acuto, aridis marg. laevi integris planiusculis utrinque laete viridibus glabris, vaginis petiolaribus puberulis, scapis terminalib. erectis inferne foliis mox bracteis linearibus vestito lana floccosa decidua sparso ap. glaberrimo, racemo pyramidali densiusculo multifloro, bracteis linearib. scariosis acutis pedicello brevioribus, florib. glaberrimis, laciniis calycinis e b. oblonga linearibus acutissimis dorso carinatis rubidis petalis calycem plus duplo superantibus late linearibus acutis inferne albidis superne amoene coccineis intus b. squama duplici duplicatis, staminib. stylo aequilongis antheris aureis, ovario pyramidiformi trigono.

Pitc. nubigena Pl. et Lind. Flor. Columb. ined.

Hab. Columbia, prov. Merida et Venezuela in alt. 8000—9000'; Funk et Schlim legerunt.

52. PITCAIRNIA RUBICUNDA C. Koch (app. ad ind. sem. hort. Ber. a. 1856. p. 3; P. Moreliana hort. nonn.)

Folia basi vix pseudocaulum brevem formantia, elongata, supra medium recurvata, supra concava et intense viridia, juniora sublus albido-furfuracea, a scapo glabro, foliis bracteaeformibus utrinque furfuraceis praedito superata; bractea pedicellis adscendentibus vix majores; petala rubentia.

Koch l. c. — Descriptio auctoris ann. 1856. data, hisce verbis circumscibitur:

Folia lurionum squamiformia, integra, reliqua supra intense viridia, sublus lanugine furfuracea detersibili vestita, integerrima, elongatolinearia, ad partem superiorem lanceolata, laxa, dependentia; scapus glaberrimus; bractea pedicellis adscendentibus vix longiores; petala rubentia, basi nuda, subringentia, staminibus longiora; stigmatum capitulum 3—4 cyclum, antheris occultum.

Ex hortis belgicis Berolinum allata est, sine dubio brasilianae originis. Folia $1\frac{1}{4}$ ped. longa, medio 6—8 lin. lata et margine subundulata, ad basin involuto-caniculata, ad apicem contra lanceolata et recurvata. Scapus foliis longior, tenuis, glaberrimus, foliis bracteaeformibus ad apicem sensim minoribus, lanceolatis, erectis, lanugine detersibili utrinque obsitis praeditus. Spica 4—6 poll. longa, glaberrima, 12—15 flora; bractea inferiores ceteris breviores, basi latae, lanceolatae; pedicelli rosei, 5—6 lin. longi. Flores amoene rubentes, elongati, $1\frac{1}{4}$ —2 poll. longi. Calyx trigonus, trisulcus, 9—10 lin. longus; petala elongata, linearia, superne latiora; antherae basi affixae, luteae, petalis breviores; stylus $1\frac{1}{4}$ — $2\frac{1}{4}$ poll. longus, rubens, staminibus brevior; stigmatum capitulum 3—4 cyclum, germen ovale-pyramidale, 3 sulcum, trigonum.

53. PITCAIRNIA RHODOSTACHYS Hassk. (in Retzia II, p. 8).

Caespitosa; folia linearilongata, subulato-acuminatissima, membranacea, rubromarginata, superne convoluta, supra glaberrima, sublus tomento arachnoideo deinde evanescente vestita, scapum dense arachnoideo-pulverulentum superantia; spica densa, tota cinnabarina, arachnoideo-puberula, apice leviter incurva; flores patuli, bracteis minoribus fulcrati, breviter pedicellati; sepala ovato-lanceolata, concava.

54. PITCAIRNIA INERMIS Mey. (in reliq. Haenk. II. 123. tab. 23). — Koch l. c.

Folia elongata, linearia, valde acuminata, glaberrima, scapum aequantia; spica composita, thysoidea, ramis erectis racemosis; sepala lanceolata, carinata; petala angustissima.

55. PITCAIRNIA MUSCOSA Mart. (in R. et S. syst. veget. VII. 2. p. 1240. bot. mag. tab. 4770; *P. leiotelema* hort. van H.; *P. Beycalema* hort. Schönbr. in Beer Bromel. p. 63). — Koch l. c.

Caespitosa; folia breviter, lineari-lanceolata, patenti-vix recurvata, plana, supra glabra aut basi raro furfure instructa, subtus albido-furfuracea, scapum floccoso-furfuraceum subaequantia; spica simplex, parce tomentosa, densiuscula; bracteae pedicellos erectos breves superantes; sepala lanceolata; petala subringentia.

In Brasilia indigena, probabiliter in prov. Minas Geraes. — Species omnium minima, aliena.

56. PITCAIRNIA PUNICEA Lindl. (in Hassk. Retzia II, p. 12; Beer Bromel. p. 56.) — Koch l. c.

Pluricaulis, caespitosa; caules breviores, cicatrisati; folia breviter, lineari-lanceolata, submembranacea, aculeis minutis sursum hamatis armata, supra glabra, subtus albido-furfuracea, scapum floccoso-furfuraceum subaequantia aut eo breviora; spica simplex, laxiuscula, parce tomentosa; pedicelli patentes, bracteis griseis accumbentibus longiores; sepala triangulari-lanceolata; flores majusculi, erecti, subringentes; petala amoene rubra, ad basin squamula plerumque adnata praedita.

Species quoad habitum aliena, forsitan e sectione rejicienda; ovula oblonga et obtusa, nec attenuata et appendiculata.

57. PITCAIRNIA LAEVIS Beer (Bromel. p. 60; *Tillandsia* Fl. Flum. III, t. 126). — Koch l. c.

Caulis cicatrisatus, brevis; folia elongata, basi canaliculata, ceterum lineari-lanceolata, subdisticha, scapum floccoso-furfuraceum aequantia aut superantia; bracteae breves; spica densiuscula, flores patentissimi, subringentes.

VI. COCHLIOPETALUM.

Folia turionum brevissima, reliqua elongata, angusta, carnosula, plerumque isomorpha, omnia integerrima; racemus simplex aut panicula; bracteae lanceolatae breves; flores albi, raro rubicundi, pedicello longiori patentissimo insidentes; petala plerumque apice revoluta, basi nuda.

58. PITCAIRNIA STAMINEA Lodd. (bot. cab. tab. 775, bot. mag. tab. 2411; *Cochliopetalum stamineum* Beer Bromel. p. 70). — Koch l. c.

Folia patula, denique recurvata, angusta, longe acuminata, supra intense viridia, subtus parce albido-furfuracea, basi furfuraceo-lacera; racemus glaberrimus, pyramidalis; bracteae pedicellis duplo triploque breviores; petala laete coccinea, apice revoluta; stamina longe exserta.

P. speciosa rubra et sp. ex horto Turicensi vix differunt foliis longioribus, magis erectis, rigidioribus.

59. PITCAIRNIA ALBIFLOS Heb. (in bot. mag. tab. 2642; *P. albiflora* Spreng. syst. veget. IV. 2. p. 131; *Cochliopetalum albiflos* Beer Bromel. p. 68). — Koch l. c.

Saepe caulescens; folia erecta, denique recurvata, angusta, longe acuminata, supra et subtus glaberrima; racemus glaberrimus, pyramidalis; bracteae pedicellis subhorizontalibus duplo breviores; petala albido-flavescentia, apice revoluta, staminibus breviora.

60. PITCAIRNIA ODORATA hort. Angl. (in Reg. Gartenfl. III. tab. 11. *Tillandsia Schüchii* Fenzl in O. et Dietr. allg. Gartenz. XIV. p. 266; *Cochliopetalum Schüchii* Beer Bromel. p. 69). — Koch l. c.

Saepe caulescens; folia erecta, denique minus recurvata, angusta, longe acuminata, supra et subtus pallide viridia; racemus laxis, glaber-

rimus; bracteeae pedicellis breviores; petala albida, apice revoluta, stamina superantia.

P. flavescens Beer (Bromel. p. 69) staminibus petalis brevioribus a *P. odorata* hort. Angl. non satis diversa videtur, in descriptione autoris incompleta petala in-, nec revoluta, flavescencia dicuntur.

61. PITCAIRNIA MICRANTHA Lindl. (in bot. reg. XXIX. misc. p. 44). — Koch l. c.

Folia flaccida, latiuscula, margine undulata, patenti-recurvata, basi subtus pubescentia, supra intense, subtus pallide viridia; scapus parce floccosus; spica composita; pedicelli breves, bractea brunnescente ovato-lanceolata paene omnino inclusi; petala brevia, sepala tantummodo duplo superantia, recurvata.

Habitu magis ad species maidifolias accedere videtur, sed ob petala recurvata cum *P. odorata*, albiflora etc. convenit.

62. PITCAIRNIA ELATA Liebm. (ind sem. hort. Haun. a. 1849. p. 14). — Koch l. c.

Folia late linearia, graminea, leviter canaliculata, glabra; racemus laxus, glanduloso-pubescentis; flores longe pedicellati, patentissimi, albi; sepala lineari-lanceolata, a petalis lineari-spathulatis obliquis triplo superata; stamina petalis parum breviora.

Species ob petala obliqua forsani sectioni maidifoliarum adnumeranda.

63. PITCAIRNIA RINGENS Regel. — Regel Reg. Flora 1853. p. 450. — *F. radicalib.* longe linearib. integerrimis glabris; racemo simplici laxo; scapo foliis caulinis bracteisque tomento laxo, bract. lanceolatis pedunculos duplo superantibus; petalis b. nudis calyceque coloratis.

NIDULARIUM Lem.

Jard. fl. IV. misc. p. 60. adnot. et tab. 411.

Perigonii superi lacinae exter. prope basin connatae dein liberae erectae rigidissimae, inter. in tubum fere duplo longiorem omnino connatae, ap. liberae erectae cucullatae b. intus penitus nudaе. Filamenta cum tubo longitudine tota connata sed perspicua ap. tantum libera, antheris linearibus ap. acutis b. submarginatis dorsifixis, stigmatib. 3 planis membranaceis spirali-convolutis. Ovar. omnino inferum trigonum trilobulare; ovula numerosissima placentis 2 angulo centrali affixis adhaerentia... Caps. baccata?

Guzmania picta Lem. ol. ms. et in hort. Cat. — Adde: Seminibus... ap. exappendiculatis. — Scapo nullo... bracteis quincuncialibus solitariis... bracteola unica. Floratio centrifuga.

1. NIDULARIUM FULGENS Lem. l. c. — Unica adhuc generis species. — Cl. Regel ann. 1857 duas adhuc species publicavit.

2. NIDULARIA SCHEREMETIEWII Rgl. — Reg. Ind. sem. h. bot. Petrop. 1857.

Glabrum, caule humili dense folioso, foliis patentibus, apice recurvis, elongatis, lineari-lanceolatis, attenuato-acutissimis, glabris spinuloso-serrulatis, basi latiore integerrima caulem amplectentibus; foliis floralibus multo brevioribus, coloratis; calycibus viridibus trigonis ad ovarium usque trifidis; laciniis rigidis, erectis, convulso-appressis acutis.

Caulis $\frac{1}{2}$ — $\frac{3}{4}$ pedem altus. Folia inferiora laete viridia, sub lente impresso-punctata, $1\frac{1}{4}$ ped. longa, pollicem lata. Flores corymboso subsessiles, in apice caulis axillares et terminales, corymbis lateralibus 4 floris. Folia floralia flores multo superantia et foliis inferioribus multa breviora 2—5 poll. longa, e basi latiore integerrima elongato lanceolata, totidem purpurea v. apice tantum viridia, v. viridi-variegata. Calyx trigonus; parte inferiore tubulosa germini totidem adnata; parte superiore erecta, ad ovarium usque tripartita, pollicem v. $1\frac{1}{2}$ poll. longa; basi bractea unica v. rarius

duabus oppositis involucreto. — Corolla supera, gamopetala, calycem multo superans, $1\frac{3}{4}$ poll. longa; limbo erecto, trifido, caeruleo; tubo albo; laciniis apice cucullato-concavis, obtusis. Filamenta 6, corollae tubo ad limbum usque adnata, 3 limbi laciniis opposita, 3 iis alterna; antherae lineares, dorso affixae, basi breviter sagittatae. Stigma conicum, capitatum. — Patria Brasilia? — Caraguata serrata H. Petrop. et Rgl. Ind. sem. hort. Petrop. ann. 56. p. 17. (Rgl.)

3. NIDULARIUM PURPUREUM Beer. Die Familie der Bromeliaceen p. 78.

Caule humili dense folioso; foliis erecto patentibus, apice recurvis, lineari-lanceolatis, attenuato-acutis, obscure purpureis squamis albidis lepidotis vestitis, spinuloso-serrulatis, basi latiore integerrima amplexicaulis, foliis floralibus multo brevioribus, concoloribus; calycibus trigonis, limbo erecto, ad ovarium usque tripartito, rubro, lobis ovato-lanceolatis, acutissimis, convoluto-appressis.

Folia usque $1\frac{1}{2}$ pedes longa, $1\frac{1}{2}$ poll. lata. Corolla superne carminea. Cetera ut praecedentis. Planta, quam cl. Beer descripsit, differt foliis nitidis glabris, serrulatis (nec mucronato-serrulatis). — Pitcairnia discolor H. Petrop. (Rgl.)

NEUMANNIA Brongn.

1. NEUMANNIA PETIOLATA C. K. et Bouch. — Ind. sem. h. Berol. 1856.

Folia longissima, omnia aut inferiora in petiolum attenuata canaliculatum, margine ciliato-spinescentem, glaberrima; spica elongata, novemfaria, scapus brevior, lanugine detersibili, griseo-albo vestitum terminans; bractee virescenti-brunneae, flores fere omnino tegentes.

Scapus cum spica subtripedalis, foliis bracteisformibus adpressis obsitus; bractee lanceolatae, 2 poll. longae, basi paene pollicem latae. Folia quadripedalia, ad superiorem partem lanceolata, medio 2 poll. lata, utrinque viridia. Flores elongati, vix e bracteis emergentes; sepala petalis dimidio breviora, oblongo-lanceolata, 8—9 lin. longa, 4 lin. lata, enervia, alba, margine extremo rubescentia. Petala lanceolato-linearia, viridi-flavescentia, postremo flava, basi intus lamellula ovata tenuiter membranacea, 4 lin. longa instructa. Stamina 6 aequilonga, filamentis filiformibus, poll. longis; germen triplex, ovatum, sulcis tribus longitudinalibus praeditum, 4 lin. longum, basi 3 lin. latum; stylus elongatus, trigonus, filiformi-columnaris, petalis paululum brevior, dimidio superiore tarde spiralis, stigmatibus tribus spiralter convolutis; ovula appendicibus triplo quadruplove longioribus praedita. — Foliis longissimis, petiolo paene pedali instructis distincta, ad *N. sulphuream* (Puyam) Hook., ut videtur, maxime accedens. Haec differt foliis elongatis quidem, attamen brevioribus et ad basin inermibus, caule lanugine non vestito, flore altius eminente atque lamellula ad basin petalorum bipartita. — Cl. de Warszewicz e Guatemala in hortum botanicum attulit. — Neumanniae genus a cl. Brongniart conditum, cui cl. Beer nomen *Phlomostachyos* (profecto magis significans) substituit, valde naturale apparet, tamen discrimina primaria: ovula appendicibus longis praedita, inflorescentia densissima spiciformis et bractee magis coriaceae, relativa esse videntur. Pitcairnam Altensteinii et species affines autem, quae ovulis brevioribus appendicibus, quam in genuinis Pitcairniae speciebus, instructis gaudent, ad Neumanniam non ducendae, etsi cl. Beer eas in genere *Phlomostachyos* enumeravit. Propter bracteeas magis membranaceas et inflorescentiam brevioris affniores sunt Pitcairniae bracteeae Ait. Cur autem cl. Lemaire (Jard. fleur. Tom. II, ad tab. 127) e Pitcairnia Altensteinii Scheidw. novum genus, *Lamproconum*, formaverit, e brevi generis diagnosi minime perspicitur.

2. NEUMANNIA OCHROLEUCA C. K. et Bouché l. c.

Puya sulphurea Hort. Herrenh. et hort. bot. Berol.

Folia medio latiora, ad basin et apicem attenuata, integerrima, supra

ut scapus, lanugine floccoso detersibili vestita, subtilus glabra; spica septemfaria, scapum longitudine aequans; bracteae virescenti-brunneae, apice lanceolato, patulo, viridi; petala basi nuda.

Scapus inferne foliis lanceolatis et rellexis. superne foliis bracteiformibus, erectis, adpressis plane vestitus; folia inferiora paene tripedalia, ad basin attenuata, amplectentia, medio $1\frac{1}{2}$ —2 poll. lata; bracteae oblongo-lanceolatae, supra basin 7—9 lin. latae, pollicem et dimidium longae. Flores bipollicares, flavescentes; calyx triqueter, albescens, apice virescens, sepalis lanceolato-oblongis, poll. longis; petala linearia, sed ad partem supremam laminam referentem latiora; stamina 6 aequilonga, filamentis filiformibus, a petalis longitudine parte sexta superata; germen pyramidale, sensim in stylum trigonum petala superans attenuata, 5 lin. longum, basi $2\frac{1}{2}$ lin. latum; capitulum stigmatum pentacyclum; ovula subsessilia, apice appendice filiformi paene duplo longiore, curvato instructa. — Ex horto Herrenhusiano sub nomine Puyae sulphureae accepimus, quo sub nomine species duae inter se diversae distributae esse videntur, quarum altera a cl. Hookero in diario anglico „botanical magazine“ ad tab. 4696 sub hoc nomine descripta et depicta est, altera Neumanniam ochroleucam nostra sistit. Hookeriana quoque nullo modo ad Puyam, sed ad Neumanniam referenda et sequenti modo distinguenda est:

3. NEUMANNIA SULPHUREA C. Koch (*Puya sulphurea* Hook., *Phlomostachys sulphurea* Beer).

Folia a medio ad basin et apicem attenuata, integerrima, glaberrima; spica septemfaria(?), scapum subaequilongum nudum terminans; bracteae virescenti-brunneae, apice lanceolato, patulo, viridi; petala basi squamigera.

N. ochroleuca et sulphurea conveniunt et a reliquis speciebus facillime distinguuntur foliis basi attenuatis quidem, sed nequaquam petiolo marginae ciliato-spinescente et canaliculato praeditis. — Conf. infra Puyam sulphuream Hook. — De ceteris Neumanniae speciebus, quatenus materies in horto botanico nostro suppeditatur, sequentes enumerandae sunt:

4. NEUMANNIA MAIDIFOLIA C. Koch (*Pitcairnia maidifolia* Pl. et Lindl. fl. des serr. IX. p. 151. *Puya maidifolia* Pl. et Lindl. in fl. de serr. IX. tab. 915, *Phlomostachys densiflora* Beer Bromel. 46).

Folia medio lata, elongata, disticha, glaberrima; spica quinquefaria, scapum breviorum, nudum terminans; bracteae brunneo-rubrae, apice erecto; petala basi squamigera.

5. NEUMANNIA IMBRICATA Brongn. in ann. d. sc. nat. 2. ser. XV. p. 369 (*Pitcairnia imbricata* Brongn. in hort., *Phlomostachys imbricata* Beer Bromel. 47).

Folia elongata, margine ciliato-spinescente, glaberrima; spica quinquefaria, scapum nudum aequilongum aut longiore terminans; bracteae virescentes; petala basi nuda. — Foliis margine ciliato-spinescentibus, sed non in petiolum canaliculatum attenuatis et bracteis virescentibus haud aegre a speciebus affinibus discernenda est. Praeterea reliquis multo minor.

Quod ad ceteras species, quas cl. Beer ad *Phlomostachyn* attulit, pertinet, de *Phlomost. Altensteinii* jam dixi. In diario „Jardin fleuriste“ a cl. Lemaireo edito supra allato loco hujus speciei varietas altior memoratur, quae in diario „Flore des serres“ Tom. III. tab. 253 et 254 nomine Puyae Altensteinii β . giganteae descripta et depicta, et a cl. Alb. Dietrich nomine Puyae macrostachyae separata est. Eadem a cl. Lemaireo denique nomen *Lamproconi gigantei* accepit. — *Pitcairnia densiflora* Brongn. (Lem. hort. univ. VI. p. 228 c. ic.), quam cl. Beer male cum N. imbricata Brongn. conjunxit, propius accedit ad P. Altensteinii, differt tamen bracteis viridibus et floribus aurantiacis, quam ob rem in hortis etiam nomine Puyae s. *Pitcairniae aurantiacae* colitur. — *Phlomostachys gigantea* Beer (Brom. p. 47), *Neumannia gigantea* Brongn. hort. Paris., mihi plane ignota. E descriptione differt a reliquis speciebus

scapo 7-pedali et bracteis rubro-brunneis. — *Phlomostachys atrorubens* Beer (Brom. p. 48) a cl. Warszewiczio in Europam allata, nunc Vindobonae culta, e Beerii verbis discrepat: bracteis intense rubris, apice nigris, patulis, nec non inflorescentia centrifuga, quae in omnibus reliquis Bromeliaceis centripeta est. — *Phlomostachys Funkiana* Beer (Brom. p. 47) denique vera *Pitcairnia* est, qualem jam cl. Alb. Dietrich (allgem. Gartenz. XIX. p. 337) definiuit, deinde etiam c. Regel in diario suo „Gartenflora“ Tom. III. ad tab. 113 depinxit. *Pitcairnia macrocalyx* Hook. bot. mag. t. 4705 et Beer (Bromel. p. 52) ab hac nullo modo differt.

1306. **TILLANDSIA** Linn.

(Walp. Ann. III. 622.)

1. **TILLANDSIA IONANTHA** V. Houtte. — Fl. d. serres X. tab. 1006.

Caule abbreviato, b. succuloso erecto, f. imbricatis patenti-erectis late linearibus sursum sensim attenuatis acutis crassis furfuraceis supremis roseo-Kermesinis bracteaeformibus flores parum superantibus, fl. paucis (sessilibus?) immersis, corollae amoene violaceae laciniis elongatis in tubum convolutis, staminibus breviter stylo longiuscule exsertis.

(Descr. ex ic.)

T. ionanthe Planch. in hort. V. Houtt.

Hab. Brasilia?

2. **TILLANDSIA PROPINQUA** (§ flores solitarii). — Gay fl. Chilena VI. p. 15.

Caespitosa; f. subdistichis, lin-subulatis, b. dilatatis, canaliculatis-argenteo-lepidoto-pruinosis recurvo-patentibus, pedunculo 1-floro brevioribus, aut rar. longioribus; bract. 3 inaequalibus, acuminatis.

Spec. valde aff. *T. recurvatae*, *T. virescenti* et *T. capillari*; crescit supra arbores prov. del Norte.

3. **TILLANDSIA DIANTHOIDEA** Ross. — Regel Gartenfl. III. p. 140. tab. 85.

LIMNOSTACHYS F. Mueller.

Fragm. phytogr. 1858. p. 24.

Calyx persistens corollinus patens aequaliter 6-partitus, laciniis lanceolatis. Stamina 6, calycis lobis opposita aequalia. Filamenta linearia basi inter se et cum fundo calycis concreta, unilateraliter supra stylum conniventia. Antherae biloculares basifixae hastato-oblongae truncatae, loculis longitudinaliter introrsum dehiscentibus et apice hiantibus. Germen triloculare multigemmulatum. Gemmulae placentis centralibus axin septorum marginantibus ope funiculi brevis affixae in loculis biserialae. Stylus cylindraceus vix decurvus. Stigma trilobulatum. Capsula libera, calyce persistente inclusa, trilocularis, demum loculicide trivalvata polysperma. Semina ovata tenuissime longitudinaliter costulata. Testa membraneo-chartacea. Umbilicus basalis. Chalaza crassiuscula terminalis. Embryon in axi albuminis subfarinosi rectum ejusdem longitudine, radícula crassiuscula hilo proxima.

Herba pulcherrima Australiae borealis paludicola, foliis cordato-ovatis acuminatis, radicalibus longe petiolatis, caulino singulo racemum ebracteolatum suffulciente, petiolis vaginantibus, floribus cyaneis. — Genus Eichhorniae et Monochoriae finitimum.

1. **LIMNOSTACHYS CYANEA**. — In terra Arnhem's Land. Leichhardt. Ad flumen Victoriae. — Rhizoma saepe repens fibras crebras agens. Caulis sesquipedalis v. humilior teretiusculus. Petioli inferne teretes, superne biangulati, caulinus folio brevior. Folia $1\frac{1}{2}$ —3" longa. Racemi floriferi erecti, fructiferi reclinati v. nutantes. Pedunculi crassi angulati pluri-multiflori semipediales v. breviores. Pedicelli cum flore articulati 2" longi crassi. Calycis lacinae fere pollicem longae, exteriores dorso virentes v. albae, margine intusque, interiores autem undique cyanae. Filamenta cyanea circiter 3" longa. Antherae aureae 1" vix longiores. Stylus coeruleus fere filamentorum longitudine. Capsula semuncialis. Semina nitidulo-fusca $\frac{1}{8}$ " longa.

IV. **MONOCHORIA** Presl.

(Kntb. en. IV. 132.)

(Walp. Ann. III. 628. — Knth. en. IV. 246.)

Parlatore nuovi generi et spec. di pianti monoc. 1854. p. 15.

1. FRITILLARIA PYRENAICA. — L. cod. Nr. 2397. (Koch ind. sem. h. Ber. 1855). —

„Infausta species, multorum sphalmatum dubiorumque mater“ jam dicitur in Caroli Linnaei systemate vegetabilium cur. J. Aug. et Jul. Herm. Schultes (Vol. VII. P. 1. p. 389), quare non mirandum est, quod nemo adhuc botanicus non ignoravit, equid Linnaeus nomine *F. pyrenaicae* intelligi voluerit. Duae opiniones ab auctoribus propositae sunt, altera *F. nervosam* Willd., altera *F. racemosam* Sm. Linnaei plantam esse contendens. Qua difficultate vitata alii Linnaei nomine nihil utuntur, id quod optimum factu sit. Accedit, quod Linnaeus ipse plantam non satis cognovisse videtur, nec postremo speciem, quae tot lites evocavit, et *F. nervosam* W. varietates solas unius speciei haberi abnuit. Attamen si perscrutari velis, quam speciem Linnaeus nomine *F. pyrenaicae* amplexus sit, omnium primum Clusii historia (II, 256 et posth. 10) requirere opus est. Loco citato Clusius quum plures *Fritillariae* species, tum duas, nomine *F. pyrenaicae* et *aquitanae*, descripsit. — De illa autor dicit: „quae (sepala) extimas oras nonnihil reflexas habebant, ut (flos) parvi tintinnabuli formam exprimeret, quorum terna exteriora internis erant angustiora, omnia obsoletioris coloris, circa oras tamen venis quibusdam flavescens distincta. A mediis foliis ad ipsos usque unguis plurimis maculis saturate purpurascens tessellatim dispositis notata“. Ex his verbis manifeste liquet, Clusium nomine *F. pyrenaicae* nostram *F. nervosam* Willd. flore saturate brunneo et paene colore neutiquam intellexisse, praesertim quum autor nomine *F. aquitanae* plantam descripsit et depinxerit, quae sine dubio speciem Willdenowianam ante oculos ponit. Recte monet autem cl. Gawler in diario botanico (botanical magazine) tab. 1538 in pagina aversa, plantam in tab. 664, nomine *F. pyrenaicae* depictam aliam esse, quam nunc *F. nigram* appellat et quae eadem ac *F. nervosa* Willd. Autor florae britannicae, Smith, primus asseveravit, hanc speciem *F. pyrenaicae* Linnaei esse, quod Clusius, ipse loco citato dicit: „quae (perianthii sepala) extimas oras nonnihil reflexas habebant“ et illam, quae antea ab autoribus majore jure pro *F. pyrenaica* habita est, *F. racemosam* nominavit. Quam opinionem Schultes, Reichenbach, Grisebach et Grenier assecuti

sunt. Hic autor praeterea suae *F. pyrenaicae* (*F. nervosae* Willd.) antea in opere suo „observations botaniques“ a. 1838 edito nomen Clusianum *F. aquitanicae* tribuit, quod nomen servandum esset, nisi Clusius ante Linnaeum et nostrum morem plantarum appellandarum vixisset. — Omnino sepala *F. racemosae* Sm. apice reflexa neutiquam sunt, sed reliqua verba Clusii et. diagnosis Linnaeana cum hac specie magis congruunt, quam cum *F. nervosa* Willd. (*pyrenaica* Sm.). Multos annos in horto Berolinensi magna cum diligentia plantae bulbosae coluntur, quae tum ex aliis hortis tum e patriis regionibus acquisitae erant. In hac collectione etiam species *Fritillariae* colitur, quae proxima quidem *F. racemosae* Sm., sed scapo 1—5 floreo et sepalis apice reflexis diversa. Hujus capsula praeterea columnaris et subito ad basin attenuata, quae in *F. racemosa* Sm. ab apice lato ad basin sensim angustior. Accedit, quod canaliculi marginum valvarum in capsulas *F. racemosae* Sm. latiores sunt, quam in nostra planta. Comparata igitur Clusiana descriptione *F. pyrenaicae*, quin planta horti botanici eadem sit ac vera *F. pyrenaica* L., non amplius dubito. Attamen accurate cognitione forte probatur hanc *Fr. pyrenaicam* tantum varietatem *F. racemosae* Sm. esse, quo posito ulterius nomen delendum et *F. pyrenaicae* restituendum esset. Nunc tamen et dum haec manifestius probetur, interscisco species diversas *F. pyrenaicam* L. et *F. racemosam* Sm.

1a. FRITILLARIA PYRENAICA L. — Caulis 1—5 florus; folia suprema erecta, flores longitudine superantia; sepala tessellata, ochraceo-brunnea, apice leviter reflexa; capsula columnaris, subito attenuata.

1b. FRITILLARIA RACEMOSA Sm.

Caulis pluriflorus; folia superiora erecta, flores longitudine superantia; sepala tessellata ochraceo-brunnea, apice erecta; capsula obconica, ab apice ad basin attenuata.

2. FRITILLARIA PRAECOX Hort.

Fritillaria alba Hort. Eystett. Ord. III. tab. 8. f. 3.

Glaucescens; caulis plurifolius; folia oblongo-linearia, elongata; flores 1—3, albi, sepalis 5 nerviis, etessellatis; stylus longitudine germinis, quocum dimidium perianthium longitudine aequat; capsula breviter oblonga.

Planta adhuc varietatibus *F. Meleagris* L. adnumerata, sed in horto Berolinensi per multos annos culta mutationi non succubuit. Haud aegre a specie, quam supra memoravi, distinguenda foliis 6—8 (nec 4—5) glaucescentibus, latioribus, floribus plerumque 2 et 3 majoribus, semper albis, unicoloribus, et stylo germen aequante, nec longiore. — Caulis 1—1½ pedalis, glaucescens, apice recurvus; folia pruinosa, glaucescentia, punctis albis subtilibus adpersa, erecta, omnia alterna, semipedalia, ½ poll. medio lata, suprema flores longitudine paene duplo superantia; flores solitarii aut 2—3 umbellati, penduli; sepala oblonga, dorso et ad basin extus angulato-carinata, inter se aequalia, sed interiora paululum latiora, poll. longa, 5 lin. lata, nervis 5 aut 7 flavescens et longitudinalibus percursa; filamenta basi appendice lata instructa, anguste lanceolata, antheris oblongis et flavis sesquilingiora; germen columnare, teres, vix trigonum. Stylus trifidus, puberulus, mox deciduus, antheras paululum superans.

3. FRITILLARIA LUTEA Bieb. fl. taur. cauc. I. 269. III, 263. — Colore florum variat, ideoque interdum varietas flore magis brunneo cum proxima *Fr. latifolia* Willd. commutata est. In horto Berolinensi plures varietates coluntur, quae omnes congruunt glaucescentia foliorum, sed discrepant sepalis sordide luteis, sordide aurantiacis et dilute brunneis, tessellis spadiceis brunneisque instructis. Icon plantae in diario botanico (botanical magazine) tab. 1207. a cl. Gawler *Fr. latifoliae* var. α . majoris nomine depictae huc aequae pertinet ac icon tab. 1538. (*latifolia* β . lutea) et *Fr. latifolia* Red. Lil. tab. 51. Ipsa icon tab. 853. (sed non descriptio), quia folia glauca exponit, potius ad *Fr. luteam* referenda est, quam ad veram *Fr. latifoliam*, quae foliis laete

viridibus et nitentibus, quemadmodum autor cl. Willdenow dicit, discrepat. Magis congruit Fr. lutea Bieb. cum Fr. glaucescente Willd., quae glaucescine convenit, sed flore sordide aureo, vix aut non tessellato, sed brunneo-striato, foliisque latioribus multum differt. Diu in horto botanico nostro culta, neutiquam mutata ideoque certe species distincta, sine dubio ex Oriente introducta, nec hortorum filia. Planta saepe bipedalis, foliis medio pollicem latis insignis. — Fr. aurea Schott, species mihi plane ignota. Fr. luteae proxima, differre dicitur foliis latiusculis subverticillatis; haud dubie Fr. glaucescenti Willd. affinium.

4. FRITILLARIA LYCIA Boiss. et Heldr. in pl. Anat. exs. 1846. — Boissier diagn. pl. n. XIII. p. 20.

Fr. glabra pallide virens, foliis radicalibus 1—2 teneris oblongis vel oblongo-lanceolatis acutis vel obtusis mucronulatis basi in petiolum tenuem eis longiore attenuatis, caulinis 5—7 parvis omnibus subaequilatis anguste linearibus acutis, flore terminali nutanti foliis supremis superato, perigonio breviter campanulato basi non gibbosa rotundato phyllis striatis non tessellatis rubris extus inaequaliter luteo suffusis obovato-cuneatis vel subdeltoideis a basi angustiori sensim dilatatis apiceque abrupte et breviter angustatis exterioribus saepius angustioribus elliptico-linearibus, filamentis dilatatis superne subangustatis parce et brevissime puberulis perigonii tertiam partem aequantibus anthera breviter mucronata duplo longioribus, stylo glabro antheras superanti ad medium usque trifido.

Hab. in pinetis montis Solyma Lyciae (Heldr.). Fl. fine martii. — Caulis 10—12 pollicaris, folia radicalia 12—18 lineas longa 4—5 lata, caulina 2—3 pollices longa lineam unam lata. Flos illo Fr. Messanensis multo brevior. Inter Fr. Graecam et Fr. acmopetalam tere media huic petalorum forma accedens sed distincta foliis caulinis angustissimis, perigonio magis abbreviato, filamentis non hirsutissimis. Fr. Graeca foliis omnibus caulinis ab infimis ad suprema sensum angustioribus, perigonii phyllis oblongis omnibus subaequilatis late virescenti-fasciatis subtessellatis longius distat. Fr. Messanensis est planta multo robustior, perigonio longiuscule cylindrico etc.

5. FRITILLARIA AUREA Schtt. — Schott Oestr. bot. W. Bl. 1854. p. 137.

F. inferiorib. elliptico-lanc., superiorib. lanc-linearib., omnib. promiscue verticillatis (ternis), oppositis et alternis; fl. solitario cernuo, late campanulato, aureo, sanguineo-tessellato; sep. exteriorib. cuneato-obovatis 7-nerviis (exclusis ramulis lateralib.), interiorib. obovatis 9-nerviis, omnib. fovea nectarifera sagittata v. cordato-triangulari acutis.

Hab. in Tauro (Kotschy). — A Fr. lutea Bieberst. cui fere florum colore et magnitud. proxima, fol. infimis latiusculis, plerumq. verticillatis v. subverticillatis, tessellis crebriorib., obsoletiorib., saepe maculis v. lineolis tantum indicatis, vasorum in sepalis numero differt.

6. FRITILLARIA OXYPETALA Hook. — Hook bot. mag. 1853. tab. 4731.

F. linearib. s. lin-lanc. alternis radicali lanceolato b. longe attenuato, caule 1-fl., fl. nutante, sep. dem. patentib. oblongo-ovatis acutis b. contractis subunguiculatis, ungue nectarifero ext. et int. ad bas. laminae pilis fasciculatis barbato, bulbo sq. elongatis erectis tunicato.

Fr. oxypet. Royle, bot. Himal. p. 388.

Lem. jard. fleur. IV. tab. 422. — Species pr. Pindari, Kumaon, in alt. c. 12500' detecta.

7. FRITILLARIA ROYLEI Hook. — Hook. Ic. pl. ser. nov. V. tab. 860. (Munroanae).

Caule b. longe nudo surs. folioso, 1—2—3 floro, foliis infimis oppositis superiorib. verticillatis 4—5-nisve lanc. attenuatis (non cirrosis), fl. nutante tessellato, sep. b. non gibbosis.

Fritillaria verticillata, Wall. Cat. n. 5079. — Royle, Ill. Himal. bot. 387. t. 92. f. 2 (non aliorum). — Fritillaria cirrhosa Don, pr. Fl. Nep. p. 517

Hab. In montib. Himalayae in provinciis Kamaoun, Gurwhal, Simore et Punjab.; in altitud. 9—12000'.

8. FRITILLARIA PTEROCARPA J. E. Stocks. — J. E. Stocks in Hook. j. Kew gard. misc. IV. 180. — Caule pubesc. 1-pluri-fl., f. 2 infim. approximatis pseudo-opposit. lanc., caulinis linearib. floralib. binis, pedunc. florif. horizontalib., p. anthesin ap. dellexis, fructifer. erect., perigonii sepal. breviter, calcarato-gibbos., sordide purpurascens. v. venis saturatorib., calcarib. atro-fuscis, staminib. b. pilos., stylo integro, ovario turbinato 6-sulcato, 6-angulato, vertice truncato cornubus 6 coronato. Caps. depressa 6-sulcata (sulcis alternis saepiss. profundiorib.) 6-angulata, angul. obtus. v. acutis v. alatis surs. in cornua productis. — H. Beloochistan super. — Fl. inconspic., fusco-colorati.

9. FRITILLARIA DELPHINENSIS Gren. in litt. — Godr. et Gren. fl. de Fr. III. p. 180.
Fr. tubaeformis Godr. et Gren. mem. soc. emul. Doubs, may 1854.

Flores purpureo-brunnei, rarius lutei, campanulati (fere tam lati quam longi), perig. divisionib. maculis quadrangularib., alternatim obscuriorib. v. laetiorib. et saep. parum distinctis variegatis, exterioribus 3 oblongis, obtusis, interiorib. 3 majorib. obovatis ap. valde rotundatis. Stam. stylo ovarium superante breviora v. eum aequantia. Stylus obconicus, fistulosus, a b. ad ap. sensim sensimque dilatatus, stigmatib. brevissimis tridentatus. Caps. oblonga. F. 4—6, ascendencia, flori approximata, lanc.; inferiora obtusa, superiora acuta. Bulbus parvus.

Hab. Hautes alpes du Dauphiné, environs de Gap. etc. — 2. Aug.

Icones addendae.

FRITILLARIA PALLIDIFLORA Schrenk. — Regel Gartenfl. VI. tab. 209.

FRITILLARIA KAMTSCHACENSIS. — Regel Gartenfl. V. tab. 173.

Fr. imperialis Lin. — A. Berg Med. Pl. tab. 126.

X b. AMBLIRION Raf.

(Knth. en. IV. 255. sub Fritillaria.)

1. AMBLIRION PUDICUM, var. *biflorum* Torr. (Knth. en. IV. 255). — Torrey in Stensbury expedit. at the Salt Lake p. 396. n. 29. tab. IX.

Caulibus omnib. bifloris.

Radix depressa, orbicularis, margine dentata, supra tuberculis plurimis obsita. Flores lutei, nutantes, fere 1 pollic. longi, obconici v. subinfundibuliformes, omnino nectario destituti. Simplex et indivisus.

X c. THERESIA Koch.

(Walp. Ann. III. 628.)

1. THERESIA LIBANOTICA Boiss. — Boissier diagn. XIII. p. 20.

Th. foetida tota farinoso-glaucula, caule crasso elato tota longitudine folioso, foliis alternis (aliquando nonnullis ternatim subverticillatis) oblongo-lanceolatis acutiusculis basi sessili amplexicaulibus, floribus numerosis racemum terminalem laxum elongato-pyramidatum formantibus pedunculis perigonio sesquilongioribus apice subnutantibus suffultis, perigonii breviter campanulati per anthesin subpatentibus basi rotundati non gibbosi phyllis ellipticis obtusissimis utrinque flavo-virentibus striis tenuissimis fuscis apice furcatis eleganter pictis, nectario basilari breviter ovato, filamentis perigonio subbrevioribus antherarum lutearum basi perforatae insertis, stylo staminibus breviori simplici apice obscure stigmatoso, capsulis papyraceis fuscescentibus erectis depressis abbreviatim hexagonis acutangulis trilocularibus, seminibus biserialibus

compresso-planis obovatis basi angustatis apice rotundatis anguste membranaceo-marginatis.

var. α . *bracteata* — Bracteae lineares paulo infra pedunculum ortae eoque paulo longiores.

var. β . *ebracteata* — Racemus omnino ebracteatus.

Hab. ambo formae mixtae sed β . rarior in lapidosis umbrosis regionis mediae Libani, in via inter Beyrouth et Damascus supra Khan Hussein, circa Eden copiose. Videtur florere primo vere, caules jam fructiferos Maii fine legi bulbosque e quibus specimina florifera educavi. — Planta odore gravi Lantanae vel urinae felinae tota polline glauco detersili obsita. Caulis florifer $1\frac{1}{2}$ —2 pedalis fructifer tripedalis et ultra. Folia inferiora 4—6 pollices longa pollicem et amplius lata usque ad caulem summum sensim decrescentia; bracteae cum adsunt $1\frac{1}{2}$ —2 pollicares $1\frac{1}{2}$ lineas latae. Racemi 15—25 flori floriferi pedem dimidium fructiferi 1— $1\frac{1}{2}$ pedes longi. Pedunculi 1— $1\frac{1}{2}$ pollicares. Flores paulo majores eis Theresiae Persicae C. Koch — Fritill. Persicae L. Phylla 6—7 lineas longa $3\frac{1}{2}$ lata. Capsula formae et fere magnitudinis earum Petilii imperialis sed tenuius membranacea et angulis angustius alatis donata. Semen tres lineas longum superne 2 lineas latum. Th. Persica cui affinis differt odore nullo, foliis angustioribus, floribus brunneo-violaceis intus viridi-maculatis, antheris e perigonio subexsertis purpureo-fuscis, racemo breviori abbreviatum pyramidato; hujus capsulam non novi nec comparare potui. Genus Theresia a Fritillaria distinctissimum est forma capsulae et bulbo non tuberoso sed squamoso omnino Lillii, a Petilio autem eodem bulbo eademque capsula donato tantum differt inflorescentia et stylo integro nec apice trilobo.

XII. LILIUM L.

(Walp. Ann. III. 628. — Knth. en. IV. 256 et 637.)

Griffith notulae (1851) tab. 276.

CONSPECTUS NATURALIS SPECIERUM GENERIS LILII L.

Morren in Fuchsia (Bruxelles 1849) p. 6.

LILIUM	Lilium, perianth. campanulatum	fl. nutantes	{	corollae campaniformes	{	<i>L. candidum</i> (1), <i>peregrinum</i> (2),
				corollae tubiformes		<i>Thomsonianum</i> (3), <i>Nepalense</i> (4),
	Martagon, perianth. revolutum.	fl. recti	{	L. bulbiferum (9), <i>croceum</i> (10), <i>pubescens</i> (11), <i>davuricum</i> (12), <i>fulgens</i> (13), <i>Thunbergianum</i> (14), <i>venustum</i> (15), <i>concolor</i> (16), <i>pulchellum</i> (17), <i>Catesbaei</i> (18), <i>lancifolium</i> (19).	{	Japonicum (5), <i>ezimium</i> (6), <i>Wallichianum</i> (7), <i>longiflorum</i> (8).

depressa, f. laete virentibus linearib. canaliculatis ap. angustatis suberectis, scapis erectis foliis longioribus, bulbo rotundato tunicato pallide violaceo. — Hab. in apricis nemor. Galloprovinciae pr. Grasse et agri Genuensis. — Fl. Martio. — A praecedente statim dignoscitur fl. albidis minorib. caet. — Sub nomine: Jacinthe blanche petite de montagne cultam saepe vidi.

3. **HYACINTHUS PROVINCIALIS** Jord. — Jordan pugillus pl. nov. praesert. Gallicar. 1852. p. 139. — Racemo valde laxifloro, fl. paucis fere secundis distantib. sub anthesi erecto-patentibus amoene coeruleis suaveolentib., pedicellis longiusculis tubi corollae diametrum transversalem superantibus, bract. subalbidis ap. bilobis b. appendiculatis corollae infundibuliformis tubo oblongo lineari ruguloso subanguloso inferne leviter ventricoso b. fere umbilicato, laciniis paulo brevioribus linearibus patulis recurvatisque subtus dorso carinatis ap. callo prominulo instructis, filamentis staminum lanceolatis acuminatis in tertia parte inferiore tubi adfixis, antheris linearib. subacutis pulchre violaceis tubo corollae breviorib. filamento duplo longioribus, stylo sulcato ovario subrotundo-ovato brevior, caps. globoso-ovata obtuse trigona b. paulisper umbilicata ap. depressa, f. intense virentibus linearib. eximie canaliculatis ap. angustatis arcuato-patulis ascendentib., scapis erectis foliis brevioribus, bulbo tunicato violaceo, rotundato. — H. orientalis auct. gall. n. Lin. — Hab. in apricis Galloprovinciae pr. Toulon. — Fl. Martio. — Plures sine dubio exstant species cultae varietatibus H. orientalis L. falso adjunctae.
4. **HYACINTHUS ORIENTALIS** var. β . phyllantha. — Vis. fl. Dalm. III. p. 352. add.
Bracteis in f. linearia longissima racemum superantia productis.
Habui insignem hanc abnormitatem ex agris e. Cittavecchia ins. Lesina a Prof. Stalio.

Icon addenda.

HYACINTHUS PURPUREUS Gr. — Griff. notulis (1851) p. 242. t. 275. Itin. not. p. 338. Afghan. n. 60.

IX a. **CHIONODOXA** Boiss.

(Walp. Ann. I. 854. n. 1. sub Hyacinthus.)

1. **CHIONODOXA CRETICA** Boiss. et Heldr. in pl. Cret. exs. 1847. — Boissier diagn. pl. n. XIII. p. 24.

Ch. foliis lato-linearibus planis flaccidis erectis apice subcucullatis obtusis scapum aequantibus superantibusve, scapo apice 1 saepius laxe 2—5 floro, pedunculis erectis perigonio 1—2 plo longioribus, perigonii caerulei laciniis oblongis obtusissimis nervo medio tenui percursis, filamentis subaequilongis albidis apice valde retusis, antheris filamento subaequilongis.

Hab. in fruticetis Berberide consitis regionis subalpinae montium Sphacioticorum supra Askyphous (Heldr.) Fl. Aprili ineunte. — Scapi saepe 6—10 pollicares. Folia 4—6 lineas lata, flores vix minores illis Ch. Luciliae minusque patentis. Huic speciei valde affinis ab ea sat differre videtur foliis dilatatis, scapo plerumque multifloro, perigonii laciniis brevioribus obtusis, filamentorum longitudine, antherae eis hujus speciei breviores pauloque acutiores sunt. Diagnosis Ch. Luciliae sic emendanda: Ch. foliis anguste linearibus subcanaliculatis recurvato-flexuosis, scapis subunifloris, perigonii laciniis oblongo-lanceolatis alternatim acutiusculis, fl. alternatim longioribus.

2. **CHIONODOXA NANA** Boiss. et Heldr. in pl. Cret. exs. 1847. — Boissier l. c. p. 24.

Ch. foliis anguste linearibus subcanaliculatis obtusis subrecurvo-patentibus, scapo foliis subaequilongo unifloro rarius bifloro, perigonii pallide lilacini inferne albidi laciniis elliptico-linearibus obtusis nervo saturatori percursis, filamentis apice truncato-retusis alternatim sesquilongioribus.

XI. **BELLEVALIA** Lap.

(Walp. Ann. I. 855. — Kuth. en. IV. 306.)

1. **BELLEVALIA MACROBOTRYS** Boiss. — Boissier diagn. pl. n. XIII. p. 35.

Foliis late lanceolato-linearibus superne attenuatis scapo aequilongis viridibus margine sub lente minute et remote serrulato-scabridis, scapo elato in racemum laxum post anthesin longissimum abeunti, pedunculis basi squamula vix perspicua obsitis flori aequilongis fructu triplo longioribus et tunc arcuato-patentibus, floribus omnibus fertilibus caeruleis demum livescentibus, perigonio campanulato infra tertiam partem usque partito, filamentis dilatatis triangularibus paululum infra tubi divisionem insertis, antheris rubello-ferrugineis, capsulae trigonae valvulis ovatis subretusis elevatim penninerviis sub lente areolatis.

Hab. in arvis Palaestinae calidioris in regione Amalecitarum ad meridiem urbis Gaza sita, inter Ramla et Hierosolymam legi flor. Aprili. — Scapus cum racemo saepe bipedalis, hic fructifer pedalis et ultra pedunculis pollicaribus aliquando subverticillatis. Folia 7—15 lineas longa, flores tres lineas longi illis *B. Romanae* paulo minores angustioresque; haec insuper differt foliis angustioribus, filamentis profundius insertis, antheris azureis. *B. dubia* distinguitur foliis angustis, pedunculis fructiferis capsula non longioribus. *B. trifoliata* denique floribus sex lineas longis breviter pedunculatis, antheris caeruleis longius distat.

2. **BELLEVALIA FLEXUOSA** Boiss. — Boissier l. c. p. 36.

B. foliis anguste lanceolato-linearibus apice attenuatis scapo aequilongis margine denticulato-scabridis parallele multinerviis, scapis 1—4 ex eodem bulbo supra basin curvatis ascendentibus in racemum sub anthesi brevem ovatum fructiferum laxum abeuntibus, floribus livescentibus pedunculo flore subbrevisiore fructu aequilongo vel sesquialongiori patuloque suffultis, squamulis ad pedunculorum basim minimis, perigonio campanulato vix ad tertiam partem sexpartito, filamentis triangulari-elongatis tubo ad ejus divisionem insertis, antheris caeruleis, capsulae trigonae valvulis ovatis obtusis mucronulatis sub lente elongatim areolatis.

Hab. in pratis siccis et muris humo tectis circa Hierosolymam frequenter. Floret Aprili (Boiss.) — Folia ut et scapi 3—5 pollicaria. Racemi 10—20 flori fructiferi 2—2½ pollicares, pedunculi fructiferi 3—5 lineas longi. Folia 2—4 lineas lata. Flores tres lineas longi. A praecedenti distinctissima statura humili, foliis angustis, pedunculis brevibus, antherarum colore. Inter species pumilas et angustifolias ejusdem generis *B. glauca* Kth. differt pedunculis fructiferis valde elongatis, antheris caesio-ferrugineis, foliis ciliatis; *B. Romana* et *B. dubia* foliis longioribus, perigonio multo profundius fisso, capsula majori.

3. **BELLEVALIA WEBBIANA** Parl. — Parlatore nuovi generi et spec. di piante monocotyl. 1854. p. 19.

Racemo sub anthesi cylindrico, pedunc. flore breviorib., recurvis, fructiferis horizontalib., bracteis minimis, florib. pendulis, summis paucis neutris, subsessilib., perigonii phyllis ad tertium tantum ab ap. liberis, laciniis ovatis, acutiusculis, subconniventib., filam. subulatis, capsulis triquetris subrotundis emarginatis, scapo terete, erecto, foliis brevioribus, foliis lin-lanceolatis, obtuse mucronatis, canaliculatis, glabris, glaucescentib., erectis, bulbo ovato.

Bellevalia dubia Reichb. fl. Germ. exc., excl. syn. Guss.

Hab. in locis sterilib., rarius in montosis et alpinis Italiae centralis. — Fl. Aprili et Majo.

XII. **BOTRYANTHUS** *Knth.*

(Knth. en. IV. 310. — Walp. Ann. I. 856.)

1. **BOTRYANTHUS STEREOPHYLLUS** Herbich. — Herb. in Oestr. bot. W. Bl. 1855. p. 182.

F. lanc., rigidis striato-nervosis, corollis campanulatis, fauce aperta, bulbo diphylo.

Bulbus ovatus. F. erecta, rigida subcoriacea lin-lanc., acuta glaberr., striato-nervosa, scapo breviora, inferne purpurascens. Scap. 3 - v. 4-unc., erectus, teres, glaberr., b. purpurascens, superne coerulesc., et gerit flores ad 10—15. Pedic. 1-fl., patuli, coerulesc., bract. exiguis suffulti. Fl. in rac. dispositi, minimi, dilute coerulei, campanulati, limbo sexfido, laciniis angustis, tubo corollae brevioribus. — In rupibus praeruptis littoris flum. Danastris pr. Dorosschon. Maj. 24.

XIII. **MUSCARI** *Tournf.*

(Walp. Ann. III. 631. — Knth. IV. 313.)

1. **MUSCARI LONGIPES** Boiss. — Boissier diagn. nov. XIII. p. 36.

M. foliis lineari-lanceolatis inferne angustatis apice longe attenuatis canaliculato-plicatis margine subundulatis sub lente scabrido-denticulatis parallele multinerviis scapo brevioribus, scapis erectis in racemum pyramidatum abeuntibus, pedunculis horizontaliter patentibus perigonio florido aequilongis vel sesquilongioribus perigonio fructifero 4—6 plo longioribus, floribus caerulescenti lividis supremis sterilibus paucis amethystinis brevissime pedunculatis, perigonio urceolato-cylindrico subpyriformi parte inferiori infra stamina subangustato apice constricto brevissime et rotundatim quinquelobo, filamentis brevissimis planiusculis versus mediam partem perigonii in duas series quarum altera altior insertis, antheris brevibus rufescentibus, capsula (juniori) pedunculo multoties breviori oblonga apice attenuata valvulis parallele et transverse nervosis.

Hab. in arvis pinguibus Palaestinae littoralis calidioris ad meridiem urbis Gaza situs et in regione Philistaeorum ad septentrionem ejusdem urbis (Boiss.) Fl. April. — Species insignis inflorescentia Bellevaliae ciliatae et floribus Muscaridis. Folia latitudine a 4 ad 11 lineas variantia. Racemi fructiferi 4—6 pollicares ob pedunculos inferiores saepe bipollicares eximie pyramidati. Perigonium sub anthesi $3\frac{1}{2}$ —4 lineas longum. Ab omnibus aliis generis inflorescentia, staminum insertione, etc. diversa.

Obs. Botryanthus Sauli Jaub. et Sp. Illustr. pl. Or. tab. 320 est Muscari moschatum W.

XIV. **SCILLA** *Linn.*

(Walp. Ann. III. 631. — Knth. IV. 314 et 679.)

1. **SCILLA NATALENSIS** Planch. — Fl. d. serres X. tab. 1043. p. 185. — Bulbo crasso ovoideo subgloboso squamoso, f. subcoetaneis lin-lanc. acuminatis acutis, scapo erecto tereti foliis longiore, racemo simplici longo multifloro, bracteis ad basin floris cujusve subulatis, pedicello plane evoluto subpollicari fere dimidio brevioribus, floribus pallide et amoene coeruleis, perianthii 6-partiti stellato-patentis laciniis ellipticis obtusis, staminum filamentis edentulis subulatis albis perianthii brevioribus, ovario ovato triloculari, stylo brevi (char. ex icone et e memoria stirpis vivae olim in horto Houttiano observatae).

Sc. Natalensis Planch. in hort. V. Houtt.

Habit. Port Natal.

2. *SCILLA PULCHELLA* Munby. — *Bullet. de la soc. bot. de Fr.* II. 286.

Racemis capitatis, paucifloris; pedicellis patentibus, nudis, perigonium excedentibus; bulbo unicato; f. serotinis, filiformibus.

Planta 2 p. alta, fl. et pedic. amethystini. — In Algeria pr. Oran.

3. *SCILLA DUBIA* C. Koch in Linn. XIX. 315.

Scilla bifolia L. β . *dubia* C. Koch in Linn. XXII. 251. — Id. in ind. sem. h. Berol. 1855.

Plantam denuo speciem propono, specimina viva in horto nostro botanico accurate perscrutatus; differt a simili *S. bifolia* L. caulis et foliorum angustiorum, non planorum sed canaliculorum brunnescentia. Bracteae sunt magis laterales et persistentes, nec deciduae; sepala in pagina utraque violaceo-coerulea, quae in *S. bifolia* L. supra diluissimae, subtus saturate coerulea. Tota denique planta multo minor.

4. *SCILLA CERNUA*. — *Red. Liliac. ad tab. 298*, nec Hoffmsgg. et Lk.

Scilla sibirica Andr. in bot. rep. t. 365. — Koch l. c.

Ineunte jam nostro saeculo in hortis anglis culta planta nequam in Sibiria crescit, quam ob rem nomen sibiricae Andr. penitus rejiciendum est. Primum e horto quodam Petropolitano Camboricum introducta et in horto Walkeriano summa admiratione affecta ab Andrew, artifice in plantis pingendis in ejus diario botanico (*botanical repository*) tab. 365. depicta est. A. 1807 in alio diario (*botanical magazine* tab. 1005.) denuo nomine *S. amoenae sibiricae* proposita, ab indagatore indefesso terrarum caucasicarum Marschal ab Bieberstein in volumine primo florum suae taurico-caucasicae p. 278. descripta est. Itidem cl. Redouté plantam caucasicam nomine *S. amoenae* depinxit in t. 130, sed mox specie propria cognita a. 1809 in adnotatione tab. 298, *S. cernuam* appellavit, quod nomen, *S. sibiricae* Andr. appellatione ob falsam patriam jure rejecta, nunc servandum est. Hornemann, horti Hafniensis botanici director, plantam coluit a. 1813 et, nominis Redouteani aequae ac Andrewsiani nullam notitiam habens, iterum nomine novo *Scillae amoenulae* (*hort. Hafn. l. 131*) proposuit. Mosquensis denique Goldbach plantae nostrae aliam patriam quam Sibiriam, sed non minus falsam, Rossiam meridionalem, tribuit et appellatione Andrewsiana jure rejecta *Scillam sibiricam* tum *S. azuream* (*mém. de la soc. d. natur. de Mosc. V. 125*) nominavit. Sed cl. Marschal ab Bieberstein in volumine tertio a. 1819 in lucem edito pag. 266 rebus ad plantam caucasicam pertinentibus optime expositis, nomen Redouteanum restituit, quod etiam in hortis nostris adhibendum est.

5. *SCILLA HOHENACKERI* F. et M. in Hohenack. *enum. pl. Tanysch.* p. 26. — Koch l. c.

Folia mox humifusa, laxa; scapus erectus pluriflorus, floribus inferioribus longe pedicellatis; bracteae brevissimae; corolla late urceolata; ovarii loculis sub 13-ovulatis.

Haec species ab autoribus cum *S. cernua* Red. conjuncta ab hac et a *S. amoena* L. longe differt foliis sub anthesi humifusis, nec erectis et postremo laxis; serius etiam quam species affines floret. Flores *S. cernuae* sunt solitarii aut bini, rarius terni et magis cernui. — Folia plura, late linearia, apice leviter cucullata, sub anthesi magis minusve in terram prostrata, stapho vix longiora; scapi plures ex eodem bulbo, latere extrorso convexi, introrso planiusculi, 2-4 flori, ex parte superiore paululum brunnescentes; bracteae persistentes, latissimae, saepe bilobae, perparvae, pedicello multoties breviores; pedicelli inferiores florem longitudine plerumque superantes, superiores ab eo superati; flores inferiores suberecti, supremi horizontales, vix cernui, ample campanulati; petala oblongo-lanceolata, a nervo medio saturato percursa, pagina inferiore pallidiora, filamentis duplo, stylo contra triente parte longiora; antherae azureae, dorso affixae, ab initio introrsae; germen sexsulcatum, trifolulare; loculi 13-ovulati; ovula biserialia, anatropa.

6. *SCILLA ELONGATA* Parl. — *Parlatore di nuovi gen. nuove specie di piante monocotyled.* 1854. p. 24.

Racemo magno, obovato, obtuso, multifloro, conferto, pedunc. flori-

feris erecto-patentib., flore multoties longioribus, fructiferis longissimis, perigonii phyllis elliptico-lanc., acutiuse., filamentis lanc-subulatis, pistillo staminib. brevioribus, ovario oblongo, bract. lanc-linearib., ciliatis, 1-nerviis, pedunculo florifero subtriplo brevioribus, f. late lanceolato-linearib., obtusiusc., planiusculis, marg. longiuscule et dense ciliatis patentib. viridibus, scapo longioribus.

Bulbus illius plantae a Sign. Fox-Strangways e Constantinopoli in hortum bot. Ferentino ann. 1832 allatum. — Flore primo m. Majo.

XIV a. **NECTAROSCILLA** Parl.

Parlatore nuovi gen. e specie di piante monocotyled. 1854. p. 26.

Perigonium corollinum, rotato-patens, persistens, hexaphyllum, phyllis ima b. connatis, aequalib. Stam. 6, perigonii phyllis ima b. inserta, subaequalia. Filam. subulata. Antherae lin-oblongae, ap. bilobae, b. bifidae, medio dorsi affixae, secund. longitud. dehiscentes. Pollen elliptico-lanceolatum utrinque acutum, laeve. Ovar. liberum, brevit. stipitatum, ovato-subrotundum, leviter et obtuse 6-costatum, externe ad b. dissepimentorum crassissimorum foris tribus nectarifluis instructum, 3-loculare. Ovula in loculis 2, obovata, collateralia, in angulo centrali prope b. affixa, adscendentia, anatropa. Stylus filiformis flexuosus b. sulcatus. Stigma obtusum, integrum. Capsulam non vidi.

XXIII. **MYOGALUM** Lnk.

(Walp. Ann. I. 857. — Knth. en. IV. 347.)

1. MYOGALUM AFFINE C. Koch et Bouché in app. ind. sem. h. Berol. 1855.

Ornithogalum affine Hort. Berol.

Glaucescens; folia linea alba media vittata, canaliculata, 10—14 nervia; flores undique directi, pedicello horizontali, postremum recurvo insidentibus; sepala viridia, late albo-marginata, postremo patentissima, deflorata conniventia; filamenta latissima, apice bidentata, alterna triente parte breviora.

Proxime ad *M. nutans* Lk. accedit, sed 10—14 dies serius floret. Speciei, quam nunc dixi, sunt praeterea folia 8—10 nervia et flores dilute virescentes, majores, postremo secundi. *M. Bouchéanum* Kth. differt foliis latioribus, viridibus, 23—26 nerviis; *M. Thirkeannum* C. K. contra (*Ornithogalum praesandrum* Gris.) foliis angustioribus, pedunculis gracilioribus, floribus rarioribus et filamentis staminum breviorum lanceolatis nec bidentatis. — Folia glaucescentia, denique humifusa, linearia, 5 lin. lata, priora duplo latiora, semper canaliculata, scapum aequantia; scapus erectus, teres, glauco-pruinosis, multiflorus; bractee hyalinae, 7 nerviae, pollicem et plus longae, lanceolatae, amplectentes; pedicelli 4 lin. longi; perigonium brevissime campanulatum, postremo patentissimum, defloratum contra connivens; sepala 9—10 lin. longa, 3 lin. lata, supra pallidiora, medio recurvata, oblongo-lanceolata; filamenta omnia latissima, apice bidentata, dentibus staminum majorum antheras superantibus, minorum contra ab iis superatis, sepalis paene duplo breviora; germen subconicum, pallide virescens, sulcis 6 obscure viridibus instructum; stylus trigonus, albus, cum germine paulo longiore stamina longiora adaequans.

XXIV. **ORNITHOGALUM** Linn.

(Walp. Ann. III. 633. — Knth. en. IV. 349 et 683.)

1. ORNITHOGALUM RUTHENICUM P. C. Bouché in Kth. en. pl. IV. — Koch ind.

sem. h. Berol. 1855. — Species vix ab *O. umbellato* L. diversa est pedicellis ascendentibus et capsulis obtuso- nec acuto-angulatis. Folia plura, superne concava, apice mox arida, linearia, 3—4 lin. lata, scapum subaequantia aut eo longiora, medio stria alba longitudinali lineam lata instructa, glaberrima; scapus leviter pruinosus, apice floribus 7—9 corymbosus; pedunculi adscedentes; petala albida, medio viridia, oblonga, exteriora apice emarginata et apiculo obtuso brevissimo instructa, filamentis latiusculis duplo longiora; germen hexagonum.

2. ORNITHOGALUM PATER-FAMILIAS Godr. not. fl. Montp. 27. — Godr. et Gren. fl.

de Fr. III. 190. — Flores graciliter pedunculati, pedunc. 3—5 centim., primum patienti-erecti inaequales, recti, asperi, tum refracti et ap. recurvi ad fructus resurgentes, bractee albae, scariosae, lanc-lin., acuminatae, inferiores pedunculum longitudine fere aequantes, superiores eum superantes, omnes in statu fructificationis pedunculo breviores. Perig. divisiones lanc-oblongae 16—20 millim. Caps. ovoidea (10—12 millim. long., 7—8 l.) costis prominentib. 6, binis approximatis. Sem. atra subgloboso-angulosa, rugosa. F. erecta, caulem superantia glabra, lin. (3—4 millim. lata), canaliculata, concoloria. Caulis 1—2 decim. Bulbus glob., tunicis membranac. munitus, bulbillos numerosissimos ovoideos fibrillosos pro parte tunicis inclusos, pro parte extra tunicas enatos, prodiens. Plerique bulbilli ap. folium erectum filiforme procreantes. — Hab.: In salinis de Cette (Godr.) Marseille. 24. Maj.

3. *ORNITHOGALUM ECKLONI* hort. Hal. — v. Schlechtend. in Linn. XXV. p. 177. — Per annor. seriem haec species in horto Halensi illo sub nomine colitur; auctor ignotus, nec nomen reperiendum. — Bulbus depresso-globosus diam. transversali $1\frac{1}{2}$ pollic. majorive, ext. tunicis sordide albicantib. tectus, viridib. stratis internis leviter perluculentibus. F. 6—7 c. caulib. 2—3 ex eodem bulbo prodeuntia ad $1\frac{1}{2}$ ped. longa, a b. latiore, 6—7 lin. lata, sens. usq. ad ap. fere subulato-attenuata, ext. convexa laevia glabra; int. concava, hac concavitate sensim c. folio decrescente in ap. f. canaliculum angustum efficiente, marg. angustissimo, albedo membranaceo cincta, nervis plurib. percursa, qui intensius virides margines versus in folio luci obverso facile in conspectum veniunt, dum pars media folii enervis apparet, viridia sunt et pruina fiunt glaucescentia. Caulis florifer folia longitudine aequat, teres laevis glaber eodem modo pruinoso-glaucus; racemum fert denique $\frac{1}{2}$ pede longiorem, fl. circ. 30, pedicell. brevib. dein bilinearib. insidentes erecto-patulis. Bractea e b. latiore mox attenuata angusta, albo-hyalina medio et ap. viridis, dein fuscescens, pedicello suo aliquantulum longior. Fl. 3 lin. longus. Perig. phylla 6 inter se aequalia elliptica obtusiuscula, ap. levissime cucullata et toto ap. papillis albidis glandulosis obsita, lactea, dorso medio paulo infra med. ad ap. usque viridi, nervis in hac viridi parte nisi in b. ejus aliquantulum conspicuis. Stam. et pistillum fere aequilonga, phyllis paululum breviora. Filam. complanata, b. latiora, dein a medib. circiter contracta, ap. fere subulata, alba laevia, glabra, interiora vix latiora. Ovar. profunde 3-sulcum, stylus albus obtuse trigonus et trisulcus ap. leviter attenuatus stigmatate terminali convexulo e papillis albidis. Post anthesin phylla dense pistillum includunt, pedicelli eriguntur et flores cauli adprimuntur, simulque phylla colorem rubro-fuscum pro viridi in dorso induunt. — Capsula matura perigonio persist. appresso duplo longior, membranacea (immatura viridis subcarnoso-coriacea) septicide trivalvis, dissepimentis ab invicem non plane solutis sed interiore marg. excepta supera tertia circ. parte cohaerentib., caeterum solutis, valvulis dorso tenuiter et remote transverse rugosis ap. brevi spatio loculicidis, lob. terminalib. obtusis. Semina atra opaca (haud nitentia) trigona, latere extero curvato tenui orbiculari rugoso, lateribus planis.
4. *ORNITHOGALUM CYDNI* Schott et Kotschy. — Schott Oestr. bot. W. Bl. 1854. p. 153. — F. subquinis erecto-patentib. (subsigmoideo-curvatis), profunde canaliculatis, oblanceolarib., obtusis, utrinq. sulcato-striatis, glaucis, marg. glabris; infl. scapo subnullo abbreviata, foliis brevioribus; bracteis lanceolato-linearib. pedicello in flore arrecto, tand. refracto, longioribus; perig. expanso vix ultrapolicari; sep. exteriorib. oblanceolarib., vix $\frac{1}{4}$ pollic. latis, ap. rotundato-obtusato perbrevisissime apiculatis, anguste albo-marginatis (externe); interiorib. lin-oblongis, paulo angustioribus, brevioribus. ap. rotundato-obtusis, non apiculatis, margine albo lato (externe) cinctis, omnib. externe disco laete viridi laevi, interne albo ornatis; staminib. $\frac{1}{2}$ longitudine sepalor.; filam. erectis, post foecundationem recurvulis, inferne dilatatis, exteriorib. inferne lanc. paulo brevioribus. (ut in reliquis speciebus observatis, tardius antheras aperientibus.), interiorib. ad $\frac{3}{4}$ oblongis, antheris praecocioribus; ovario hexaedro, aciebus valde prominulis, ap. quasi truncato, stylo ovario brevioribus, inferne flavescens. — Hab. in alpestribus. Ciliciae ad fontes Cydni (Kotschy).
5. *ORNITHOGALUM SORORIUM* Schott et Kotschy. — Schott Oestr. b. W. Bl. 1854. p. 105. — F. canaliculatis, glaucidulis tandem patentissimis, lin-lanceolato-linguiformibus, ap. versus subsensim angustatis, acutiusculis, utrinq. laevibus, enerviis, marg. glabris; florum rhachi inter folia sessili, bracteis lanc-acuminatis, striato-nervosis; pedicellis bractea brevioribus. arrectis, sepalis sulcato-lineolatis, exteriorib. elliptico-linearibus, intus 5—7 striatis, interiorib. lanc-linearibus, paulo angustioribus. brevioribusq. exapiculatis, intus sub 5-striatis; filamentis exterioribus lanc., interioribus ovato-lanc. sublongioribus. (praecocioribus!) ovarii hexaedris, aciebus valde prominulis. — Hab. in Tauro Ciliciae (Kotschy). — F. subquina etc., cfr. l. c. descr. plantae ampliore.
6. *ORNITHOGALUM AEMULUM* Schott et Kotschy. — Oestr. bot. W. Bl. 1854. p. 161.

— *F. binis lanc-linearib., acutatis, canaliculatis, erectis, supra laeviusculis, glaucis, infra obs. striatis, viridibus, marg. glabris; infl. racemosa, scapo brevi saepe subnullo, rhachi 2—3 pollicari, fl. remotis, pedunculis bractea duplo longiorib. patentissimis demum declinatis; sepalis inaequalib., intus disco sulcato-striatis (albis), exteriorib. oblanceolatis, brevit. apiculatis, anguste marginatis, interiorib. ex obovato oblanceolatis, bas. versus magis angustatis, late marginatis; filamentis inaequalib. dimidia sepalii magnitudine, exteriorib. inferne late obovatis subrepentino in subulam lanc-linearem $\frac{1}{2}$ breviorum angustatis, interiorib. inferne oblongue linearib., priorib. duplo angustiorib., subsensim in ap. subulatum attenuatis; antheris pallidissime flaventib. (interior. staminum praecocioribus!), polline flavo; ovarium pyriforme hexaedrum, acieb. valde prominulis, ap. arcuatim convergentibus; stylo ovario paulo brevior, ad apices staminum producto. — Habit. in Olympo Bithyniae.*

7. ORNITHOGALUM RUDOLPHI Jacq. (Knth. en. pl. IV. 367). — v. Schlechtend. in Linnaea XXV. p. 176. — Cfr. l. c. pl. descript.

XXIV a. CARUELIA Parl.

Parlatore generi nuovi e specie di piante monocotyled. 1854. p. 21.

Ornithogali spec. Linn. sp. pl. p. 441 et auctor.

Perigonium corollinum, campanulatum persistens, hexaphyllum, phyllis ima b. vix connatis, subaequalib., concavis, exteriorib. carinatis. Stam. 6, perigonii phyllis ima b. inserta. Filam. complanata, subulata. Antherae lin., longae, ap. subbilobae, b. bifidae, introrsae, medio dorsi affixae. Pollen ellipticum utrinque acutiusculum, laeve. Ovar. liberum sessile obovato-conicum subrotundum, ap. planiusculum, 6-sulcatum, 3-loculare. Ovula in loculis plurima, obovato-subglobosa, 4-seriata, horizontalia, anatropa. Stylus filiformis, subteres sulcatus, erectus. Stigma obsolete trilobum, papillosum. Capsulam maturam non vidi.

Dicavi genus illud amico meo Sign. Teodoro Caruel botanico bene merito.

(Knth. en. IV. 372.)

1. ALBUCA? GARDENI Hook. — Hook. bot. mag. tab. 4842.

Acaulis bulbosa stolonifera glabra, bulbis squamosis, squamis 4—5 amplis latis laxis, f. 3—5 lato-lanc. inferne attenuatis b. dilatatis obsolete striatis, scapo simplici foliis brevior, bracteato, racemo ovato erecto plurifloro, pedicellis strictis b. bracteatis, sep. (albis) oblongis patentib. usq. ad b. liberis, filamentis subulatis omnib. antheriferis, antheris oblongis.

Hab. in Africa australi Natal, (Capt. Garden introduxit in hortos 1854).

XXVI. UROPETALUM Cawl.

(Walp. Ann. III. 634. — Knth. IV. 377.)

1. UROPETALUM UNICOLOR — J. E. Stocks in Hook. j. Kew gard. misc. IV. 180.

F. linearib. canaliculat. glaucesc. glabr. scapum subaequantib., racemo nutante 4—6 fl., bract. striat. ovato-acuminat. pedunc. floriferum dimid. superantib., pedunc. floriferis horizontal. v. nutantib., fructiferis erectis, perigonii foliaceo-viridis cylindrico-campanulati sepalis linearib. obtus.,

exteriorib. ad dimid. interiorib. ad tert. part. et leviter recurvatis, stylo ovarium aequante, stigmatē inconspic. obt., trilobo, caps. polysp., depresso profunde trigastra, vix stipitata vertice truncata b. nunc attenuata nunc truncata.

H. in collibus, Scinde et Beloochistan infer.; Q. temp. pluv. — Bulbilli ab indigenis eduntur. F. 6—8 p. Scap. 8—12 p. Flor. pedic. 2 l., fruct. pedic. 3—4 l. Bract. 2½ l. Fruct. 4 l. long. 3 l. l. Proxima U. serotino.

Tribus II. *ALLIEAE* Knth. en. IV. 379.

XXVII. *ALLIUM* Linn.

(Walp. Ann. III. 634. — Knth. en. IV. 379, 681.)

1. *ALLIUM ORIENTALE* Boiss. (Sect. *Molium*). — Boissier diagn. pl. n. XIII. p. 25.

A. bulbo ovato simplici tunicis subcoriaceis externis nigricantibus internis candidis vestito, scapo tereti crassiusculo usque ad quartam partem tantum foliorum vaginis tecto; foliis subternis glabris patuloflexuosis recurvisve subundulatis planis canaliculato-plicatis oblongo-linearibus vel late linearibus acuminatis sub lente obscure denticulato-ciliolatis scapo brevioribus crassiusculis glaucescentibus, umbella multiflora capsulifera ob pedunculos inferiores decumbentes hemisphaerica, spatha membranacea candida persistenti multinervi tandem ob phyllorum lacerationem plerumque ad basin usque 4 phylla phyllis ovatis cucullatis acuminatis pedunculis aequilongis demum deflexis, pedunculis flore triplo longioribus, perigonii albidi vel pallide rubelli phyllis elliptico-linearibus obtusis nervo virenti percursis ad basin usque liberis, filamentis basi dilatata connatis inde ad apicem usque sensim attenuatis edentulis perigonio vix brevioribus, antheris lutescentibus, ovario capsulaque ovata perigonio subaequilonga laeviusculis.

Hab. in Oriente, Asia minori in Caria (Pinard), Siplyo monte (Aucher Nr. 2200) et Cilicia (Nr. 2188), monte Solyma Lyciae (Heldr.), in agris Syriae ad Aleppum Kotschy Nr. 71, in desertis Arabicis ad fines Palaestinae (Boiss.), in Mesopotamia (Aucher Nr. 2215). — Species characteribus habitu, umbellae et florum amplitudine valde affinis *A. tulipaefolio* Ledeb., decipienti Fisch. pro cuius forma eam diu habuimus sed differt foliis latioribus (4—6 lin.) *A. tulipaefolium* insuper habet spatham diphyllam obtusiusculam pedunculis dimidio breviorē, perigonii phylla basi longiuscule connata, ovarium tuberculato-scabriusculum.

2. *ALLIUM LIBANI* Boiss. in pl. Syr. exs. 1849 (Sect. *Molium*). — Boissier l. c. p. 26.

A. bulbo simplici tunicis exterioribus griseo-nigricantibus tenuibus interioribus pellucidis albidis vestito, scapo humili tereti fere ad apicem usque folioso, foliis glaucis crassiusculis glabris scapo longioribus linearilanceolatis planis acutis vel breviter attenuato-acuminatis expansis incurvis saepe circinnatis margine undulatis integerrimis, umbella multiflora capsulifera convexa, spatha membranacea alba persistenti pedunculos aequanti ultra medium irregulariter 2—4 loba lobis acutis, pedunculis crassiusculis rigidis flore sesquilongioribus sub eo incrassatis, perigonii albidi phyllis basi ad quartam partem usque longitudinis coalitis lanceolatis acutis nervo rubello percursis, filamentis usque ad perigonii divisionem cum eo et inter se coalitis triangulari-lanceolatis acutis perigonio dimidio brevioribus, antheris brevibus luteis, capsula ovata breviter rostrata perigonio vix breviori.

Hab. in arenosis summi jugi Libani Makmel dicti alt. 7000—8000'. Legi floriferum

Julio ineunte. — Scapus 2—3 pollicaris saepius ad $\frac{3}{4}$ longitudinis arena mobili saepultus. Limbus foliorum 2—4 pollicaris inferne 2—3 lineas latus. Flores illis *A. tulipaefolii* tertia parte majores. Perigonii phylla superne angustissima. Ex affinitate *A. tulipaefolii* et *A. akakae* Gmel. = *latifolii* Jaub. et Sp. Prius differt scapo elatiori, staminibus phylla perigonii oblonga aequantibus; posterius foliis brevibus latis, perigonii phyllis angustioribus basi breviter coalitis multo latius nervosis.

3. **ALLIUM PHILISTAEUM** Boiss. (Sect. *Molium*). — Boissier l. c. p. 26.

A. bulbis aggregatis, tunicis exterioribus coriaceis punctatis cinerascens interioribus membranaceis albidis, scapis pluribus teretibus crassiusculis tantum ima basi vaginatis, foliis viridibus erecto-patulis flexuosis anguste linearibus canaliculato-plicatis superne longe subulato-attenuatis scapo aequilongis brevioribusve margine remote ciliolatis caeterum glabris, umbella capsulifera multiflora convexa, spatha persistenti membranacea plurinervi sordide lutescenti monophylla pedunculis floriferis vix breviori ad medium usque vel inferius fissa saepius 3—4 lobata lobis abrupte et breviter acuminatis, pedunculis rigidiusculis flore sesquilogioribus fructiferis elongatis, perigonii e sicco straminei nitidi phyllis elongatis oblongo-lanceolatis basi breviter inter se coalitis apice attenuatis acutis obscure nervatis, filamentis a basi latiori inter se breviter et cum corolla coalitis sensim attenuatis perigonio subaequilongis, antheris luteis, capsula rotundato-subdepressa brevissime rostrata acute triangulata perigonio persistenti clauso plus dimidio breviori.

Hab. in Palaestinae collibus siccis et arenosis circa Gaza. Legi Apr. 1846. — Scapi floriferi 3—4 post anthesin 6—8 pollicares, folia inferne 2 lineas tantum lata. Flores magnitudinis eorum *A. moly* et *A. rosei* sed phylla perigonii angustiora 5—5½ lineas tantum longa. Ex affinitate *A. chamaemoly* et *A. subvillosi* a quibus characteribus datis facile distinguitur.

4. **ALLIUM PAPPILLARE** Boiss. (Sect. *Molium*). — Boissier l. c. p. 27.

A. bulbo ovato-simplici tunicis exterioribus coriaceis fusciscentibus interioribus membranaceis vestito, scapis mediocribus ascendentibus teretibus crassiusculis glabris vix ad quartam partem usque vaginato-foliosis, foliorum vaginis papillis linearibus albis adpressis plerumque retrorsis dense pubescentibus, limbo erecto glabro canaliculato-plicato a basi lineari longissime et sensim subulato-acuminato margine integro scapo parum breviori, umbella capsulifera multiflora convexa pedunculis subaequalibus flexuosis flore duplo longioribus, spatha pedunculis aequilonga persistenti membranacea alba nervosa in 3—4 lobos in caudam setaceam eis saepe subaequilongam abrupte desinentes lacero-partita, perigonii albi phyllis ovalis obtusis obscure nervatis basi inter se longiuscule connatis, filamentis perigonio subaequilongis inter se et cum perigonio connatis a basi lata sensim attenuatis triangulari-lanceolatis, antheris luteis, capsula subrotundo-angulata perigonio subaequilonga,

Hab. in deserto ad meridiem Palaestinae inter Nochl et Gaza (Boiss.) Ineunte Aprili jam fere defloratum erat. — Scapi 6—8 pollicares, folia ad basin limbi 2½ lineas circiter lata, flores magnitudinis eorum *A. subvillosi* Salz. - *vernalis* Guss. cui ut et *A. subhirsuto* et *A. hirsuto* Zuccar. e Palaestina quoque oriundo affine est sed ab hisce omnibus facile distinguendum indole indumenti vaginarum non e pilis sed e papillis rigidis brevibus latiusculis constanti, foliis non planis sed canaliculatis longissime attenuatis, spathae lobis longius caudatis et praesertim perigonii phyllis brevibus obtusis nec acutis.

5. **ALLIUM CASSIUM** Boiss. (Sect. *Molium*). — Boissier diagn. l. c. p. 28.

A. bulbo ovato simplici tunicis exterioribus cinerascentibus punctatis interioribus albidis vestito, scapo tereti tenui flexuoso ad quartam vel quintam partem usque folioso, vaginis glabris vel parcissime et tenuiter puberulis, foliis angustissime linearibus planis plurinerviis margine integris glabris acutis flexuosis scapo vix brevioribus, umbella capsulifera 6—11 flora pedunculis gracilibus erecto-flexuosis flore 2—2½ plo longioribus, spatha membranacea pedunculis dimidio breviori alba persistenti deflexa unilateraliter fissa vel 2—4 loba lobis breviter acuminatis, perigonii primum albi demum pallide rosei phyllis oblongo-ovatis obtusis fere ad basin usque liberis nervo medio saturatori notatis, filamentis perigonio dimidia vel tertia parte brevioribus brevissime connatis a basi dilatata usque ad 2/3 longitudinis sensim angustatis tertia parte superiori subulatis, antheris luteis, capsula...

Hab. in lapidosis partis superioris montis Cassii Syriae borealis orientem versus (Boiss. Junio incunte florere incipit. — Scapus 8—9 pollicaris, folia inferne sesquilineam tantum lata viridia, flores illis *A. rosei* vix minores. Hoc affine nostrae speciei ab ea differt scapo elato robustiori, foliis latioribus denticulato-scabridis, umbella multiflora, perigonii phyllis intense roseis minus obtusis concoloribus, filamentis a basi ad apicem sensim attenuatis perigonio vix quarta parte brevioribus. *A. eriophyllum* et *A. Graecum* phyllis perigonii acutis longius distant.

6. **ALLIUM CARMELI** Boiss. in pl. Syr. exs. 1847. (Sect. *Molium*). — Boissier diagn. l. c. p. 28.

A. bulbo ovato tunicis albidis crassiusculis opacis secus scapi basin in vaginas elongatas rubellas productis vestito, scapo crasso elato tereti rigido laevi medulla farcto ad quartam partem usque folioso, vaginis foliorum undique retrorsum pilis albis brevibus mollibus velutino-hirtis, foliis lato-linearibus planis elongatis scapo brevioribus superne longe et sensim attenuatis canaliculato-plicatis utrinque hirtis margine ciliatis, umbellae multiflorae globosae capsuliferae pedunculis subaequalibus flore subquadruplo longioribus, spatha monophylla in 4 laciniis ovato-ventricosas albedo-membranaceas virescenti-nervosas apice attenuatas breviter setaceo-caudatas umbella paulo breviores demum deflexas fere ad basin usque partita, perigonii campanulati albi phyllis oblongis-obtusis concavis subnerviis fere a basi liberis, filamentis vix coalitis a basi dilatata sursum attenuatis superne subulatis, antheris luteis brevissime exsertis

Hab. in rupestribus Carmeli ubi legi floriferum ineunte Maio. — Culmus 3—4 pedalis inferne penna aserina crassior, foliorum interiorum limbus 1½—2 pedalis basi 6—7 lineas latus. Umbella diametro 1½—2 pollicaris, flores magnitudinis et coloris eorum *A. cepae*. Species quoad affinitatem dubia; statura elata et umbella *A. porri* et *A. multiflori* sed stamina simplicia. Hoc *Molium* ob spathae formam indumentumque foliorum adnumeravi sed ab eis differt scapo inferne folioso et perigonio campanulato nec patenti. Forsan melius in Sect. *Scorodo* collocandum.

7. **ALLIUM ATROVIOLACEUM** Boiss. Diagn. VII. var. *angustifolium*. — Boissier diagn. l. c. p. 29.

Minus elatum. Umbellae minores magnitudinis speciminum majorum **A. Sphaerocephali**. Folia 1½—2 lineas lata.

A. serrulatum Boiss. in Kotsch. pl. Pers. bor. Nr. 449.

Hab. prope Teheran (Kotschy), in Mesopotamia ad Bauerl; Kotschy pl. Mesop. Nr. 409.

8. **ALLIUM RUBROVITTATUM** Boiss. et Heldr. in pl. Cret. exs. 1847. (Sect. *Porrum*). — Boissier l. c. p. 29.

A. bulbo unico vaginis albis opacis vestito, scapo humili fere ad medium usque foliato tereti sub lente angulato-costato, foliis anguste

lineari-subulatis scapum plerumque superantibus semiteretibus superne canaliculatis non fistulosis inferne margine subserrulatis caeterum glabris viridibus flexuosis, umbella capsulifera parva densa capitato-globosa, spathae valvis binis albis opacis breviter acuminatis umbella triplo brevioribus, pedunculis externis brevissimis internis florem aequantibus vel eo sesquolongioribus, floribus mediocribus, perigonii phyllis a basi distinctis ovatis carinatis obtusiusculis dorso et margine aculeolato-scabridis ad carinam intense rubro-vittatis margine albidis, filamentis dilatatis apice rubellis internis tricuspidatis, cuspidate antherifera lateralibus exsertis dimidio breviori filamento multoties breviori, capsula minuta ovato-rotunda perigonio paulo breviori.

Hab. in Creta, in saxosis faucis Kordaliotiko in Eparchia Agio Vasili (Heldr.) Floret ineunte Junio. — Scapi 2—3 pollicares, folia tenuia rigidula. Umbella magnitudinis avellanae minutae. Flores eis *A. sphaerocephali* paulo minores a quo scapo humili, foliis non fistulosis, pedunculis multo brevioribus, perigonii coloratione et dentium stamineorum proportione differt. Habitu magis affinis *A. gomphrenoidi* et *A. Cilicio* quae eisdem characteribus differunt et *A. Reuteriano* quod foliis crassioribus, perigonio roseo laevi, filamentis multo longius exsertis differt.

9. *ALLIUM CALYPTRATUM* Boiss. (Sect. *Porrum*). — Boissier diagn. nov. XIII. p. 30.

A. bulbo unico ovato tunicis fuscis apice in fibras longas laceras partem inferiorem scapi laxè vaginantes productis vestito, scapo tereti striato ad tertiam partem usque vaginato-folioso, foliorum limbo glabro viridi brevi plano-lineari acuto multinervi rigidulo margine sub lente scabridulo, umbellae laxiusculae 10—15 florum pedunculis inaequalibus flore 1—2½ plo longioribus, spatha membranacea rubra tenera calyptrae-formi monophylla ovata in cuspidem ea sequilongiore abrupte abeunti tandem floribus explicatis basi circumscissa saepeque lateraliter fissa decidua, spathellis partialibus albis laceris pedunculorum basin cingentibus, perigonii albidis phyllis oblongis fere a basi liberis carinatis obtusis carina scabrida apice prominenti obscure mucronulata, filamentis dilatatis interioribus tricuspidatis cuspidate antherifera lateralibus triplo breviori subexserta filamento multoties breviori, antheris brunneo-luteis.

Hab. in regione alpina montis Cassii in consortio *A. Cassii*. Nondum floribus satis explicatis hanc plantam Junio ineunte legi. — Pedale. Fibræ e tunicis ortae secus scapum fere 2 pollices longae; foliorum limbus 1½—2 lineas latus 3—4 pollices longus Caricis folium referens. Flores magnitudinis eorum *A. ampeloprasi*. Spatha ampullacea in cuspidem 7—9 lineas longam abrupte desinens. Flores in speciminibus meis in charta explicatis albi. Species spathae forma insignis, indole tunicarum *A. Baeticum* referens, ab eo et ab *A. arvensi* petalis carina scabridis, cuspidate antherifera brevissima foliisque planis distincta.

10. *ALLIUM SINAITICUM* Boiss. (Sect. *Porrum*). — Boissier l. c. p. 31.

A. bulbo . . . , scapo humili ad medium usque foliato, foliis glabris viridibus angustis teretibus fistulosis apice attenuatis acutis scapo plus duplo longioribus, umbellae pauciflorae pedunculis subinaequalibus flore 2—3 plo longioribus, spatha alba membranacea plurinervi persistenti floribus expansis irregulariter rupta, perigonii albi phyllis oblongis obtusiusculis carina virentibus tota facie scabridulis, filamentis internis tricuspidatis cuspidibus subaequalibus filamento dimidio brevioribus antheris fuscescentibus exsertis.

Hab. in locis elatis deserti Sinaitici inter conventum et jugum Tihubi specimina pauca Aprilis 1846 legi. — Scapi 4—5 pollicares, folia 6—8 pollices longa 1—1¼ lineas lata. Flores 5—8 magnitudinis eorum *A. ampeloprasi* et *A. calyptrati* cui affine est sed a quibus foliis, cuspidum staminum proportione distinguuntur. Forskahlæus in *Flor. Aegypt.* paucissimis verbis *Allii* speciem in desertis Kabirinis ei obviam et ab eo *A.*

desertorum nominatam describit quae ex antheris quae subulatae dicuntur et corolla albo-fuscescenti a planta hic descripta diversa esse videtur.

11. **ALLIUM SCABRISCAPUM** Boiss. in Kotschy pl. Pers. bor. 1847. (Sect. *Rhizirideum*). — Boissier diagn. l. c. p. 31.

A. bulbis oblongis rhizomate tenui horizontali brevissimo conjunctis tunicis crassis fibrosis elongatim areolatis densissime obsitis inferne fibras tenuiter cylindricas longas numerosas edentibus, scapo erecto tereti striato crassiusculo inferne tantum breviter folioso superne secus strias regulariter papillari-scabrido, foliis in fasciculos steriles tunica communi inclusos dispositis et secus scapi partem inferiorem sitis, vagina albida tubulosa virescenti-nervosa, limbo plano crassiusculo glaucescenti brevi margine serrulato-papillari lineari apice breviter angustato acutiusculo inferne usque ad vaginam longe attenuato, umbellae multiflorae capsuliferae globosae pedunculis aequalibus flore subtriplo brevioribus, spathe tenera membranacea albida obscure nervosa umbella dimidio breviori in 3—4 phylla obtusa demum deflexa lacero-partita, perigonii albi campanulati phyllis vix coalitis oblongis obtusis nervo medio pallide virenti percursis, filamentis a basi dilatata ad apicem usque sensim attenuatis perigonium subaequantibus, antheris fusco-luteis.

Hab. in saxosis montis Elbrus Persiae borealis prope pagum Passgala Kotschy l. c. Nr. 262. — Pedale vel sesquipedale. Folia 5—6 pollices longa circ. 3 linesa lata inferne valde attenuata. Umbella diametro circiter pollicaris, flores magnitudinis et coloris eorum A. Cepae. Ob rhizoma vix manifestum inter *Rhizirideum* et *Scorodon* medium est. Radicis indole et toto habitu affine A. Tatarico foliis anguste linearibus scapoque laevibus, perigonii paulo majoris phyllis acutissimis distincto. Foliorum limbus inferne in petiolum angustatus quamdam affinitatem cum A. *Victorialis* quoque demonstrat.

12. **ALLIUM MACRORRHIZUM** Boiss. in Kotschy pl. Pers. bor. 1846. (Sect. *Rhiziridium*). — Boissier diagn. nov. XIII. p. 32.

A. bulbo subrhizomatoso tunicis fuscis coriaceis secus basin scaporum in lacinas laceras longe productis dense vestito longo crasso, parte inferiori fibras numerosas longas tenues cylindricas edenti, culmis terebibus striatis ad medium usque foliatis, foliis linearibus rigidulis laevibus glabris scapum subaequantibus infra canaliculatis supra planis, umbella globosa capsulifera pedunculis aequalibus flore subduplo longioribus, spathe valvis binis ovatis albis membranaceis umbella dimidio brevioribus cito laceris evanidisque, perigonii rosei phyllis oblongo-linearibus obtusiusculis basi inter se coalitis nervo saturatori percursis, filamentis basi breviter coalitis dilatatis dein attenuatis superne subulatis rubellis perigonio sesquilongioribus edentulis, antheris rubellis.

Hab. in regionibus excelsioribus montis Demawend Persiae borealis Kotschy Nr. 610. Fl. Aug. — Radix 3—4 pollices longa pollicem diametro lata. Culmi 12—15 pollices longi, folia superne sesquilineam lata. Umbellae et flores similes eis A. stricti quod a nostra specie differt tunicis radicis tenuioris reticulato-fibrosis filamentis tribus basi utrinque unidentatis, foliis angustioribus. Affine quoque A. *ochroleuco* tunicis apice truncatis coloreque floris diverso.

Obs. A. *vulcanicum* Boiss. in Kotschy Pl. Pers. bor. exs. Nr. 49. ulteriori examini subjectum est tantum forma floribus majoribus A. *rubelli* MB.

13. **ALLIUM FRIGIDUM** Boiss. et Heldr. (Sect. *Codonoprasum*). — Boissier.

A. bulbo ovato tunicis externis membranaceis nigris secus scapi partem inferiorem plus minus productis internisque albis pellucidis vestito, scapo tenui humilis ad medium usque 2—3 foliis instructo sicco striato, foliorum vaginis striatis, limbo subulato semicylindrico rigidiusculo flexuoso

obtusio scapo breviori, umbellae capsuliferae pauciflorae pedunculis subinaequalibus per anthesin flori aequilongis tandem elongatis, spathae phyllis binis e basi latiori attenuatis lanceolato-linearibus umbella vel brevioribus vel sublongioribus, perigonii breviter campanulati phyllis ovato-oblongis laevibus in vivo lutescentibus siccis stramineo-rubellis nervo dorsali rubello producto breviter mucronatis, filamentis basi longiuscule perigonio adnatis a basi latiori sensim attenuatis perigonium subaequantibus, capsula laevi breviter ovata trigona perigonio subbreviori.

Hab. in cacumine Taygeti orientem versus Heldr. pl. exs. 1845 sub A. montano Sibth. vulgatum. Alt. 6000—7500'. Huic quoque probaliter referenda sunt specimina incompleta e Tauro Ciliciae Kotschy pl. Taur. Nr. 497. — Scapus 4—5 pollicaris, folia tenuia, flores magnitudinis eorum A. carinati sed subbreviores. Ab omnibus formis A. pallentis statura, umbella 3—12 flora, perigonii phyllis acutiusculus mucronatis nec obtusis truncatis longe diversum. Magis affine A. Sipylo Boiss. quod ab eo foliis crassioribus, pedunculis crassioribus longioribus valde inaequalibus perigonioque elongato cylindrico-campanulato tantum differt. A. montanum Sibth. Fl. gr. tab. 319 cujus tandem specimina e loco classico (Olympo Bithyniae) et iconi omnino conformia in Aucher Nr. 2207 vidi, differt a nostra specie tunicis bulbi coriaceis elevatim costato-nervis.

14. *ALLIUM CHLORANTHUM* Boiss. (Sect. *Codonoprasum*). — Boissier diagn. l. c.

A. bulbo ovato simplici tunicis exterioribus nigricantibus corticosis interioribus membranaceis vestito, scapo flexuoso tereti ultra medium ramoso folioso, foliis subcylindricis fistulosis acutiusculus scapo subaequilongis, umbella multiflora capsulifera pedunculis parum inaequalibus flore $1\frac{1}{2}$ —2 plo longioribus exterioribus deflexis, spathae valvis binis albo-membranaceis nervosis a basi oblonga longe caudato-acuminatis umbellam aequantibus aut ea $1\frac{1}{2}$ —2 plo longioribus tandem deflexis, perigonii campanulati phyllis oblongis obtusissimis laevibus recentibus pallide luteolo-virentibus nervo viridi percursis exsiccatis luteolo-stramineis, filamentis basi inter se et cum perigonio connatis sinibus edentulis a basi sublatori usque ad apicem paululum attenuatis, antheris breviter exsertis luteis, ovario hexagono sulcato tuberculato-oblongo, capsula trigona truncata vesiculoso-tuberculata perigonio sublongiori.

Hab. in monte Cassio Syriae borealis ubi Junio 1846 legi et unde bulbos retuli e quibus plantam vivam descripsi. — Species A. pallenti L. habitu, umbellae et florum magnitudine characteribusque proxime affinis sed ab ejus formis omnibus florum colore, ovario capsulaque eximie vesiculoso-tuberculatis nec laevibus facile distinguenda.

15. *ALLIUM MODESTUM* Boiss. (Sect. *Codonoprasum*). — Boissier diagn. l. c.

A. bulbo ovato tunicis albo-membranaceis vestito, scapo tereti humili ad medium usque folioso ante anthesin apice eximie flexo, foliis tenuibus semicylindricis superne canaliculatis inferne fistulosis scapum aequantibus vel superantibus cito emarcidis, umbella capsulifera submultiflora pedunculis tenuibus patulo-effusis inaequalibus flore 3—4 plo longioribus, spathae phyllis binis a basi subdilata linearibus umbellae aequalibus vel ea duplo longioribus deflexis, perigonii elongati cylindrici phyllis oblongo-linearibus obtusiusculus laevibus vivis sordide albivirentibus rubello-tinctis siccis rubellis, filamentis inferne inter se et perigonio adnatis e basi sublatori attenuatis edentulis perigonio tertia parte brevioribus, antheris luteis, ovario ovato obtuse hexagono vesiculis oblongis obsolete punctato.

Hab. in desertis ad meridiem Palaestinae Gazam versus ubi Aprilis 1846 floridum legi et unde retuli bulbos quibus plantam educavi et descripsi. — Scapi 5—8 pollicares. Umbella 15—20 flora. Perigonium 3— $3\frac{1}{2}$ lineas longum. Inflorescentia diffusa et

habitus *A. pulchelli* Don. Ab eo et omni grege *A. pallentis* et *A. carinati* distinctissimum perigonio longiori cylindrico filamentis multo longiori. *A. callimisco* Kth. *A. lepto* et *A. parvifloro* perigonii forma magis accedit sed propter inflorescentiam diffusam, colorem florum, etc., cum eis non confundi potest.

Obs. 1. *A. Pisidicum* Boiss. et Heldr. pl. Anat. 1846 cum amiciss. J. Gay in *Ann. Sc. Nat.* Oct. 1847 cum *A. Cupani* Rafin. conjungimus.

2. Cl. Gay loco citato sub *A. pulchello* *A. carinatum* β . capsuliferum Koch et *A. pulchellum* Don verum conjunxit sed haec planta mihi a priori pedunculis longis effuse divaricatis, perigonio rotundato nec ovato, statura minori facile distinguenda esse videtur.

3. *A. Olympicum* Boiss. a cl. Gay ut synonymon *A. pulchelli* sui *A. carinati* β . capsuliferi citatum mihi semper species distincta esse videtur; praeter umbellae condensatae pedunculos subaequales, flores in eo semper saltem tertia parte minores sunt, tunicae radicales ultra scapi originem ut in eo nunquam productae sunt.

16. **ALLIUM** (*Mollium*) **CYDNI** Schott et Kotschy. — Schott in *Oestr. bot. W. Bl.* 1854. p. 217. — *A. bifolium*; foliis anguste linearibus ap. sens. angustatis, canaliculatis, antice glabris, postice subsulcato-lineolatis, patentissime puberulis (apic. vers. saepe calvis); scapo tereti inferne puberulo, foliis parvum longiore; spatha brevi late ovata, acuminata, trinervia, subscariosa; umbella pauciflora; pedunculis spatha triplo fere longioribus, gracilib.; sepalis albis pedunculo duplo breviorib., ad bas. usque distinctis exteriorib. subovato-ellipticis, interiorib. angustius ellipticis, omnib. obtusis, patentissimis, nervo inferne virente, superne rubicundo percursis staminib. sepalis paulo breviorib.; flam. distinctis e b. dilatata lanceolato-triangularib., albis anth. luteis, ovario sphaeroideo-triquetro, flavo virente, (foveis trib. nectarib. majusculis aucto); stylo subulato albo, longit. staminum, stigmate simplici brevissime papilloso. — Fl. suaveolentes, diam. 7-lin. — Hab. in Tauro Ciliciae, in praeruptis vallis Cydni (Kotschy).

17. **ALLIUM** (*Mollium*) **OPIZH** Wolfner. — Wolfner in *Regensb. Fl.* 1855. p. 433.

Scapo trigono, nudo, ad basin semper 1-phyllō; f. lin-lanceolato, plano subt. carinato glabro acutiusculo; spatha 1-phylla, umbella 1-flora capsulifera; petalis oblongis obtusiusculis staminib. triplo longioribus.

Bulbus ovato-rotundus, tunicatus, magn. nucis Avellanae. Scap. argute 3-gonus, debilis 1—1½ ped. viridis, vers. b. 1-phyllus. F. lin-lanceolatum planum subt. carinatum, acutiusculum, scapum aequans v. paulo superans (3—6" lat.). Umbella 1-flora capsulifera. Caps. albae nitidae magnitud. pisi. Spatha 1-phylla membranacea. Pedicelli pollicares penduli. — Perigonium campanaeforme. Pet. oblongo-obtusiuscula, alba, linea media viridi carinata (3—5" long. 2—2¼" l.) Fil. teretiuscula, simplicia, b. subdilatata, perigonio ½ lin. adnexa. Anth. luteae. — Hab. Stern pr. Pragae. Fl. Majo. — Proximum *A. pendulino* Ten. sed diff. scapo ad b. semper 1-phyllō, umbella 1-flora.

18. **ALLIUM** **LEHMANNIANUM** Mercklin. — Bunge in *Al. Lehm. reliq. bot.* p. 333.

A. (*Porrus*. Schult. § 2 c.) bulbo solitario ovato tunicato, caule subtriphyllō tereti glabro foliis glabris teretiusculis superne canaliculatis, umbella subfastigiata multiflora capsulifera, spatha integra bi-trifidave pedicellis brevioribus hyalina, perigonii laciniis ovato-lanc. acuminatis glaberrimis, staminib. alternis tricuspidatis inclusis, stylo lobos capsulae aequante.

Hab. in planitie argillacea inter fl. Kuwan et Syr-Darya caet. — Species habitu fere *Allio oreophilo* C. A. M. quodammodo similis, at fl. minoribus staminibusque diversissima, characteribus potius *A. sphaerocephalo* appropinquat, facillime tamen staminib. inclusis, statura humili, umbella laxa fastigiata dignoscitur. *A. caesium* quoque e diagnosi affine videtur sed diversum f. margine scabris, filamentorum lobis lateralibus abbreviatis. — Bulbus ovatus tunicatus, caet.

19. **ALLIUM XANTHICUM** (*xanthinum*?) Griseb. et Schenk. — Wiegmanns Arch. 1852. I. p. 358. — (*Allium Moly* Baumg., *A. tenuifolium* Schur, non Jord.)

(Scorodon). Bulbo elongato, tunicis in fibras solutis incluso, scapo basi foliato angulato, foliis planis lin-filiformibus, nervis subtus prominulis, ligulis transversim truncatis, spatha univalvi subulato-costata, umbellam vix aequante, umbella tenui capsulifera, perigonio flavescente patente, segmentis elliptico-oblongis obtusiusculis, staminib. simplicib. perigonio duplo longioribus, alternis basi dilatatis.

Syn. *A. Moly* Baumg. Fl. transs.

Habitus *A. saxatilis* M. B. a quo bulbi tunicis a b. ad ap. in fibras tenues solutis spatha univalvi et fl. flavis differt; characterib. propius accedit ad *A. ochroleucum* Kit. sed scapus angustus, umbella tenuis, f. multo angustiora, spatha et bulbi vaginae recedunt. — Siebenbürgen, in reg. alpina pr. Fogarasch.

20. **ALLIUM APPROXIMATUM** Gren. et Godr. — Gren. et Godr. fl. de Fr. III. p. 200.

A. sphaerocephalon Bor. not. nov. 1853. p. 18, non L.

(*Porrum*). Ovar. ovoideum. F. laete viridia, cylindracea, paululum compressa, fistulosa, in pag. sup. tantum in ap. leviter sulcata.

Caetera ut in *A. sphaerocephalon* L. — Hab. Le Cher; Angers; 24. Jun. Jul.

20. **ALLIUM PRAESCISUM** Rchb. — Regel ind. sem. h. bot. Petrop. 1857. — Species bona nobis videtur corollis cylindricis elongatis quam illae *A. paniculati* L. et oleracei L. conspicue longioribus post anthesin etiam conniventibus nec apice ampliatis, staminibus alternis plerumque brevissimis distincta. — Nostra optime convenit cum ic. Rchb. et vix differt nisi interstitiis exacte rotundatis, quae in ic. cit. denticulis ad filamentorum basin minutis interjecta sunt. — *A. praescissum* Rchb. Ic. pl. crit. 5. p. 17, t. 429. Ic. fl. germ. 10, t. 489, f. 1066. Ledeb. Fl. ross. 4, p. 189. *A. paniculatum* α. legitimum Ledeb. l. c. p. 176 et herb. pro parte. — Bulbos misit Becker e regione Sareptana (Rch.)

21. **ALLIUM NEAPOLITANUM** Cyr. var. *latifolia*. — Jaub. et Spach ill. pl. or. V. t. 442. — *A. vulgatoribus* formis *Allii Neapolitani* differt f. subtripto latioribus (10—15 lineas latis) nec non floribus conspicue majoribus. — Ins. Chio leger. Oliv. et Brugiere (herb. m. Par.).

Icones addendae.

ALLIUM CASPIUM Bieb. (Kunth en. IV. 445). — Bot. mag. tab. 4598.

ALLIUM ACUMINATUM Hook. (Kunth en. IV. 451). — Fl. d. serres VI. tab. 644; Lindl. in Paxt. fl. gard. I. 130. tab. 25 (hic imitata).

XXIX. **NOTHOSCORDIUM** Knth.

(Walp. Ann. III. 636. — Knth. en. IV. 457.)

1. **NOTHOSCORDIUM PHILIPPIANUM** C. Koch et C. Bouché ind. sem. h. Ber. 1853.

Bulbus globosus, fibris albis tenuibus crebris basi vestitus, tunica brunneo-grisea velatus; folia graminea, crassiuscula, planiuscule-caniculata, linearia, scapo obsolete trigono elongato dimidio breviora, vix ultra lineam lata. Umbella 3—6 flora, spatha bi-quadrivalvi marcida multistriata, phyllis oblongo-lanceolatis. Sepala patula, alba, oblonga, acuta, dorso secus nervum medium brunnea vel interdum viridia, basi tantum connata. Stamina alterna vix breviora, basi latiora, dimidium perianthium attingentia, basi sepalorum inserta. Ovarium trigonum, sessile, stylo columnari duplo et ultra brevius; stigma obscurum; ovula in loculis quina, biserialia, campylotropa (cl. Endlicher generi *Nothoscordii* ovula amphitropa tribuit).

N. striato et striatello Kunth maxime accedit, siccum vix, vivum non aëgre distinguendum scapo longiore et foliis angustioribus, non planis, sed canaliculatis. Beatus

Dr. Philippi e regionibus Chilensibus mari finitimis attulit. Genus *Nothoscordii* caeterum vix ab *Allio* separandum esse videtur. (C. K.)

2. **NOTHOSCORDIUM STRICTUM** Gay. — Gay Fl. Chilena VI. p. 114.

F. anguste linearib., umbella 9—11 flora; spathae valvis oblongo-ovatis aut oblongo-lanc., acuminatis, hyalino-membranaceis, pedicellis breviorib.; sep. oblongo-lanceolatis, obtusiusc., b. connatis, aequalib., filament. planis superne gradatim angustatis, ovario oblongo; stylo perigonio apicem subattingente.

Species en los Patos (Cordilleras de Ovalle), in alt. 3680 varas inventa.

XXXI. TRITELEIA Dougl.

(Walp. Ann. I. 865. — Knth. en. IV. 465.)

1. **TRITELEIA POEPPIGIANA** Gay. — Gay fl. Chilena VI. p. 117.

Virescens; f. linearib., planis, scapum 5—7 fl. quandoque superantib.; spathae 2 aut 3—4 valvis; valvis lanceolatis, hyalino-membranac., subroseis pedicellos aequantib. aut breviorib.; perig. 6-laciniato, laciniis oblong., obtusis, 4 l. long., 1½ l. l.; tubo laciniarum longit.; stylo staminib. brevior; stigmatibus lobis abbreviatis.

Speciem dedicamus illustrissimo Poeppig, viro de botanica Chilena optime merito.

Icon addenda.

TRITELEIA UNIFLORA Lindl. — (Knth. en. IV. p. 466). — Fl. d. serres IX. t. 967. p. 283.

XXXIII. BRODIEAEA Sm.

(Walp. Ann. III. — Knth. IV. 470.)

1. **BRODIEAEA PARVIFLORA** Torr. et Gr. — Torrey and Gray, Rep. of the bot. of the exped. of Gunnison and Beckwith, in 1854. (ed. 1857) p. 11.

Scapus rigidus, umbella multi- (15—20-) flora; pedicelli florib. breviores; stamina sterilia ovato-lanceolata, vix acuta, integra; ovarii loculi 6—8 ovulati.

Hab. Madelin Pass in m. Sierra Nevada Californiae. — Bulbus ovatus, nonnunquam diametro ultrapollicari, caet.

XXXIV. LEUCOCORYNE Lindl. Endl.

(Knth. en. IV. 472.)

1. **LEUCOCORYNE PURPUREA** Gay. — Gay Flora Chilena VI. p. 122. (atl. bot. Phanerog. tab. 69.)

Purpurea f. linearib., elongatis viridib.; perigonio hypocraterimorpho, regulari, limbo patente, 6-partito, fauce atro-purpurea; tubo cylindraceo, b. tumido; staminib. sterilib. crassis, acutis pedunculis inaequalibus.

En los lugares aridos de Coquimbo.

2. **LEUCOCORYNE ANGUSTIPETALA** Gay. — Gay fl. Chilena VI. p. 124.

Elongata, fl. subpurpureaceis, laciniis subpatulo-recurvatis, linearib., angustis, tubo aequalib.; staminib. sterilib. helvolis, linearib., b. paululum attenuatis, laciniar. longitudine; umbella 4-flora, pedunculis inaequalibus.

Species bene distincta et in provinc. centr. indigena.

XXXV. TRISTAGMA Poepp.

(Knth. IV. 474.)

1. **TRISTAGMA DIMORPHOPETALA** Gay. — Gay Flora Chilena VI. p. 126. — (Atl. bot. Phanerog. tab. 69 bis).

Foliis linearib., obtusis, carnosis, planis; umbella 5—6 flora, pedunc. inaequalib. strictis; spatha bivalvi, valvis oblongo-lanc., elongatis b. connatis; perig. 6-laciniato, laciniis tubo breviorib., diversis, exteriorib. membranaceis helvolis, interioribus crassis subviolaceis.

En los cerros aridos de Asquera cerca de Coquimba.

XXXIX. **MILLA** Cav. Endl.

(Knth. en. IV. 478.)

1. **MILLA COERULEA** Scheele. — Ad. Scheele in Linn. XXV. p. 260. — *Bulbus* globoso-ovatus tunicatus, tunicae membranaceae, reticulatae supra basin dein circumscissae, Vagina hyalina f. scapumque b. involvens tubulosa integra et truncata ap. fissa. F. radicalia 4 erecta fistulosa, striata deorsum scabra ap. breviter subulata glaucescentia scapum excedentia. *Scapus* erectus fistulosus glaber furcatus et biflorus, rarius 1 - v. 3 - florus, ad bifurcationem bracteis 4—5 alboscariosis instructus, bractee 2 amplexicaules oppositae majores ovatae nervosae acuminatae pedunculum subaequantes spatham formantes, reliquae minores angustiores bracteoliformes e b. latiori lanceolato-subulatae. *Pedunculi* elongati erecti glabriusculi spatham aequantes v. superantes flore plerumque breviores. *Perigonium* corollaceum hypocraterimorphum glabrum coeruleum, tubus elongatus oblongo-campanulatus, limbus 6-partitus patentissimus, lacinae acutae zona dorsali - viridi 3-nervi notatae tubum subaequantes, 3 exteriores angustiores oblongo-lanc., 3 interiores ovato-oblongae. *Stamina* 6 monadelphia perigonii fauci inserta laciniis breviora. Filam. in coronam cylindraceam connata, pars libera subnulla. Antherae biloculares introrsae lineares erectae subsessiles. Ovarium obovatum liberum trigonum triloculare multiovulatum. Stylus cum ovario continuus filiformis elongatus. Stigma ap. pilis crassis brevibus albicantibus glandulosis densissime obsitum. Capsula... — Frequens in pascis aridis pr. Neubraunfels. Römer, m. Martio. — *Milla biflora* Cav. mihi ignota gaudet fl. albis, filamentorum parte superiori libera lineari et bracteolis 3 brevibus ad bifurcationem. — Planta $\frac{1}{2}$ pedalis, caet.

GENERA ALLIACEIS AFFINIA.

L. **ASPHODELUS** L.

(Walp. Ann. III. 638. — Knth. en. IV. 554. 693.)

1. ASPHODELUS REFRACTUS Boiss. in pl. Syr. exs. 1847. — Boiss. l. c. p. 23.

A. annuus, radice simplici brevi in fibras abeunti, foliis omnibus radicalibus lineari-subcylindricis compressis laevissimis parte inferiori viscidulis basi membranaceis dilatatis parte superiori attenuatis acutis, scapis 1—3 lateralibus ascendentibus incurvis teretibus laevibus folia multo superantibus infra medium semel bisve dichotome ramosis, racemis longis laxis, pedunculis viscidulis bractea albo scariosa ovata

abrupte mucronulata suffultis paulo supra basin articulatis superne clavato-incrassatis floriferis erectis flore sesquolongioribus fructiferis refractis capsula 2—3 plo longioribus, floribus parvis, perigonii phyllis oblongis albidis nervo medio valido obscuriori percursis, filamentis perigonio paulo brevioribus dilatatis basi apiceque attenuatis, capsula rotundato-trigona transverse sulcata, seminibus griseo-albidis acute trigonis dorso transverse sulcatis facie planis non foveolatis.

Hab. in arenosis vallis Wadi Mokatteb jugi Sinaitici mixta cum Asp. clavato (Vide Diagn. 7. p. 119). Legi floriferum Marte 1846. — Folia 3—4 pollices longa inferne vix lineam unam lata. Scapi $1\frac{1}{2}$ pedales, racemi demum semipedales longioresque tenues laxe 10—16 flori. Pedunculi fructiferi eximie refracti 4—5 lineas longi. Flores illis A. clavati et fistulosi minores obconici vix 2 lineas longi. Capsula piso dimidio minor. Species ab A. fistuloso, clavato et viscidulo affinibus praeter notas datas statim pedunculis fructiferis elongatis curvatione partis non articulatae eximie refractopendulis notabilis. — A. viscidulum a me prius in Diagn. Nr. VII. ex speciminibus Schimperianis descriptum in planitie arenaosa Ramleh dicta ad radices meridionales jugi el Tih in Arabia petrea Marte 1846 abunde florentem legi et eum praeter notas indicatas ab A. clavato scapo ascendenti, foliis non scabridis, capsula depressa, seminibus minoribus caesiis lateraliter non foveolatis valde distinctum esse observavi.

2. ASPHODELUS RIGIDIFOLIUS Boiss. et Heldr. in pl. Anat. exs. 1847. — Boissier diagn. XIII. p. 22.

A. perennis foliis omnibus radicalibus confertis numerosissimis lineari-subulatis rigidis quadrangulis subcompressis ad angulos scabridis acutis basi membranaceo-dilatatis glaucescentibus, scapo nudo folia superanti tereti a media parte ramoso paniculato rarius simplici, racemis terminalibus tenuibus laxiusculis, bracteis scariosis pellucidis albis nervo obscuro percursis a basi latiori triangulari subulato-acuminatis flores non aequantibus, pedunculis e bractea 1—4 erectis paulo supra basin articulatis sub anthesi brevibus postea elongatis perigonium dimidium aequantibus, perigonii albidis ante evolutionem longe et anguste tubulosi phyllis lineari-oblongis basi tantum connatis obtusis nervo saturatori percursis, filamentis a basi dilatata sub lente minute scabrida sensim ad apicem usque attenuatis tribus perigonio quarta parte brevioribus, tribus aliis perigonio dimidio brevioribus apice struma globoso-triquetra in cuspidem brevem cui anthera inserta est producta instructis, antheris filamentorum strumosorum brevioribus, capsula immatura sicca globoso-subtrigona, seminibus acute trigonis sub lente punctatis dorso ruga una alterave instructis.

Hab. in collibus apricis Isauriae inter Koniah et Beychehr loco tribus leucis a priori urbe distante (Heldr.). Fl. Junio ineunte. — Folia 6—7 pollices longa lineam dimidiam lata. Scapus cum racemis $1\frac{1}{2}$ pedalis, racemi 5—7 pollicares, perigonium clausum 7—8 lineas longum $\frac{1}{2}$ latum. Species pulchra collocanda prope A. Tauricum quod quoque staminibus alternatim strumosis gaudet sed longe differt caule folioso racemo denso thyrsoidae simplici compacto, bracteis dense confertis flores aequantibus vel superantibus.

3. ASPHODELUS DAMASCENUS Boiss. — Boissier diagn. XIII. p. 22.

A. perennis, foliis omnibus radicalibus confertis numerosissimis lineari-subtriquetris superne subulato-attenuatis pagina inferiori ad margines asperulis superiori laevibus, scapis elatis nudis folia superantibus in racemum simplicem longum laxiusculum abeuntibus, bracteis lanceolatis scariosis acuminatis pedunculos non multum superantibus, pedunculis ex eadem bractea aggregatis supra medium articulatis floriferis perigonium dimidium aequantibus fructiferis elongatis, perigonio albidis

ante evolutionem tubuloso phyllis lineari-oblongis basi tantum connatis obtusis nervo lato obscuro percursis, filamentis inferne scabridulis e basi latiori sensim attenuatis tribus perigonio paulo brevioribus, tribus aliis perigonio dimidio brevioribus apice struma alato-trigona cuspidata instructis, antheris filamentorum strumosorum brevioribus, capsula (immatura) obovata rugosa, seminibus acute triquetris dorso rugosis sub lente punctatis.

Hab. in jugis humilioribus Antilibani in latere orientali ad Wadi - Barrada (Boiss.). Fl. Maio. — Folia 8—12 pollices longa inferne 1—2 lineas lata. Scapus cum racemo 2—3 pedalis, racemus fructifer saepe pedalis et ultra, perigonium 9—12 lineas longum. Affinis habitu et florum structura speciei praecedenti a qua foliis latioribus planioribus laeviusculis, racemo semper simplici crassiori, pedunculis longioribus ad medium articulatis, floribus paulo majoribus sat distincta videtur.

4. ASPHODELUS SPHAEROCARPUS Gren. et Godr. — Gren. et Godr. fl. Fr. III. p. 223. — Fl. densissimi compacto-racemosim dispositi, bract. lanceolatae, pedunculos erectos aequantes v. superantes, fere adpressae et ap. paulo gibbae. Perigon. circ. 18 millim.; stamina filamentis anguste lanc. et b. ciliatis. Caps. parv. (7 millim. diam.), valvis suborbicularib., ap. rotundatis, nervatura mediana non inflexa et marg. lateralib. reflexis apiculatis apparentib.; nervis dorsalis. vix nullis, costis transversalib. paulo eminentib. paucis (4—5), marginibus post dehiscentiam b. rima ovali, medio rima angustissima et ap. valde ringenti, discretis. Semina atra, reticulata. — F. lanceiformia (10—12 millim. lata). Scapus circ. metralis, factus, simplex, rarius ap. ramosus. Radix fasciculato-ramosa. — Hab. Bois de l'Hermilain, dans les Deux-Sèvres etc. — 4. Maj. Jun.

5. ASPHODELUS SUBALPINUS Gren. et Godr. — Gren. et Godr. fl. de Fr. III. 224. — A. *Delphinensis* Gren. et Godr. mem. soc. ém. Doubs, may 1854; A. *ramosus* Lap. abr. 188; A. *neglectus* Roem. et Schl. syst. 7. p. 488? — Cfr. l. c. pl. descr.

11. CHARLWOODIA RIGIDIFOLIA C. Koch et Bouché ind. sem. h. Berol. 1855.

Dracaena yuccifolia Hort.

Caulis mediocris; folia rigida, stricta, serrulata; panicula racemosa, lateralis; flores solitarii aut inferiores gemini; bractearum infera longior, floris basin ambiens; sepala exteriora semper erecta.

Species jam diu in hortis Berolinensibus nomine *Dracaenae yuccifoliae* et *D. congestae* var. culta haud aegre distinguenda est foliis rigidis et iis *Ch. congestae* Sweet substantia durioribus, etiam magis serrulatis et intensius viridibus. Bractea infera basin floris non attingente, sepalis exterioribus sub anthesi revolutis et staminibus styloque lilacinis *Ch. congesta* Sweet a planta nostra praeterea discrepat. — Caulis mediocris, debilis, 6–7 lin. crassus, dense cicatrisatus, simplex; folia patentissima, rigida, $\frac{1}{4}$ poll. longa, supra medium 6 lin. lata, deinde ad apicem lanceolata, ad basin contra paulo angustiora, lineata, multinervia; panicula prope apicem caulis lateralis pedunculo communi brunneo-viridi, angulari; rami simplices, patentissimi, floribus breviter pedicellatis dense obsiti; bractee inaequales, parvae, ovato-lanceolatae, laterales infera duplo breviores; perianthii dilute violacei sepala ovato-lanceolata, exteriora semper erecta, interioribus sub anthesi et serius revolutis duplo breviora. Antherae erectae, flavae, filamentis albis aequilongis, a stylo albido indiviso vix superatae; germen globosum, 3 loculare, loculis pluriovulatis; ovula uniseriata, anatropa. — Patria ignota, sine dubio Nova Hollandia.

VII. DASYLYRION Zucc

(Knth. en. V. 38. — Walp. Ann. III. 644.)

1. DASYLYRION LINDHEIMERIANUM Scheele. — Ad. Scheele in Linn. XXV. p. 262.

Caulis erectus 3–5 pedalis striatus glaber foliosus ap. paniculatus inferne teretiusculus superne angulatus. F. radicalia 2–3 pedalia caule breviora anguste lanceolata, striata glabra canaliculata ap. versus longe attenuato-subulata ap. ipsa truncata b. marg. scarioso instructa vix dilatata, marg. spinuloso-scabra spinis validis inter spinulas (serraturas) destituta, spinulae horizontaliter patentis e b. latiore acuminatae incurvae. — Panicula terminalis simplex oblonga 1–2 pedalis, ramis acutanguli glabri decrescentis; inferiores erecti superiores patentes. Flores dioici.

Masc. F. caulina inferiora b. dilatata vaginantis lin-lanceolata ap. truncata. F. floralia s. e. paniculae ramos inferiores stipantis decrescentia, e b. latiori semiamplexicauli

subulato - acuminata marg. laevia, inferiora herbacea marg. scariosa 2—4 uncialia, superiora breviora membranacea, infima ramos superantia reliqua ramis breviora. — Flores pedicellati secus ramos per 3—5 fasciculato - congesti; in ramis racemoso-spicati magnitudine Sambuci nigrae; pedicelli patentes perigonium aequantes v. superantes medio reticulati b. bracteolati. Bracteolae hyalinae latae acuminatae laceratae pedicellis plerumque breviores. — Perigonium corollaceum profunde 6 partitum albidum glabrum, laciniae ellipticae 1-nerviae acutiusculae naviculares patentes ima b. connatae staminibus longiores longitudine subaequales. Stamina 6 foliolorum b. inserta. Filam. filiformia. Anth. ellipticae biloculares dorso medio affixae introrsae flavae.

Femina: F. caulina inferiora e b. dilatata vaginante longe subulato - acuminata, floralia membranacea ramis breviora. Pedicelli subgemini perigonio longiores infra medium articulati. Perig. persistens. Stam. 6 laciniarum b. inserta, antheris effectis. Ovar. liberum sessile ovale triquetrum glabrum ap. depressum. Columna stylina terminalis brevissima in stigma trilobum dilatata, stigmatis lobi breves obtusissimi. Fructus (samara) ovato - oblongus trigonus trilocul. abortu sub 2-spermus, angulis in membranam latam expansis, membrana fructum latitudine aequans. Pedicelli fructu subbreviores. Semen obovatum trigonum badium. — In rupestribus pr. Neubraunfels.

2. **DASYLYRION TEXANUM** Scheele (Walp. Ann. III. 644. 1.) — Scheele in Linn. XXV. p. 265. — Descriptio l. c. hisce emendanda: F. marg. spinosa inter spinas serratulo-scabra, spinae validae flavae cartilagineae conico - subulatae incurvae 2—6 lineas a se invicem remotae 1—1½ lin. longae, serraturae minimae densissimae spinulosae horizontaliter patentes. — A D. Lindheimeriano toto coelo abhorrens.

(Knth. en. V. 270.)

1. **RIPOGONUM ALBUM** R. Br. Prodr. I. p. 293. — Ferd. Müll. Fragm. phyt. 1858. p. 43.

Glabrum, foliis oppositis v. ternatis v. floralibus alternis ovatis v. lanceolato-ovatis in basin paulo angustatis apice breviter acuminatis, nervis foliorum lateralibus prope basin folii ortis, racemis simplicibus, floribus parvis brevissime pedicellatis, sepalis ovatis obtusis antheras fere uncinato-acuminatas vix superantibus, stylo brevissimo germineque glabris, stigmatibus obtusis.

In Nova Austro-Vallia usque ad sinum Moreton Bay. — Folia pleraque inter 1½ et 3 pollices longa. Petioli torti. Racemi sesqui- v. bi-pollicares. Sepala circiter 2 lin. longa ovata. Antherae lineam longae. Flores penitus evolutos et fructus nondum vidi.

2. **RIPOGONUM MOORIANUM** F. Müll. l. c.

Glabrum, foliis alternis lanceolato-ovatis in petiolum sensim angustatis apice in acumen elongatum angustum productis, nervis foliorum lateralibus prope basin folii ortis, racemis simplicibus, pedicellis flore duplo triplove brevioribus, sepalis magnis antheras breviter superantibus, stylo germine aequilongo quocum glabro.

In Australia orientali subtropica detexit amic. Carolus Moore, horti bot. Sydney. Director. — Folia in unico specimine mecum communicato 2½—3 poll. longa. Petioli torti. Racemi bi- tripollicares. Sepala circiter 3 lin. longa oblongo-ovata. Stylus sicut filamenta demum lineam longae. Antherae sesquilineam longae.

3. **RIPOGONUM ELSEYANUM** F. Müll. l. c.

Petiolis brevibus pedunculisque ferrugineo-tomentosis, foliis magnis oppositis ovatis antice sensim acutatis basi cordatis, nervis foliorum lateralibus alte supra basin folii ortis, spicis elongatis simplicibus, sepalis magnis antheras demum conspicue superantibus, stylo brevissimo, germine tomentoso, stigmatibus incrassato trilobulo-capitato.

In Australia orientali calidiore. C. Moore. — Folia in unico specimine viso fere semipedalia. Petioli crassi semuncia breviores. Spicae sex-ad octo-pollicares. Sepala 3—4 lin. longa oblongo-ovata glabra. Stylus tomento albedo occultus germinae multo tenuior. Antherae 2 lin. longae. — Speciem generis nobilissimam tribui memoriae Josephi Elsey, in itinere Gregoriano per plagas Australiae intratropicas socii nostri amabilis, qui faunam hujus tractus gnauiter perscrutatus est, tunc investigatione florum Antillanae occupatus praemature obiit.

Ordo XXVIII. LAPAGERIEAE *Knth.*

(Kunth. en. III. 315. — Walp. Ann. III. 653.)

1. JUNCUS COMMUNIS E. Mey. — Meyer in pl. Muellerianis, Linn. XXVI. p. 243.

α. *effusus*. J. effusus L.

β. *subglomeratus*.

γ. *robustus*. J. robustus E. Mey. quond.

Forma mihi antea ignota, fl. fructuque omnino non diversa a legitimo Junco communi, spatha subpungente, anthelaeq. ramificatione simillima Junco maritimo. An hybrida stirps? Ad rivulos montium Lofty-ranges (F. Muell.) Van Diemensland (Stuart). β. γ. et forma nova, Van Diemensland (Stuart).

2. JUNCUS REVOLUTUS R. Br. pr. p. 259. — E. Meyer in pl. Muellerian. in Linn. XXVI. p. 245. — J. Brownii F. Mueller. — Ad riv. Tamar Van Diemensld. etc. — Cl. Müller nomen mutandum esse censuit utpote ineptum, quia folia non revoluta sed convoluta essent. Mihi aptissimum videtur. Sunt enim etc.

3. JUNCUS CHILENSIS Gay. — Gay fl. Chilena VI. p. 146.

Caespitosus; culmo foliato; vaginis tereti-compressis striatis, inferiorib. aphyllis; f. teretib. subsetaceis, obsolete articulatis, anthela terminali, cymosa, sub brevioribus; capitulis globosis sessilib. et pedunculatis; staminib. 6 perigonium aequantib.; involucre monophyllo corymbo longius, foliis simili; sepalis aequalib. interiorib. oblongo-subobtusis, marginib. membranac., exteriorib. oblongo-lanc., acuminatis; capsula oblonga, triangulari, mutica, perigonii longitudine.

Species valde affinis J. alpino Vill. et J. multicipiti, Kze. In Cordilleras de San Fernando.

4. JUNCUS OLYMPICUS Schott. — Schott Amalecta bot. I. 1854. p. 3.

Foliis intus septatis, extus striatulis, caeterum laevibus; perigonio capsula $\frac{1}{3}$ brevior, phyllis aequilongis, omnib. acutis et ap. ipso breviter mucronatis.

Perennis, parvulus (uncialis et ultra), ascendens, b. vaginis folior. rubens. Culmi compressi, 3—4 folii. F. disticha, complanata longe subulata, falcata ap. acuto rubro tineta. Anthela paupera, ut plurimum triflora, constans florib. 2 sessilib. et tertio terminali pedicellato. Perig. brunneum, albido marginatum. Caps. atra, anguste ovoideo-pyramidata, mucronata. Sem. reticulata. — Hab. in Olympo Bithyniae. — J. lamprocarpus Ehrh. proximus, diff. perigonio et foliis.

FLAGELLARIEAE Endl.

(Tribus Juncacearum Kunth. en. III. p. 369.)

IX. **FLAGELLARIA** Linn.

(Kunth. l. c. 369.)

FLAGELLARIA L. (char. reform.) — Hooker, on Chortodes, a subgenus of Flagellaria in Kew garden misc. VII. 198.

Perianth. persistens; lacin. 6, 2-seriatis. Stam. 6 hypog.; filament. filiformib., liber.; anther. oblongis, med. dorso affixis, longitudin. dehisc. Ovar. liber. sessile 3-loculare; ovul. in loc. solitariis basilarib., anatropis; stigmatib. 3, patulis filiformib. Bacca coriac., pisif., 1—3 loba, 1—3

locularis, stigmatib. coronata. Semina oblonga v. subglob.; testa membranac., tenui; hilo basilari, chalaza orbiculari; embryone lenticulari, minimo.

Herbae perennes; caule erecto v. sarmentoso; f. sparsis, longe vaginantib.; vaginis integris v. fassis, striatis plicatisve, interd. in cirrhos desinentib.; fl. bracteolatis, in ramis paniculae amplae decompositae sessilib., parvis, viridibus albisve.

1. Subgenus EUFLAGELLARIA.

Perianthii lacinae interiores exteriorib. majores, submembranaceae. Bacca 1-locul., 1-sperma.

Herbae sarmentosae v. scandentes, f. striatis ap. in cirrhos desinentib., vaginis plerumq. integris.

2. Subgenus CHORTODES.

Perianthii lacinae interiores exteriorib. aequilongae. Bacca 3-locularis, 3-sperma.

Herba erecta, f. plicatis, vaginis ad b. fassis.

1. FLAGELLARIA (*Chortodes*) PLICATA Hook.

Erecta, f. late elongato-lanc., longe acuminatis, creberrime plicatis et longitudinaliter nervosis nervis primariis minute scaberulis venulis transversis convexis, vagina fissa marginib. membranac. superne in auriculas obtusas utrinq. dilatata, paniculae ramis puberulis, perianthii laciniis ovato-subulatis.

Habit. In ins. Pinorum (isle of Pines) pr. ap. austr. insulae Novae Caledoniae ad silvium rivulos. — Herba elata, 5-ped. robusta. Caulis erectus, indivisus? F. ped. et ultra, 3—5 p. lata, creberrime plicata, plicis 20—30, vagina spithamaea et ultra subtilissime asperula striata, ligula breviss. membranacea. Panic. pedalis ampla ramosiss., ramis et ramulis saepe flexuosis angulatis puberulis. Fl. parvi, (1—2 l. f.) sessiles, bracteola minuta suffulti; bracteola ramulo paniculae adnata, dentiformi. Perianth. viride, b. late campanulatum. Fil. filif., perianthio duplo longiora. Anth. filamentis aequilongae, lin-oblongae, dorso supra b. filamentum insertae. Ovar, glob.; stigmatib. 3 filif. coronatum. Bacca immatura, $\frac{1}{10}$ p. lata triloba.

Sonder in Linn. XXVIII. 218.

XI. XEROTES R. Br.

(Knth. en. III. 371.)

Sonder in Linnaea I. c. 218.

1. XEROTES FILAMENTOSA Brongn. in Duperrey voy. Botan. Phanerog. t. 35. opt. I. Kunth Enumerat. III. p. 375. — Sandberg (Adelaide), Apr. (Dr. Behr). Inter portum et urbem Adelaide, Mart.; ad lacum Victoriae; Reedy creek; Guichen-bay (Dr. F. Müller). In Nov. Holland. subtropica leg. cl. T. L. Mitchell!

Variat: foliis angustioribus et latioribus, capitulis masculis solitariis vel 2—6 remotis superimpositis, globosis, oblongis nunc pluribus confluentibus lineari-oblongis 3—4-pollicaribus.

Rhizoma repens. Folia in spec. minoribus pedalia, in maximis bipedalia scapo semper longiora. Bracteae floribus longiores subulatae. Flores albi. Perigonium exterius 3-phyllum hyalinum; interius e foliolis 3 basi cohaerentibus duplo majoribus albo-coloratis constat. Planta feminea deest. — An eadem ac X. leucocephala R. Br. l. c.?

2. XEROTES FRAGRANS F. Müll.

Acaulis, foliis distichis linearibus rigidis subtus convexis striatis margine serrulato-scabris, apice plano bidentato sinu acuto, basibus dilatatis laceris, scapo compresso nudo, panicula mascula foliis multo brevior laxa racemosa, ramis primariis saepius oppositis, reliquis plerumque alternis, pedicellis solitariis binis ternisve erecto-patulis perigonio 2—4-plove longioribus bracteam aequantibus superantibusve, perigonii foliolis subaequalibus lineari-oblongis, bracteis omnibus hyalinis.

In planitie versus Gawlertown, Julio (Dr. F. Müller). — Folia 1—1½-pedalia, lineam lata, rigida, incurva, latere interiore plana. Scapus 2—3-pollicaris, panicula subaequilonga, demum effusa terminata. Bracteae inferiores longiores lineari-lanceolatae, superiores subulato-acuminatae, pedicellum aequantes vel breviores. Perigonium patens; foliola 2 lin. longa, stamina 6 duplo superantia. Flores feminei desunt.

3. XEROTES DURA F. Müll.

Foliis elongatis linearibus rigidis coriaceis dorso convexiusculis antice planis apice tabescente obtusis subdenticulatisve margine laevibus basibus dilatatis laceris, panicula verticillato-ramosa foliis multo brevior, glomerulis florum sessilibus, bracteis acutis adpressis perigonium aequantibus, perigonii subglobosi foliolis subaequalibus obtusis, staminibus perigonio subbrevioribus, capsulis subtrigonis laevibus.

In montibus sterilibus Lofty-ranges, Novb.; inter Macclesfield et Villnuga, Janr.; Cudnaka (Dr. F. Müller). — Folia 1½—2 pedes longa, 1½—2 lin. lata, subtiliter striata, margine non incrassata. Scapus compressus vel subtrigonus, rarius teretiusculus, 2—3-pollicaris, panicula 3—4-pollicari, simplici, verticillato-ramosa terminatus. Glomeruli magnitudine pisi majoris. Perigonium masculum lineam longum, foliolis concaviusculis ovatis obtusis, tribus exterioribus subcoloratis margine pallido, tribus interioribus apice summo tantum coloratis. Stamina 6, filamentis brevibus basi latioribus, alternis brevioribus, antheris minutis. Perigonii feminei foliolis basi connatis, cordato-ovatis obtusis, lineam longis. Ovarium triloculare, loculis 1-ovulatis, 1—2 saepe abortientibus. Capsula circ. 2 lin. longa et lata, stylorum basi brevissime apiculata, laevis in sicco quasi pruina levissima obducta; valvae virides margine albidae, itaque fructus ex 6 striis viridibus et 6 albis tinctus adparet. Semina matura desunt. — X. rigidae R. Br. affinis.

4. XEROTES LONGIFOLIA R. Br. l. c. p. 262. — *Lomandra longifolia* Labill. Nov. Holl. I. tab. 119. — Inter montem Gambir et Rivoli-bay. In collibus ad ripas fl. Yarra et in udis prope St. Kilda, Septemb. (Dr. F. Müll.) — Variat panicula stricta 1—2-pedali. — X. arenaria Schnizl. Icon. famil. I. 51 b. ab X. longifolia R. Br. non diversa videtur.

CALECTASIEAE Endl.

(Juncacearum trib. Knth. en. III. 377.)

XIV. CALECTASIA Brown.

(Knth. l. c. 377.)

1. CALECTASIA CYANEA R. Br. l. c. — Sonder in Lin. 1856. p. 222.

Perigonii tubo basi villosa apicem versus subpubescente, limbi laciniis (azureis) tubum aequantibus intus ad basin glabris, filamentis filiformibus glabris.

2. CALECTASIA INTERMEDIA Sond. l. c.

Perigonii tubo basi villosa apicem versus pubescente, limbi laciniis (azureis) tubum aequantibus intus basi puberulis, filamentis basi pilosis.

Inter „Grampians et Victoria range“, Nov. 1853, leg. Dr. Ferd. Müller. — Fruticulus ramosus facie C. cyaneae. Folia in spec. a cl. Müller missis adpressa, ab iis C. cyaneae

non diversa. Flores terminales solitarii, azurei, adulti margine interdum pallidiores; lacinae tubum aequantes (5—6 lin. longae), subtus ad costam adpresse pilosae. Filamenta brevissima, basi pilosa, pilis erectis. Stylus et ovarium ut in antecedente.

3. CALECTASIA GRANDIFLORA Preiss. (Walp. Ann. I. 882. 1.) — Sonder l. c.

Perigonii tubo striato glabro ima basi villosa, limbi laciniis (purpureis subvariegatis) tubum subduplo superantibus intus ad basin vel a basi ad medium usque sublanato-pubescentibus, filamentis basi dilatatis glabris.

(vagnar. ore excepto) glabra, b. ramosa, ram. strict. erect. teretib. striat., f. lin. acuminat. nitid. plan. 8 p. long., 3 lin. l. internod. duplo longiorib., inferior. vaginis fiss., superior. subito in bract. floralib. brevib. vaginantib. transeuntib., pedicell. ex bractear. axill. solitar. gemin. v. ternis $\frac{1}{2}$ p., 1 florib., bractea subduplo longiorib. med. bis articulatis ap. vers. puberul., ovul. in locul. solitar.

Calyc. lacin. exter. ovato-oblong., puberul., fr. paulo longiores. Stam. 2, fertil.; anth. aurantiacae. Stam. effoeta glandulaef. 4, glandulae flav. Styl. coeruleus. Caps. obt. trigona, rotundata glabra nitida; ovula in quoq. loc. solitar.; sem. tuberculata. — *Aneilemati* vaginato Br. affine, sed f. multo longiora, et caps. loculi 1-spermi. — Cresc. in Concano australiore; fl. temp. pluviali.

§ 2. florib. paniculat.

4. ANEILEMA ELATUM. — Dalzell in Hook. *journ. Kew gard. misc. III. 137.*

3—4 ped., caule erecto tereti glabro folioso, f. lin-lanc. acut. glabr. plan. albo-marginatis, marginib. undulat., 6—8 p. long., 2 p. l., vagin. integr. pollic. ore puberulis v. subglabr., peduncul. terminalib. dichotomo-ramosis, ramis ramulisq. distantib. pauciflor. b. bract. integr. vaginantib. suffultis, florib. ternis.

Sep. exteriora prof. concava, oval. obt., interiora petaloidea obovato-cuneata, concava sub anthesi reflexa. Stam. fertil. 3. Stam. glanduliform. 3 breviora, glandulae luteae, cordato-bilobae: flam. omn. infra med. barbata. Caps. sep. exter. inclusa, loculis 3-sperm. — Cresc. in silv. umbrosis regni Warreensis; f. Aug. — *A. giganteo*, R. Br. et A. elato, *Knth. en. IV. 70.* valde affine, a priore differt staminib. omnib.

barbatis; ab *A. elato*, Knth. sepal. exterior. non linearib. Spec. haec fructib. coerule. metallicis rotundis verosimiliter *Commelyna elata* Vahl est, haud recta descripta, quare nomen specificum est conservatum.

5. ANEILEMA CANALICULATUM. — Dalzell in Hook. j. Kew gard. misc. III. 137.

6—7 pollic., radice fibrosa, caule simplicit. ramoso, erecto, striato, uno latere linea pubesc. alternat. notato, f. infer. l. lin-lanc., super. cordato-oblong., omnib. amplexicaulib. glabr. 10—18 l. long. 4—5 l. l., med. canaliculat., pedunc. terminalib. et ex f. superior. axill. solitar. v. gemin. dichotomo-ramosis paucifloris, florib. longiusc. pedicellat. bifariis distantib., pedicellis fructu longior., bract. minutis persist. oppositis.

Sep. exter. sub anthesi patent., inter. majora, petaloid. rotundata. Stam. perfecta, 3 fertilia, anth. ap. apiculat. cyaneis; glanduliform. 3 breviora, stylum aeq., glandul. 3-lobat. alb.; filam. omn. barbata. Caps. oblonga acute trigona, sepal. exterior. dimid. longior. locul. 4—5 spermis; semina 1-serial. Fl. cyanei. — Cresc. in provinc. Malwan; fl. temp. pluviali.

6. ANEILEMA DIMORPHUM. — Dalz. in Hook. j. Kew gard. misc. III. 138.

Totum, (exc. vaginar. ore ciliato) glabrum, pedale, radice fibrosa, b. parce ramosa, ram. erect. teretib. striatis, internodiis uno latere linea pubesc. notatis, f. inferiorib. lin-acuminat., superior. lanc. acutis, omnib. amplexicaulib., florib. terminalib. dichotomo-paniculat. pauc., paniculae ram. pedicellisq. b. bracteate., bract. minut. rotundato-cucullatis.

Sep. exter. ovata, obt., concava, sub anth. reflexa, inter. rotundata, b. cuneata petaloid. Stam. fertil. 3, anther. purpur., filam. med. barbat., stylo 4-plo longiorib. glandulif. 3 breviora, fil. glabr., glandul. alb. 3-lobatis. Ovarii loculi 3-ovulati. Styl. breviss., strict. subul. Stigma simplex. Caps. sep. exter. longior., oblonge acuta, trigona. Fl. cyanei. — Cresc. in prov. Malwan; fl. temp. pluviali.

7. ANEILEMA SEMITERETES. — Dalz. in Hook. j. Kew gard. misc. III. 138.

Caule erecto simplici tereti 2—5 p., glabro, f. pauc. subulat. carnosis semiteretib., vagin. integr., florib. terminalib. et ex folii supremi axilla dichotomo-paniculat., panicul. pauciflor., pedunc. pedicellisq. rubris, vaginis floralib. truncatis 1-dentatis.

St. fertil. 3, incumbent., sep. exter. opp., anth. fusc., filam. glabr.; sterilia 3, glandulif., glandul. trilob. albis, filam. omnib. ima b. coalitis. Ovar. ovale, stylo stricto paulo brevius, 3 loculare; ovula in quoq. loc. 6, biserial. Pet. obovata, cuneata, ap. mucronata, irreg. dentata. Fl. cyanei. — Crescit in Concano utroque, in loc. saxosis; fl. temp. pluviali.

§ 3. Florib. cymoso-racemosis.

8. ANEILEMA COMPRESSUM. — Dalz. in Hook. j. Kew gard. misc. III. 138.

Basi ramos. radicans, ram. adscendentib. compress simplicib. glabr., fol. bifariis brevib. 2—3 p. long., 4—5 l. l., ensiformib. obtusiusc. subcomplicat., super. minorib., vaginis undiq. hispid., pedunc. terminalib. et in bractearum vaginant. axill. pollic. plurifl., florib. racemos. br. pedicellat., sepal. exter. oblong. obtus. glabr., inter. petaloid. rotundat., roseis, ovulis in locul. ternis.

Anth. fertil. 2 albae, filam. alb., pil. roseis barbat. Stam. 1, depauperatum barbatum; glandulif. 3 parce barbata, glandul. 3-lob. Caps. oblonga, sep. exter. persist. duplo longior., 9-sperma; cartilaginea. — Cresc. in prov. Malwan; fl. temp. pluviali. — *A. nudifloro* valde aff.

9. ANEILEMA FOLIOSUM Hassk. — Hassk. in pl. Jungh. II. p. 144.

Repens, f. b. amplexicaulib., sessilib., lin-lanceolatis, patentib., glabris; racem. terminalib. oliganthis, bracteatis; fructib. 3-ocularib., loculis 2-spermis, calycis foliolis interiorib. aequalib., staminib. fertilib. binis.

Hab. Javae centr. montis Ungaram declivitates bor. pr. Medini, inter 3—5000' alt. — Herbae e caule centrali radiatim prorepentes, etc.

10. ANEILEMA DIVERSIFOLIUM Hassk. — Hasskarl in pl. Jungh. II. p. 142.

Pilosum, caule b. repente adscendente, f. infimis lato-linearib. acuminatis, ramis sessilib. amplexicaulib. oblongo-lanc. acutis s. acuminatis utrinq. glabris, fl. 4—6 in racemos terminales aut quid. in ramor. apicib. racemoso-collectis bracteatis, staminib. fertilib. binis, filamentis barbatis, seminib. in loculis binis, fructib. nitidis.

Hab. Javae centr. montis Ungaram declivitates bor. pr. Medini inter 3—5000' alt. — Herba b. procumbentes, dein adscendentes etc.

11. ANEILEMA LORIFORME Hassk. — Hasskarl in pl. Jungh. II. p. 143. — Hab. in Javae centralis montis Ungaran declivitatib. borealib. pr. Medini inter 3—5000' alt.

Herbae perennae, cespitosae, gramineae; radices fibrosae; caules plures erecti, subsimplices aut ramosi etc.

Maxime accedit A. siliculosum R. Br. (Kunth enum. IV. 68. 9). quod differt: filam. imberbibus, f. supra scabris, ensiformib.; caeterum differunt A. gramineum R. Br. (Kunth. I. c. 14) filament. 3 fertilibus, f. subciliatis et tota pl. pilosiuscula; A. longifolium Hook. (Kunth. I. c. 71. 34) paniculis submultifloris, staminib. fertilib. tribus.

VIII. TRADESCANTIA Linn.

(Kunth. en. IV. 80. — Walp. Ann. III. 659.)

v. Schlechtend. in Linn.-XXV. p. 186.

1. TRADESCANTIA IRIDESCENS Lindl. (Kunth. en. IV. 85. n. 16.) — v. Schlecht. hort. Hal. fasc. III. p. 21. tab. XI. f. 1—6. cfr. I. c. plantae nov. descript. — Illis adjicenda est speciebus quae c. Tr. crassifolia conveniunt foliis crassiorib. et caulibus persistentib., a quib. removendae sunt perennes, quar. caules quotannis novi e terra surgunt et perfecta fructificatione pereunt, ut Tr. Virginica, pilosa, Lyoni aliaeque.

var. *glabrescens* Regel h. bot. Petrop. 1857. — Haec varietas vel potius forma et a diagnosi Lindleyana (Bot. Reg. 26, tab. 34) et a descriptione Schlechtendaliana (Hort. Hal. fasc. 3, 21, tab. 11) differt foliis subtus glaberrimis vel hinc inde pilo rarissimo conspersis margine tantum molliter denseque ciliatis. Caulis inferne glaber, superne pilis patentibus mollibus pubescens. (Kcke.)

2. *TRADESCANTIA HYPOPHAEA* C. Koch et Bouché ind. sem. h. Berol. 1855.

Procumbens; caules geniculati, unifariam pilosi; folia oblonga, acuta, hirsuta, vaginis villosis; pedunculi dichotomi, glaberrimi, ramis glandulosis; umbella 2—5 flora, glandulosa; flores parvuli; calyx longitudine corollam aequans.

Species a cl. Warszewicz e regionibus tropicis Americae in Germaniam allata, *T. geniculatae* Jacq. proxima, differt tamen caule unifariam piloso, foliis minoribus et umbellis glandulosis. — Caules procumbentes, imo dependentes, elongati, serie pilorum praediti, ceterum glaberrimi, nitentes, saepe brunnescentes; folia ovato-oblonga aut oblonga, 7—10 lin. longa, 4—6 lin. lata, pilis singulis tuberculis parvulis insidentibus vestita, margine brunneo-cincta, subtus violaceo-brunnea, internodia subaequantia, 3- aut 5 nervia, vaginae striatae, villis obsitae, lamina folii quadruplo breviores; pedunculi terminales, gemini, inaequales, folio breviores, dichotomi; bractee dichotomiae geminae, lanceolatae, ramis subtriplo breviores. Pedicelli inaequales, floribus sesquolongiores; calycis sepala ovato-lanceolata, basi connata, nervo medio plerumque glandulifera; petala alba; stamina subaequalia, antheris subdicocis, aureis; filamenta villis singulis obsita; ovarium trigonum, apice truncatum, stylo duplo brevius; ovula subglobosa, orthotropa; capsula ovata, vix trigona, vertice saepe pilis singulis obsita, stylo persistente coronata; semina compressa, medio impressa, subrotunda, grisea, subtiliter punctulata.

3. *TRADESCANTIA ERECTA* Jacq. Ic. 2, t. 2354. — Regel hort. bot. Petrop. 1857. —

Cl. Kunth in En. pl. IV., 98 injuste ad hanc speciem ducit Cavanillesii iconem (Cav. Ic. tom. 1, 53, tab. 74) sub eodem nomine promulgatam, quae ad *Tr. undatam* Willd. pertinet. Differt enim haec species a *Tr. erecta* Jacq. praeter corollam roseam (nec coeruleam) pedunculo praeter pilos breves densos pilis multo longioribus hyalinis in sicco irregulariter perturbatis hirsuto (nec pilis brevibus tantum densis tenuibus non hyalinis pubescente). Id enim docet non solum icon Cavanillesii ipsa, sed etiam specimen a cl. Ortega olim cum Pallasio communicatum nunc in Herb. Hort. Petrop. conservatum. Praeterea stamina nostrae speciei a cl. Kunthio l. c. male describuntur. Filamenta enim coerulea (nec fusciscentia nec albedo-barbata), staminum trium inferiorum sursum arcuata, duorum lateralium supra (sc. in latere interiore) a medio fere ad basim usque pilis longis coeruleis articulatis barbata, tertii medii paulo brevius glabrum; staminum trium superiorum breviorum minus sursum arcuata, duorum lateralium in medio (in latere exteriori) pilis coeruleis et flavis fasciculatis barbata, tertii medii paulo brevius in medio pilis flavis (inferioribus basi subcoeruleiscentibus) barbata. Antherae staminum trium longiorum oblongae, coeruleae; staminum minorum breviores sed latiores, ovaes, basi apiceque emarginatae pulchre flavae. (Kcke.)

4. *TRADESCANTIA PANICULATA* Roxb. — Griffith notulae (1851) p. 234. — Cfr. l. c. plantae descr. — Hab. in humidis silvosis inundatis, Mergui; Moulmein copiosa. — Omnib. fere notis accedit, sed ovar. 2-loculare 2-ovulatum et breviter stipitatum.

5. *TRADESCANTIA LYONII* hort. — v. Schlechtendal in Linnaea 1852. p. 187.

6. *TRADESCANTIA GONATANDRA* Schldt. — v. Schlecht. in Linn. XXIV. p. 659, melius fortasse: *Gonatandra tradescantioides* Schldt. — Cfr. l. c. pl. descr. et observ. — Confer infra *Campeliama fastigiata* Schlecht. l. 1

6. *TRADESCANTIA MARTENSIANA* (Kunth. enum. IV. 697.) — Hook. bot. mag. t. 4849.

8. *TRADESCANTIAE* sp. — Griffith l. c. p. 235.

VIII/2. **STREPTOLIRION** Edgew.

(Walp. Ann. I. 885.)

Icon addenda.

STREPTOLIRION VOLUBILE Edgew. Linn. Tr. — Wight Ic. tab. 2081.

IX. **TINANTIA** Scheidw.

(Knth. en. IV. 100.)

1. **TINANTIA UNDATA** Schlechtd. (*Tradescantia undata* Willd. = *Tinantia fugax* Scheidw. Knth. enum. IV. p. 98. et p. 101.) — v. Schlechtend. in Linn. XXV. p. 185. — Sepala anguste elliptica, obtusa, concava, pilis albis glandula terminatis hirsuta. Petala (Kunthii sepala interiora) dilatato-rotundata breviter cuneato-unguiculata, calyce vix longiora, intense rosea. Stamina 6, 3 superiora anther. luteis, filamentis a medio barbatis, barba e pilis moniliformib. in latere superiore tantum praesente, pilis filamenti medii totis aureis, lateralib. b. roseis superne aureis; antherae rotundatae connectivo medio dilatato in utroq. marg. pollinifero. Stamina 3 inferiora longiora surs. curvata, intermed. brevius nudum, lateralia longiora inferne in latere superiore pilis longis nodoso-articulatis roseis breve per spatium obsessa; antherae his tribus paulo longiores ellipticae e glauco viridescentes, locul. parallelis marginalib. connectivo angusto sejunctis, polline luteo et viridescente. Ovar. declinatum oblongum e lutescenti viridescens. terminatum stylo cylindraceo, eodem modo ac stamina infera curvato, intense roseo, ap. attenuato; stigma terminale parvum, capitatum. Caps. in pedicello erecto sese aperiens trivalvis. — Habitu Tinantiam erectam omnino aequat, etc.
2. **TINANTIA ERECTA** Schlichtd. — v. Schlechtend. l. c. = *Trad. erecta* Jacq. (Knth. enum. IV. p. 98.)
3. **TINANTIA LATIFOLIA** Schlichtd. — v. Schlichtd. l. c. = *Tradescantia latif.* Rz. et P. (Knth. l. c. p. 99.)

XI. **CYANOTIS** Don.

(Knth. en IV. 102. — Walp. Ann. III. 660.)

1. **CYANOTIS HISPIDA**. — Dalz. in Hook. j. Kew gard. misc. III. 139.

4—5 unc., annua tota hispida b. versus parce ramosa, caulib. erect. teretib. striat. rubris, f. lin.-ensiformib. carnos. subplan., 1—2 p. lg., 3—6 l. l., fl. terminalib. in bract. falcato- $\frac{1}{2}$ cordatis sessilib. capitato-congestis paucis (4—5).

Calyc. lacin. exter. lin.-lanc., dorso marginibusq. ciliatae, 3-nerv., ima b. connatae interiores exteriorib. paulo longiores, 3 lin., in tub. petaloid. obconic. ap. 3-lobat. connatae; lobi rotundati, laete punicei, tubo albo breviores. St. 6 fertib., lg. exserta, corollam duplo superantia, styl. aeq.: anth. intense violac.; filam. superne pilis coeruleis secundis barbata, sub ap. incrassata. Caps. inclusa, oblg. obtusa, ap. vers. pilosa, locul. dispermis. — Crescit in rupib. prov. Malwan; fl. Aug. et Sept.

2. **CYANOTIS VIVIPARA** Dalz. — Dalzell in Hook. j. Kew gard. misc. III. 226.

Epiphyta acaulis tota pilis rufis patulis dispersa, f. radicalib. lin.-ensiformib. plan. crass. carnosis fasciculat., scapis ex radice orientib., filiformib. radican. viviparis, peduncul. e scapi nodis solitariis alternis, umbellam bi-trifloram bractea duplici suffultam gerentib., bracteis ad bas. pedunculi foliac. parvis oblg. acutis vaginantib., capsulae valvis post dehiscenciam valde recurvis, oculis 2-spermis, seminib. cylindricis.

Cresc. in arborib. in jugo Syhadrensi. Fl. Aug. Septbr.

3. **CYANOTIS ADSCENDENS** Dalz. — Dalzell Contrib. to the bot. of Western Ind. Kew journ. bot. IV. 343.

Caulib. e radice tuberoso plurib. adscendentib. simplicibus b. ad nodum infimum radican. teretib. striatis nitentib. alternatim linea pilosa instructis, f. lineari-ensiformib. acutis glabris carnosis recurvis b. vaginatis, vagina brevi integra glabra v. pilosa, pedunc. axillarib. terminalibusq. elongatis, axillarib. solitariis v. geminis, terminalib. ex folio supremo quinis umbellatis, capitulis involuto-spicatis multifloris (30 fl.)

folio brevi suffultis, bract. floralib. biserialib. imbricatis falcatis obtusis ciliatis.

Tubera cylindrico-oblonga. Caulis $1\frac{1}{2}$ ped. F. 2—3 p. lg., 2— $2\frac{1}{2}$ l. l. Pedunc. $1\frac{1}{2}$ —3 p. lg. Calyc. laciniae lin. acutae, dorso pilosae. Cor. 3 l. longa. Filamenta corolla duplo longiora; anth. flavae. Ovar. 3-lobat., appresse pilosum; sem. in quoq. loculo 2, rugosa, nitida. — Crescit circa Belgaum, in graminosis humidis frequens.

4. CYANOTIS CRISTATA Roem. et Sch. — (*Commelyna cristata* Linn. non Burm.) Wight. Ic. tab. 2082.
5. CYANOTIS PILOSA Roem. et Sch. — Wight Ic. tab. 2083.
6. CYANOTIS LONGIFOLIA R. W. — Wight Ic. tab. 2084.
7. CYANOTIS LANCEOLATA R. W. — Wight Ic. tab. 2085.
8. CYANOTIS ROSEA R. W. — Wight Ic. tab. 2086.
9. CYANOTIS LAWIANA R. W. — Wight Ic. tab. 2086.
10. CYANOTIS FASCICULATA? Roem. et Sch. — Wight Ic. tab. 2086.
11. CYANOTIS DICHOTRICHIA Stocks ms. — Wight Ic. tab. 2087. 1.
12. CYANOTIS SARMENTOSA R. W. — W. Ic. tab. 2087. 2.
13. CYANOTIS DECUMBENS R. W. — W. Ic. tab. 2088. 1.
14. CYANOTIS VAGINATA R. W. — W. Ic. tab. 2088. 2.
15. CYANOTIS PAPILIONACEA Roem. et Sch. — W. Ic. tab. 2089. 1.
16. CYANOTIS BURMANNIANA R. W. — (*Commelyna cristata?* Burm. non Linn.) — Wight Ic. tab. 2089. 2.

XI $\frac{1}{2}$. ZEBRINA Schnizl.

(Walp. Ann. III. 661 in annot.)

1. ZEBRINA PENDULA Schnizl. (Walp. Ann. III. 661. n. 5. in adnot.) — Schnizl. observat. hort. Erlang. 1851. — Speciem hanc ex qua genus Zebrinae condideram (Bot. Z. 1849 p. 869) celebr. Nees ab Esenbeck in catalogo h. Vratislav. Cyanotidis generi adnumeravit. Pl. autem e seminib. Cyanotidis cristatae acceptis indeque enata, atque jam Linnaeo cognita docuit me, genus Zebrinae bene conditum esse et plane inter se differre haec 2 genera. Cyanotis illa differt calyce fere eleutherophyllo, staminib. mere hypogynis longeque prominentib., connectivo angusto, item ut antherar. loculi sese fere tangant, deniq. forma stigmatis quod amphoram valde contractam aequat et margine prominulo instructum est. Zebrina autem habet calycem tubulosum, stamina corolliflora, connectivum illud maxime dilatatum et stigma capitato-trilobum. — Decaisne Rev. hort. Par. 1855. p. 141. tab. 8.

XII. CAMPHELIA L. C. Rich.

(Knth. en. IV. 107.)

1. CAMPHELIA FASTIGIATA Schlicht. (*Tradescantia Gonatandra* v. *Gonatandra tradescantioides* Schldl.) Linn. XXIV. p. 659. Quam in corollario praeteriti anni novam Tradescantiae speciem imo novum genus habuimus plantam nunc, speciminib. laetius evolutis, copiosius florentib., melius observatis sine omni dubio in Campheliae genere collocamus, sed e. aliq. temeritate pro nova specie declaramus. Multis enim notis C. glabratae Kothii, a me non visae, nimis parce obiterque descriptae respondet, — Confr. pl. descr. f. c.

XIII. DICHORISANDRA Mik.

(Knth. en. IV. 109. — Walp. Ann. III. 661.)

1. DICHORISANDRA THYRSIFLORA Mik. (Knth. en. IV. 113). — Mart. fl. Brasil. l. c. tab. 32. f. 1. (analysis).
2. DICHORISANDRA TEJUCENSIS Mart. — Mart. Fl. Bras. p. 238. tab. 32. f. 2.

<i>Dichorisandra Tejucensis</i>	}	Knth. en. IV. p. 113 et 112.
<i>Dichorisandra Leandri</i>	}	

Caule ramoso pubescente f. e b. oblique rotundata ovato-oblongis acuminatis subt. vaginisque sericeo-pilosis; racemo terminali villosa pubescente ramulis patentissimis 4—5 floris; sep. molliter pilosis; petalis obovatis obtusis.

Caules 2—3 pedales caet. — In locis provinc. Sebastianopolitanae Bras. fl. Febr., Mart. 2.

3. *DICHORISANDRA PICTA* Hook. (bot. mag. t. 4760). — Martius l. c. p. 240.

F. lato-ellipticis mucronato-acuminatis subternatim approximalis fusco-maculatis, panicula terminali plurifl., fl. hexandris dioicis (an semper?) petalis ovalib. obtusis.

Dichoris. picta hortulanor. et Hook., Schlecht. in Linn. XXV. p. 456.

Patria: Brasilia? — Planta paululum ultra pedalis, subramosa etc.

4. *DICHORISANDRA INCURVA* Mart. (Kunth en. IV. III.)

var. *glabrescens*: Mart. fl. Brasil. p. 242.

Caulib. elongatis, ramosissimis subscandentib. vaginisque glabriusculis.

Cresc. in silvis alternis prov. Sebastianopolitanae var. β . pr. Cujaba: M. 2.

5. *DICHORISANDRA OXYPETALA* Hook. — Martius l. c. p. 242.

Dichorisandra oxypetala Hook. }
Dichorisandra latifolia Knth. } Knth. en. IV. 113 et 112.

F. ellipticis utrinque acuminatis glabriusculis, vaginis ore ciliatis; racemo terminali villosa pubescente; ramulis abbreviatis paucifloris; sep. oblongis glabris; petalis acutis.

Cresc. in Brasiliae prov. Sebastianopolitana. 2. — Caulis humilis simplex, caet.

6. *DICHORISANDRA PENDULIFLORA* (Knth. en. IV. 114.) — Martius l. c. p. 244. t. 33.

7. *DICHORISANDRA LEUCOPHTHALMOS*. — Hook. bot. mag. 1853. tab. 4733.

F. ellipticis acuminatis utrinque glabriusculis, scapis radicalib. v. subradicalib. aphyllis vaginatis paniculatim racemosis glaberr., bract. e lata b. acuminatis sep. exteriora vix superantib., fl. hexandris.

Patria: Brasilia. — Spec. valde affn. *D. radicali* Nees et Mart.

8. *DICHORISANDRA MARGINATA* Schldt. (*D. ovalifolia* h. Jen. nec Presl.) — v. Schlecht. in Linn. XXVI. p. 454. — Caulis florifer quotannis ex rhizomate oritur 3-ped. etc. —

Patria l. c. non appellata.

Annotatio: Gynandrarum subclassis secundum in Annalibus adhuc observatum ordinem rite locum obtinere delieat quartum, inter subclassem Rhizanthearum et Scitaminearum. Quod tamen subclassis haec a celeberrimo Reichenbachio curata serius quam desideraverim ad lucem publicam prodeundam adferit, illa hoc in loco effermat subclassem octavam, et inter monocotylearum ordines locum obtinet duo detricesimum. — Subclasses Coronarias (p. 99) et Enanti oblastas (p. 157) errore numeris VII. et VIII. ut in priore cyclo hic designatas, numeris VI. et VII. lectores benevole significant ab iis observanter quaero, ut ordinum series rite inhibeatur.

Subclassis VIII. **GYNANDRAE** Endl.

(Endl. Gener. pl. p. 184. — Meisn. Gen. pl. vascul. I. 367. II. 275.)

Ordo XXVIII. ORCHIDES Juss. *)

(Gen. 64. (1789).)

Lindley, Folia *Orchidacea*. Vol. I. Londini 1852 — 1855. H. C. Reichenbach fil. *Xenia Orchidacea Lipsiae* ab anno 1854.**Subordo I. MALAXIDEAE** Lindl.1316. **PLEUROTHALLIS** R. Br.

(Walp. Ann. III, 516.)

Sect. *ELONGATAE* Lindl.— Typus *Pleurothallidis bogotensis* Lindl. —

1. **PLEUROTHALLIS GLOSSOPOGON** Rehb. fil. in Bonpl. III, 71: aff. Pl. bogotensi Lindl. labello basi humerato tripartito, partitionibus lateralibus linearilanceis introrsum hamatis, partitione media plus duplo longiori ligulata basi bicarinata, lineis tribus parallelis papularum per discum, apice barbulate; gynostemio apiculato. Tenuior Pleurothallide bogotensi. Caulis secundarius spithamaeus tenuis. Folium oblongum utrinque attenuatum Pleurothallidis racemiflorae. Spatha inflorescentiae parva membranacea. Racemus folio longior; pauciflorus. Flores illis P. bogotensis paulo majores; vulgo resupinati. Sepalum utrumque a basi ovato lanceolata attenuatum, inferius apice latius, superius ibi subulatum. Tepala Pl. bogotensis, sed longius subulata. Granat. nov. 7000'. Wagener.
2. **PLEUROTHALLIS BISERRULA** Rehb. fil. in Bonpl. III, 71: aff. Pl. bogotensi labello obtusiori utrinque argute retrorsum serrato dentato. Planta angustior. Folium oblongum valde coriaceo-carnosum basi cuneatum apice obtusatum tridentatum 4 — 5 pollices longum, duos latum. Spatha pergamenea nitida. Pedunculi folium quarta excedentes gemini. Sepala multo validiora, minora, quam in Pl. bogotensi, inferius apice bicuspe. Tepala uti in illa, basi undulata, crenulata. Labellum basi cordatum, ligulatum, per discum tricarinatum — supra descriptum. Ocanna Wagener.
3. **PLEUROTHALLIS SIRENE** Rehb. fil. in Bonpl. III, 71: e typo Pl. bogotensis: tri-sepala, labello tripartito, basi humerato, partitionibus lateralibus lineari-ligulatis abbreviatis, partitione media rhombeo-ligulata acuta basi utrinque carinata antice serrulata. — Minor Pleurothallide bogotensi. Folium oblongum attenuatum subacutum valde coriaceum. Spatha coriacea. Inflorescentia solitaria, seu plures, folio tantum tripollicari duplo triplove longiores. Sepala Pl. bogotensis, sed tria. Gynostemium apiculatum. Perigonium aquose brunneum purpureo-striatum uti in Pleurothallide Lindeni. — n. Granat. 6 — 7000'. Martio, Wagener.

*) Compilavi, quae annis 1851 — 55 edita additis quibusdam in tomo tertio omissis. In eo autem in anachronismum incidi, ut quae emendata post annum 1855, ea jam nunc correxerim. — H. G. Rehb. fil.

4. **PLEUROTHALLIS PHALANGIFERA.** *Acronia phalangifera* Presl. Pl. Mathewsii Lindl. Pl. bogotensis Lindl. Rehb. fl. in Bonpl. III. 239. Planta elata incluso pedunculo pedalis. Caulis secundarius sub folio longe evaginatus. Folium oblongo obovatum acuminatum basi rotundato cuneatum, spithamam longum, ultra tres pollices latum. Pedunculus racemosus nunc geminus; infra nunc laxiflorus, nunc totus laxiflorus. Bractee oblique ochreatae vaginatae apice acutiusculae. Flores infimi longe pedicellati, supremi breviter. Sepalum utrumque triangulo acuminatum, tepala a basi lanceolata setacea, subaequalia. Labellum triangulo acuminatum, utrinque ante basin rotundatam angulatum, disco basilari gibberoso carnosum, tepalis plus duplo brevius. Gynostemium gracile clavatum labello brevius. (Néu - Granada Linden 1271!) Woods near Pasto. Sept. 1848. 436. Jamieson
5. **PLEUROTHALLIS PEDUNCULATA** Rehb. fl. Linnaea XXII. 822. Paxt. fl. G. III. 138. c. xyl. 298.
— Typus *Pleurothallidis acuminatae* Lindl. —
6. **PLEUROTHALLIS ACUMINATA** Lindl. (*Dendrobium acuminatum* Hb. f. B. Kth. I. 357.) Rehb. fl. Bonpl. II. 24. — Caule secundario abbreviato angulato, folio oblongo apice basique attenuato valde coriaceo, racemo spithamaeo sextuplo breviori, spatha vaginisque basilaribus abbreviatis, racemo totum pedunculum occupante, bracteis vaginaeformibus ore dilatatis retusis supra nervum medium acutis, ovariis pedicellatis bracteis duplo longioribus, mento obliquo, sepalis linearilanceis acuminatis subaequalibus, tepalis anguste oblongis acutis, quadruplo brevioribus, labello oblongo utrinque attenuato, ante basin utrinque undulato constricto, apice retusiusculo emarginato, nervis 3 carinato elevatis, gynostemio gracili alato, apice cucullato, denticulato. Flores sicci flavo - rubri.
7. **PLEUROTHALLIS ASPERILINGUIS** Rehb. fl. et Warscew. Bonpl. II. 114: aff. Pl. aureae tepalis trinerviis, labello cuneato oblongo quinquenervi ante apicem papulis acutis aspero, medio utrinque obliquo marginaliter carinato, anthera apiculata. Spithamaea. Caulis in sicca planta obscurus, infra a vaginis 3—5 vestitus, supra summam elongatam acutam nudus. Folium oblongum apiculatum basi cuneatum racemo subdimidio brevius, bene coriaceum, bipollicare, medio prope dimidium pollicem latum. Spatha membranacea acuta trilinearis in basi racemi basin usque floridi, — 10 flori; 3—4 pollicaris. Bractee ochreatae apice retuso apiculatae. Mentum rectangulum. Sepalum summum triangulum apice lineare, inferiora subaequalia, basin usque divisa. Tepala a cuneata basi ovata acuta trinervia. Labellum a basi angustiori oblongum acutiusculum, 5 nerve, ante apicem papulis acutis asperum, carinula obliqua brevi extrorsa utrinque ante medium marginem; gynostemio alato, androclinio cucullato denticulato; anthera apiculata. Flores flavi, illis P. aureae Lindl. seminaeque. Peru. Warscewicz.
8. **PLEUROTHALLIS DINOTHERII** Rehb. fl. et Warscew. Bonpl. II. 114: aff. Pl. intricatae, perigonio externo bilabiato, sepalis 2 inferioribus linearifalcatis deflexis, sepalis ovato-falcatis, labello ligulato, gynostemio utrinque rotundato alato. Caulis gracilis vaginis Lepanthinis hyalinis arctis ostio ampliori ciliolato ita sibi superpositis, ut recentissimus sit axillaris in folio anni praecedentis, ita 4 vulgo superpositi; foliigeri. Folium lanceolatum acutum basi bene cuneatum, bipollicare, medio $\frac{1}{2}$ pollices latum, trinerve; basi sua cum pedunculo ac gemma pro anno insequenti inclusum in vagina ampla quinquenervi acuta. Pedunculus elongatus, sparsiflorus (secundiflorus), 6—7 pollicaris, per pollicem infimum nudus, bractee arcte vaginatae acutae minutae; perigonium ima basi coalitum tripartitum, bilabiatum, sepala linearia, summum ascendens, inferiora falcato deflexo; tepala cuneato ovata, acuta, incurva, margine microscopice denticulata; labellum brevissime unguiculatum, ligulatum acutum, utrinque obscure sinuatum, margine minutissime velutino ciliatum; gynostemium gracile retusum, ala semiovata minute denticulata utrinque pone foream. Peru. Warscewicz.
9. **PLEUROTHALLIS LISTROSTACHYS** Rehb. fl. in Bonpl. III. 71: aff. Pl. stenopetalae Lindl., sepalis linearibus elongatis (nec lineari-lanceis) ciliatis, inflorescentia hinc

scopiformi. Caulis secundarius ultra spithamaeus paucivaginatus. Folium ovatum seu oblongum basi petiolato-attenuatum apice contractum, valde carnosum, superne venosum. Spatha minuta pro inflorescentia nunc solitaria, nunc gregaria. Racemi densiflori secundiflori. Flores horizontales siccis cinabarinis seu flavidi. Sepala linearia margine ciliatula. Tepala cuneato-ovata apice unipapulosa, multo breviora. Labellum trilobum: lobi laterales semiovati, lobus medius ligulatus productus, carinae ternae in labelli basi; discus lobi medii nunc papulosus. Gynostemium clavatum apiculatum. — N. Granat. 1000'. Ocanna. Wager. Martio.

10. **PLEUROTHALLIS LANCEANA** Lodd. Bot. Cab. 1767. Huc: Pl. crassifolia Focke in Tidsch. voor de Wis. Nat. Wetsch. II. Af. 1849. p. 196. Caule brevi monophyllo. Folio elliptico acuto subcarnoso, racemo multifloro cernuo folio longioro, sep. in tubum angulosum attenuatum connatis, lat. apice tantum liberis, supremo ultra dimidium cum lateralibus connato, petalis plus dimidio minoribus oblongo-lanceolatis aristato acuminatis ciliatis, labello dilatato linguiformi unguiculato, basi bicalloso. Caulis teres, erectus, subincurvus, 1—4 cent. longus. Fol. ellipticum, vel oblongum, utrinque acutum, apiculatum, crassum, strictum, subcarnosum, planum, basi plicatum, caule interdum quadruplo longius, 3—8 cent. longus, 15—30 millim. latum. Racemus multiflorus, teres, cernuus, validiusculus, articulatus, e sinu baseos folii ortus, ibique bractea complicata, acuta, membranacea, fusca vestitus. Vaginae minutae ad quemque articulum adpressae, deltoideae, aristate mucronatae, virides. Pedicelli brevissimi. Flores subsecundi, adpressi, sub lente velutini, ochracei, centimetri longitudine, 2 mm. ad basin crassi. Perianth. clausum. Sepala in tubos triangulares apice attenuatos connatos, ochracea, basi intus purpurea; lateralibus inter se non nisi apice libera, supremum ultra dimidium cum lateralibus connatum. Petala plusquam dimidio minora, oblongo-lanceolata erecta, aristato-acuminata, margine ciliata, uninervia, diaphana. Lab. petalis brevius, dilatato linguiforme, concavum, unguiculatum, cum columnae basi producta apiculatum, subcarnosum, intus basi bicallosum. Columna erecta, crenata, labello subaequalia, marginata, basi purpurea, clinandrio tridentato. Anthera unilocularis, clinandrio immersa. Poll. 2, orbiculata, **in clinandrio subinde attenuata** (!!!), plano convexa, incumbens. Ovarium sulcatum, obsolete trigonum. — Hab. In Surinami sylvis ad plantationem Berlijn, ad rivum Pansa, supra arborem. Fl. Oct. et Majo.

Obs. Non solum iconem Fockeanam habeo 250 et 1846. delineatam, quam habuit cl. Lindley, sed quae addidit 24. Majo 1848 et typum Fockei et Wulfschlaegelii, Icon primaria est plantae macrae stenophyllae.

— Typus *Pleurothallidis loranthophyllae* Rchb. fil. —

11. **PLEUROTHALLIS LORANTHOPHYLLA** Rchb. fil. in B. Z. 1852. p. 674: disepala labello indiviso, caulibus secundariis teretiusculis, validis, folio oblongo basi petioli instar cuneato, apice acuto, imo apice tridentato, dente medio minori, spatha coriacea magna, ancipiti; pedunculo valido folium nunc longe excedente, racemoso; bracteis ochreatis, retusis, hyalinis; floribus bilabiatis, phyllo supremo lanceolato, acuminato seu acuto, phyllis lateralibus externis connatis in unum naviculare, acutum, phyllis lateralibus internis a cuneata basi oblongis, acuminatis, externa subaequantibus; labello rhombeo antice ligulato; gynostemii androclinio nudo.

Rhynchopora punctata Karsten Ausw. Gew. Venez. VII! Walp. Ann. III. 521. Flores illis Pl. pubescentis Lindl. aequales albivirides maculis rufo violaceis. Columna et labellum aequicolores. Pollinia viscoso appendice antice quadrato. Pedicelli alte supra axillam bractearum inserti. Pars inferior est racemosa, superior spicata. — Rchb. fl. Bonpl. II. 24. — Eodem loco: Caracas. Wager.

„*Pleurothallis subpellucida* Kloitzsch est valde affinis et transire videtur in hanc.“ — Nunc omnino persuasum habeo, esse exacte eandem. En descriptio: Pl. (Elongatae) subpellucida Kl. Caespitosa; caule secundario teretiusculo, infra medium vagina membranacea obtusa arida instructo; folio crasso, coriaceo, oblongo, longitudinaliter canaliculato, apice breviter tridentato, basi attenuato, articulato, caule duplo

longiore; vagina spathacea, membranacea, subtubulosa, compressa, ab uno latere in acumen brevissimum attenuata; pedunculis solitariis, binis aut rarissime ternis, 12—15 floris, filiformibus, folio subduplo longioribus; bracteis pellucidis, ochreatis, breve acutis; pedicellis elongatis, extraaxillaribus; ovariis brevibus, teretiusculis, longitudinaliter 6-sulcatis, perianthii foliolis exterioribus pellucido-stramineis, elongato-lanceolatis, acutis, superiore trinervio, inferiore latiore sexnervio, interioribus angustis brevioribus; labello lanceolato, acuto; gynostemio brevi, subovato. — Orchidea e tribu Malaxidearum. — Caulis secundarius 4—5 pollices longus, lineam in diametro. Folia 4 poll. longa, 1½ poll. lata. Spatha bipollicaris. Racemi 6—8 poll. longi. Pedicelli 3—4 lin. longi. Germen lineam longum. Perigonii foliola exteriora 4 lin. longa, supremum lineam latum, 2 inferiora in unum usque ad apicem connata, 2 lin. lata, interiora 3 lin. longa, vix lineam lata. — E Venezuela misit Wagner.

— Typus: *Pleurothallis Kefersteiniana* Rchb. fil. —

12. PLEUROTHALLIS KEFERSTEINIANA Rchb. fil. B. Z. 1852, 673: caulibus secundariis teretiusculis tenuibus abbreviatis, folio oblongo, apice attenuato, acutiusculo, imo apice microscopice tridentato, basi longe cuneato, pedunculo tenuissimo, superne flexuoso, racemoso, plurifloro (—9). (certe ex spatha decidua orto), trivaginato, vaginis scariosis, arctis, apice libero acutis, folium nunc duplo superante, bracteis ochreatis, acuminatis, floribus hiantibus, perigonii phyllo supremo lanceolato acuto, lateralibus externis connatis, a cuneata basi ovatis, utroque interne papillis filiformibus barbato, phyllis lateralibus internis a cuneata basi dilatatis, apice obtuso triangularibus, duplo brevioribus; labello unguiculato, cordato, lateribus rectis antrorsum cuneatis subito utrinque profunde emarginatis, in unguem apicis ovalis (si mavis: trilobo unguiculato, lobis lateralibus dolabriformibus, medio unguiculato ovali minuto papuloso) papulosi; androclinio membranaceo, ciliolato. — Sepala tepalis duplo latiora. Papillae niveae filiformes spectabiles. Labellum introrsum complicatum. Sepala et labellum ochracea, illa maculis fuscis, hoc violaceis. Columna rosea. — Venezuela, Wagener. — Rchb. fil. Bonpl. II. 24: Caracas. 4000—5000'. October. Rarissima.

— Typus *Pleurothallidis pulchellae* Lindl. —

13. PLEUROTHALLIS (Elongatae Racemosae Disepalae) SEGOVIENSIS Rchb. fil. in Bonpl. III. 223. — Aff. *P. Ghiesbreghtianae* A. Rich. Gal. caulibus secundariis abbreviatis, folio anguste cuneato oblongo obtuse acuto, pedunculo gracili multifloro, sepalo inferiori lanceolato bidentato, tepalis falcatis acutis abbreviatis, labelli ungue margine papilloso, laminae cordato rotundatae partitionibus lateralibus lanceis acutis antrorsis partitioni mediae oblongae obtuse acutae duplo brevioribus, gynostemii clavati gracilis androclinio denticulato. Planta gracilis semipedalis. Caules secundarii omisso pedunculo vix pollicares. Folia tripollicaria. Pedunculus tenerrimus tertio inferiori paucivaginatus, sursum secundiracemosus. Bractee ochreate apiculatae. Flores bilabiati sicci violacei. Sepalum summum lanceum. Labelli lamellae marginales a lobi medii basi discum versus convergentes. — Magnitudo florum *Pleurothallidis saurocephalae* Lindl. In Segovia. Oersted.
14. PLEUROTHALLIS MAGDALENAE Rchb. fil. in Bonpl. III. 72. — Similis *Pl. incomptae* Rchb. fil. trisepala, labello ligulato obtuso utrinque ante basin angulato, tepalis ligulatis basi inferiori acutangulis, gynostemio clavato. — Plantula gracilis macra quinquespollicaris. Caulis secundarius vaginis vestitus. Foliolum spatulato-oblongum acutiusculum vix bipollicare dimidium pollicem vix latum. Pedunculi tenues pluriflori secundiflori. Bractee pellucidae ochreate. Sepala triangulo-ligulata. Quasi imminuta *Pl. pulchella* Lindl. — Ocanna: Magdalena. Wagener.
15. PLEUROTHALLIS INCOMPTA Rchb. fil. Bonpl. II. 24. — Caule secundario abbreviato, folio cuneata basi oblongo obtuso apice obtusato, medio minute trimucronulato, spatha membranacea abbreviata, pedunculo gracili laevi dimidio inferiori

1—2 vaginulato, vaginis brevibus arctis acutis, racemo plurifloro, sublaxifloro, bracteis vaginaeformibus oblique retusis supra nervum acutis, floribus illos *Pl. pictae* aequantibus, sepalo summo oblongo lanceolato acuto, galeato, inferiori elliptico apice bidentato ceterum omnino connato, tepalis ovato lanceis paulo brevioribus, labello sepalis aequilongo oblongo obtuso, supra medium pandurato constricto, gynostemio gracili, androclinii limbo cucullato denticulato. Pone *Pl. panduriferam* Lindl., quae tepala habet obtusa et lobum labii medium angustum. Caracas. Wagener.

15. *PLEUROTHALLIS NICARAGUENSIS* Rehb. fl. in litt. ad cl. Wendl. fl. — Aff. *Pl. incomptae*: sepalo superiori ovali obtuse acuto, inferiori subaequali latiori apice non emarginato, tepalis rhombeis obtusis, labello ovali medio utroque latere emarginato, hinc trilobo, lobis lateralibus obtusatis, lobo medio ovali obtuso acuto, callis geminis in parte postica, androclinio tridentato. — Cum *Physosiphone* foliis oblongo-ligulatis atque florum colore flavido pulcherrime congruit. Hinc:

„*Physosiphon Nicaraguensis* Liebm. — Liebm. Mss. ind. sem. h. Acad. Hauniensis 1853. (Ann. sc. nat. IV. t. 1. p. 329). — Differt a *Ph. Loddigesii* Lindl., f. ap. leviter emarginatis, spica longitudine folii, scapo minus bracteato, perigonii exterioris foliolis magis acutis pallide virescentibus, perig. interni foliolis 2 acutis columnam duplo superantibus, labelli lobis lateralibus minus evolutis, lobo medio acuto, columna brevissima, capsula perigonio triplo quadruplove longiore clavata 6 costata, 6-sulcata, costis rotundatis.

E Nicaragua reportavit Oersted.“

16. *PLEUROTHALLIS PULCHELLA* Lindl. Rehb. fl. in Bonpl. III. 71. — N. Granat. 2. Februar — 3. März. 6000' Wagener.

— Typus *Pleurothallidis pictae* Lindl. —

17. *PLEUROTHALLIS ZEPHYRINA* Rehb. fl. in Bonpl. III. 71. — Aff. *Pleurothallidis aristatae* Hook. (si mavis intricatae Lindl.) tenuissima (inde si placebit *Muscosa*) sepalis tepalisque aequalibus a basi lancea aristatis. — Caespes adest tenuis. Caules tenues brevissimi. Folia a basi aequilonga filiformi lanceolata acuta, nunc curvata, prope pollicaria, lamina superiori duas tresve lineas lata, pedunculus capillaris tri- ad quadripollicaris. Bractee adeo minutae ut vix nisi lente conspiciantur. Ovaria in pedicellis tenuissimis longissimis (6 lineas longis). Labellum ligulatum utrinque ante basin acutangulum sepalis tepalisque multo brevius. Gynostemium gracile clavatum apice cucullatum. Perigonium flavidum. — N. Granat. Ocanna. Wagener.

18. *PLEUROTHALLIS MARGINALIS* Rehb. fl. in Bonpl. III. 224 et Otto Hamb. Ztg. — Aff. *P. parvifoliae* Lindl. folio crassissimo apice acuto (tridentatulo), tepalis rhombeis acutis. Foliolum oblongum superficie superiori circa marginem sulco marginatum; viride atroviolaceo irroratum; superficie inferiori disco quidem planum, marginem versus proclivi attenuatum; viride atroviolaceo punctatum, crassum; subsemipollicare, tres lineas latum. Pedunculus vere capillaris tripollicaris; apice racemosus. Bractee membranaceae abbreviatae. Perigonium luteum, tepalis purpureis, bilabiatum. Sepalum superius triangulo ligulatum acutum, inferius ligulatum deflexum apice bidentatum. Tepala multo breviora. Labellum ligulatum obtuse acutum ante basin unguiculatum obtuse humeratum, carnosum, tepalis paulo longius. Gynostemium elatum apice tridentatum. Species tenuis folio crasso infra purpureo, pedunculo perlongo. Rio.

19. *PLEUROTHALLIS FLORULENTA* Lind. Rehb. fl. Bonpl. III. 223.: aff. *Pl. pictae* Lindl. (nec Hook.): folio cuneatoligulato apice retuso, sepalo inferiori apice bidentato, tepalis cuneato ovatis obtusis, labello a basi brevissime unguiculato oblongo medio dilatato, gynostemio gracili alato apice tridentato. Foliolum duos et dimidium pollicem longum, tres lineas latum. Pedunculus capillaris quadripollicaris, ultra medium ananthus, minute uni—bivaginat. Racemus laxus pluriflorus. Bractee minutissimae. Pedicelli ovarii duplo terve longiores. Sepalum supremum lanceum acumi-

natum, inferius simile deflexum. Flores flavi nervis sepalorum atropurpureis. E Nova Granada a cl. Linden introducta.

20. *PLEUROTHALLIS PICTA* Lindl. B. Reg. 1797. : huc Pl. surinamensis Focke in Tidsch. voor de Wis- en Natr. Wetenschappen II. 3. Aufl. 1849. p. 194 et Nat. Verhdl. van de Holl. Maatsch. Haarl. Sturp. Surin. 1851. 214 cum ic. Tab. LXIV. — F. elongato-spathulatis obtusis emarginatis, racemis filiformibus subsecundis multifloris folio longioribus, sepalis lanceolatis, lateralibus alte connatis, petalis spatulatis acutis columnam aequantibus; labello liguaeformi obtuso plano, clinandrio dentato. — Herba epiphyta nana, caespitosa. — Caulis brevis, monophyllus. Folia elongatum apice obtuse emarginatum —, in caulem processu petioliformi attenuatum, erectum, apice leviter recurvum, 4—5 cent. oblongum. — Racemus axillaris, sc. ad basin folii ortus, filiformis, flexuosus, subsecundus, 6—15 florus, erectus, foliis multo longior. — Sep. lateralibus alte connata, apice tertia libera, basi saccata, supra cymbiformia. Pet. minora, columnam aequantia, spatulata, acuta, diaphana, uninervia. Labellum liguaeforme, obtusum, planum, cum pede columnae articulatam, columnae parallelum, paulisper recurvum, fusco-ochraceum. Columna marginata, subarcuata, alba, margine membranacea, utrinque apicem versus in dentem desinens. Anthera terminalis, opercularis, subconica, albidula, unilocularis. Pollinia duo rotunda, plano-compressa. Ovarium sulcatum, cum pedunculo articulatam. Capsula obovato-oblonga, triquetra subincurva, 7 millim. longa, 3 millim. crassa viridis. — Flores luteo ochracei. — Hab. passim in sylvis Surinam, supra arbores. Flor. Apr. Maj. Oct.

Obs. Valde accedit ad *P. racemifloram* et emarginatam Lindl., sed differt ab hac labello indiviso liguaeformi, ab illa petalis nanis spatulatis acutis; ab utraque foliis elongato-spathulatis. — Cf. Sw. Fl. Ind. Occ. p. 1554 1. sub *Dendrobio racemifloro*.

— Typus *Pleurothallidis tricarinatae* Pöpp. Endl. —

Pluribus minor *Pleurothallide tricarinatae*. Caulis primarius crassus polyrrhizus. Caulis secundarii triangulares pollicares. Foliolum oblongo-ligulatum sesquipollicare, tertium pollicis latum. Pedunculi gemini folio subduplo longiores; basi spatha minuta tultu univaginati. Spica disticha. Bractee abbreviatio triangulae carinatae. Ovaria pedicellata minute triptera bracteis paulo longiora. Sepalum utrumque triangulum, superius uni-, inferius bicarinatum. Tepala plus duplo sepalis breviora. Bolivia. Bridges.

— Typus *Pleurothallidis saurocephalae* Lodd. —

22. *PLEUROTHALLIS MINAX* Rchb. fil. Bonpl. II. 24. : caule secundario abbreviato, folio oblongo apice acuto, illo duplo longiore, spatha parva basilari, pedunculo firmo dimidii inferioris medio acute univaginato, spica densiuscula, bracteis vaginatis retusiusculis acutis, floribus bilabiatis elongatis, sepalo summo linearilanceolato apice subdilato acuto, inferiori oblongo apice acute bidentato, tepalis quater brevioribus lanceolatis acutis fimbriatis, labello aequilongo a basi cuneato oblongo antice subito attenuato ligulato obtuso lamella elevatula semilunato utrinque inter lineam mediam et marginem, toto disco striolis carnosulis elevatulis transversis fasciato, gynostemii subaequilongi gracilis androclinio membranaceo marginato ciliolato; toto pedunculo, bracteis, ovario, sepalorum pagina externa sericeo velutinis. Flores vitellini, sepalum inferius rufo punctatum. Labium rubrum Caracas. Roxb. 5000'. November. Wagener.

Obs. Ab ill. Lindley pro Pl. plumosa Lindl. habita (Fol. IX. Maj. 1859.). Icon Pl. plumosae Lindleyanae a planta mea longe recedit, praesertim labello serrato.

23. *PLEUROTHALLIS XIPHIZUSA*. Huc: *Crocodelanthae* Rchb. fil. et Warscew. in Bonpl. II. 113. n. gen. Malaxidearum habitu Xiphizusae nulli affine glandula spuria insigne. Racemus multiflorus subsecundus; bractee membranaceae cucullatae acutae. Flores

transversi. Perigonja externa bilabiata, labia (sepala) oblongolanceolata, inferius concavum, apice bidentatum. Tepala cuneata apice retusa cum apiculo. Labellum ovato rhombeum acutiusculum nervis 3 mediis carinatis, cum gynostemio continuum, nec articulum. Gynostemium a basi ampliori gracile, semiteres; cupula apicularis obliqua pro anthera ac stigmatibus interjecta regione transversa bicallosa (rostello). Anthera depressa, apice tantem aperta. Pollinia 2 depresso pyriformia in glandula spuria triangula sessilia. C. Xiphizusa. Blüthen wenig grösser als die der Xiphizusa chloroptera. Peru. Warscew. — Rchb. fil. Xenia I. Tab. VI. I. 1—7. 19. 10. Ab illi, Lindl. qui meliora tenuit specimina (mediante Skinnero!), dum mihi frustulum subvenit scilicet pedunculus, bene huc relata. Pl. Crocodilanthæ Folia VIII. Cum tamen contra leges nostras nomen speciei haud servaverit ill. auctor, haud sine magno gaudio nomen ab illo propositum iterum mutari.

— Typus: *Pleurothallis erinacea* Rchb. fil. —

24. PLEUROTHALLIS ERINACEA Rchb. fil. in Bonpl. III. 72: nulli affinis?, elongata, spicata, trispala, bracteis triangulis carinatis magnis, ovario erinaceo muricato, tepalis lanceo - cuneatis basi utrinque unicallosis, labello a lineari basi trilobo, utrinque ante unguem uniaristato. — Mira planta! Caulis secundarii adest apex validus. Folium obovatum basi cuneatum apice contractum plus tres pollices longum; unum et dimidium latum. Spatha inflorescentiae minuta. Pedunculus alter jam emarcidus, alter apice floridus; ultrapedalis, obtusangulo flexuosus, distiche et remote bracteosis. Bractee semipollicares; pedicellis paulo longiores, carina virides, margine scarioso albidæ. Perigonium flavo - rufum. Sepala triangula, dorsale lateralibus brevius. Tepala duplo breviora. Labelli unguis brevis basi utrinque unicallosus, lamina triloba; lobi laterales postici rotundati, lobus medius ligulatus acutus, omnes margine serrulato - papulosi. Arista brevis linearis apice bifida utrinque in basi laminae. Gynostemium gracile clavatum; androclinii cucullus elevatus; rostellum productum. Anthera et pollinia genetica. Flores inclusis pedicellis ultrapollicares. — Ocanna — novae Granatae. Wagerer.

— Typus *Pleurothallidis Tripteranthæ*. —

25. PLEUROTHALLIS TRIPTERANTHA Rchb. fil. Bonpl. II. 24: caule secundario brevissimo, folio oblongo basi cuneato, apice attenuato, pedunculo valido, bivaginato, folium excedente, racemoso 7—9 floro, bracteis vaginatis retusis acutis, pedicellis validis cum ovariis callosis articulatis, ovariis cylindraceis gracilibus, sepalis lanceolatis, alis erectis hinc crenatis, hinc integerrimis a costis ovarii per nervos medios sepalorum transcendentibus medium usque, tepalis abbreviatis ($\frac{1}{2}$ longitudinis sepalorum) lanceolatis obtuse acutis, labello brevissime unguiculato basi utrinque rotundato angulato, rhombeo retuso, trinervi, carinulis crenulatis utrinque inter marginem crenulatum et nervos laterales, tota labelli superficie praesertim anteriori trabeculis transversis minutis scabra, gynostemio subaequilongum gracili apice membranaceo cucullato minute lobulato. Flores brunnei pupureo maculati. Caracas. Wagerer. 5000'. Martio. Pedunculus quinquepollicaris. Folium tres pollices longum, medio unum pollicem latum. — Rchb. fil. Xenia I. p. 73. Tab. 28. III. 4—6.
26. PLEUROTHALLIS TRIPTERYGIA Rchb. fil. Bonpl. II. 24: simillima praecedenti a qua differt statura duplo minori, alis multo humilioribus, labello exacte rhombeo acuto integerrimo ceterum aequali, tepalis ligulatis sensim acutis. Caracas. Wagerer. Rchb. fil. Xenia I. p. 74. Tab. 28. IV. 7—9.

— Typus *Pleurothallidis longissimæ* Lindl. —

27. PLEUROTHALLIS FRITILLARIA Rchb. fil. in Bonpl. III. 240: similis Pl. longissimæ Lindl. labello a basi ligulata hastato dilatato, ibi minute denticulato, gynostemio utrinque angulato, androclinio integro. Planta ultrapedalis. Caulis secundarius non praesto est nisi summitas. Folium coriaceum oblongum basi cuneatum apice subacutum (tridentatum). Racemus elongatus basi 1—2 vaginulatus; spatha membranacea

parva cinctus superne racemosus, secundiflorus. Flores ringentes violaceo purpurei basin versus flavido tessellati magni. Ovaria pedunculata bracteas ochreas retusas bene excedentia. Sepala oblongolanceolata, inferius bicuspe. Tepala rhombea multo breviora. Ravines of the Andes at an elev. of 7000 feet. 678. Jamieson.

28. *PLEUROTHALLIS MALACHANTHA* Rchb. fil. in Bonpl. III. 223: aff. *Pl. longissimae* Lindl. caule secundario apice triptero sepalo inferiori semibifido, laciniis acutis, tepalis cuneatis obtuse acutis, labello cuneato-flabellato retuso, androclinio bene cucullato, denticulato. Caulis secundarius quinque—sexpollicaris apicem versus bene tripterus. Folium oblongum utrinque attenuatum, bi—tripollicare, pollicem medio latum. Racemi tenues multiflori quinque—sexpollicares. Flores illis *Pl. longissimae* paulo minores valde molles (ex sicca) forsitan virides, tepalis ac labello pallidioribus. Sepalum utrumque basi connatum: triangulum. Serra dos Organnos. Gardner 660.

29. *PLEUROTHALLIS PERPUSILLA* Rchb. fil. in Seemann Herald. p. 215: caulibus secundariis brevissimis a squamis hyalinis 2—3 vestitis, folio spatulato basi valde et longe attenuato apice rotundato obtuse minuteque tridentato, pedunculo capillari folium duplo-triplo excedente, minute bivaginato, vaginis ochreatis acutis, racemo 6—8-floro, bracteis ochreatis acutis, pedicellis brevioribus. sepalis oblongis acutis, tepalis lineari-lanceolatis acutis, brevioribus, labello oblongo, excavato, apice acuto solido inflexo, inferne carinato, gynostemio abbreviato utrinque rotundato alato, ab anguli apice ad medium, postice unidentato, in labellum incumbente (!), anthera mitrata. — Plantula tenuissima, bipollicaris. Flores minutissimi. Near Panama, on trees Semann, n. 1565.

Obs. Nescio, cur ill. Lindley (Folia IX.) amiciss. Seemann pro auctore scribat, cum et in Botany of Herald, et in Xenii t. I. 173 et tab. 70 nomen meum distincte legere potuisset; forsitan nebulae Londinenses impedimento fuerunt.

Cl. Lindley dicit: „— but the lip in different; by no means, however, slipper shaped as it appeared to Rchb.“

Haec scribit, dum tres lineas superius habet: „labello concavo carnosio apice inflexo“. Calcei Anglorum nonne sunt convexi?

— Typus: *Pleurothallis laurifolia* H. B. Kth. —

30. *PLEUROTHALLIS LAURIFOLIA* Hb. Kth. ! Bpl. 1, 364: Rchb. fil. Bonpl. II. 23.: subpedalis, caule secundario valido, biarticulato, medio vaginato, folio valde coriaceo, lato oblongo basi angustato, apice angustato (3 denticulato), prope spithamaeo, medio 2—3 pollices lato, (spatha florali acuta carinata ex icone ipsius ill. Humboldt), pedunculo valido infra medium bivaginato, superne racemoso rarifloro, bracteis vaginatis arctis quam ovaria pedicellata triplo brevioribus, floribus galeato bilabiatis, sepalo summo galeato acuto, inferiori subaequali apice bidentato, tepalis cuneato orbicularibus acutis valide trinerviis, subaequalibus, labello naviculari ligulato antice trilobo, lobis lateralibus obtusangulis erectis, lobo medio carnosio ligulato acuto (ancipiti?), superne verrucosio papuligero, nervis 3 lateralibus in fundo labelli carinigeris, gynostemio gracili utrinque pone stigma angulato, androclinio minuto apicali, anthera depressa, pollinibus clavatis. Tepala et labium sepalis paulo breviora. Flos illi *Schlimiae jasminodora*e prope aequalis.

Obs. Ill. Lindley (Folia VIII.) aliter sentiens plantam descriptam pro adversa specie habet exclamans: „I am quite at a loss to understand upon what ground this remarkable plant has been referred to the *Pl. laurifolia* of H. B. K., which in expressly declared to be related to *P. ruscifolia*, a well known species among the gregatae. I have never seen any thing to which Rchb's description at all applies. He says the stem of his plant is stout and about 1' high; and the leaf 6" \times 2—3"; that it has an acute keeled spatha; and that the flowers are as large as in *Schlimia jasminodora* that is to say a full inch long by 1/2 inch across the tube. Had this *Pl. laurifolia* been described by a less experienced orchidologist than Professor Rchb., it might have been reasonably doubted, whether the plant is a *Pleurothallis* at all.“

Ad haec Rchb. fil. haec respondet:

- 1) Planta omni non non a Wagenero lecta, unde descriptio in parenthesi data.

- 2) Signum exclamationis post Kth. l significat, plantam ex auctoris Kunthii herbario descriptam.
- 3) Iconem Humboldtii visam in descriptione commemoratum.
- 4) *Pleurothallis ruscifolia* R. Br. non est „a well known plant“. Non mirum, Kunthium false et inepte juxta descriptionem certe comparasse suam cum *Pl. ruscifolia* sibi non nota, cum ipsissimus ill. Lindley *Pl. ruscifoliam* diutissime non solum non noverit, sed ipsissimam pro nova specie (*Pl. succosa* Lindl.) descripserit.

Inde repeto, *Pl. laurifoliam* meam esse Kunthianam.

— Typus: *Pleurothallis floripecten* Rehb. fil. —

31. **PLEUROTHALLIS FLORIPECTEN** Rehb. fil. Bonpl. II. 25: caule secundario gracili, folio suo semel, bis, ter longiore, vaginis 4—5 arctis appressis nervosis ostio dilatato ovato mucronato dense fimbriato, vagina summa laxa, ampla, folii basin tegente, folio oblongo basi cuneato, apice attenuato minute bidentato, pedunculis subcapillaribus fasciculatis (4—5), dimidio longiori inferiori vaginulis arctis brevibus retusiusculis membranaceis 3—4 hinc inde vaginatis, parte superiori densissime florifera, bracteis arctis, vaginatis, ostio ovato acuto minutissimis, floribus distichis transversis alternantibus, flavidis (in sicca), sepalo summo ovali abbreviato, inferiori elongato apice suo subdivaricato bilobo, nervo utroque dorso carinato, tepalis ovatis acutiusculis minutissimis semi-uninerviis, labello brevissime unguiculato ovali basi obtuse sagittato trinervi, gynostemii rostellato lato trilobo, lobis lateralibus ligulatis, medio lobo denticiformi, anthera dorsali. Blüten höchst zart, wie bei einer *Lepanthes*, etwa 3 Linien lang, $\frac{2}{3}$ Linie breit, sehr zahlreich. Granat. Wagerer.

— Typus *Pleurothallidis roseopunctatae* Lindl. —

32. **PLEUROTHALLIS TRULLA** Rehb. fil. et Warszew. Bonpl. II. 114: aff. *Pl. oblongae* (similis tamen *roseopunctatae*) racemis 2—3, perigonio externo bivalvi basi coalito, tepalis cuneato oblongis acutis, labelli ungue ancipiti a lateribus compresso lamina ovata basi alte cordata. Caulis secundarius subtrigonus. Folium valde coriaceum oblongum utrinque attenuatum apice acutum: 3,5 pollices longum, $1\frac{1}{2}$ latum. Spatha ultra pollicaris acuminata opaca. Racemi 3 basi et media partis ananthae 2,5 pollicaris univaginatae, pluriflori (—13), secundiflori, bractee ochreae cum apiculo, ovaria pedicellata longe exserta (3^{''}), perigonium externum mento angulato ante mentum constrictum, ultra medium bifidum, bivalve, valva utraque oblonga acuta, tepala cuneatoovata acuta, labellum tertia inferiori ancipiti unguiculatum, lamina ovata basi utrinque semicordata, carina membranacea introrsa in utroque margine, linea papulosa per medium, gynostemium gracile, apice cucullatum, denticulatum. Blüten $\frac{2}{3}$ der Grösse derer der *P. roseopunctata*: relative Längen dieselben. Peru. v. Warszew.

EFFUSAE

— Typus *Pleurothallidis floribundae* Lindl. —

33. **PLEUROTHALLIS HARPOPHYLLA** Rehb fil. in Bonpl. III. 72: aff. quodammodo *Pl. floribundae* Lindl. et *chamensi* Lind. caule ancipiti, folio oblongo-lanceolato complicato hinc falciformi spicam paulo breviorē obelante. — Caules primarii graciles paucivaginati. Caules secundarii bipollicares, nunc paulo longiores. Folium pollicare basi rotundato cuneatum, dimidio pollicem longum. Pedunculus gracilis solitarius seu geminus. Flores flavidi. Sepalum superius lanceolatum acutum; inferius oblongum apice bidentatum. Tepala breviora cuneato-lanceolata serrata. Labellum oblongo-ligulatum obtusum, basi utrinque rotundato auriculatum, per discum tricarinatum. Gynostemii gracilis clavati cucullus serrulatus. Granata: Ocanna. Wagerer.
34. **PLEUROTHALLIS ROSTRIFLORA** Rehb. fil. Linnaea XXII. 827. Huc: *Pl. longirostris* Focke! Bot. Z. 1853, 341: caule monophyllo terete folio breviorē, folio spatulato-lanceolato recurvo emarginato utrinque attenuato basi plicato, scapo erecto pauci-

floro axillari folio triplo brevior, sepalis subcarnosis ovatis sensim in acumen longum lineare productis, supremo basi conduplicato concavo incurvo, lateralibus connatis apice vix liberis basi utrinque plicatis triplo minoribus spathulatis aristatis integris uninerviis, labello breviori linguaeformi obtusissimo medio dilatato. Epiphyta caulescens. Caulis teres monophyllus, folio spathulato-lanceolato recurvo marginato utrinque attenuato basi plicato brevior, 5 centim. longus. Scapus erectus 1—2 floribus gracilis, folio triplo brevior, viridis. Perianthium connivens, triquetrum, caput avis (inprimis gallatoris cujusdam) referens. Sepala aequilonga, ima basi concreta, ovata, in acumen longum lineare attenuata, subcarnosa; supremum basi concavum, conduplicatum, incurvum; lateralia connata, apice vix libera, vel potius emarginata, basi convexa utrinque plicata, acumine canaliculato. Petala triplo minor, spathulata, integra, in aristam attenuata, uninervia, nervo extus prominulo. Labellum linguaeforme, obtusissimum, medio dilatatum, marginibus conniventibus, a medio recurvo, apice incurvo, lamina interiori subglandulosa, petalis brevius, columnae parallelum. Columna semiteres, recurva, basi cum labello articulata, flavescens, labello vix brevior, clinandrio lacero. Anthera conica, unilocularis, purpurea. Pollinia 2 rotundata, compressa, sulphurea. Ovarium sulcatum, incurvum, triquetrum. Flores ochracei. Habitat in districtu Para Surinamensi. Decembri.

— Typus *Pleurothallidis truncatae* Lindl. —

35. **PLEUROTHALLIS TRUNCATA** Lindl. Rehb. fil. in Bonpl. III. 240: caulis gracilis teretiusculus spithamaeus, folium pergameneocoriaceum a basi rotundata seu cuneata oblongum subito acuminatum, quadripollicare, unum et dimidium pollicem latum. Spatha tenuis lancea semipollicaris, basi gutturosa. Racemi fasciculato congesti folium subaequant. Bractee ochreae hyalinae retusae, Flores flaveoli parvuli. Sepalum superius ovato triangulum concavum, sepalum inferius ovale concavum; tepala ligulata apice cucullata contracta retusa cum angulo protruso in medio; multo breviora; labellum transversum antice retusum cum apiculo nunc evanido utrinque involutum; gynostemii gracilis recti cucullus bene evolutus. Andes of Quito. 1848. Nr. 679. Jamieson.

36. **PLEUROTHALLIS NAVILINGUIS** Rehb. fil. in Bonpl. III. 72: aff. et similis Pl. truncatae Lindl. labello ligulato antice acuto naviculari, sepalo utroque aequali oblongo-ligulato. — Caulis secundarius gracilis trivaginatius tri- ad quadripollicaris. Folium oblongo-cuneatum acutum. Racemi 3 abbreviati folio duplo breviores. Flores angustiores et obtusiores et minores, quam in Pl. truncata. Sepalum utrumque oblongo-ligulatum; perigonium externum igitur exacte bivalve. Tepala ligulata obtusa minuta. Gynostemii clavati cucullus triangulus elevatus in margine postico. Ocanna. Granata. 5000'. Wagener.

— Typus *Pleurothallidis obovatae* Lindl. —

37. **PLEUROTHALLIS OCTOMERIAEFORMIS** Rehb. fil. Bonpl. II. 25: pedalis, caule secundario quadrialato, valido, vaginis jam emarcidis, folio satis coriaceo basi cuneato. obovato, acuto, pedunculis capillaribus abbreviatis numerosis basin usque floridis 3—5 floriferis, bracteis cucullatis acutis pedicellis subaequalibus, floribus hyalinis (flavis), mento parvo, sepalo summo lanceolato, inferiore basi coalito subaequali, tepalis aequalibus, labello ligulato acuto basi brevissime obtuseque sagittato, unguiculato, per mediam lineam intruso, gynostemio gracili clavato, dimidio superiori alato, androclinii limbo fimbriato. Verwandt mit Pl. hypnicola, welche stumpfe Sepala, ganz kleine Tepala und verschiedene Statur hat. Blüten 1½ Linien lang Caracas. 5000' October. Wagener.

Obs. Haec species nuper in Foliis (IX. Pleurothallis pag. 22. n. 125) ab ill. Lindl. ad Pleurothallidem obovatam Lindl. reducitur. Eadem esse docetur Pl. albida Lindl. Et in herbario Lindleyano planta fersan bene congruens adest. Nilminus nomen non accipio. Descriptio enim Spekliniae obovatae Lindl. (B. Reg. XXV. 1839. Misc. 137) habet: „folio coriaceo obovato emarginato“. Nunc dicuntur „obovata obtusa“. Hinc certe confusio duarum specierum et nomen obovatae reponendum ad tempus, quo planta foliis emarginatis denovo reperitur.

— Typus *Pleurothallidis Lindeni* Lindl. —

38. PLEUROTHALLIS LINDENI Lindl. Ann. Nat. Hist. XII. 397. Rehb. fil. Bonpl. II. 25. Colonie Tovar. 5000' Febr.

var. *pumila* Rehb. fil. in Bonpl. III. 72: spithamaea, folio tripollicari, vix pollicem lato, racemo bifloro, flore elongato, sepalo inferiori lanceolato. Ocanna. Nov. Granat. 6000'. Wagener.

var. *gigantea* Rehb. fil. in Bonpl. III. 240: folio ultrapedali, quatuor pollices lato, fasciculo racemorum abbreviato, sepalo inferiori valde dilatato cymbiformi, toto flore abbreviato. Valley of Lloa, on the trunk of a tree. 326. Jamieson.

Obs. Huc, sc. ad Pl. Lindeni referendam esse Pl. secundam Endl. Pöpp. 85! jam in Bonpl. III. 72. dixi. Attuli labellum false pictum, directionem inflorescentiarum falsam, eas in specimine typico excepta una decurva omnes decisas.

III. Lindley contradicit. Contradicat. Ille vidit iconem, ego iconem et typos! —

— Typus *Pleurothallidis mesophyllae* A. R. Gal. —

39. PLEUROTHALLIS (Aggregatae velutinae) PANTASMI Rehb. fil. in Bonpl. III. 224: affinis Pl. mesophyllae A. Rich. Gal., caulibus elongatis tripteris, apice dilatato in folia oblonga acutiuscula dilatato, spatha abbreviata, racemo solitario abbreviatissimo, sepalo inferiori bifido, tepalis rhombeis, labello ligulato basi utrinque angulato, nervis 2 in basi lamellisque geminis, androclinii margine dentato. Insignis caule secundario subsex—septempollicari apice adeo alato dilatato, ut folium ipsum summa latitudine suprabasilarum vix ter sit latius. Bracteae triangulae acutae. Spatha parva. Flores duplo minores, quam in Pleurothallide pubescenti Lindl., illis Pl. mesophyllae aequales. Sepalum superius oblongum. In monte Pantasmo Nicaraguae Januario 1848, nec non in Segovia. Oersted.

— Typus *Pl. chamensis* Lindl. —

40. PLEUROTHALLIS TRIPTERIS Rehb. fil. Linnaea XXII. p. 829. Rehb. fil. in Bonpl. II. 25. Caracas. Wagener.

Obs. Nescio qui ludibrio cum Pl. sicaria Lindl. in „Foliis“ conjuncta, quae labello et tepalis toto coelo abhorret. Huc: Pl. trigonopoda Kl. in Otto et Dietr. Allg. Giz. XXI. n. 46. Caule trigono deorsum attenuato, dorso carinato, antice canaliculato alato in folium carnosocoriaceum strictum oblongum acutum brevius sensim ampliato; vagina ovato lanceolata, acuminata costata carinata arida; racemo perbrevis bifloro; floribus lilacinis elongatis basi gibbosis; perigonii exterioris profunde tripartiti deflexi laciniis elongatis acuminatis alutaceis lineis tribus purpureis ornatis, interioribus rectis spatulatis acutis, exterioribus duplo brevioribus striis purpureis parallelis quinque vestitiis, labello integro ligulato deflexo obtuso lilacino-marginato centro excavato; columna clavata incurva striis lilacinis parallelis tribus notata, apice tridentata. Venezuela. Wagener.

47. PLEUROTHALLIS XANTHOCHLORA Rchb. fl. in Bonpl. II. 24. Merida. Wagener.

AGGREGATAE.

— Typus *Pleurothallidis cordatae* Lindl. —

48. PLEUROTHALLIS CORDATA Lnd. O. p. 5. Rchb. fl. in Bonpl. II. 26. Pedalis et ultra, caule primario polyrrhize crasso, caule secundario biarticulato, internodio superiori longissimo, inferiori brevissimo, folio crasso chartaceo orbiculari, altissime cordato, apice acutato retusiusculo (spatha decidua? nulla?), floribus pluribus, heterochronis, abbreviatis, sepalo summo oblongo obtuse acuto, inferiori orbiculari subacuto, sepalis lineari lanceolatis acutis ciliatis subaequilongis, labello orbiculari carnosissimo basi obtuse cordato, gynostemio retuso. Peru Ruiz! Auctor flores non viderat.
49. PLEUROTHALLIS CORIACARDIA Rchb. fl. Bonpl. II. 26: ultra pedalis, internodio superiori longissimo, vaginis tenuibus abbreviatis arpophyllaceis, folio horizontali, valde coriaceo, lucidissimo, lato oblongo acutato, apice retuso tridentato, basi obtuse cordato, spatha florali membranacea acuminata, floribus aggregatis, sepalo superiori oblongolanceolato, inferiori subaequali, tepalis lineari lanceis margine subtiliter denticulatis, labello lanceo basi obtuse sagittato, quater longiori, quam lato, carnosio, medio sulcato, gynostemio truncato. Pleur. cordata Lndl. in Hartweg. Pl. Popayan exsicc.
50. PLEUROTHALLIS (Aggregatae : Laeves : Cordatae) CARDIUM Rchb. fl. Bonpl. II. 26: caule secundario elongato, internodio superiori longissimo, folio pergameneo oblongo apice acuminato, retuso bi-tridentato, basi alte cordato, spatha membranacea obtusa, floribus patulis aggregatis 6—10, bracteis vaginantibus retusis hyalinis, perigonio tenui (ejusdem substantiae ac Pl. Lindenii), sepalo summo lanceolato, inferiori subaequali paulo latiori, tepalis linearisetaceis divaricatis dimidio brevioribus, labello breve unguiculato, ligulato, triangulo, basi anguste cordato, ter-quater longiori quam lato, densissime muriculato, gynostemio retuso abbreviato. Spectabilis *Pleurothallis*. Folia horizontalia, 4—6 pollices longa, supra basin 3— $3\frac{1}{2}$ pollices lata. Flos expansus ab apice supremo ad apicem inferiorem prope pollicem longus, carneus, nervis ac labello atropurpureis. Caracas. 600'. December. Wagener.
51. PLEUROTHALLIS CORDIFOLIA Rchb. fl. et Wagener Rchb. fl. Bonpl. II. 25: gracilis, folio (semper inaequali?) orbiculari, subito acutato, basi cordato, spatha minuta, flore solitario, sepalo summo ligulato obtuso, inferiori duplo latiori, excavato, apice bidentato, sepalis linearisetaceis divaricatis ciliatis, labello oblongo basi subsagittato, unguiculato, duplo longiori, quam lato, gynostemio retuso. Omnibus par-

tibus dimidium Pl. Cardii aequans. Flos uti in illo. Caulis aequilongus. Folium supra basin prope aequilatum. Caracas. 4000'. October. Wagerer.

52. *PLEUROTHALLIS MACROCARDIA* Rehb. fil. in Bonpl. III. 72: aff. Pl. cordatae floribus maximis, labello oblongo subcordato acuto apicem versus serrato, tepalis linearilanceolatis apice serratis. — Caulis secundarius quinquepollicaris. Folium sex pollices longum, plus duos latum, oblongo-acuminatum alte obtuseque cordatum. Flores pollicem longi, bivalves. Sepalum utrumque oblongo-lanceolatum. Tepala cum labello aequilongo sepalis paulo breviora. Labelli unguis lineis transversis notatus; lamina trinervis, plicula in basi. Gynostemium laeve crassum Pl. cordatae. Flores brunnei. 5000' Ocanna Nov. Granat. Wagerer.
53. *PLEUROTHALLIS MONOCARDIA* Rehb. fil. in Bonpl. III. 72: aff. Pl. ionanthae Rehb. fil. foliis quadruplo majoribus obovato-lanceis bene cordatis, floris bivalvis sepalo superiori ligulato, inferiori transverso ovato acuto, tepalis falcatis linearibus, labello anguste ligulato basi cordato, acuto. — Caulis quinquepollicaris. Folium tres pollices longum, plus unum supra basin latum, pergamenium. Flos quam in Pl. ionantha duplo major; „brunneus“. Ocanna. Wagerer. 6000'.
54. *PLEUROTHALLIS CARDIOSTOLA* Rehb. fil. in Bonpl. II. 26: caule secundario compresso tereti sculo, folio basi cordato, lobis contiguis oblongo acuminato, inverse deflexo, pedem prope caulis tegente, spatha brunnea, — flore inverso (solitario?) flavo, sepalo summo ovato acuto, inferiori (hic superiori ex inversione) orbiculari acuto, tepalis oblongis acutis dimidio minoribus, labello minuto, basi cordato, aequaliter obtuse trilobo. Flores pallide flavi, diametro 5 linearem. Folium ultra 6 pollices longum, medio et basi duos pollices latum. Caracas. 6000'. Juli. Wagerer. Rehb. fil. in Xenia Orch. Tab. 28, p. 72.
55. *PLEUROTHALLIS MICROCARDIA* Rehb. fil. in Bonpl. III. 72: aff. Pl. undulatae Endl. Pöpp. folio a basi minute cordata lineari-ligulato, acuminato undulato, labello triangulo cordato obtuso papuloso minuto; sepalis longe attenuatis. — Caulis secundarius longissimus usque octopollicaris, tenuis. Folium tripollicare, vix dimidium pollicem supra basin latum. Flores angustissimi prope pollicem longi. Tepala uti in Pl. undulata a basi lineari-lancea acuminata margine scabrido-ciliolata. — Ocanna. Nov. Granat. Wagerer.

Obs. Cl. Lindley (Fol. IX) haec. „Stem very long, as much as 8“, slender. Leaf 3" \times $\frac{1}{2}$ ". Flowers very narrow, nearly 1". Petals as in P. undulata, linear-lanceolate, acuminate, scabrous ad the edge.“ So far Rehb, and if there is no misprint in his description, this must be near P. grandiflora. But I have a specimen from himself, without flowers, and with stems only 3, not 8, inches high, and evidently close to P. tridentata.

Ad haec ego: caulem dixi usque octopollicarem. Caules non floridi adsunt vix bipollicares in altero specimine meo. Pleurothallidis grandiflorae folium bene evolutum quinques, latius; at omnia quae hujus habeo folia apice tantum abrupte angustata, dum in microcardia a parte suprabasitari angustata. Idem de sepalis valet. Pl. tridentata me judice longe recedit flore brevi, sepalo inferiori bifido et mihi Pl. discoideae Lindl. peraffinis videtur.

— Typus *Pleurothallidis undulatae* Endl. Pöpp. —

56. *PLEUROTHALLIS CROCODILICEPS* Rehb. fil. in Bonpl. III. 72: aff. undulatae Pöpp. Endl.; caule secundario ancipiti, folio oblongo-ligulato acuto, pedunculo gracillimo valde elongato, labello rectangulo retuso abbreviato, gynostemio elongato clavato velutino (!). — Caulis secundarius adest quadripollicaris valde compressus alato-anceps. Folium pergamenium quadripollicare, unum pollicem latum apice acutum basi rotundatum ceterum subaequilatum. Pedunculus incluso ovario pedicellato bipollicaris. Bractea vaginiformis supra medium. Sepala ligulato-lineariter subaequalia ringentia. Tepala lineariter acuminata subaequilonga. Labellum a basi humerata cordata divergens, subito utrinque emarginatum apicem usque retuso-rotundatum; linea media

antice carinata; brevissimum. Flos illi Pleurothallidis undulatae paulo major, siccus livide violaceus. An cum *Pl. gratiosa* Rehb. fil. et *hemirrhoda* Lindl. ob pedunculos longe exsertos segreganda? — Ocanna. Wagener.

57. **PLEUROTHALLIS PRUINOSA** Lindl. B. Reg. 42. — *Stelis?* *flavida* Focke in Nederl. Tidsch. II. 202: folio oblongo lanceolato subcarnoso emarginato, pedunculo solitario capillari folium vix superante, sepalis concavis, lateralibus in unum connatis, petalis linearibus acutis, incurvis, labello subcordato sepalis petalisque brevioribus. Herba epiphyta, caespitosa. Caules filiformes, monophylli, folio aequilongi. Folium oblongo-lanceolatum emarginatum, planum subcarnosum, nitidum, 3—4 cent. longum. Pedunculus solitarius, axillaris, capillaris, folium vix superans, 2—3 florus. Flores minutissimi, sordide flavidi, bracteis vaginantibus suffulti. Perianthium globoso-conivens. Sepala concava, lateralia in unum conflata, supremum orbiculato-ovatum, acutum, extus incurva. Labellum petaloideum, subcordatum, sepalis petalisque brevius. Columna nana, crassa, Ovarium sulcatum. Capsula oblonga in pedunculum attenuata. Surinam supra arbores inter muscos. Majo.

Obs. Cf. Folia Orchidacea Lindleyana! Ad calcem *Pleurothallidis*: *Pleurothallis flavida* = *Stelis*. Ad calcem *Stelidis*: *Stelis flavida* = *Pleurothallis*.

58. **PLEUROTHALLIS UNDULATA** Endl. Pöpp. Rehb. fil. Bonpl. II. 26: spithamaea, caule secundario tenuiori, internodio superiori longe longissimo, folio horizontali pergamenaeo oblongo lanceolata margine undulato apice retuso tridentato, basi subinaequali cordato, spatha carinata acuta abbreviata, floribus fasciculatis hystheranthiis elongatis, sepalo superiori lanceolato, inferiori subaequali paulo latiori apice bidentato, tepalis linearilanceolatis, papillis obtusis in margine, tertia parte brevioribus, labello tepalis subaequilongis, anguste triangulo, minute sagittato, margine papillis asperulo, nervis lateralibus elevatis, gynostemio abbreviato truncato. Pampayaco. Pöppig.

— Typus: *Pleurothallis cochlearis* Rehb. fil. —

59. **PLEUROTHALLIS COCHLEARIS** Rehb. fil. in Mohl et Schldl. B. Z. 1852. 764: caule secundario tereti monophyllo, folio oblongo-lanceolato, apice leviter tridentato, basi cuneato, spatha univalvi carinata, rhachi spicae pauciflorae vaginata, bracteis vaginatis, perigonii phyllis externis inaequalibus, superiori phyllo lanceolato, angusto, membranaceo, lateralibus carnosius connatis cochleatis, lateralibus internis lanceolatis, acutis, membranaceis, gynostemio sublongioribus, labello cum gynostemio continuo, sagittato, unguiculato, complicato, medio carinato, gynostemio brevi, androclinio membranaceo, pollinibus 2 materie viscinosa conjunctis. — 3—4 pollices alta. Sepalum superius albidum striis purpureis quinis. Sepala lateralia griseo purpurea maculata. Tepala alba stria una purpurea. Labellum purpureum marginibus viridis flavis. Columna flava. Mexico.

— Typus *Pleurothallidis tribuloidis* Lindl. —

60. **PLEUROTHALLIS FALLAX** Rehb. fil. Mss. Juni 1844. Rehb. fil. in Bonpl. III. 224: prope *Pleurothallidem vitatam* Lindl. cui haud stricte affinis: caespitosa, caulibus secundariis humillimis, folio spatulato obtuso; floribus subsolitariis, ovario papulis acutis hispido, sepalis ligulato triangulis, intus papulosis, inferiori vulgo bifido, nunc integro, tepalis linearibus acutis plus duplo brevioribus, labello ligulato acuto in crassato velutino. Planta pusilla. Flores carnosius tri — quadrilineares, cinnabarinii. Bractee ac vaginae caulis brevissimi scariosae albae. Mexico Leibold! In monte Irasu Costaricae. Oersted.

Obs. Num cum *Pl. tribuloide* Lindl. vere congruat, nondum mihi perspicuum. Exacte examinatis typis Swartzianis de re disseram.

61. **PLEUROTHALLIS SARCOPHYLLA** Rehb. fil. in Bonpl. III. 224: nulli affinis, folio cuneato ovato apice retuso carnosissimo, spica biflora brevissima, sepalis apice conglutinatis. Planta pusilla caespitosa. Folium pollicare apice obtusato tertiam pollicis latum subtus purpureo maculatum. Pedunculi brevissimi 1—3, uni — biflori, quo an-

ceps exoritur plantae locus. Bracteae ovaria aequantes. Flos purpureus obscurius guttulatus papillis filiformibus villosus. Mentum obtusangulum. Sepala triangula libera, apice conglutinata, quo oritur perigonium trifenestratum. Tepala spatulata gynostemio aequilonga. Labellum rhombeum, marginibus anticis minute denticulatis. Carina transversa in basi, carina utrinque margini parallela. Gynostemii cucullus utroque latere angulatus. Antherae protuberantia purpurea. (Pollinia?). — In Horto Schülleriano culta, Masdevallia maculata nominata, ex Caracas advenisse dicitur.

— Typus *Pleurothallidis Raymondi* Rehb. fil. —

62. PLEUROTHALLIS (Aggregatae: Papillosae) HYSTRIX Rehb. fil. Bonpl. II. 26: rhizomate repente, caule secundario dense vaginato, vaginis omnibus linearilanceis papillis deflexis asperimis, folio coriaceo lanceo apice minute trimucronulato caule secundario longiore, floribus aggregatis paucis, vaginis bracteisque aequalibus retusis medio acutis, maculatis, extus puberulis, ovario puberulo, mento subnullo; sepalo summo triangulo acuto, inferiori ovato ab apice medium versus bifido, laciniis triangularibus, tepalis basi obtuse quadratis, dein parte superiori linearibus apice teretiusculo carnosius, labello oblongo obtuso antice utrinque minute sinuato, gynostemio alato, alis inflexis, alula postica androclini denticulata arrecta. Haec planta *Pleurothallidis Raymondi* persimilis, sed omni parte dimidio minor. Folium vix ultra duos pollices longum, medio tertiam pollicis latum. Caracas. Wagener.
63. PLEUROTHALLIS RAYMONDI Rehb. fil. (*Duboisia Raymondi* und *Dubois-Raymondia palpigera* Karsten) Rehb. fil. Bonpl. II. 26. Nulla adest causa separandae hujus speciei a *Pleurothallide*. Tepala memorabilia, apicibus nunc cruciata. Pollinia periplana. Caracas 6000'. Wagener. Toto anno.

— Typus: *Pleurothallis Wageneriana* Kl. —

64. PLEUROTHALLIS (Aggregata) WAGENERIANA Kl. in Oto et Dietr. Allg. Gz. 1852. 275. Rhizomate funifero, squamis oblecto, caulibus secundariis 2—3 articulatis, vaginis 2 appressis obtusis subintegris oblectis, folio crasso carnosio angusto primum conduplicato deinde canaliculato, basi cuneato, apice attenuato retuso, floribus binis brevi pedunculatis, perigonii foliolis 3 exterioribus ringentibus crassis carnosius sordide flavidis, internis membranaceis sulcatis acutis flavidis striis parallelis purpureis notatis externis triplo minoribus, labello trilobo atropurpureo tumido, antice tuberculoso scabro, perigonii foliola interiora aequantes; pedunculo bracteis hyalinis obtusis binis aut tribus subcucullatis vestito. Venezuela, Wagener. — Rehb. fil. in Bonpl. II. 26. Caracas. 6000'. Aug. Wagener.

Obs. A cl. Lindl. infauste ad Pl. vittatam relata (Fol. IX), quae pubescentiflora. Pl. vittata tepala habet rhombea, apice serrata; haec ligulata acuta integerrima. Pl. vittatae labellum basi biauriculato-sagittatum, hujus exauriculatum. Vittatae portio antica labelli semiovata, Wagenerianae ligulata retusa. Vittatae discus labelli laevis, Wagenerianae rugoso-verruculosus.

— Typus *Pleurothallidis Octomerioides* Lindl. —

65. PLEUROTHALLIS RIGIDIFOLIA Rehb. fil. in Bonpl. III. 224: ex systemate artificiali pone *Pleurothallidem* retusam Lindl. (nec sicariam Lindl. quae ex ipsius ill. auctoris legibus ob pedunculos bi-trifloros in „Effusis“ collocanda), melius autem pone *Pleurothallidem Hartwegii* Lindl. 1842: folio lanceolato utrinque optime attenuato rigidissimo, floribus bivalvibus oblongis, sepalis inferioribus alto bifidis, tepalis linearibus, labelli trilobi lobis lateralibus triangularibus margine externo denticulato, lobo medio ligulato. Planta ultrapedalis. Caulis secundarius crassus robustus (anceps? multangulus?) bivaginatatus in specimine, quod prostat, cinereus, spithamaeus. Folium coriaceum infra (in sicca) sulcato striolatum spithamaeum medio ubi latissimum vix bipollicare. Flores numerosi aggregati ex pulvinari spatharum. Sepala oblongoligulata. Tepala lineari ligulata subfalcata. Labellum multo brevius angustum. Gynostemium crassum androclini membrana parca, Chachapoyas. Matthews. (Herb. ill. Boiss.)

66. *PLEUROTHALLIS OCTOMERIOIDES* Lind. in Comp. bot. Mag. II. 354. Huc: *Pleurothallis* (Aggregatae) *elongata* Hort. Hamburg. — Klotzsch in app. ind. sem. h. Berol. 1853. — Caulis vaginis quatuor albidis obtusis, dorso plus minusve carinatis, minutissime transversim atrocoeruleo fimbriatis; folio oblongo elliptico crasso coriaceo, supra canaliculato, subtus pallide nigrescente, apice tridentato, basi inflexe petiolatum attenuato; floribus 2—4 divaricatis, singulis bracteato-vaginatibus, bracteis bifidis albidis, pilis atro-purpureis adpressis stellatis conspersis; perigonio exteriore sordide flavido profunde trifido, basi rubescente, laciniis strictis crassis latis obtusis, perigonii foliolis interioribus angustioribus acutis lacte flavidis; labello atro-purpureo curvato obtuso integro, intus excavato aureo, basi attenuato. — Caulis secundario crassitudine pennae corvinae, 4—6 pollices longus. Folium 3—5 pollices longum 12—13 lineas latum. Pedicelli 2 lineas longi. Germen incurvum, rubescens, obsolete trigonum. Perigonium 4 lineas longum. Lacinae exteriores 2 lineas latae. Lacinae interiores lineam latae. Labellum 2 lineas longum. Gynostemium alatum incurvum, sesquilineam longum. Anthera unilocularis. Pollinia 2 integra. — Patria? Floruit in horto Berolinensi M. Octob. 1853. (Kl.)
67. *PLEUROTHALLIS MIQUELIANA* Lindl. Fol. IX. Pleur. n. 93: Huc: *Specklinia*? *Miquehana* Focke in Nederl. Tijdsch. II. p. 199: caulibus folio lanceolato supinato aequalibus, tepalibus lateralibus connatis apice liberis facile partibus, supremo libero ligulato, petalis multo brevioribus lanceolatis, labello linguaeformi, pedunculo uni — vel bifloro, rhizomate filiformi. Rhizoma repens, filiforme. Radices fibrosae. Caulis graciles, erecti, monophylli, vaginati, longitudine folii. Folium lanceolatum, coriaceum, resupinatum, apice recurvum, basi plicatum purpurascens-viride. Pedunculus brevis capillaris, in sinu baseos folii, uni — vel biflorus. Perianthium connivens. Sepala lateralia dimidiata acuta, connata, apice libera, facillime partibilia, labello supposita, basi saecata, atropurpurea, apice ochracea, supremum liberum ligulatum acutum, lateralibus longius, tribus striis purpureis pictum, apice ochraceo recurvo. Petala multo breviora membranacea, lanceolata, abrupte acuta, columnae parallela diaphana, una stria purpurea picta. Labellum linguaeforme obusum, crassiusculum, planum, basi gibbosum, petalis longius, atropurpureum. Columna petalis brevior, semiteres, erecta, leviter incurva, cum ovario continua, membranaceo alata, lutea, intus purpureo picta. Anthera unilocularis. Pollinia duo. Ovarium sulcatum, breve. Supra truncos *Crescentiae* Cujete ad rivum Para. Novembri.

— Typus: *Pleurothallis Ceratothallis* Rehb. fil. —

68. *PLEUROTHALLIS CERATOTHALLIS* Rehb. fil. Bonpl. II. 25: caule secundario spithamaeo valido pauci-longique articulo, vaginis articulis aequilongis mox laceris, caducis, folio oblongo lanceolato basi angustato, pedunculis fasciculatis abbreviatis nigro puberulis, bracteis arctis vaginatis acutis nigro puberulis, ovarii abbreviatis puberulis, mento valido obtusangulo, sepalo summo triangulo acutiusculo, sepalo inferiori ovato, apice breviter bicuspidato, tepalis ovatis, margine inferiori antice serrulatis, medio subito in ligulam linearem extensis sepalis aequilongis, labello basi obtuse humerato utrinque in lobum semifalcatum acutum divaricatum extenso ceterum obtuse pandurato, carinis 2 parallelis contiguis per discum, 2 semilunatis extrorsis, gynostemio incurvo, androclinio cucullato, denticulo utrinque falcato minuto, denticulo altero minuto utrinque in basi gynostemii, pollinibus (2) compressis basi attenuata productis in glandula spuria minuta. Omnino affinis *Pl. sicaria* differt ovario glabro, labello etc. Flores virides, rufo nervati, 4—5 lineas longi, folium prope 5 pollices longum. Caracas. 6000'. Novbr. — Huc *Pl. longipes* Körnicke in Otto et Dietr. Allg. Grtz. 1855. Nr. 36: *Pleurothallis* (Aggregatae. Dissepaliae) caule secundario plus minus elongato, inferne tereti, superne valde compresso ancipite et laevioribus gracilibus, articulo; vaginis articulos paulo superantibus caulem totum arcte cingentibus superioribus glabris, inferioribus setis fusco-atris multipartitis deflexis demum evanescentibus vestitis; folio lanceolato, basi breviter attenuato, superne sensim acuminato, apice tridentato, supra nitido, obscure viridi, costa media canaliculato, subtus opaco,

flavo-viridi, carinato; floribus 1—3, brevi-pedicellatis; pedunculo bracteis lilacino-puberulis ornato; germine puberulo; perigonii foliolis exterioribus 2, intus pilosis viridibus, lilacino striatis, membranaceis, supremo lanceolato, acuto, altero e binis lateralibus connato, ovato-orbiculari, acuto, usque ad medium fisso, paullo convexo, intus basi nectario excavato instructo et labello breviter connato; foliolis interioribus oblique oblongis, longe falcato-attenuatis, pellucidis trinerviis, nervis inferne et apice lilacinis, viridescensibus, erectis, exteriores aequantibus; labello multoties minori, ovato-oblongo, obtuso, margine tenui-membranaceo albido medio utrinque in dentem ascendentem producto, intus et extus apice atro-purpureo, intus canaliculato; columna intus profunde canaliculata, utrinque ad antheram in auriculam subtiliter acuminatam sursus curvatam apice lilacinam producta, pulchre lilacino 5-striata, glabra; anthera subrectangulari, pallide flavida, apice leviter lilacino bimaculata.

— Typus *Pleurothallidis nudae* Rchb. fil. —

69. **PLEUROTHALLIS NUDA** Rchb. fil. Mss. Huc: *Restrepia vittata* Lindl. Journ. Hort. Soc. III. 1848. 314 c. xyl. Ex Columbia Linden: petalis a lata basi ciliata filiformibus recurvis, labelli ciliati convexi laciniis lateralibus minimis obtusiusculis. One oblong leathery leaf, which is rather shorter than the terete spotted stem. The flowers grow singly on a slender erect stem, about half the length of the leaf. Sepals are white, and the lower somewhat boatshaped; the petals are spotted with deep rose, extended into a long slender process as long, as the dorsal sepal, and turned backwards. The lip is dull yellow, striped with deep rose, shorter than the double anterior sepal, and blunt.

Huc: *Restrepia nuda* Kl. in Otto et Dietr. Allg. Grtz. p. 275: 28. Aug 1 1852: caulibus secundariis caespitosis, basi vaginatis teretibus, fol. carnosis solitariis acutis planis versus basin attenuatis, floribus pedunculatis paucis nudis, perigonii foliolis 2 candidis rubro-striatis elongato-lanceolatis, acuminatis, supremo trinervio, inferne 4 nervio, interioribus basi lanceolato dilatatis candidis, margine denticulatis, dorso acumineque setiformi, purpureis; labello purpureo elongato-obovato acuminato magno fimbriato ima basi auriculato; gynostemio clavato.

Huc: *Pleurothallis hemirhoda* Lindl. in Paxt. Fl. g. III. 612 (Novb.). *Restrepia vittata* Lindl. J. H. S. III. 315 c. xyl. No positive difference appears to exist between the genera *Pleurothallis* and *Restrepia* except that the former has 2 and the latter 4 pollen masses. Usually however the latter have solitary, handsome, highly coloured flowers and a pair of ears at the base of the lip, and judging from this alone, we referred the present plant to *Restrepia*. But having now had the opportunity of examining the pollenmasses, we find that it is a true *Pleurothallis*, to which genus we are obliged to refer it, necessarily changing the specific name, because there is already a *Pl. vittata* from Mexico.

70. **PLEUROTHALLIS GRATIOSA** Rchb. fil. in Bonpl. II. 25: caule secundario elongato, folio oblongo basi subcuneato, apice angustato, acuto, bi-tridentato, pedunculo gracili longiarticulato, cum ovario pedicellato folium subaequante, sepalis ab ovata basi lanceoacuminatis subaequalibus, inferiori ex duobus omnino coalito, tepalis linearisetaceis carnosulis, subaequilongis, labello sepalis quinques breviori, orbiculato, basi humerato, utrinque setaceofalcato, setula dimidiae laminae latitudini subaequali, disco carnosio tricarinato, margine puberulo, limbo ciliato, gynostemio gracili, androclinio subcucullato postice unidentato. *Restrepis* subsimilis, quae polliniorum numero diversae. In hac quidem specie pollinia non vidi, inde *Restrepia* forsitan erit. Caulis secundarius basi laxè vaginatus, tum liber, prope tres pollices altus. Folium tres pollices longum, medio duos pollices latum. Pedicellus tenuis, sesquipollicaris. Ovarium cum pedunculo prope pollicare. Sepala subaequalia, sex lineas longa, apice angustata, nivea, maculis purpureis in basi. Caracas 5000'. Martio. Wagerer. Rchb. fil. Xenia Orchidacea Tab. 28. pag. 71.

71. **PLEUROTHALLIS ASPASICENSIS** Rchb. fil. in Bonpl. III. 73: similis „*Pleurothallidis*

pedunculari" Hook. folio lanceolato utrinque attenuato, pedunculo paucivaginato ultrapollinari, flore ringente, sepalis oblongo-lanceis liberis, tepalis falcatis duplo brevioribus, labello tepalis aequilongo ligulato antrorsum attenuato retuso ante basin utrinque falcula extrorsa aucto, carina per regionem antebasilarem transversa, carinula utrinque ante falculam margini parallela, gynostemio clavato gracili anguste alato labello aequilongo. — Caulis secundarius tri- seu quadripollinarius, vaginis magnis jam laceris vestitus. Folium spithamaeum, medio pollicem latum, spatha mediocri. Flos extus puberulus. Ocanna. Wagener.

72. *PLEUROTHALLIS BREVIPES* Focke Tidsch. voor de Wis. nat. Wetsch. II. p. 98: caulibus folio oblongo utrinque acuto subaequalibus, sepalis ovatis attenuatis, lateralibus basi tantum connatis aliquid subgibbosis, petalis duplo fere minoribus ovato rhomboideis integerrimis aristato attenuatis, labello linguaeformi aristato-apiculato magno fimbriato ante basin involuto. Caulis monoph., gracilis, articul., vaginat.. Vag. fibrosae, demum emaricidae, totum fere caulem vestientes. Fol. oblongum, vel oblongo-lanceolatum, utrinque acutum, coriaceum, convexum, 3—4, 5 cent. longum. Pedunculi plurimi, articulati, bracteati, apice racemosi, ad basin paginae inf. folii erecti multiflori. Fl. minuti, patuli, fulvo-purpurei, brevissime pedicellati, bracteis pedicellum amplectantibus suffulti. Sep. subaequalia, ovata, attenuata, supremum erectum, lateralia basi tantum connata, ibique subgibbosa, recurva, flavo purpurea 3 mm. longa. Petala duplo fere minor, ovato-rhomboidea, integerrima, aristato-attenuata, patula. Labellum linguaeforme, subaequale, aristato-apiculatum, margine utroque tenuissime fimbriato, ad basin involuto, cum basi brevissime fimbriato, ad basim involuto, cum basi brevissima producta columnae articulatum, breve unguiculatum, recurvum, atropurp., disco flavo. Columna labello petalisque brevior, incurva marginata, flavida, clinandrio tridentato. Anth. unilocularis, subglobosa, flavida. Pollinia duo rotunda, plano compressa, materie viscida apice cohaerentia. Ovarium brevissime sulcatum, purpureum. Hab. in sylvis ad rivum Para, supra arbores toto anno florens.

73. *PLEUROTHALLIS BIFLORA* Focke in Tidsch. Wetensch. II. 1949. p. 197: caulibus folio ovali acuto marginato subaequalibus, pedunculis axillaribus binis brevibus bifloris, sepalis lanceolatis, lateralibus ad medium usque connatis, patentibus, petalis apicem versus ciliatis acuminatissimis, labello oscillante lineari linguaeformi, margine fimbriato, apice integro aristato recurvo. Radices filiformes, fusciscentes. Caules monophylli folii longitudine, numerosi, erecti, bracteis membranaceis, cucullatis, fuscis vestitis. Folium ovale, acutum, coriaceum convexum marginatum, 3—3, 5 centim. longum, 2 centim. latum. Pedunculi bini, breves, filiformes, ad basin paginae inferioris folii adpressi, biflori. Perianthium patens. Sepala lanceolata, supremum erectum apice flavum, lateralia ad medium usque connata, reflexa basi gibboso-saccata, ad juncturam convexa, purpurascens, 6 millim. longa. Petala multo minor, lineari-oblonga, acuminatissima, margine apicem versus ciliato diaphana, flavescens. Labellum lineari-linguaeforme, petalis longius, margine usque ad medium fimbriatum, apice angustato in aristam recurvam attenuato, cum columnae basi horizontaliter producto articulatum, oscillans, atropurpureum. Columna petalis aequilonga cum ovario continua, membranaceo-marginata, alba, clinandrio antice bidentato, postice fimbriata. Anthera globosa, unilocularis, clinandrio alveolo immersa, violacea. Pollinia duo pyriformia, plano convexa, lutea, apice materie viscida cohaerentia. Ovarium sulcatum. Capsula oblongo-oboata, triquetra, subincurva, purpurea. Habitat in sylvis prope Berlijn, ad rivum Para, supra arbores. Florebat Junio, Julio, Octobri et Novembri.

Obs. Cl. Lindley habet pro Pl. articulari. Ego non credo. Illius folium orbiculare, hujus ovatum acutum. Hujus sepala oblonga, illius acuminata. Hujus labellum apicem usque serrulatum, illius in medio tantum. Hujus vaginae acutae, illius lepanthinae.

Obs. Nuper ill. Lindley in foliis VIII. novum proposuit ordinem, quem hic juvat addere, licet assentiri non omnino possim.

1. There is a group of species with great coriaceous leaves, long herbaceous spathes, and numerous racemes of fleshy flowers, rising above the leaves. These are the aristocracy of the genus, although some approach very nearly the mean genus *Stelis*; they form my *Spathaceae*.
2. Many others there are, conspicuous for their large leathery leaves, usually heart-shaped, pouring forth great membranous flowers in racemes, or usually smaller ones in clusters, all without conspicuous spathes; such form the *Macrophyllae racemosae* (Aconias of Presl), *Macrophyllae fasciculatae*.
3. Then come large leaved plants with winged stalks, sometimes resembling a thin stiletto, and fasciculate small flowers. These are *Sicariae*.
4. Immediately follows a crowd, many of which resemble *Otomerias*, all with fasciculate flowers and leaves tapering to the base: to these is applied the name of *Aggregatae*.
5. Much like the last is a little group with the points of the petals distended into a gland, offering a passage to the genus *Restrepia*, of which they are kinsmen; whence they are called *Restrepioidae*.
6. Close to *Aggregatae*, but with the inflorescence developed into a raceme, stands a herd, none of which are able to extend it beyond the summit of the leaves; hence the name of *Brachystachyae*.
7. Then the development of the floral axis is manifested by long racemes of flowers rising high above the leaves, as in *Elongatae*.
8. And parallel with these are other species in which the lengthened axis is accompanied by a well marked attenuation of the sepals: the *Acuminatae*.
9. Having considerable relation to the last division, but with little or no development of the stem, appear the *Apodae* or species in which the stem, if present, is much shorter than the leaves; and of them some form dense tufts: the *Apodae caespitosae* while others crawl upon the ground: the *Apodae prorepentes*.
10. Finally, a very small number of species casts off the character of a creeping or shortened rhizome producing erect one-leaved stems, and form an ordinary stem with leaves alternating with each other in the usual way. These, the *Cutescentes*, close the genus. The parallel of these is to be found among the Labiated *Stelises*.

MUSCOSAE.

74. PLEUROTHALLIS CHAMAELEPANTHES Rehb. fl. in Bonpl. III. 240: aff. forsan *Pl. pusillae* Lindl. vaginis arctis secus nervos ciliatis, ostio libero triangulo ciliato, folio oblongo marginato apice emarginato seu acuto basi petiolari cuneato, pedunculo capillari, sepalo utroque lanceo subulato, inferiori bifido, margine minute scabro, tepalis ligulatis brevissimis, labello basi trilobo, gynostemio gracili. Planta tenella, Lepanthides racemifloras simulans. Caulis secundarius tenuis, tri-, quadrivaginitus vix bipollicaris. Foliolum pergamenum vix semipollicare, vix quartam pollicis latum. Pedunculus capillaris folio longior. Bractea triangulari ciliatae minutae. Perigonium hyalinum flavidum. Labelli basi trilobi lobi laterales acinaciformes valde abbreviati, lobus medius ligulatus productus. Gynostemium utrinque pone foveam lobulatum. Nunc caulis tertianus axillaris in axillis folii! Capsula glabra oblonga. Valley of Lloa, on trees. 313. Jamieson.
75. PLEUROTHALLIS UNIFLORA Lindl. Comp. B. M. II. 355. Huc referenda: *Pl. striata* Focke in Tjdsch. f. Wiss. u. Naturst. IV. 63: foliis ovali-oblongis utrinque attenuatis caule triplo longioribus, pedunculis unifloris erectis, sepalis patulis, lateralibus connatis apice tantum liberis basi gibbosis, petalis dimidio minoribus ovatis acutis inaequilateris integris, labello linguiformi utroque margine in lobum acutum dilatato integro apice rotundato, floribus vitellinis aurentiaco striatis. — Radices filiformes, albescentes. Caulis monophyllus, folio triplo brevior, vestitus. Bractea marcescentes. Foliolum ovali-oblongum, vel late lanceolatum utrinque attenuatum, coriaceum,

strictum, planum, in caulem processu petioliformi conduplicatum decurrens, cum caule articulatum. Pedunculus solitarius, filiformis, ad medium articulatus, ibique vagina fuscescenti instructus, erectus, uniflorus, ad caulis basin ortus, 4 centim. longus. Sepala oblonga, acuta, patula; lateralia in unum connata, apice fissa, basi gibbosa, vitellina omnia, striis elevatis aurantiacis picta. Petala dimidio minora, ovata, acuta, integra, inaequilatera, basi obliqua, sepalis concolora, uninervia, nervo aurantiaco, latere majori stria aurantiaca picta, conniventia. Labellum linguiforme petalis aequale, concavum, integrum, cum basi producta columnae articulatum, unguiculatum, subhastatum, lobis scilicet lateralibus acutis, conniventibus, apice rotundato incurvo, aurantiacum. Columna labello vix brevior, arcuata, cum labelli unguiculo articulata, viridis, aurantiaco-marginata, clinandrio tridentato. Anthera unilocularis, cristata, albida, clinandrio immersa. Pollinia duo pyriformia, compressa, incumbentia, lutea. Ovarium teres trisulcatum, cum pedicello geniculato-articulatum. Epiphyta in sylvis ad flumen Boyen-Commewyne. Floret Martio et Aprili. Flores vix 5 millim. longi.

76. **PLEUROTHALLIS SEMPERFLORENS** Lindl. Fol. IX. n. 248. Huc: Pl. acuminata Focke in Tidsch. voor de Wis-nat. Wetsch. II. 3. Aft. 1849 p. 195. Nat. Vdl. van de Holl. Maatsch. Haarl. VII. Sur. Select. 1851. 245 cum ic. Tf. LXIV: foliis oblongis ovalibusque emarginatis in caulem brevem sensim attenuatis, junioribus discoloribus, sepalis oblongis subito et longe acuminatis, acumine lineari obtusiusculo trinerviis concavis, lateralibus basi connatis, petalis dimidio minoribus ovatis inaequaliter serratis uninerviis, labello oblongo hastato unguiculato, obtusissimo, disco velutino, lobis lateralibus conniventibus. Epiphyta, pusilla, caespitosa. Radices filiformes albidae. Caulis brevis, tenuis, monophyllus. Foliolum oblongum v. ovale, obtusum, emarginatum, in caulem sensim attenuatum, planum, junius purpurascens, subtus pallide purpureum; cum caule 1—1,5 centim. longum, 0,5 centim. latum. Pedunculus solitarius, capillaris, nudus erectus, folio multum longior, uni (vel raro pauciflorus, ad basin folii ortus. Perianthium patulum. Sepala oblonga, subito et longe acuminata (acumine lineari, obtusiusculo, patulo, demum recurvo) trinervia, (nervo medio subtus prominente, lateralibus apicem versus evanescentibus) concava; lateralia basi connata, anguloso plicata, acuta, plana, inaequaliter serrata, vel sparsa lacinato-ciliata, uninervia. Labellum oblongum, hastatum, purpureo unguiculatum, obtusissimum, subcarnosum; lobis lateralibus rotundatis, incurvis, apice recurvo, lamina interiore granuloso velutina. Columna labello brevior, arcuata cum labelli unguiculo articulata, clinandrio tridentato, dentibus antheram excedentibus; lateralibus majoribus. Anthera 1 locularis, cristata albida. Poll. 2, dimidiata, plano convexa, incumbentia, apice materie pulverea cohaerentia. Ovarium sulcatum, cum pedunculo articulatum, purpureum 1,5 mm. longum. — Flores sordide lutei. In Surinami sylvis ad ripas fluminis Commewyne superioris. Toto anno.

Obs. P. aristatae Hook affinis.

77. **PLEUROTHALLIS BARBULATA** Lindl. Fol. IX. Huc: Pl. barbata Focke in Schldl. B. Z. 1853. 227: foliis obovatis obtusis crassiusculis in caulem brevem attenuatis, scapo paucifloro foliis brevioribus, sepalis reflexis, lateralibus connatis apice tantum liberis, supremo oblongo concavo, petalis vix brevibus ovatis attenuatis integris erectis, labello linguaeiformi oscillante marginato et apice laminae exterioris pilis densis longiusculis barbatis. Epiphyta, pusilla, caespitosa, habitu Pl. acuminatae. Radices griseae. Caulis brevis, monophyllus. Folia obovata, adultiora oblonga, obtusa, crassiuscula, in caule attenuata. Scapus lateralis, racemosus, pauciflorus, foliis brevior. Sepala reflexa, lat. connata, apice tantum libera, basi sub labelli ungue gibbosa, purpurea, supremum oblongum, acutum, concavum, flavum. Petala sepalis subaequilonga, ovata basi subobliqua, sensim attenuata, erecta, integra, flava. Labellum linguaeiforme seu lineari-oblongum obtusum, basi hastatum, oscillans, cum corolla parallelum, cumque ejus pede producto ungue brevissime articulatum, convexum, duabus lamellis longitudinalibus parallelis vitellinis totum discum obtegentibus, margi-

nibus et apice laminae exterioris purpureae, pilis densis diaphanis albis longiusculis barbato. Columna petalis subaequalis, leviter arcuata membranaceo marginata, utrinque dente postice, apiculo bidentato terminali. Anthera globosa, clinandrio immersa. Ovarium triquetrum, trisulcatum, purpureum. — Hab. in Surinami sylvis. Junio.

78. **PLEUROTHALLIS OVALIFOLIA** Rehb. fl. Mss. Huc: *Stelis ovalifolia* Focke Tidsch. vor d. Wis. Nat. Wetsch. II. 1849. p. 202: folio ovali-subcarnoso, pedunculo solitario 1—2 floro, filiformi folium vix superante, sepalis ovatis acutis, petalis lineari-lanceolatis acutis recurvis, labello petaloideo ovato acuto sepalis brevior. Herba epiphyta pusilla acaulis, caespitosa. Rhizoma filiforme, repens. Folium ovale, petiolatum, in petiolum attenuatum, acutiusculum, planum, subcarnosum, nitidum. 7—8 mm. longum, 4 mm. latum. Pedunculus solitarius, uni — vel biflorus axillaris, filiformis folio vix longior. Flores minutissimi sordide flavescens, diaphani. Perianthium patens. Sepala libera, ovata, acuta, lateralia paululum approximata. Petala angustiora, lineari-lanceolata, acuta, recurva, sepalis subaequalia. Labellum petaloideum, ovatum, acutum, anticum, sepalis brevior. Columna nana, cum ovario sulcato continua carnosa. Pollinia subcarnosa, distincta, flava. Anthera opercularis, unilocularis, late cordata. Capsula triangularis, oblongo-ovata, in pedunculum attenuata, cumque eo articulata. — Surinam ad truncos arborum inter muscos, non rara. Decb., Martio ad Junium.

Obs. Cf. Lindley novas monographias: in fine *Stelidis* legis: *Stelis ovalifolia* Focke = *Pleurothallis*. In fine *Pleurothallidis* legis: *Pl. ovalifolia* Focke = *Stelis*.

1316/a. **PHYSOSIPHON** Lindl.

B. R. sub tab. 1797.

1. **PHYSOSIPHON TUBATUS** Rehb. fl. Mss.: *Physosiphon Loddigesii* Lindl. l. c. Bot. Mag. 4869. Folio oblongo obtuso, racemo solitario multo brevior, calycis tubo triquetro, labelli lobo medio serrulato scabriusculo. *Stelis tubata* Lodd. B. Cab. 1607. „Under the name of *Stelis tubata*, says Dr. Lindley l. c. Mss. Loddiges have published a very curious plant, with the habit of *Pleurothallis* but with its sepals all united into a tube, which is inflated at the base and contracted at the mouth. Otherwise its fructification has the structure of *Stelis*.” Besides the present species, Dr. Lindley includes in the genus

Physos. emarginatus (Pl. — Lindl.).

— *spiralis* (in hb. Hook. St. Catherine Brazil).

— *carinatus* Lindl. (a species very near the present).

— *ochraceus* Rich. Gal. (probably not distinct from this)

and he has since expressed the opinion, that Ppp. and Endlicher's *Specklinia dichotoma* is a fourth species. — Klotzsch. Allg. Gz. 1850. p. 122.

Obs. Ill. Hooker iconis ab ipso editae: Ic. VI. 1843. tab. 508. non fecit mentionem.

9. MASDEVALLIA MACULATA Kl. Krst. Rchb. fil. Bonpl. II. 23. Es liegen verschiedene getrocknete Exemplare und drei Abbildungen vor. Die Abbildungen haben den Blütenstiel länger, gleichlang, kürzer als das Blatt und sind die Blüten ganz gelb; gelbgrün mit rothem Fleck auf Grund der seitlichen Sepala; und ganz purpurn. Caracas. Juni. August. Wagener.
10. MASDEVALLIA MELANOXANTHA Lindl., Rchb. fil. in Bonpl. II. 283: nulli proprius affinis, pedunculo ancipiti pedali, bracteis vaginatis acutis appressis, floribus heterochronicis, cupula brevissima, triangulo superiori sensim attenuato, inferiori ligulato apice bifido, tota superficte aspera, tepalis ligulatis apiculatis, supra basin anticam obtuse semihastatis, labelli portione postica cordata lineari, duobus lobulis obtusis impositis in portione antica ovali acuta parte antica papulosa. — Folium a basi lineari petioliformi oblongospatulatum apice obtuse acutum. Perigonii hiantis subcarnosi labium superius aureum, inferius atroviolaceum. — Ocanna. 5000'. Juni. Nr. 1166. Schlim. — Rchb. fil. in Bonpl. III. 69. Wagener.

— Typus *Masdevalliae coriaceae* Lindl. —

11. MASDEVALLIA CAYENNENSIS Rchb. fil. in Otto et Dietr. Allg. Gtz. 1855. p. 242. Aff. quodammodo *M. coriaceae* quadruplo minor, cupula brevi ampla, triangulo superiori statim in processum linearem producto, triangulis inferioribus connatis semiovatis apice tantum exciso-bidentatis. — Folium spatulatum tri-quadripollicare. Pedunculus aequalis. Bractea convoluta apice retuso-apiculata. Tepala ligulata acuta supra basin utrinque angulata, margine anteriori carinata. Labellum ligulatum acutum portione posteriori carinis geminis incurventibus transeunte in partem anticam ovatam acutam minutam denticulatam, papulis quibusdam in disco. — Gynostemium clavatum vertice membrana denticulata marginatum. — Cauda supremi labii inferioribus longior. Perigonium cupreoflavum.
12. MASDEVALLIA AMANDA Rchb. fil. et Warszew. in Bonpl. II. 115: nulli affinis, racemis bi-trifloris, ovariis tripteris, sepalo summo galeato maximo; tepalis tridentatis; labello trilobo. Folia bipollicaria, 3—4 lineas lata lineariligulata acuta, basi valde lineari-attenuata, pedunculo gracili, bi-trifloro breviora; pedunculi ima basi univaginati; apice racemosi; bractea cucullatae, apiculatae hyalinae ovario pedicellato triptero dimidio breviores-aequales; cupula amplissima mento magno, imo conice extruso, postice bicarinato; labium superius maximum, galeatum, margine inferiori serrulatum carinatum, dimidio antico linearifiliforme; labium inferius bifidum, laciniis triangulo setaceis; tepala hyalina, cuneato ligulata, margine serrulata; apice tridentata dente medio porrecto; trinervia; carinis serrulatis supra nervos; labellum ligulatum, trilobum, medio immersum, lobis lateralibus rectangulis, lobo medio ligulato exserto; tricarinatum; gynostemium gracile androclinio membranaceo marginato denticulato; rostellum productum retusum. Flos valde amabilis. Perigonium siccum flavum maculis multis violaceis, haud majus, quam illud *M. floribundae*. Plantae huc usque notae racemosae typi sunt *M. racemosae* et *Schlimii*. Nov. Granat. Warszewicz. — Bonpl. II. 233: flores albi maculis roseis. Ocanna. 6—7000'. In sylvis. Martio. Nr. 503. Schlim.

13. *MASDEVALLIA LAEVIS* Lindl. Rehb. fil. in Bonpl. III. 69: aff. *ensatae* Rehb. fil. cupula brevissima ante basin constricta, labello obovato basi complicato, sulcato, ante apicem utrinque constricto, lineis tribus elevatulis in disco; sepalis inferioribus intus sericeo velutinis. Folia oblonga spatulata acuta valde coriacea, tres pollices longa, unum lata. Pedunculus folio subduplo brevior. Bractea retusa pedicello brevior. Cupula brevis. Triangula subaequalia, lateralia profunde bifida. Tepala obliqua apice retuso tridentata; dentibus lateralibus obtusis; supra basin semisagittata, limbo anteriori bicarinato. Gynostemium gracile; androclinii cucullus serratus. Papillae sericeae intus in perigonio et limbi papilloso. Flos flavidus maculis purpureis.
14. *MASDEVALLIA LEPIDA* Rehb. fil. in Bonpl. III. 69: aff. *M. affini*, duplo minor. folio ovali, triangulo superiori abbreviato. Plantulae caulis vaginis hyalinis retusis vestitus. Foliolum ovale acutum in petiolum aequalem attenuatum. Pedunculus gracilis subaequilongus. Bractea convoluta retusa pedicello prope duplo brevior. Tepala ligulata acuta supra basin anticam breviter ac obtuse semisagittata. Labellum ligulatum supra basin involutum. Gynostemium gracile. Androclinium minute denticulatum. Flos flavus et brunneus. 8000'. März. Ocanna. Wagerer.
15. *MASDEVALLIA AFFINIS* Lindl. Rehb. fil. in Bonpl. III. 69: aff. *lepidae* Rehb. fil. folio oblongo, acuto, perigonii triangulis setisque aequalibus. Foliolum petiolato oblongum acutum, quinque- ad sexpollicare. Pedunculus subaequalis. Bractea retusa pedicello aequalis. Perigonium sesquipollicare. Mentum rectangulum. Cupula ampla. Tepala ligulata supra basin anticam semisagittata, apice tridentata, dentibus lateralibus obtusis. Labellum a basi cordata ligulatum, apice obtuse acutum. Gynostemium gracile. Androclinium denticulatum. Neu-Granada. 1273. Linden. — Rehb. fil. Bonpl. II. 23. Caracas. 5—6000'. März, April. Wagerer.
16. *MASDEVALLIA CIVILIS* Rehb. fil. et Warszew. in Bonpl. II. 115: aff. *M. coriaceae* sepalis longius et multo tenuius attenuatis, mento arciore, tepalis medio hastatis, labello utrinque carinato. Folia lineariligulata acuta basi valde attenuata. Pedunculus plurivaginatus, 2—3 pollicaris. Bractea ochreate, ampla, ovario pedicellato brevior. Perigonium coriaceum, mentum productum, bene angulatum; tubus amplus; medio subconstrictus, labium superius triangulum, per duas tertias linearisetaceum; labium inferius sub sinu divisionis angulatum, in duas partes labio superiori aequales, paulo latiores bilobum; tepala incurva, ligulata, acuta, utrinque rectangulata (hinc hastata), labellum ligulatum acutum; utroque margine a regione antebasilari apicem versus carinatum; androclinii cucullus lineariligulatus. Flos extus brunneus maculis rufis, intus flavus, eadem arte punctatus. Peru. v Warszewicz.
17. *MASDEVALLIA LEONTOGLOSSA* Rehb. fil. in Bonpl. III. 69: aff. *M. coriaceae* Lindl. cupula breviori, tepalis lato-ligulatis acutis medio inferiori angulatis, labello basi lato-cuneato dein lato-linguiformi acuto, ansis carinatis duabus in basi, limbo postico denticulato, superficie praesertim anteriori dense papulis asperula. Flos paulo major, quam ille *M. coriaceae*, purpureo-violaceus fuisse visus.
18. *MASDEVALLIA ENSATA* Rehb. fil. in Linn. in Bonpl. II. 283: aff. *affini* Lindl.: folio ovali, cupula ante basin constricta, triangulo supremo lateralibus duplo minori, labello oblongo marginibus et apice acutiusculo revoluis. — Caulis secundarius dense vaginatus. Lamina petiolo suo brevior. Pedunculus elongatus supra basin univaginatus. Bractea retusa pedicello brevior. Perigonium flavobrunneum atropurpureo nervosum. Setae laterales crenato deflexae. Tepala ligulata apice inaequaliter tridentata dentibus lateralibus obtusis, basi antica semisagittata. Gynostemium gracile vix marginatum. Androclinii cucullus posticus denticulatus. Ocanna. 8—10000'. Juli. Nr. 731. Schlim.
19. *MASDEVALLIA BONPLANDI* Rehb. fil. in Bonpl. III. 69: aff. *M. coriaceae* cupula breviori tepalis oblongo-ligulatis acutis antice bicarinatis, carina interiori supra basin angulato praerupta, labello oblongo ante medium leviter trilobulo, ansis duabus in basi, carinis 2 in medio, angulis papulisque plurimis in portione anteriori, gynostemii androclinio minute denticulato. „Masdevallia uniflora Ruiz. Pav.“ Hb. B. Kth.; Foliolum spatulatum angustum pedunculo subduplo brevius. Flos *M. coriaceae* major.

20. *MASDEVALLIA ELEPHANTICEPS* Rchb. fl. et Warscew. in Bonpl. II. 116: aff. coriaceae et laevi, quater—sexies major, dorso carinato, tepalis ligulatis acutis uninerviis, labello rhombeo ligulato, basi bicarinulato, dimidio antico papulis acutis asperrimo. „Folium cuneato-obovatum acutum“. Pedunculus validus teretiusculus parce vaginatus. Bractea membranacea acuta ovario pedicellato multo—dimidio brevior. Tubus amplissimus, subcoriaceus, bilabiatus; labium superius a basi triangula lineariligulatum; labium inferius longe coalitum; subito sinuato bifidum in duas lacinias superiores aequales, dificiente basi triangula elongata; tepala ligulata acuta uninervia; labellum rhombeoligulatum, basi bicarinatum, antrorsum papulis acutis asperrimum; gynostemium incurvum; androclinium membranaceo margiatum, denticulatum. Flos flavus et purpureus, maximus generis. Neu-Granada. — Bonpl. III. 69. 1000'. April. Wagerer. — Bonpl. II. 233. — Rchb. fl. Xenia tab. 6, var. pachysepala: sepalorum setis latioribus. Ocanna. 7—8000' Wälder. Nr. 410. Schlim. Van Houtte Fl. d. S. X. 997.

— Typus *Masdevalliae tovarensis* Rchb. fl. —

21. *MASDEVALLIA AUROPURPUREA* Rchb. fl. et Warscew. in Bonpl. II. 115: nulli affinis—haud ita remota a *M. Schlimii* pedunculo alato bifloro, cupula brevissima subnulla, sepalo summo angustissimo, sepalis lateralibus in laminam ovalem apice bicaudatam coalitis. Folium coriaceum oblongum apice rotundatum, dimidio inferiori cuneato lineare; trinerve; 4—5 pollicare; pedunculus ancepiti alatus 5—6 pollicaris, alis in carinas bractearum ascendentibus; flores valde approximati; ovaria pedicellata bracteis duplo longiora; cupula angusta brevissima minuta; sepalum superius linearitriangulum, longe setaceum; sepalum inferius late ellipticum, apice sinuato bilobum; lobi trianguli brevissimi longe setacei; tepala basi anguste ligulata uniauriculata dein dilatata obtuse acuta; labellum brevissime unguiculatum ligulatum acutiusculum, limbo basin versus reflexo, carinis 2 marginalibus in laminam tertio antico intrantibus; gynostemium clavatum, androclinii limbus erectus denticulatus; regio pone foveam anguste alata. Flores illis *M. affinis* aequimagni, sicci nigri apicibus flavis. Neu-Granada. Warscew. — Bonpl. III. 69. 5000'. Wagerer. — In Bonpl. II. 283. Ocanna. 5000'. Nr. 40. Schlim.

22. *MASDEVALLIA TOVARENSIS*: Rchb. fl. in Bonpl. III. h. 24 huc reduxit nomen *M. candidae* Klotzsch Karsten, quod videtur Mss. in hort. — Rchb. fl. Bonpl. II. 23: Caracas. 6000'. November. Wagerer.

— Typus *Masdevalliae coccineae* Lind. —

23. *MASDEVALLIA ROSEA* Lindl. Annal. Nat. Hist. YV. 257. Rchb. fl. in Bonpl. II. 116: folium coriaceum oblongum acutum a basi cuneata in portionem petiolarem subaequilongam attenuatum, nervis 5 prominulis, 6 pollices longum, $1\frac{1}{2}$ in media lamina latum; pedunculus gracilis uniflorus, bractea arcta oblonga acuta scariosa ovarii pedicellati dimidium aequans; perigonium externum (2—3 pollices longum) ultra dimidium aequaliter tubulosum mento rectangulo parvo, dein bilabiatum; superius liberum a basi anguste triangula brevi setaceum labio inferiori brevius; labium inferius extorsee utrinque rotundatum, ad medium usque bilobum sinu triangulo interjecto, lobus uterque oblique triangulus in setam subaequilongam abrupte angustatus; tepala a latiori basi angustata, ligulatofalcata, retusa, uninervia, bilinearia; labellum aequilongum pandurato ligulatum, quinquenerve imo apice trilobum, lobi laterales rectanguli minuti; lobus medius crassus, asperulus, limbo denticulatus, minutus, tamen porrectus, reflexus; gynostemium semiteres, dorso bene carinatum, androclinii margo posticus elevatus, ligulatus, retusus; rostellum ligulatum, retusum, convexum, porrectum; anthera conica, utrinque antice auricula dependente ligulata retusa aucta!!! (quod adeo nunquam videram!) Perigonium pulcherrime roseum. Loxa. (Hartweg.)
24. *MASDEVALLIA COCCINEA* Linden (Orch. Linden. p. 5) Rchb. fl. in Bonpl. II. 115: folium coriaceum trinerve oblongum obtusatum (cum apiculo) anguste cuneatum, trinerve, cum parte petiolaris teretiuscula canaliculata articulatam; in caule secundo brevissimo; pedunculus ultra pedalis, ovarium pedicello suo quadruplo brevius; bractea

vaginans acuta ovario pedicellato duplo brevior; perigonium externum mento vix prominulo in tubulum curvum 4—6 linearem coalitum, dein bilabiatum; labium superius triangulum per quinque sextas linearisubulatum; labium inferius ellipticum, dilatatum, maximum, ab apice medium usque sinu triangulo angusto bilobum, lobo utroque falcato triangulo introrso apice valde angustato; tepala ligulata, apice obtusato emarginata 2—3 linearia uninervia; labellum ligulatum, apice dilatatum, utrinque rotundatum, medio retuso lateque apiculatum; gynostemium utroque angulo marginatum, androclinium elevatum cucullatum, cucullo retuso denticulato. — Rehb. fl. Bonpl. II. 283. Ocanna. Wälder. 8—10000'. Mai. Nr. 1164. Schlim.

25. MASDEVALLIA AMABILIS Rehb. fl. et Wrsw. in Bonpl. II. 116: similis *M. roseae* triplo minor, tubulo medium versus ampliato, tepalis apiculatis binerviis, labello apiculato, gynostemio alato, anthera antice emarginata. Folium cuneato oblongum obtusum tripollicare, $\frac{2}{3}$ pollices supra medium latum. Pedunculus tenuis. Bractea arctissime vaginans acuta ovario pedicellato plus duplo brevior. Perigonium externum medium usque tubulosum, tubulo superne ampliato mento obtuse rectangulo parvo; superne bilabiatum; labium superius lato triangulum per duas tertias subulato-lineare; labium inferius duplo latius, externe rotundatum, sinu interjecto triangulo bilobum, lobi oblique trianguli per tres quartas seu duas tertias linearisubulato lineares; tepala a lata basi angustata, ligulata, apice sinuata, altero lobo obtuso, altero apiculato (nunc utroque obtuso), binervia, nervo altero carinato; labellum breve unguiculatum, lamina lineariligulata apice dilatata, acuta; carinulae 2 per medium in sicca bene conspicienda; in planta humefacta evanescentes; gynostemium semiteres, lateribus alatomarginatum, androclinii cucullo hyalino denticulato. Pulchre purpurea. Peru. Warszewicz.

26. MASDEVALLIA MILITARIS Rehb. fl. et Wrsw. in Bonpl. II. 115: aff. *coccineae* tepalis inaequalibus binerviis, labello apice dilatato integro. „Folia oblonga acuta basin versus anguste cuneata. Pedunculus validus folio suo vulgo dimidio longior, violaceus“. Perigonii tubulus incurvus septemlinearis mento omnino obtusato evanescente; dein bilabiatum; labium superius a basi angustissima triangula linearisetaceum; sesquipollicare; labium inferius latissimum medium usque bilobum, lobi trianguli utrinque obtusati, apiculati; tepala ligulata, binervia, altero latere rectilinea, altero lobulata; 3—5-linearia; labellum ligulatum apice dilatatum, obtusatum integrum; androclinium margine cucullatum. Flores duabus tertiis illorum *M. coccineae* aequimagni, siccis cinnabarini, vivi scarlatini. Neu-Granada. Wrsw. — Bonpl. II. 283. Ocanna. Wälder. 9—11000'. Januar. Nr. 415. Schlim.

27. MASDEVALLIA RACEMOSA Lindl. Rehb. fl. in Bonpl. III. 69: affinis *M. coccineae* cupula elongata, sepalorum triangulo summo minuto apiculato triangulis lateralibus semiovatis alte connatis extrorsis apiculatis. Folia basi linearia subito ovalia acuta. Racemus pluriflorus folio longior. Triangula inferiora cupulae aequalia. Tepala ligulata acuta supra basin anticam angulata. Labellum ligulatum; portio basilaris carinis duabus transiens in anticam brevior rhombeam apice emarginatam. Gynostemium clavatum, androclinii cucullus minutè denticulatus. Hartweg 1432?

— Typus *Masdevalliae polyanthae* Lindl. —

28. MASDEVALLIA POLYANTHA Lindl. Rehb. fl. in Bonpl. II. 283: affinis *M. Schlimii* Lind. et Sceptro Lind., Rehb. fl.: pedunculo ancepiti anguste alato, polyantho, floribus duplo minoribus, cupula brevissima recta, sepalis ceterum aequalibus, tepalis ligulatis acutis obliquis, labello ligulato apice apiculato reflexo, lateribus revoluta, basi cordato, carina a basi in discum, lamellis duabus triangulis antepositis, androclinii cucullo denticulato. — Folium a cuneata basi ligulatum acutum, dum in *M. Schlimii* Lind. spatulato oblongum. — Flores purpurei, apicibus aureis. Ocanna: Wälder. Februar. 7—8000'. Schlim. — Bonpl. III. 69. April. 6000'. Wagoner.

29. MASDEVALLIA BUCCINATOR Rehb. fl. et Wrsw. in Bonpl. II. 115: aff. *M. Schlimii* pedunculo alato, bifloro, perigonio breviori, cupula coalita longiore, labio inferiori VI.

- incurvo deflexo buccinato, apiculo interjecto in sinu. Foliū valde coriaceum oblongoligulatum acutum trinerve tertio inferiori cuneato lineare subpedale. Pedunculus anceps utrinque alatus; biflorus, internodio brevissimo. Bracteae cucullatae acutiusculae scariosae amplae ovariis pedicellatis in articulatione angulatis breviores. Perigonio coriacea (firmiora quam in *M. Schlimii*); cupulae quinquelineares amplae mento bene angulato; labium superius a basi triangula brevissima lineariligulatum; labium inferius latissimum, cucullatum, subito et sub angulo deflexum, marginibus extrorsis erectis curvatis; apice apiculo in sinu parvo interjecto bicaudatum, caudis lineariligulatis; tepala ligulata acuta uninervia hinc angulata; labellum lineariligulatum acuminatum, asperulum carinis 2 a basi in disco, ibi abrupte angulatis; gynostemio marginato, androclinio denticulato cucullato. Flores purpurei, tertia breviores, quam illi *M. Schlimii*. Neu-Granada. Wrsw. — Wrwz. in Bonpl. II, 283. Perigonio flava seu purpurea. — Pamplona: la Baja. Januar. 8000'. Nr. 1181. Schlim.
30. *MASDEVALLIA CINNAMOMEA* Rehb. fil. in Bonpl. III. 224: affinis *M. Schlimii* pedunculo tenui hand adeo ancipiti, sepalis inferioribus alte bipartitis, tepalis ligulatis apiculatis, supra basin utrinque angulatis, latere inferiori carinatis, labelli hypochilio ligulato apice abrupto utrinque angulato carinae instar in lobum medium rhombeum apiculatum serrulatum transeunte, tumore hippocrepico retrorso in disco, androclinii cucullo subnullo denticulato. Spithamaea. Caulis secundarius brevis vaginis retusis sat laxis nigro guttulis vestitus. Foliū quadripollicare ligulato spatulatum, basi bene petiolatum, apice contractum trimucronatum. Pedunculus sexpollicaris apice pauciflorus. Bracteae pedicellos aequantes. Cupula recta per tres lineas clausa. Lacinia triangularis libera summa bilinearis dein caudata. Laciniae inferiores exacte sub ortu laciniae summae fissae, triangulae, sensim in caudas abeuntes. Peru. Chachapoyas. Matthews. (Herb. ill. Boiss.)
31. *MASDEVALLIA MASTODON* Rehb. fil. in Bonpl. III. 69: ex flore (quem solum teneo) affinis *M. Schlimii*: labello flabellato apice acuto inflexo, tepalis ligulatis apice retusis emarginatis, latere antico tricarinatis, carina medio in falcnlam descendentem exeunte. Flos illi *M. Schlimii* Linden aequalis. Tubus tamen paulo longior et curvus, per duplam longitudinem connatus. Lacinia summa triangula per duas lineas, dein in aristam subbipollicarem extensa. Laciniae inferiores sub ortu aristae imparis jam fissae, curvo triangulae, longi aristatae. Inde omnino dispar est species *Masdevalliae* Lindeni et polyanthae quae cum labello lamelligero, tum sepalis inferioribus alte coalitis recedunt. Flores atrorufi. März. Ocanna. 6000'. Wagener.
32. *MASDEVALLIA SCEPTRUM* Rehb. fil. in Bonpl. II. 283: aff. *M. Schlimii* Lind.: pedunculo gladiato ancipiti apice bene racemoso, cupula brevissima recta, sepalo summo brevissimo, triangulo dein aristato, sepalis inferioribus incurvo semiovatis longe connatis, tandem lissis, triangulis caudatis, tepalis oblique cuneatoovatis acutis, labello lineariligulato basi cordato, apice apiculato, marginibus lateralibus inflexo, carinis triangulis geminis in disco, androclinii cucullo bene denticulato. — Pedunculus validus compressus utrinque elatus, apice longe racemosus. Bracteae oblongae acutae hyalinae pedicellis breviores. Flores quam in *Masdevallia Schlimii* Lind. (Funk et Schlim. 1497) minores; atropurpurei, setis aureis. — Pamplona: la Baja. Januar. 8—9000' Nr. 1200. Schlim.
33. *MASDEVALLIA SCHLIMI* Lind. Rehb. fil. in Bonpl. II. 283: aff. *Sceptro* Lind., Rehb. fil.: folio spatulato obovato obtuse acuto, racemo paucifloro, flore majore, labio inferiori longiori, tepalis oblique panduratis acutis, angulo inferiori bicarinato, igitur duplici, labello ligulato, portione inferiori antice utrinque obtusangula in lineas 2 elevatas portionis anterioris transeunte, gynostemio gracili, androclinii cucullo integerrimo. — Inter hunc gregem flores maximi. Foliū ambitu, natura pedunculi, tepalis, labio diversissima. — Merida. 6000'. Mai 1847. Funk u. Schlim. Nr. 1497. — Rehb. fil. Bonpl. II, 23. Merida, 5000'. Januar. Wagener.

— Typus *Masdevalliae Echidnae* Rehb. fil. —

34. *MASDEVALLIA VERRUCOSA* Rehb. fil. in Linn. XXII. 819. Rehb. fil. Bonpl. II. 24 (sub *Pleurothallide*): rhizomate scandente polyrrhizo vaginis magnis paleaceo-hyalinis vestitis, caule secundario dense laxaque vaginato abbreviato, folio basi cuneato, dein oblongo, apice angustato, minute mucronulato, pedunculo valido dense asperoque verrucoso medio univaginato, apice flexuoso, racemo elongato, sparsifloro, bracteis arctis apice acutis, floribus inversis, sepalo impari lineari lanceolato, dein lineari apice dilatato, s. lateralibus oblongis margine inferiori antice implicitis apice lineari setaceis, tepalis oblongo triangulis acutis, nunc altero margine angulatis repandisve, labello a basi ligulata medio rotundo apice ligulato retuso margine medio rotundato ac apice retuso denticulato, callis 2 semilunatis laceris in medio, gynostemio gracili supremo margine membranaceo denticulato. Folia usque tres et dimidium pollices longa, superne sesquipollicem lata. Pedunculus aequilongus seu longior. Flores 4—5 lineas longi, flavovirides cum striis purpureis. Apices reflexi sepalorum lateralium et apex porrectus summi sepali memorabiles. Pamplona: la Baja. Funck et Schlim. — Caracas. 5000'. November. Wagener.
35. *MASDEVALLIA ECHIDNA* Rehb. fil. in Bonpl. III. 69: aff. *M. verrucosae*: pedunculo densissime papulis subulatis linearibus papuloso, ovario hystricino, cupula brevissima, setis linearibus carnosis, tepalis integris ligulatis apice carnosis, labello sigmoideo basi lamella superunguiculari aucto, dein carinaeformi, apice rhombeo, androclinii cucullo obsoleto. Perigonium subcarnosum. Sepala per duas ad tres lineas connata. Cupulae vertex acute papulosus carinatus in sepali setam lineari teretem carnosam exiens. Mentum obtusum buccatum. Sepalorum setae deflexae. Tepala linearia apice rotundato carnosae, margine inferiori medio angulata. Labellum sigmoideum: unguis liber tectus a lamella lineari brevi basi adnata apice retuso carnosus inflexus; per curvaturam semilunato introrsum carinatum; adnata lamella apicis rhombica complicata carnosae, basi utrinque breviter ciliata. Gynostemium tepalis duplo brevius, androclinium levissime trilobulo marginatum denticulatum. — Flos brunneus, prope illi *M. Wagerianae* Lind. aequalis. Pedunculus tripollicaris. Bractee non muricatae pedicello breviores. Bei 6000' Seehöhe im März. Ocanna. Wagener.
36. *MASDEVALLIA OCHTHODES* Rehb. fil. in Bonpl. III. 70: aff. *M. verrucosae* Rehb. fil. sepalis lateralibus ante apicem rectangulo erectum tumidis, tepalis ligulatis acutis, labelli lobis lateralibus semiovatis integris, lobo medio oblongo toto margine serrulato. carinis 2 in medio integris, gynostemii alis semiovatis medio emarginatis. Usque pedalis. Internodia infima brevissima, trilinearia. Vaginae membranaceae elongatae. Foliolum basi petiolato lineare canaliculatum per sex lineas, dein in laminam spatulato oblongam apice contracto acutam (tridentatam) expansum. Pedunculus subpedalis gracillimus dense verrucosus vaginis 2 arctis membranaceis vestitus. Racemus elongatus pluriflorus, internodia infima nunc valde distincta. Bractee ochreae oblique acutae, carinatae, multipustulatae. Flos carnosus, flavidus, trilinearis—quadrilinearis. Sepalum impar lanceum in apicem ligulato teretem carnosum eductum. Hac specie detecta *M. verrucosam* haud ad *Pleurothallides* pertinere sentio. Auf Steinen. 6000' März. Ocanna. Wagener.

1233. **OCTOMERIA** R. Br.

H. Kew ed. 2. V. 211. — Walp. Ann. III. 523.

1. *OCTOMERIA SURINAMENSIS* Focke in Tidsch. vor de Wis. Nat. Wetsch. II. p. 200. 1849: foliis solitariis lanceolatis, floribus axillaribus fasciculatis, sepalis ovatis attenuatis basi subconnatis, petalis oblongis basi acutis, apice attenuatis, labello trilobo, lobis lateralibus falcatis erectis, intermedio undulato basi bicristato, cristis longitudinalibus purpureis dorso in angulum obtusum productis. Caules monophylli, teretes, articulati, vaginis fibrosis marcescentibus vestiti, folio breviores. Foliolum lanceolatum, processu petiolum mentiente in caulem attenuatum, crassum, coriaceum,

12—14 cent. longum, 17—20 mm. latum; juniora margine purpurascens. Flores fasciculati, ad basin folii congesti, brevi pedunculati, bracteati, flavi. Bractee imbricatae sub anthesi emarcidae, persistentes. Perianthium patens. Sepala ovata, attenuata, basi paululum connata. Petala oblonga, basi acuta, apice attenuata, sepalis aequilonga. Labellum trilobum, cum pede columnae articulatam lobis lateralibus falcatis erectis, intermedio lacerato-undulato, apice reflexo, apiculato, basi bicristato, cristis longitudinalibus purpureis, postice in angulum obtusum desinentibus. Columna teres, leviter arcuata, basi paulo producta, cum ovario continua, purpureo striata; clinandrio concavo. Anthera terminalis, opercularis, cristata, bilocularis, albida. Pollinia octo oblongo obovata, plano compressa, per paria apice materie viscida cohaerentia, flava. Ovarium sulcatum. Habitat in arborum truncis ad rivum Parae. Julio et Nov. Pollinia antherae operulo remoto per paria sibi invicem incumbentia reperiuntur, 2 paria in quovis loculo $\circ \circ \circ \circ$ ita ut primo intuitu non nisi 4 adesse videantur.

2. **OCTOMERIA SCIRPOIDEA** Rehb. fl. in v. Mohl et v. Schldl. B. Z. 1852. 856: caulibus secundariis teretiusculis (fid. Pöpp.), articulatis, vaginatis, articulo summo valde elongato, nudo, folio terminali, subulato (?), obscure cum caulis internodio summo articulo, fasciculo florum laterali in folii basi, bracteis (anthesis tempore? exsiccatione mala?) emarcidis, perigonii phyllis 5 linearibus acutis subaequalibus, labello unguiculato, trilobo, lobis lateralibus falcatis basilaribus, lobo medio producto pandurato retuso, nervis lateralibus ante basin cariniferis; gynostemio gracili incurvo, androclinio trilobo, lobo postico acuto, lobis lateralibus obtusis. — *Aspegrenia scirpoidea* Endl. Pöpp. Labium roseum. Flos reliquus ex cl. Pöppig citrinus. Cuclero, Pöppig.

1324. **LEPANTHES** Sw.

(Act. Ups. VI. 85. — Walp. Ann. III. 523.)

- I. **BRACHYCLADAE**: axes secundarii, quam primarii breviores, cum axi primario acutangulo ascendentes, hinc quasi distichifoliae.
- II. **MACROCLADAE**: axes secundarii, quam primarii manifeste longiores, vulgo rectanguli cum axi primario. „Acaules“.

A. **ELONGATAE**: racemi foliis aequales; seu longiores.

a. Tepala medio mutica.

α. Folia orbiculata seu oblonga. (nunc obtuse acuta.)

αα. Tepala utrinque acuta.

1. **LEPANTHES AVIS** Rehb. fl. Xenia. Tab. 50. II. 5—7.
2. **LEPANTHES IONOPTERA** Rehb. fl. in Bonpl. III. 70: aff. *L. capitaneae* Rehb. fl.: sepalis utroque lineari-lanceo, inferiori apice bidentato, tepalis transverse et humiliter obtriangulis, labelli lobo utroque oblongo obtusato. — Elongata. Caulis secundarii pollicares ad bipollicares, tenues. Vaginae arctae ostio triangulo examplicatae; ostio et super nervos minute ac spisse muriculatae. Folium a basi cuneata lineari oblongum apice obtuse acutum, marginatum, apice tridentatum dente medio minuto, pollicem longum, quatuor lineas medio latum. Racemus capillaris apice tri-quadriflorus. Bractee minute scabridae ipsae minutissimae. Perigonium atrovioleaceum vivum certe prope pollicem longum ubi expansum ab apice apicem usque sepalorum. Nervus transversus a basi in apicem tepalorum. — Ocaina. Wagerer.

ββ. Tepala manifeste obtusata.

3. **LEPANTHES CAPITANEA** Rehb. fl. in Bonpl. III. 241: aff. *L. bilobae* Lindl. tepalis basi obtusangulis superne ligulato linearibus ciliatis, labelli lobis panduratis introrsum

acinaciformibus (apice!), gynostemio sub medio labellifero. Gracilis, quinque—septempollicaris. Caulis secundarius vaginis quatuor ad sex vestitus. Vaginae arcte appressae ostio dilatato subcordatae acutae limbo ac nervis omnibus minute muriculetis. Folium coriaceum cuneato ovale marginatum apice tridentatum. Pedunculi 1—2 capillares basi nudi, superne laxe racemosi, flexuosi. Bractee triangulae ovariis pedicellatis ter ad quater breviores. Sepalum superius triangulum, inferius paulo latius, aequale, sed apice bidentatum. Tepalorum laminae ciliatulae dimidium superius lanceum apice obtusato extrorso; dimidium inferius obtusangulum brevius; unguis brevissimus. Labelli lobi margine ciliatuli subpanduriformes, dimidium superius introrsum acutum, subacinaciforme. Gynostemium apice postice bene excisum, supra basin labelligerum. Blüthe getrocknet kirschroth. Valley of Lloa. 168. Jamieson.

β. Folia ovalia bene acuta.

4. LEPANTHES OTOSTALIX Rchb. fl. in Bonpl. III. 241: folio chartaceo oblongo apice lineari, tepalis ligulatis utrinque acutis juxta unguem transverse carinatis, tepalis ovatis peltatis. Tenuis, quinquepollicaris. Vaginae apice infundibulari ostio subcordatae, nervi et limbus ostii bene muriculati. Folium a basi lineari cuneato oblongum apice subito ligulato lineare tridentatum, marginatum. Racemus capillaris elongatus multiflorus. Bractee triangulae acutae ovariis pedicellatis duplo breviores. Sepalum superius triangulum, inferius subaequale apice bidentatum. Flores flavi. Woods Western side of Pichincha. 266. Jamieson.

B. EFFUSAE: racemi foliis manifeste breviores.

a. Tepala lacinula seu angulo medio aucta.

5. LEPANTHES ANDRENOGLOSSA Rchb. fl. in Bonpl. III. 241: aff. L. monopetala Lindl. tepalorum dimidio superiori ovali acuto, inferiori triangulo, lacinula lineari ciliata minuta exforsa inter utrumque ante lineam carinatam paginae inferioris, labello minuto clandestino triangulo apice bifido margine ciliato, gynostemio basi labellifero. Plantula caespitosa. Caules tenues, tri—quadrupollicares, septem ad octovaginati. Vaginae in nervis minutissime muriculae ut lentium bonarum egeas ad videndos muriculos: ostium cordatum limbo tumido minute muriculato. Folium horizontale papyraceum cuneato oblongum ante apicem subito per quartam lineae apice retuso tridentatum tenuissime marginatum, inferne violaceum. Pedunculi capillares uni—biflori. Sepalum superius ovato triangulum, inferius paulo brevius et latius apice bifidum. Alabastris perigonium supra ovarium cordatum. Flores flavi. Quito. 66. Jamieson.

b. Tepala medio mutica.

§. 1. *Laxiflorae*: racemi rari laxi.

6. LEPANTHES WAGENERI (Effusae) Rchb. fl. Bonpl. III. 70: nulli bene affinis, tenuis, vaginis arctis violaceis muricatis, folio orbiculato, racemo brevi, tepalis dolabriformibus abbreviatis, labelli lobis anguste oblongis apice inferiori acutis, margine inferiori reduplicatis. — Planta facie Pleurothallidis punctatae Lindl. Dense caespitosa. Vaginae arctae supra nervos atque ostio explanato triangulo minute muriculae. Folium basi petiolare per breve spatium, ceterum orbiculare apice minutissime tridentatum, infra violaceum. Racemus folio brevior. Bractee ochreato triangulae laeves. Flores flavi. Sepalum superius ovatum acutum; inferius ovatum bidentatum. Tepala oblonga sursum oblique ascendenti retusa, apice acuta (hinc dolabriformia diximus) pone apicem inferiorem sessilia, haud ultra sepalum superius producta. — Ocanna. April. Wagerer.
7. LEPANTHES AQUILA BORUSSIAE Rchb. fl. in Bonpl. II. 22: gracilis, pusilla, caule secundario tenui 5 articulado, vaginis arctis ostio cordato triangulo expanso ciliato, folio lanceolato, utrinque attenuato, apice minutissime trilobulo, racemis capillaribus 3—4 abbreviatis seu folio subaequalibus, bracteis vaginalis retusis medio acutis,

sepalis triangulo cuspidatis, lateralibus basi coalitis, tepalis semilunatis, extrorsis, apice superiori obtusis, inferiori erosulo bidentato, labello bilobo, lobo utroque dolabriformi, angulo superiori subfalcato introrso, apice inferiori obtuso, facie interna utrinque pone marginem lamellifera, gynostemio ultra labellum porrecto, rostello terminali, obtuso, obreniformi, medio apiculato, androclinio medio dorso acuto. Affinis *Lepanthi monoapterae* Lindl. Haec species omnibus partibus tertia major gaudet labio altius inserto, columna longiori, tepalis utrinque acutis. Columna cum alis similis aquilae borussicae. Flores violacei. Caracas. Wagerer.

§. 2. *Distichae*: racemi arcti quasi bipectinati.

8. *LEPANTHES LINDLEYANA* Oersted et Rehb. fl. Xenia Tab. 50. III. 8—10.
9. *LEPANTHES TURALVAE* Rehb. fl. in Bonpl. III. 225 (Effusae): similis *L. cochleariformi* Sw. vaginis arctis, ostio tantum angusto microscopice muriculatis, folio ovato acuto bene limbo, racemi pectinati bracteis parvis muricatis, sepalo inferiori alte bifido, tepalis incisione triangula extrorsa acuta bilobis, labelli lobis obtuse triangulis. Caulis tres — quatuor pollices altus incluso folio. Flos ex Dr. Oersted icone. Sepala triangula rubro-carnea. Tepala flavida, superne purpurea in angulo interno. Labii lobi et columna purpurea. 3000'. Oersted.
10. *LEPANTHES ERINACEA* (Effusae) Rehb. fl. in Bonpl. III. 225: aff. *monoapterae* Lindl. quinquepollicaris, vaginis ostiisque magnis cordatis valde hispidis, folio pergameneo oblongo in apicem ligulatum apice tridentatum producto, racemis congestis abbreviatis, bracteis navicularibus acutis hispidis, sepalo superiori triangulo, inferiori bifido utrinque acuto, tepalis introrsum triangulis obtusis imbricantibus, labelli lobis triangulis. Planta rigida floribus flavis. Tepala basi et labium fusciorubra. Turalva in Costarica. Oersted.

1325. **STELIS** Sw.

(Ind. occ. 1549. — Walp. Ann. III. 524.)

DISEPALAE.

1. *STELIS CHACHAPOYENSIS* Rehb. fl. in Bonpl. III. 224: aff. *St. spirali* Pers. folio oblongo ligulato angusto angustissime petiolato acuto; spica elongata, bracteis acuminatis flores excedentibus, tepalis reniformibus, labello rhombeo obtusangulo abbreviato, linea crenulata carinata per medium. Planta gracilis subpedalis. Caulis secundarius abbreviatus. Vaginae paucae apice acuminatae hinc radicibus perforatae. Folium vix duos pollices longum, dimidium non latum. Spica prope spithamaea, hinc flexuosa. Sepalum superius triangulum, inferius semiovatum apice bidentatum. Gynostemii anguli obtusati. Chachapoyas. Matthews. (Herb. ill. Boiss.)
2. *STELIS FLACCA* (Disepalae) Rehb. fl. in Bonpl. III. 240: nulli affinis, magnitudine *Stelidis ophioglossoidis* Lindl., floribus majoribus, tepalis a basi cuneata transversis margine externo inflexocucullatis, labello transverso retuso basi utrinque pone unguem dente retrorso instructo, gynostemii angulis acutis. Caespitosa, quadri—quinquepollicaris. Caules secundarii bi—trivaginati. Folium lanceolatum anguste petiolato attenuatum duos pollices longum, quartam tertiamve pollicis latum. Spicae plures tenues congestae folio longiores. Bractee cupulato triangulae abbreviatae. Perigonium siccum atratum membranaceum. Sepalum superius triangulum, inferius transverse ovatum apice bidentatum. Western side of Pichincha, on trees. 735. Jamieson.
3. *STELIS MAXIMA* Lindl. — Rehb. fl. in Bonpl. II. 115. Bipedalis et ultra, caulis ex axilla folii caulis secundarii anni praecedentis internodia longa (angulata?) vaginata; folium oblongum acutiusculum basi cuneatum, 4—5 pollices longum, 1½ latum; pedunculus ultra pedalis, basi a spatha membranacea stipatus, parte inferiori 4 articulata 5—6 pollicari vaginis ochreatis acutis valde abbreviatis vaginata; racemus multiflorus, quaquaversus; bractee cupulatae acutae ovarii pedicellatis breviores, flores

illis *S. grandiflorae* duplo majores, perigonium basi coalitum, bilabiatum, sepalum superius triangulum, inferius concavum, ellipticum, imo apice bidentatum; tepala latissima, brevissima, latissime cuneata, apice retuso biloba cum apiculo, linea carinata transversa supposita, involuta; labellum subaequale, antice tamen lato triangulum, disco carnosum; gynostemium antrorsum utrinque brachiatum, brachiis ligulatis incurvis acutiusculis. Hartweg 1407.

4. **STELIS DIALISSA** (Disepalae) Rehb. fil. in Bonpl. III. 71: bracteis ochreatolanceis distichis squarrosis. *Dialissa pulchella* Lindl. in Tayl. Ann. XV. 1845. p. 107. — Planta pedalis-quadrupollicaris. Caulis secundarius paucivaginatus. Folium lanceolatum, acutum. Racemus folio aequalis seu multo longior. Pedunculus nunc squamulis minutis vestitus, nunc vaginis falcatis. Bractee longae a basi ochreate lanceo falcatae distichae floribus pedicellatis longiores. Perigonium bivalve. Sepalum superius ovatum, s. inf. apice obtuse bilobum; utrumque alte coalitum. Tepala ovata seu elliptica minuta. Labellum rhombeum obtusangulum per discum transverse bicarinatum. Gynostemium omnino Stelidum: clavatum, truncatum. Limbus infrastigmaticus bilobus lobis rotundatis, rostellum dens erectus integer. Popayan Hartweg! Tolima Linden 1275!
5. **STELIS CUPULIGERA** Rehb. fil. et Warszew. Bonpl. II. 114: simillima *S. maximae*, duplo minor, tepalis rhombeis dimidio superiori carnosis, labello rhombeo, per discum tricarinato, gynostemii brachiis retusis. Caulis validus siccus angulatus. Folium oblongum acutum basi cuneata angustatum, 5 pollices longum, unum latum. Pedunculi 2-3, basi a spatha nervosa lancea acuta stipati; sub inflorescentia triquadri-vaginati, vaginis ochreatis arctis apice acutis; racemus multiflorus, floribus spiritaliter secundis; bractee basi brevi ochreatea cupulatae dorso longe triangulae acutae uniuerves ovariis pedicellatis breviores; sepalum superius triangulum, inferius ovatum apice bidentatum; tepala minuta et labellum supra descripta; gynostemii rostellum productum ligulatum retusum. Flores illis *St. grandiflorae* aequales. Peru. Warszewicz.
6. **STELIS MELANOXANTHA** (Disepalae) Rehb. fil. in Bonpl. III. 71: aff. *St. maximae* Lindl. tepalis unguiculatis reniformibus, labello unguiculato rhombeo per discum lamella medio sinuata aucto, gynostemii angulis ascendentibus quadratis. Ultra pedalis. Radices adventitiae numerosae tenues. Vaginae ternae, superne valde amplae tubulosae. Folium multum varians: oblongum, ellipticum, obovatum, tres ad septem pollices longum, dimidium ad duos pollices latum, basi petiolarum attenuatum usque per pollicis longitudinem. Racemus solitarius folio longior. Bractee triangulo cupulares apice tantum acutae. Perigonium atroviolaceum disco et basi sepali inferioris flavis. Sepalum inferius apice bidentatum. Gynostemii anguli divergentes externe oblique retusi. Flores illis *Stelidis maximae* Lindl. duplo minores. Ocanna. Wagerer.

— Labellum integrum cochleare. —

7. **STELIS SCANSOR** Rehb. fil. in Bonpl. III. 241: caule primario funiformi scandente basi polyrrhizo, caulibus secundariis appressis abbreviatis, foliis ovalilanceolatis, spica minutiflora folio longiore, bracteis ochreatis acutis bene distichis, sepalis triangulis, tepalis cuneatis apice retusis involutis, labello cuneato „cochleari“ (ex Lindl.). Adsunt rhizomata pedalia. Caules secundarii vix bipollicares. Folia bipollicaria, basi bene cuneata, medio tertiam pollicis lata. Racemus folio longior. Gynostemii anguli obtusanguli erecti. Inflorescentia juvenis illam *Pholidotae* ludit ob bracteas (hic hyalinas) dense imbricantes. Occurs near Pasto in woods. Sept. 1845. 448. Jamieson.

TRIVALVES.

— Labellum integrum transversum retusum. —

8. **STELIS MAJOR** Rehb. fil. in Bonpl. II. 23. *Spithamea*, caule secundario abbreviato dense vaginato, vaginis retusis apiculatis (summa acuta) imbricantibus, folio a basi anguste ligulato obovato spatulato obtuso caule longiore, spatha membranacea carinata

acuta, pedunculo folio duplo longiori, tertio inferiori hinc brevivaginato, superne racemoso, racemo subsecundo (saltem ex sicca planta), bracteis membranaceis vaginatis acutis, sepalis basi connatis ovatis transversis apiculatis, tepalis obtusangule oblongis transversis minutis, labello transverso basi latissime cuneato margine involuto, dilatato, obtuso bilobo seu trilobo, callo magno in tota basi obtuso antice quadricarinato, nunc tri—quadrisulcato, androclinio trilobo, lobo medio acuto. Prope Stelidem grandifloram, cujus flores minores et labium et tepala diversissima. Caracas. S. Nevada. Wagerer.

9. *STELIS GRANDIS* Rehb. fl. in Bonpl. III. 70: characteribus artificialibus pone *St. crassifoliam* Lindl., elata, oblongifolia, pluri- et longispicata, tepalis a basi unguiculata hastato reniformibus margine externo scabris, labello flabellato antice bisinuato hinc trilobulo, callis 2 obtusangulis in disco. — Caulis secundarius 6—8 pollicaris paucivaginat. Foliis octo pollices longum, tres medio latum, basi petiolarum ligulatum. Spicae plures folium aequantes seu excedentes; basi 2—3 vaginatae. Spica disticha multiflora internodiis inferioribus magnis. Bractea ochreato triangulae apiculatae, ovaria aequantes. Sepala basi coalita ovata. Tepala trinervia. Anguli laterales antici gynostemii obtusi. — Flores flavi. Merida. 6000'. Septbr. 1846. 1049. Funck et Schlim. (Herb. Boiss.)

— Labellum integrum transversum retusum cum apiculo. —

10. *STELIS CAPILLIPES* Rehb. fl. in Bonpl. III. 240; aff. *St. Jamiesoni* folio lanceolato angusto pergameneo, pedunculo capillari nunc gemino folium duplo excedente, sepalis oblongis margine puberulis. Plantula tenuis incluso pedunculo quadripollicaris. Caulis secundarius minutus vix pollicaris vaginis ostio oblique retuso laxis vestitus. Foliis nunc ellipticum, vulgo anguste lanceolatum longe attenuatum, usque subbipollicare. Spathula tenuis. Pedunculus unus seu geminus folium bene, nunc longe excedens; vaginula una seu gemina minuta vestitus superne flexuosus. Bractea ochreata acutae minutae. Sepala oblonga sicca atrofusca. Tepala brevissima cuneata basi obtusangulo-rhombica, transversa. Labellum obovatum emarginatum cum apiculo minuto in sinu, callo magno obovato bilobo per discum. Gynostemium a basi arca velutina dilatatum. Limbus foveae erectus bilobus cum apiculo interjecto. Valley of Lloa. 265. Jamieson.

Obs. III. Lindley hanc ad suam *St. flexuosam* Lindl. in Ann. nat. hist. XII. 1843. p. 397. ducit. Stelides ratione florum distinguuntur, Stelidis flexuosae flores non descripti. Inde nescio quomodo probari possit, utramque eandem. Juvat addere descriptionem Lindleyi originariam et juvat, non accipere nomen adeo incerte et illegitime introductum.

Stelis flexuosa Lindl. Folio oblongo acuto tridentato marginato in petiolum angustato, racemis subgeminis filiformibus flexuosis multifloris 2—3 plo longioribus, bracteis minimis ovatis acutis pedicellis brevioribus. Peru, Mathews no. 1910. — Leaves about $\frac{1}{4}$ " long. Racems drooping, zigzag, bracts very minute at the angles of the axis.

11. *STELIS TRICHORRHACHIS* Rehb. fl. in Bonpl. III. 71; aff. *St. capillari* folio oblongo lanceolato longe petiolarum, acuto, sepalis ovatotriangulis, tepalis cuneatis retuso involutis, labello flabellato retuso cum apiculo bene evoluto in medio (nunc uncinato), linea transversa callosa ante marginem anticum. Caulis primarius funiformis polyrhizus. Caules secundarii 3—5 pollices alti; mediocres. Foliis tres, quatuor pollices longum. Pedunculus capillaris 6—8 pollicaris tenuis. Bractea triangulo ochreata angustae. Flores illis Stelidis ophioglossoidis aequales, brunnei. Anguli antici gynostemii obtusati, Ocanna. 6000'. Oct. 1850. Schlim. 168.

— Labellum ligulatum angustum retusum integrum. —

12. *STELIS BRACCATA* Rehb. fl. et Warsw. Bonpl. II. 114; aff. *St. truncatae*, scabridae, argentatae (tristylae), sepalis oblongolanceolatis, tepalis cuneatis bis emarginatis apice callosis, labello rhomboligulato retuso, gynostemio curvato (1), Vaginae basi-

lares sericeae transverse rugulosae amplae; illae caulis secundarii sesquipollicares s. pollicares, amplae, carinatae, arphophyllaceae, apice oblique retuso falcato apiculatae super nervum medium. Folium valde carnosum a basi cuneata lineariligulare acutum 3—4 pollices longum, 0,3" latum; racemi capillares minutiflori plurimiflori foliis breviores, fasciculati more Pl. effusarum, secundarii, bracteae ochreae apiculatae ovario pedicellatae breviores, sepala basi coalita, oblongolanceolata, obtusata, tepala brevissima, cum labello et gynostemio retuso conferruminata more Stelidum, cuneata, apice calloso trilobula, lobulo medio minore producto, labellum ligulato rhombeum retusum, gynostemium basi paulo gracilius: androclinium cupulatum antrorsum, rostellum deflexum. Caules longissimi cum foliis spithamaei. Flores minutissimi. Neu-Granada, Warszewicz.

— Labellum rotundatum integrum antice obtusatum. —

13. **STELIS ATROVIOLACEA** Rehb. fl. in Bonpl. III. 70: aff. St. Hallii: folio ligulato spatulato, spica aequilonga disticha, bracteis cupulatis amplis apiculatis, sepalis oblongis intus velutinis (!), tepalis reniformibus unguiculatis margine externo limbosis, labello flabellato antice rotundato utrinque extus acuto, carina anguliformi transverse insiliente ante apicem. — Caulis secundarius bipollicaris amplivaginatus. Folium valde coriaceum a basi angusta, bipollicare. Spica aequilonga ante anthesin secunda. Flores illis St. ophioglossoidis Lindl. aequales, valde firmi, vivi atropurpurei; sicci atri. Gynostemii anguli omnino obtusati. Ocanna. März. 5000'. Wagener.

— Labellum oblongum integrum acutum. —

14. **STELIS COSTARICENSIS** Rehb. fl. in Bonpl. III. 224: aff. St. lamellatae Lindl. compacta, caulibus secundariis laxè vaginatis, vaginis nervosis, amplis, folio suo duplo—triplo brevioribus, folio carnosissimo cuneato oblongo apice acuto trimucronulato, racemo folio subduplo breviori, bracteis ochreatis distichis, tepalis truncatis cum mucronulo, labello ovato acuto utrinque ante basin calloso, callo utrinque a margine introrsum obtusangulo limbo squamuloso, canali inter callos. Caulis 2—4 pollices altus. Flores ex icone Oerstediana viridiflavi. Cartago in Costarica. Oersted.
15. **STELIS GUTTUROSA** Rehb. fl. in Bonpl. II. 23: caule secundario valido, vagina mediana ampla acuta tenui, folio a basi angustissima spatulato obtusato, spatha florali membranacea acuta basi gutturosa, spicis 1—3 folio paulo brevioribus, a basi floridis, bracteis cupuliformibus retusis super nervum medium acutis, floribus minutis quaquaversis, sepalis ima basi coalitis, ovatis, apiculatis, tepalis cuneatis retusis, limbo externo retuso incrassato, trinerviis, nervis ante apicem retusum evanidis, labello pandurato acutiusculo, carinulis 2 semilunatis in disco, androclinio trilobo, lobis lateralibus acutis minutis, medio lobo magno trilobo. So gross, wie St. angustifolia Kth. Caracas. Wagener.
16. **STELIS HYLOPHILA** Rehb. fl. in Bonpl. III. 241: aff. St. ascendenti Lindl. et spatulatae Pöpp. Endl. foliis ligulatis obtusiusculis breve petiolatis caule brevioribus, spica folium subaequante (nunc gemina) dense disticha, bracteis ochreato triangulis hyalinis conspicuis, floribus minutissimis, tepalis cuneato ovatis transversis, labello ligulato apice triangulo, disco incrassato. Caules incluso folio usque spithamaei. Folia tri—quadripollicaria. Pedunculus prope basin usque floridus. Sepala ovata. Forests of the Andes at 8000': 687. Jamieson.
17. **STELIS EUBLEPHARIS** Rehb. fl. in Bonpl. III. 240: aff. ciliatae Lindl. (atropurpureae Hook., purpurascens A. Rich. Gal.?) caulis vagina ampla, labello triangulo subacuto per discum papulis argenteis more Stelidis argentatae ornato, carina transversa ante basin. Adest unicum specimen parvulum. Caulis secundarii summitas pollicaris. Folium oblongo lanceolatum acutum bene marginatum, basi petiolare, haud bipollicare, tertiam pollicis latum. Spatha anceps minuta. Pedunculus bi—tripollicaris. Bractee distantes cupulatae apiculatae pro planta magnae. Sepala ovatotriangula margine ciliolata, pone marginem puberula. Tepala cuneata apice retuso medio inflexa cum apiculo. Gynostemii anguli antici obtusi. Pululagua, on trees. 264. Jamieson.

18. *STELIS STENOPHYLLA* Rehb. fl. in Bonpl. III. 70: aff. *St. ophioglossoidi* (Sw.?) Lindl. folio lineari - ligulato basi bene petiolari apice obtuse acuto, sepalis ovatis obtusis, tepalis a basi cuneata transverso oblongis, labello cordato triangulo lateribus hinc minute serrulato, disco incrassato. — Caulis secundarius gracilis tripollicaris. Folium tripollicare, tres lineas latum. Pedunculus aequilongus bene secundiflorus. Flores fuscati. Bracteae ochreato apiculatae angustae. Flores illis *Stelidis lamellatae* paulo minores. — *St. angustifolia* Kunth! optime recedit foliis oblongo - lanceolatis bracteisque amplo cupulatis. — Ocanna. 3—6000'.
19. *STELIS DISCOLOR* Rehb. fl. in Bonpl. III. 241: aff. *Stelidi* ascendenti Lindl. foliis spatulatis vernixiis, spica spirali, sepalis discoloribus intus papuloso velutinis ovatis apiculatis, labello ovato medio apiculato disco bicallioso, callis papulosis. Rhizoma amplum crassum, uti caulis vaginis muriculatis velutinis vestitum. Folia bipollicaria, tripollicaria, vernixia, tertiam pollicis lata. Spica quadri—quinquepollicaris. Bracteae cupulatae retusae cum apiculo. Flores texturae validae extus atropurpurei, intus grisei. Tepala a basi unguiculata triangula obtusata transversa. Anguli antici laterales gynostemii obtusi trianguli erecti. Towards the base of Pichincha, in ravines. 691. Jamieson.

— Labellum trilobum lobis subaequalibus obtusiusculis. —

20. *STELIS ARGENTATA* Lindl. B. Reg. 1842. misc. 78: Huc: *Stelis Heylidyana* Focke in Tidsch. vor de Wis. Nat. Wetsch. p. 201. 1849: folio oblongo lanceolato coriaceo obtuso emarginato, spica secunda multiflora folio multum longiore, floribus minutis trigonis patentibus, sepalis deltoideo cordatis acutis, petalis minutissimis, truncatis, labello aequalibus. Herba epiphyta, caespitosa. Caulis teres, brevis, monophyllus. Folium oblongo - lanceolatum, coriaceum, obtusum, profundiuscule emarginatum, in petiolum subvaginatum attenuatum, nitidum, strictum, apice subrecurvum, decimetri longitudine. Spica axillaris, nempe a basi petioliformi folii orta, erecta, multiflora, gracilis, flexuosa, folio multo longior, bracteata, purpurascens. Bracteae vaginantes. Flores minuti, trigoni, alterni, secundi, nutantes, viridi purpurascens. Perianthium patens. Sepala valvata, aequalia, basi subconnata, deltoideo - cordata, acuta, patentissima, subconvexa, pagina interiore sub lente pilis sparsis oblecta. Petala minutissima, truncata. Labellum petalis conforme. Columna nana, apice dilatata cum ovario continua. Anthera opercularis, cordato ovata, subbilocularis, septo scilicet medium versus evanescente. Pollinia 2 oblongo ovata, libera, sulphurea. Capsula oblonga, triquetra, adpressa erecta. Sylvae Surinami passim. Aprili. Decembri. Dicta *Henrico Heylidy*. Non longe distat a *Stelide ophioglossoidi*, atamen satis diversa.
21. *STELIS EUSPATHA* Rehb. fl. in Bonpl. III. 225: aff. *St. atrae* Lindl. folio a basi linearicuneato oblongo lanceolato acutiusculo, spatha carinata apice inflexo minuto uncinato, spicis folium excedentibus tenuissimis, sepalis oblongis nervo medio carinatis, tepalis cuneatis limbo retuso, cucullato, involuto medio umbonato, labello cuneato obtriangulo apice trilobo, lobis lateralibus anticis obtusis, lobo medio dentiformi parvo; carinis duabus ligulatis divergentibus in basi. Caules secundarii validi tri—quadripollicares. Vaginae paucae distantes. Vagina summa tubuliformis ostio retusa. Folium tri—quadripollicare. Spicae capillares fasciculatae. Flores quaquaversi minuti flaveoli. Bracteae cupulato triangulae pusillae. Gynostemii anguli laterales antici obtusi. — Bolivia. Bridges.
22. *STELIS CAESPITIFICA* Rehb. fl. in Bonpl. III. 71: aff. *Stelidi Serrae* Lindl.: foliis lanceolatis, sepalis triangulo lanceolatis, labelli trilobi lobo medio producto obtuse triangulo, lateralibus obtusangulis extrorsis, disci carinulis duabus transversis. Dense caespitosa. Caulis secundarius paulo pollicem excedens squamis fuscis ostio amplis vestitus. Folium a basi tenui lineari elongata lanceolatum acutum, marginatum, inferne in sicca quinquenerve, bipollicare, quintam pollicis latum. Spatha hyalina parva brevis. Pedunculus gracillimus 4—8 pollicaris, superne dense floridus; secundi-

florus. Bractene cupulato triangulares, pedicellos aequantes. Perigonium flavido-brunneum in sicca, basi violaceum. Tepala ovata retusa cum apiculo obtusato, omnino obtusangula, nervo medio ante apicem evanido. Gynostemium haud omnino genuinum; androclinii limbus posticus evolutus trilobus cucullato antrorsus; androclinii dens medius dentesque infrastigmatici aequae revoluti. Ocanna. Wagerer.

Labellum trilobum lobo medio acuto.

23. **STELIS PORPAX** Rchb. fl. in Bonpl. II. 23: pusilla, vix bipollicaris, caule secundario laxo tenuique vaginato, folio carnosissimo a basi anguste lineari spatulato obtuso, spatha florali acuminata hyalina, spica capillari folio subaequilongia, bracteis vaginatis oblique retusis acuminatis, internodii parti liberae scilicet a bractea non tectae subaequilongis, floribus quaquaversis albis, sepalis ima basi tantum coalitis, oblongis acutis trinerviis, tepalis ima basi unguiculatis cordato dilatatis, limbo externo incrassato, nervo uno transverso, labello porrecto trilobo, lobis lateralibus obtusangulis, medio producto acute triangulo, gynostemio utrinque brachiato (more *St. tristylae*, *Ruprechtianae*). Descriptio floris *St. apricae* Lndl. similis, at planta longe recedit et *Stelidi micranthae*, *papaquerensi* affinis. *Stelis atra* Lndl. videtur recedere tepalis retusis et sepalis obtusis. Caracas. 5000'. Oct. Wagerer.
24. **STELIS LOBATA** Rchb. fl. in Bonpl. III. 241: aff. *St. Lindenii* foliis oblongolanceolatis, racemi bracteis triangulis acuminatis, tepalis trilobis, labello basi tridentato, dentibus lateralibus posticis acutis, lobo medio producto anguste triangulo, callo inter dentes posticos. Scandens. Caules secundarii bi—tripollicares. Folium paulo ultrapollicare, quatuor — quinque lineas medio latum, apicem versus marginatum. Racemus longe exsertus, flexuosus. Sepala oblongolanceolata, sepalum summum majus. Tepala parva triloba, lobi laterales obtusangulo divaricati, lobus medius obtusatus. Labellum tepalis longius; lobus medius pagina inferiori externa tricarinulatus sub callo umbonatus. Anguli laterales antici gynostemii bene evoluti angusti. From woods near Pasto. Sept. 1845. 451. Jamieson. Obs. Labelli fabrica subsimilis in *St. Porpace* Rchb. fl. et *St. spatulata* Endl. Pöpp.
25. **STELIS SPATHULATA** Endl. Pöpp. Rchb. fl. in Bonpl. II. 22. Specimina *Lindeniana* cum *Pöppigianis* bene congruunt.

— Labellum trilobum lobo medio retuso. —

26. **STELIS NITENS** Rchb. fl. in Bonpl. II. 22: caule secundario abbreviato, vagina laxa obtuse acuta, folio oblongo basi valde attenuato spatulato, apice sensim obtusato, spatha carinata acuta, abbreviata, pedunculo folio duplo longiore, dimidio inferiori bi—trivaginato, vaginis brevibus basi arcuatis dein amplis, nervo mediano in apiculum setaceum porrectum excurrente, spica subsecunda (?), bracteis amplis cupulatis, nervo semper in apicem acuminatum excurrente, sepalis oblongo triangulis obtusis trinerviis altius sc. tertia parte coalitis, tepalis abbreviatis apice retuso obtuse obscureque trilobulis, labello a basi cuneata dilatato trilobo, lobis lateralibus extrorsis triangulis obtusis, lobo medio extrorso latissimo quadrato obtusangulo brevi, gynostemii rostiello aequaliter obtuseque trilobo. Prope *Stelidem* ophioglossoidem. Caracas. Wagerer.

1329. **RESTREPIA** *H. B. Kth.*

(*H. B. K. I.* 367. — *Walp. Ann.* III. 525.)

— *Pleurothallidiformes.* —

1. **RESTREPIA OPHIOCEPHALA** Rchb. fl. in Seemann Bonpl. II. 88. Huc: *Pl. puberula* Klotzsch in *Otto et Dietrich Allg. Gtz.* 1854. p. 393: caulibus secundariis seriatim-caespitosis 2—3 articulatis erectis teretibus, basi incrassatis, vaginis duabus appressis, apice rotundatis submucronatis fusciscentibus aridis obtectis; folio carnosocoriaceo ovato-lanceolato, apice brevissime tridentato, basi torto attenuato caule

secundario subduplo brevior; flore solitario subpollicari ex albido-roseo, basi breviter gibboso, perigonii foliolis duobus exterioribus magnis linguiformibus, extus intusque furfuraceo-puberulis, interioribus membranaceis conformibus coccineo-striatis albivilloso-marginatis rectis triplo brevioribus; labello recto integerrimo albido obtuso excavato perigonii foliolis interioribus duplo brevior; gynostemio recto pallide coccineo brevi, infra antheram bidentato; pedunculo bractea magna, apice obtuse-tridentata suffulto.

2. *RESTREPIA UJARENSIS* Rehb. fl. in Bonpl. III. 225: tenella, vaginis amplis nervosis, folio lineari lanceo, racemis unifloris paucis seu solitariis, sepalo dorsali fornicato lanceolato, sepalis lateralibus lanceolatis, lobo medio cuneato retuso, gynostemii androclinio producto lanceo. Planta bi—tripollicaris caespitosa habitu *Lepanthis* seu *Pleurothallidis tenuioris*. Flores virides ex icone Oerstediana. Vaginae siccae fuscae, amplae, dorso bene carinatae, acutae. Folium vix unciale, sat crassum, lineas duas—tres latum. Flores, minuti octomeriacei, sepalum dorsale imbricatum super sepala lateralialia. Gynostemium gracile. Ujaras in Costarica. Oersted.

Obs. A cl. Lindley ad *Pleurothallides* relata, quae binis tantum gaudent pollinibus dum haec quaternis gloriatur.

3. *RESTREPIA HYPOLEPTA*: huc ex Lindl. Folis I. Feb. 19, 1853: Pinelia. Sepala patula, petaloidea, libera; lateralibus basi inaequalibus. Petala conformia, minora. Labellum majus, indivisum, c. columna continuum, eique basi adnatum, (basi bicallosum?). Columna nana, reclinata, fere horizontalis, margine petaloideo („Stigma prominens“ Pinel.). Pollinia 4, basi materae glutinosa colligata, caudicula glandulatae nullis? (caudiculis 2 pulvereis replicatis. Pinel.) Anthera (columnae apice adnata, carnosa, 4-locularis. Pinel.) — Herba epiphyta, Brasiliensis; pseudobulbosa, monophylla. Folium carnosum, apice tridentatum, *Lepanthis* more. Pedunculus terminalis, filiformis, distanter vaginatus, uniflorus.

This very singular plant has been communicated by the Chevalier Pinel, a French botanist, who has paid attention to the minute species of the order, and after whom it is named. The materials consist of one plant glued to paper, with some sketches and manuscript notes. Although insufficient to enable me to speak with certainty of some of the parts of fructification, they are enough to show that it is a very curious and wholly new form. In habit the plant would be a *Pleurothallis*, if the stem had not the fusiform condition of an *Aulizean Epidendrum*. The leaf is quite that of many *Pleurothallides*. Of the flower, which is very nearly half an inch from tip to tip of the back sepal and lip, M. Pinel says, „Ce serait un *Cattleya* en miniature sans l'expansion foliacée du gynostème et l'adhérence du labellum à la colonne“. The anther, which I have not seen satisfactorily, is represented by him as resembling that of the same genus; as are the pollen-masses, of which he says, „Quatre masses polliniques, sur deux lames semblables à celles du grand *Cattleya Harrisoniae* et de tous les *Cattleya*“. This I have not been able to verify; M. Pinel's drawing is at variance with his description, and shows to each pair of pollen-masses the same kind of glutinous secretion of matter as is found in many species of *Pleurothallis*. This, and some other parts of the structure therefore remain for further examination.

P. hypolepta. — Wild in Brazil; near Rio Janeiro—Pinel (v. s. sp.) — Herba caespitosa, 2-pollicaris. Caules pseudobulbosi, 1½ l. longi. Folium solitarium, sessile, carnosum, ovatum, acutum, obsolete tridentatum, 3½ l. longum. Pedunculus filiformis, 9 l. longus, vaginis 3 distantibus arcte convolutis. Flos solitarius, virens, vi expansus semipollicem latus. Sepala ovata obtusa. Petala obovata, obtusa, minora, uninevia. Labellum basi verosimiliter 2-callosum, linguiforme acutum, planum, sepalis duplo majus.

— Antenniferae. —

4. *RESTREPIA ANTENNIFERA* Hb. B. Kth.: Rehb. fl. in Bonpl. III. 70. Subpedalis, labello a cuneata basi ligulato, apice retuso bilobulo, ante medium utrinque obtusangulo postposita arista extrorsa, carinis tribus validis per discum. — Caulis secundarius

- compressus vaginis apice falcatis ancipitibus vestitus, infimis nigro guttulatis. Folium a petiolari basi oblongum utrinque cuneatum, apice trimucronulatum nervo dorsali carinatum. Pedunculus solitarius, nunc plures, apice bracteati, floridi. Sepalum summum a lancea basi subulatum apice incrassatum. Tepala subaequalia. Sepalum inferius cuneato flabellatum apice trifidum. Gynostemium gracile sursum obtuse decurrentique alatum apice postice apiculatum. — Ocanna, 6000'. Wagener. (Ocanna: fleur jaune d'or, rayée de pourpre. Schlim. 738! — an 739? Parama; labellum unici floris non adest. Etiam habemus: *Loxa* v. Warscewicz! flore majori iconi Humboldtianae similior.)
5. *RESTREPIA WAGENERI* Rchb. fil. in Bonpl. II. 23: caule secundario valido, vaginis laxis amplis, ostio producto apice acuto dorso carinatis, spatha florali subaequali, folio transverse ovato acuto, basi rotundato, pedunculo folium excedente capillari, sepalo summo linearilanceo, dein subulato, apice subdilato, tepalis subaequalibus paulo brevioribus, sepalo impari ligulato retuso basi utrinque angulato, apice denticulato, nervis 3 carinulatis, ceterum laevi, gynostemio gracili clavato, postice apice unidentato. R. elegans folii ambitu, dentibus labii, tepalis brevibus diversa. Merida. 7000'. Wagener.
6. *RESTREPIA LANSBERGII* Rchb. fil. et Wagener, Rchb. fil. in Bonpl. II. 23: gracilis, acaulis, caule secundario arcte vaginato, folio angusto oblongo, utrinque attenuato, apice obtuse tridentato, spatha florali membranacea, carinato falcata, floribus more generis sub folium versis, pedunculis capillaribus, sepalo summo a basi paulo dilatato lanceo setaceo apice incrassato, sepalo inferiori oblongo apice bidentato, tepalis sepalo summo aequalibus, multo angustioribus, paulo brevioribus, labello ligulato retuso, basi utrinque obtusangulo, nervis tribus elevatis, papulis muriculato, gynostemio clavato gracili, labello tepalorum dimidium subaequante paulo brevior. R. antennifera recedit vaginis amplis, ancipitibus, maculatis, circuitu folii, sepalo inferiori integro. R. guttulata sepalum superius et tepala habet aristata, sepalum inferius medium versus connatum. Nostra habet sepala tria superiora flava maculis rubris. Labium flavum punctis quibusdam purpureis. R. eleganti aequimagua, caulis secundarius autem longior. Caracas. 5000'. Toto anno. Wagener.
7. *RESTREPIA ERYTHROXANTHA* Rchb. fil. — Rchb. fil. in Bonpl. II. 23. Spithamaea. Vaginae membranaceae pallidae, densae. Folium oblongum. Flores plures, majores, quam R. antenniferae, sepala superiora tria purpurea. Labellum et sepalum inferius vitellina. 7000'. Januar. Merida. Wagener.
8. *RESTREPIA ASPASICENSIS* Rchb. fil. in Bonpl. III. 70: aff. R. Wageneri folio lanceolato, angulis labelli posticis rectis non obtusatis, labelli portione antica a cuneata basi oblongo ligulata ante apicem retusum constricta, carinis ternis elevatulis per discum. Gracilis. Caulis secundarius subbipollicaris vaginis ancipitibus apice acutis impunctatis vestitus. Folium sesquipollicare lanceolatum acutum. Flores quam in *Restrepia* Wageneri ter minores. Sepalum superius a lancea basi subulatum apice clavatum. Tepala similia tertia breviora. Sepalum inferius oblongum apice bilobulum, lobi acuti. Nervi carinati laterales basi divergentes marginales. Gynostemium gracile margine superiori anguste alatum. Aspasica. Wagener.
9. *RESTREPIA RUYNCHANTHA* Rchb. fil. et Warscew. Bonpl. II. 114: aff. R. cucullatae sepalo inferiori apice bidentato, labello ab ungue brevissimo dilatato utrinque angulato excavato, dein ligulato acuto, carina utrinque in fundo, in disco antico confluenta. Adest folium oblongocuneatum acutum nulli alii speciei pertinens earum, quae adsunt, appositum, forsitan hujus *Restrepiae*, quacum missum. Pedunculus gracilis 7—8-pollicaris. Bractea oblonga acuta ovario aequalis seu longior. Perigonium externum ultra bipollicare. Sepalum superius a basi angusta triangula setaceum. Sepalum inferius oblongo triangulum, apicem versus valde attenuatum imo apice bidentatum seu bifidum. Tepala valde membranacea, basi triangula ($\frac{2}{3}$ pollicaria) setacea. Labellum supra descriptum, anguli subbasilares. Gynostemium exaete R. cucullatae;

ala anguste oblongoquadrata utrinque abrupta et cucullo super antheram. Pollinia pyriformia basi cuspidata! — Flores illis Restrepiae cucullatae majores. Peru Warscewicz.

Obs. Ab inclyto Lindley in Fol. VIII. ad cucullatam relata. Hujus labellum ligulatum integrum, illius trilobum, hujus tepala linearia acuta basi attenuata, illius a basi oblonga lata caudata,

1335. **MICROSTYLIS** Nutt.

(Gen. Am. 2195. — Walp. Ann. III. 525.)

1. **MICROSTYLIS DISCOLOR** Lindl.: stem leafy, leaves ovate, oblong, abruptly petioled, undulated, plaited: lip ovate, entire, cucullate at the base: column two horned at the apex: sepals and petals all turned to one side, Ceylon. Fl. July. Mrs. Col. Walker made the drawing. (not „Guoindoo“ as in the page ic.) — Wight Ic. V. I. 1631. 1851.
2. **MICROSTYLIS LUTEOLA** R. W.: stem leafy at the base, leaves ovate, subcordate at the base, acute, plicate: sepals obovate, obtuse, the middle one narrower: petals linear, obtuse, emarginate: lip somewhat 2-lobed, lobes broad, spreading, fimbriato-dentate. Flowers yellow. Ootacamund, Neilgherries, fl. August. Nearly all, to *M. versicolor*, but certainly dist. It grows under the shade of bushes and among long grass on the highest peaks of the hills. — Wight Ic. V. I. 1632. 1851.
3. **MICROSTYLIS DISEPALA** Rehb. fl. in *Linnaea* XXVI. 142. Caulis secundarii internodio cylindraceo, pseudobulboso, pollicari, vaginis membranaceis oblongo-triangularibus vestito; foliis evolutis binis e vaginis linearibus in laminas orbiculares acutas dilatatis, pedunculo elongato (7 pollicari) angulato, apice clavato, racemoso, bracteis lineari-lanceis brevissimis, pedicellis elongatis, floribus posticis, sepalo inferiori (igitur summo) oblongo, apice bidentato, sepalo superiori lanceo triangulo obtusiusculo, tepalis linearibus circinnatis, labello orbiculari basi obtusissime cordato, margine obsolete undulato lobulato, basi pro gynostemio recipiendo foveato, gynostemio minuto, rostello tridentato. — *Semipedalis*. *Curcucuti* Caracas. Wagener.
4. **MICROSTYLIS PARTHONI**: huc: *Malaxis Parthoni* Morren, bullet. de l'acad. voy. Belg. 1839 p. 485 c. tab. Pseudobulbis ovato-acutis, f. binis ovato-lanceis, acutis; scapo pentagono, spica sertuliformi densa depressa; concavo-umbilicata, labello concavo ovato acuto. — Hab. in sylvis humidis Brasiliae.
5. **MICROSTYLIS VENTRICOSA** Endl. Pöpp. Rehb. fl. in *Bonpl.* II. 22. Carac. Wagen.

Obs. Porro huc revocandae sunt omnes *Dieniae* Lindl. ob solum directionis columnae characterem haud sufficientem olim separatae, „Yet I shrink from that creation of genera, which some observers find so easy“ Lindl. Quam bene congruant haec genera ex eo patebit, quod ill. Lindley exacte eandem plantam, *Microstylidem* monophyllam et sub *Microstylide*, et sub *Dienia* (*Dienia* Gmelini Lindl.!) citata quidem *Hermii* Monorchidi icone, quod abhorret, descripsit. Etiam *D. muscifera* Lindl. I videtur eadem.
6. **MICROSTYLIS CONGESTA**: *Dienia congesta* Lindl. O. 22. Rehb. fl. in *Bonpl.* III. 259. Planta pedalis—tripedalis. Pseudobulbus vaginis hyalinis occultus. Folia terna—quina oblonga, basi cuneata, apice acuminata, quinquenervia, septem usque pollices longa. Pedunculus longe exsertus, angulatus (siccus), apice cylindraceo racemosus.

- Bracteae subulatae pedicellos superantes. Sepala oblongo lanceolata obtuse acuta. Tepala lineari falcata. Labellum ovatum apice trilobulum, lobulo medio porrecto, omnibus callosis. Gynostemium latum super labellum flexum. Capsulae oblongae tuberculatae. Specimina quam specimina nepalensia majora. Hongkong. Novb. Hance!
7. MICROSTYLIS FUSCA. Huc *Dienia fusca* Lindl. Orch. 22.
8. MICROSTYLIS CYLINDROSTACHYA. Huc *Dienia cylindrostachya* Lindl. Wight Ic. V. 1. 1630 (1851): stem one leaved; leaf ovate obtuse: spike dense cylindrical: perianth flattened: lip excavate, thickened at the ape, nearly entire; column very short. Lindl. Simla Countess Dalhousie — Edgeworth, Left. fig. — spec. Dalh. Drawing right side — E. M. Edgeworth.
9. MICROSTYLIS CARINATA. Huc *Dienia carinata* Rehb. fil in Bonpl. III. 223: aff. *Dienia congestae* Linpl. flore duplo majori, bracteis lanceis deflexis, labello tridentato, dente medio maximo, lineis carinatis duabus convergentibus in disco. Planta spithamaea. Folia inferne tria a vagina oblonga acuta basi lato rotundata seu cuneata nervosa, tres quatuorve pollices longa, duos lata. Pedunculus angulatus breviter bisquamatus. Bracteae lanceae aristatae deflexae. Ovaria angusta hexaptera bracteis (ubi pedicellos includis) longiora. Sepala oblonga. Tepala linearia. Gynostemium Microstylidis, sed in labellum incumbens. Flos illi Microstylidis Rhedii aequalis. 2144. Cuming. Phil.
10. MICROSTYLIS CRISPATA. Huc *Dienia crispata* Lindl. Ann. N. H. XV. 1845. p. 385: caule diphylo, foliis ovato-oblongis obtusis pedunculo brevioribus, spica dense cylindracea, sepalis oblongis obtusis, petalis linearibus, labello ovato indiviso, capsulae angulis crispato-laceris. Mexico (Hartweg). Stem and spike, taken together, about a feet high.
11. MICROSTYLIS CORDATA. Huc: *Dienia cordata* Lindl. Bot. Reg. 1838 Misc. 134: folio solitario subrotundo cordato membranaceo-marginato, racemo tenui elongato, sepalis lateralibus ovatis obtusis, intermedio lineari-oblongo, petalis linearibus, labello carnoso trilobato; laciniis lateralibus auriculaeformibus intermedia ovata. Mexico, Barker. — It has a single cordate leaf, a slender spike of green small flowers, and narrow ovate pseudobulbs. It is a plant of no beauty, and differs from *D. Myurus* in the form of its lip, the number and form of its leaves, and in its long slender spike.
12. MICROSTYLIS MACROSTACHYA Lindl. Huc etiam monente ill. Lindley in herbario suo pertinebit *Dienia calycina* Lindl.
13. MICROSTYLIS MYURUS. Huc *Dienia Myurus* Lindl. Orch. 23.

1337. **MALAXIS Sw.**

Act. Holm. 1800. p. 223. t. 3.

Hoc genus nuper unius tantum speciei putaverunt. Omne tamen Oberoniae genus certe nil differt. Videtur inesse discrimen in polliniis. At non inest. Oberoniae enim nimvero quaedam etiam pollinia gerunt apicibus connexa, qualia intercurrent in Malaxide. Id etiam in iconibus Wightianis pulchre repraesentatur. Genus autem ita auctum felicissime congruit cum Liparide cui tot adscribuntur species gaudentes foliis coriaceis — Cestichides, dum aliae longe serpent. Etiam Microstylides adsunt distichifoliae. Totum Oberoniae genus ex habitu tantum conditum. Hic tamen mihi non sufficit, nec certe ill. Lindley, qui nuper exclamavit in verba illa pulchra: „Yet I shrink from that creation of genera, which some observers find so easy.“

Addo locupletissimam Monographiam Lindleyanam (Folia VIII. 1859), ut totus error statim aboleatur eo oriundus, quod ill. noster Lindley ab initio putavit, Oberonias suas gaudere polliniis geminis, nec quaternis.

OBERONIA.

L. O. 15. Malaxis; § Ensifera; Blume, Bijdr. i. 393.

Sepala libera, dorsali minore, saepius reflexa. Petala minora. Labellum sessile, columnam amplectans, immobile, varie divisum, raro

integrum, nunc basi pulvinatum aut carinatum, saepius concavum. Columna nana, teres, basi angustior, clinandrii angulis anticis acutis. Anthera 1-locularis. Pollinia 4, cerea, libera, incumbentia, nunc obliqua et inaequalia. — Herbae epiphytae. Folia equitantia. Spicae (v. Racemi) terminales. Flores minuti. Omnes Asiaticae, Australasicae, Polynesiicae v. Mascarenenses.

The species now collected into this curious genus are for the most part inhabitants of the tropics of Asia, both continental and insular. One is found in the Mauritius and Bourbon, one in Eastern Australia, and five in the South Sea Islands. None have as yet been brought from Africa.

They divide readily into stemless and caulescent species; and although some are as it were intermediate, as in § 2 ***, yet there is no practical difficulty in recognising to which section a species belongs.

§. 1. ACAULES Lindl. Folia VIII.: caule nano vel parum evoluto, foliis omnibus fere radicalibus.

* *Labello indiviso vel obsolete lobato.*

1. MALAXIS IRIDIFOLIA. Huc l. c.: *Oberonia iridifolia* (L. O. 15: *Cymbidium iridifolium*, Roxb. Fl. Ind. 3, 45*); bracteis petalisq. ovatis serratis, labello multifido varie lobato, foliis longissimis ensiformibus.

A. labello basi pectinato apice bilobo multifido. Sylhet, Roxb. h. s. sp.

B. labello basi pectinato apice bilobo obtuso denticulato. Hb: Wallich sine numero, h. s. sp.

C. labello ovato emarginato alte serrato. Burma, Griffith, h. s. sp.

Peduncle two edged. Spike very long and slender. Flowers yellow. Evidently a variable plant, and probably appearing under other forms than those above mentioned. *O. iridifolia* of Griffith is probably *O. Brunoniana*, Nr. 6; of the Bot. Mag. is *O. tahitensis*, Nr. 4.

2. MALAXIS CYLINDRICA. Huc l. c.: *Oberonia cylindrica* (Lindl. in Bot. Register, 1840, misc. 23); bracteis serrulatis, floribus intus pilosis, petalis serratis, labello oblongo basi latiore emarginato margine fimbriato — Philippines, Cuming (Island of Bohol) h. s. sp. and v. v. c. — Leaves 6—7". Spikes stout, much longer. Peduncle compressed, winged only near the base. Flowers very small, and compact, green.

3. MALAXIS GRIFFITHIANA. Huc l. c.: *Oberonia Griffithiana* (Lindl. Sert. Orch. t. 8 B.); bracteis linearilanceolatis denticulatis, petalis obtusis fimbriatis papillois, sepalis acutis longioribus, labello multifido papilloso in laminam bipartitam producto — Moulmein, Griffith (common on trees in damp places), h. s. sp. — A small species with narrow sabre-shaped blunt thin leaves shorter than the spikes, which are covered to the base with scattered flowers. Sepals pale green. Petals and lip dull purplish brown. This has slight tendency to becoming caulescent.

4. MALAXIS TAHITENSIS. Huc l. c.: *Oberonia tahitensis* (*O. iridifolia* Bot. Mag. 4517); bracteis duplicato-serratis, sepalis dorso verrucosis, petalis linearibus integerrimis, labello oblongo apice bilobo integro laciniis latis subfalcatis basin versus rotundato denticulato — Otahete, Bidwill — Leaves 5—6", broad, thick. Spikes not much longer, stiff, with two-edged peduncles, closely covered with brownish yellow flowers. Differs from *O. iridifolia* in its petals as well the other marks above indicated. — Huc: *Oberonia iridifolia* Lemaire Jardin fl. II. 113.

5. MALAXIS DENTICULATA. Huc l. c.: *Oberonia denticulata* (Wight, ic. 1625); bracteis dentatis, petalis ovatis acutis integerrimis, labello triangulari dentato nunc apice producto bis bidentato — Southern Hindostan, Wight (Iyamally Hills, near Coimbatore, fl. Jul. Aug.) — I have not seen this. — Leaves short, broad, thick. Spikes much longer, drooping, very dense. Flowers „dull orange“. Peduncles completely 2-edged, Varies much in size according to Wight. Huc etiam:

Oberonia denticulata R. Wight Ic. V. I. 1625. 1851: leaves broad, ensiform, stem short, flatly, compressed, spike very long, closely covered with minute sessile flowers: bracts ovate, obtuse, reflexed: lip irregularly triangular, denticulate, somewhat two lobed at the apex, each lobe bidenticulate. Flowers dull orange colour. Jyamally Hills near Coimbatore, flowering July and August. Of this species I have given two fig. to show how it varies in size. The lip of the smaller one differs from that of the larger, but in all other respects, except in size, they seem sufficiently to accord.

6. **MALAXIS BRUNONIANA.** Huc l. c.: *Oberonia Brunoniana* (Wight, ic. 1622): bracteis denticulatis, petalis linearibus integerrimis, labello circulari integerrimo infra apicem 2-lobum constricto denticulo interjecto — Southern Hindostan, Wight (Jyamally Hills, near Coimbatore); Khasya, Lobb, h. s. sp. — Leaves as much as 8 or 9 inches long, very broad. Spikes dense, stiff, erect, not much longer. Peduncles completely 2-edged. „A large and handsome species; flowers large for the genus; lip and sepals dark brownish; petals pale yellowish“. R. W. This is probably the *O. iridifolia* of Griffith's *Notulae* III. 274, found at Churra growing on a species of *Eugenia*. If so it will also be an Assam plant. Huc etiam:

Oberonia Brunoniana R. Wight. Ic. V. I. 1851. N. 1622. 1851: leaves ensiform, succulent, nearly as long as the raceme: stem compressed at the base, furnished near the apex with a short narrow falcate sheathing leaf or common bract: raceme compact: bracts ovate, denticulate, acute: sepals ovate, obtuse, reflexed, a little longer than the narrow lanceolate petals: lip entire, broad, cordate at the base, obtusely 3 lobed at the apex, the middle one small or sometimes obsolete. Flowers olive brown, the left somewhat darker towards the centre. — Jyamally Hills near Coimbatore, flowering June and July. — A large and handsome species: flowers large for the genus; lip and sepals darks brownish coloured, petals pale yellowish. It appears quite distinct from all the following. As being the most conspicuous of the genus, so far as I know it, I have taken the liberty of dedicating it to the Presid. of L. Soc., the first of living Botanists.

7. **MALAXIS FORCIPATA.** Huc l. c.: *Oberonia forcipata*: bracteis dentatis, petalis linearibus nanis recurvis, labello circulari denticulato apice abrupte forcipato — Ceylon, Thwaites (Hewahette district, on trees, 2511) h. s. sp. — Much like *O. Brunoniana* in structure, except that the lip is toothletted all round and that is extended apex is much smaller. The petals are moreover much shorter, and the whole plant, not more than 4" or 5" high, has none of the robustness of that species. Peduncle slightly 2-edged. Bracts very deciduous. „Flowers dingy yellow“, Thwaites, from whom I have an excellent sketch along with the specimens.

8. **MALAXIS LONGIBRACTEATA.** Huc l. c.: *Oberonia longibracteata* (L. O. 45): bracteis subulatis alabastris multo longioribus, petalis ovatis acutis integerrimis, labello subrotundo obsolete 4-lobo, caule in pedunculum monophyllum ancipitem producto — Ceylon, h. s. sp. — Of this little plant the leaves are thin, narrow, and nearly straight. The stem is extended enough to bear one or two rather distant leaves at its base, and another at its summit immediately below the flower spike; in my specimens it is from 2 to 3 inches long. Perhaps therefore it would be better to place the species in the caulescent division.

9. **MALAXIS PLATYCAULON.** Huc l. c.: *Oberonia platycaulon* (Wight, ic. 1623): bracteis serrulatis, petalis filiformibus sepalis aequalibus, labello carnoso oblato trilobo; lobo medio tridentato, pedunculo latissime alato — S. Hindostan, Wight (Courtallum; Pulney Mountains in September) h. s. sp. — Flowers „whitish or pale yellow“. Peduncle four lines wide up to the very flowers, quite thin. Huc etiam:

Oberonia platycaulon Wight. Ic. V. I. 1623. (1851): leaves long, narrow ensiform; stem flatly compressed, nearly as broad as the leaves; raceme lax, flowers longish pedicelled: bracts ovate, acute, the length of the ovary, fimbriate on the margin; sepals ovate, lanceolate, acute, petals linear, narrower and slightly shorter than the

sepals; lip 3 lobed, the middle one the least. Flowers whitish or pale yellow. — Pulney Mountains, fl. September. The remarkably compressed stalk of the raceme and the peculiar lip of this species easily distinguish it from all the others represented here.

10. MALAXIS LINDLEYANA. Huc l. c.: *Oberonia Lindleyana* (Wight, ic. 1624): bracteis ciliatis, petalis filiformibus integerrimis, labello subrotundo truncato obsolete quadrilobo integerrimo — Khasya Hills, Lobb.; S. Hindostan, Wight (Iyamally Hills, near Coimbatore) h. s. sp. — Leaves very succulent, broad and often dolabriform. Spikes longer, drooping. Peduncles narrow, the winged edges vanishing near the flowers which are „straw colour with a dull orange lip“ (R. W.) My Khasya specimens have the front of the lip less lobed than in Wight's figure, and the petals are narrower. Specimens of the southern form I have not seen. Huc etiam:

Oberonia Lindleyana R. Wight. Ic. V. 1, 1624. (1851): leaves ensiform, short, very succulent, slightly falcate; stem compressed, spike drooping towards the apex, densely covered with innumerable small sessile flowers: bracts ovale, somewhat obtuse, sub-denticulate on the margin, sepals broad, ovate, obtuse, entire: petals narrow linear; lip broad cordate at the base, crenate, twolobed at the apex; with a minute tooth between: all furnished with numerous minute opaque glandular (?) dots. Flowers straw colour, lip dull orange. — Jyamally Hills near Coimbatore, flowering August and September. — The leaves of the species are very succulent, and with its long drooping raceme afford good distinguishing marks, which are amply confirmed by an examination of flowers. This species is remarkable on account of the opaque gland-like points scattered over the flowers. The bract is represented too pointed in the fig. I dedicate the species to the founder of the genus.

11. MALAXIS SETIFERA. Huc l. c.: *Oberonia setifera*: bracteis cymbiformibus integerrimis, petalis setaceis sepalis longioribus, labello obsolete quadrilobo truncato denticulato versus basin rotundato — Western India, (S. Concan, Dalzell.) h. s. sp. ex hb. Stocks, 38 — A very small species not exceeding 2½", flower spike included. Leaves quite sharp-pointed. Peduncles terete. Flowers perhaps the smallest in the genus — This might perhaps be better placed among the quadrifid species, further on.

12. MALAXIS TRUNCATA. Huc l. c.: *Oberonia truncata*: bracteis acuminatis serrulatis, petalis integerrimis oblongis, labello carnosissimo obtriangulari obsolete aequaliter 3-lobo — Ceylon, Champion (Hantané) h. s. sp. — Leaves about 4" broad, and apparently thin. Peduncle broadly winged. Flowers small, green? From root to tip of erect spike 5".

** *Labello bifido.*

13. MALAXIS LUNATA Bl. Bijdr. p. 394. Huc l. c.: *Oberonia lunata* (L. O. p. 17. Rehb. fl. in Bonpl. Mar. 1, 1857): „foliis paucis ensiformibus basi vaginatis subincurvis, labelli limbo semilunato denticulato, capsulis oblongis“ — Java Blume (Mt. Salak, flowering from October to February) — Lip often slightly 3-lobed according to Rehb. fl. Can this be *O. truncata*, Nr. 12?

14. MALAXIS VERTICILLATA. Huc l. c.: *Oberonia verticillata* (Wight, ic. 1626); bracteis angustis serrulatis, labello truncato in laciniis 2 aequalibus semibipartito, floribus verticillatis, capsula oblonga.

A. *grandiflora*; floribus majoribus glabris, habitu vegetiore — Nilgherries, Schmidt, 37; Pulney Mountains, Wight; Khasya, Lobb, h. s. sp. — Flowers green and orange (R. W.) Some of Schmidt's specimens in the Hookerian herbarium are 1' from root to tip of spikes. Peduncle terete except near the base.

B. *pubescens*; floribus minoribus pubescentibus, petalis latioribus — Ceylon, Thwaites, 2516, h. s. sp. — Rather less in stature than A, with much smaller flowers.

C. *densiflora*; floribus minoribus densis, habitu multo humiliore — Nilgherries, Schmidt, 36, h. s. sp. — The flowers appear to be much yellower than in A. Not more than 4" high.

D. *Khasyana*; floribus laxis multo minoribus glabris viridibus — Khasya, Lobb; at

2'—6000', Hooker and Thomson 118; h. s. sp. — A small form with short drooping spikes, never above 3—4" high. Flowers pale green.

- E. *gigantea*; petalis spatulatis, labello basi dilatato laciniis apicis carnosis — Java, Junghuhn 294, h. s. sp. — Spikes in fruit more than a foot long. Capsules sessile, obconical. Huc porro:

Oberonia verticillata R. Wight, Ic. V. I. 1626. (1851): leaves narrow, ensiform, sub-falcate; raceme erect, or inclined, short peduncled; flowers verticelled: bracts ovate, lanceolate, acute, fimbriate on the margin, sepals short, broad, ovate, obtuse, petals sub-obovate, obtuse, longer than the sepals: lip oblong, slightly cordate at the base, 2-lobed at the apex, lobes broad, roundish, spreading, slightly crenulate on the margin. Ovary and sepals pale green, perianth dull orange. Neigherries on branches of trees, flowers during the rains between July or Oct., also on the Pulney Mountains. — This seems a very distinct species. I at first supposed it *O. anthropophora*, but a more careful consideration of the characters of the species led to the conviction of its being quite distinct.

15. MALAXIS PYRULIFERA. Huc l. c.: *Oberonia pyrulifera*; rhachi acutangula, bracteis integris acuminatis rigidis, petalis serrulatis, labelli bifidi lobis acutis parallelis, capsula pyriformi — Khasya Hills, Griffith (Myrung, on trees) h. s. sp. — Much like var D. of the last species, but the long-stalked pear-shaped fruit, and serrulate petals induce me, with much hesitation, to distinguish it. The flowers appear to be pale yellow with an orange lip.

*** *Labello trifido.*

16. MALAXIS TENUIS. Huc l. c.: *Oberonia tenuis*; bracteis setaceis floribus longioribus; petalis linearibus obtusis integris sepalis aequalibus, labelli lobis lateralibus elongatis filiformibus incurvis, intermedio cuneato leviter trilobo, angulis productis — Ceylon, Thwaites (Hittawaka, on trees, March, 2654) h. s. sp. — A slight erect thing with small thin lanceolate leaves. Spike erect, 2 inches long. Flowers minute, ochrey red. Lip and appendages dark red, Thwaites, from whom I have an analytical sketch.

17. MALAXIS BICORNIS. Huc l. c.: *Oberonia bicornis* (L. O. 16); bracteis setaceis floribus verticillatis longioribus, petalis ovatis, sepalo dorsali maximo, labelli lobis lateralibus linearilanceolatis erectis medio carnosus, intermedio brevi cuneato truncato. — Sylhet, Wallich, h. s. sp. — A small species with thin short leaves and long drooping dense verticillate spikes. An elevated fleshy line runs across the base of the lip and along the middle of each erect arm, forming a kind of crescent.

18. MALAXIS DEMISSA. Huc l. c.: *Oberonia demissa*; floribus verticillatis, bracteis ovatis subdentatis, petalis oblongis dentatis, labelli 3-fidi lobis subaequalibus, lateralibus rotundatis, intermedio ovato acuto — Terai, below Sikkim, J. D. Hooker 121, h. s. sp. — A low plant with thin spikes not longer than the thin broad blunt incurved leaves, about 2" long. Flowers green?

19. MALAXIS BRACHYSTACHYS. Huc l. c.: *Oberonia brachystachys* (Lindl. Sert. Orch. sub t. 8); floribus verticillatis, bracteis ovalibus integerrimis, petalis obtusis labellique aequaliter 3-partiti lobis cuneatis denticulatis — Burma, Griffith, h. s. sp. — Another dwarf thin-leaved species, in habit much like the last.

20. MALAXIS JENKINSIANA. Huc l. c.: *Oberonia Jenkinsiana* (Griffith, MSS.); floribus densissimis, bracteis setaceo-acuminatis denticulatis, petalis obtusis dentatis, labelli 3-partiti lobis lateralibus majoribus fimbriatis, intermedio integro nunc 3-dentato.

A. labelli lobo medio tridentato, lateralibus bene fimbriatis — Assam, Major Jenkins (Deboroo Mookh) h. s. sp. — Somewhat inclined to be caulescent.

B. labelli lobo medio integerrimo, lateralibus dentatis — Khasya Hills, Lobb, h. s. sp. — About 5" high. Leaves narrow, erect, acuminate, as long as the spikes.

*** *Labello quadrifido, vel bene quadrilobo.* (See Nr. 11.)

21. MALAXIS ENSIFORMIS Smith in Rees Cycl. Huc l. c.: *Oberonia ensiformis*. *Oberonia acaulis*, Griff. Notul. III 275, ic. 286. Itin. not. 76, Nr. 1139); bracteis oblongis integerrimis, floribus verticillatis glandulosis, petalis sepalisq. aequalibus, labello oblongo quadrilobo, laciniis rotundatis, anterioribus productioribus — Narainhetty in Nepal, Buchanan Hamilton; Khasya Mountains, Griffith (under Churra, on trees) h. s. sp. — The largest of the genus. A broken leaf before me must have been 18" Spikes dense, shorter than the leaves. Peduncles terete. „Leaves brownish, pallid. Sepals and petals reflexed. Lip projecting, 4-lobed. Flowers brownish, with clavate dot-like glands; sepals paler“. Griffith. Capsules small, dark brown, very dense.
22. MALAXIS SIKKIMENSIS. Huc l. c.: *Oberonia Sikkimensis*; bracteis lanceolatis serratis, petalis linearibus integris sepalis aequalibus, labello quadrifido laciniis lateralibus semiovatis falcatis brevioribus — Sikkim, J. D. Hooker (low valleys 114) h. s. sp. — Leaves narrow acuminate, as long or longer than the slender spikes. Flowers more or less perfectly verticillate. Looks like a diminutive form of the last, but the lip has quite a different form and wants the clavate glands. The flowers seem to be green.
23. MALAXIS MYRIANTHA. Huc l. c.: *Oberonia myriantha*; bracteis setaceis denticulatis, petalis obtusis integris sepalis aequalibus, labelli oblongi quadripartiti medio scabri laciniis obtusis lateralibus duplo brevioribus falcatis. — Khasya, Griffith; at 2—4000', J. D. Hooker and T. Thomson, 113, h. s. sp. — Leaves narrow, rather thick, sometimes setaceo-acuminate, longer or shorter than the very densely flowered verticillate erect (?) spikes. Peduncles terete, with distant empty scales far below the flowers, which are dirty greenish yellow.
- B. foliis angustioribus, floribus minoribus, labelli lobis acutioribus, lobis lateralibus rectis. — Khasya, at 4000', J. D. Hooker and T. Thomson, 117; Assam, Griffith, h. s. sp. — There seems to be no appreciable character by which this can be specifically divided from the last; unless mere size of flowers with small differences in the direction of the lobes of the lip can be so considered.
24. MALAXIS RECURVA. Huc l. c.: *Oberonia recurva* (Lindl. in Bot. Reg. 1839, misc. 8); bracteis ovatis integris, petalis obovatis, sepalis acutis aequalibus, labello subrotundo quadrilobo laciniis subrotundis anterioribus paulo minoribus mucronulo interjecto — Bombay, Loddiges, v. v. c. — A very small species. Leaves short acute. Spike recurved, quite green.
25. MALAXIS WIGHTIANA. Huc l. c.: *Oberonia Wightiana* (Lindl. in Bot. Reg. 1839, misc. 9. Wight, ic. 1627. O. Arnottiana, Wight, ic. 1625. O. stachyoides, A. Richard in Ann. des Sc. ser. 2. XV. 15, t. 1 A.); bracteis lanceolatis denticulatis, petalis linearibus integris, labelli quadrifidi lobis lateralibus erectis rotundatis, intermediis longioribus linearibus divergentibus — Nilgherries, and Pulney Mountains, Wight, Perrottet; Khasya Hills, Lobb; Ceylon, Thwaites 2506 (Newera Ellia Gardner) h. s. sp. — Leaves lanceolate, erect, always shorter than the slender erect or drooping spikes. Peduncles terete. Flowers pale green. This seems to vary more than usual in the present genus, in the form of its lip, the front lobes of which are either ligulate and denticulate at the point, or entire, or short and acute; and these differences seem to occur on the same or otherwise undistinguishable individuals. I can find nothing sufficient to separate my learned friend Wight's *O. Arnottiana*, whose bracts appear exactly the same as in *O. Wightiana*, and by no means furnished with long cilia, as is represented by his Indian draughtsman. — Huc porro:
Oberonia Wightiana Lindley in Hb. Wight et Bot. Reg. 1839, Misc. 9. Wight. Ic. VI. I. 1627. (1851): leaves broad, ensiform, acute: racemes very long drooping towards the apex: flowers scattered, short pedicelled: bracts broad ovate at the base, acute, denticulate at the apex: sepals ovate, obtuse, shorter than the linear obtuse petals: lip three-lobed, lateral lobes strap like embracing the base of the column, middle one prolonged, ending in two obovate spatulate spreading lobes, crenulate

on the margin. Flowers pale green. — Neilgherries and Pulney Mountains, flowering Aug. and Sept. — The ligulate lateral lobes of the lip of this species is peculiar and at once distinguishing it from the following very nearly allied species, with which if I mistake not, it was confounded in the first instance by Lindley.

Oberonia Arnottiana R. Wight. Ic. V. I. 1628. (1851): leaves ensiform, subfalcate, succulent racemes erect or slightly inclined towards the apex, scarcely drooping: flowers alternate, longish pedicelled; bracts ovate acute, ciliate, somewhat sheathing at the base; sepals ovate, acute, about the length of the narrow linear petals: lip cordate at the base, 3 lobed; lateral lobes broad ovate, obtuse, middle one prolonged, forked at the apex. Flowers pale green. — Neilgherries and Pulney, flowering Septbr. — These two species were, I believe, mixed in the coll. sent home and named as above by Dr. Lindley. Now that they are distinguished, I have much pleasure in associating my friend with them by dedicating one of the two to him.

26. MALAXIS THISBE. Huc l. c.: *Oberonia Thisbe* (Rchb. fil. in Bonpl., Mar. 1, 1857); bracteis setaceis floribus subverticillatis brevioribus, petalis erectis sepalisq. concavis obtusis, labelli linearis basi pulvinati laciniis lateralibus setaceo-falcatis intermediis divaricatis denticulo interjecto — Philippines, Cuming h. s. sp. — Leaves thin, obtuse, shorter than the spikes. Flowers minute, brick-red when dry. Very near the next, but the blunt sepals and petals, shorter bracts and much smaller flowers seem to distinguish it pretty well. Huc porro.

Oberonia Thisbe Rchb. fil. in Bonpl. III. 223: aff. *Oberoniae ruflabris* Lindl., foliis (equitantibus) ensatis ligulato obovatis acutiusculis, (siccis margine tenui undulatis), floribus triplo minoribus, labello ligulato apice trilobo, lobis lateralibus setaceo-falcatis retrorsis divaricatis, lobo medio minutissimo dentiformi, lacinia setaceofalcata antrorsa utrinque ante basin. Folia pollicaria seu paulo longiora, breviora, quatuor usque lineas lata nunc aequilata, nunc ante apicem dilatata bina, terna, quaterna. Pedunculus quadri- octopollicaris in altero specimine erectus, in altero curvatus. Bractee setaceae flores minutos, (siccis cinnabarinoflavos) bene excedentes; plurimae steriles in pedunculi basi sub inflorescentia congestae. Racemus subverticillaris. Sepala ovato-triangularia; tepala linearilancea acuta. 2134. Cuming. Phil.

27. MALAXIS RUFILABRIS. Huc l. c.: *Oberonia ruflabris* (Lindl. Sertum Orch. t. 8 A.): bracteis setaceis floribus sparsis multo longioribus, petalis patulis sepalisq. acutis, labelli linearis bifidi basi pulvinati laciniis lateralibus setaceis intermediis lanceolatis divaricatis — Moulmein, Griffith (on trees in damp places) h. s. sp. — Flowers deep dull red, larger, than in the last. The petals which are acute fall back upon the sepals instead of standing erect as in that species.

28. MALAXIS SCYLLAE. Huc l. c.: *Oberonia Scyllae*: bracteis herbaceis setaceo-acuminatis floribus longioribus, sepalis lateralibus orbiculatis concavis dorsali lanceolato longiore, petalis lineari-lanceolatis falcatis ciliatis multo longioribus inflexis, labelli lobis lateralibus linearibus acutis asperis erectis intermediis divergentibus brevioribus apice in crinibus solutis — Ceylon, Thwaites, 3124, h. s. sp. — A most remarkable thing with minute crimson flowers whether opening or expanded, looking like a bunch of red tongues thrust from within a mask, worthy of a Gorgon. The leaves are erect, short, fleshy, bristle-pointed, according to an excellent drawing sent me by my indefatigable and most accurate correspondent, Mr. Thwaites. There does not seem to be any cushion at the base of the lip as in the two last, which is rather singular considering the very close relationship of all three.

§ 2. CAULESCENTES; caule elongato distiche folioso. (O longibracteata,
* Nr. 8 should perhaps be referred to this division.)

* *Labello indiviso v. obsolete lobato.*

29. MALAXIS ANGUSTIFOLIA. Huc l. c.: *Oberonia angustifolia*; bracteis ovatis complicatis integerrimis, petalis integris, labello subrotundo obsolete quadrilobo lobalis

anterioribus oblique truncatis v. emarginatis — Sikkim, Griffith (Dorjeeling); Khasya, Griffith; at 4000—5000', J. D. Hooker and T. Thomson, III. h. s. sp. — A very remarkable species with numerous distichous leaves, scarcely more than $\frac{1}{2}$ " broad, although 8" long. The flowers are perhaps the smallest of the genus, perfectly smooth, in ascending spikes from $1\frac{1}{2}$ " to $2\frac{1}{2}$ " long.

30. MALAXIS PACHYSTACHYA. Huc l. c.: *Oberonia pachystachya*; bracteis lanceolatis acuminatis sepalisq. hispidis, petalis nanis labelloque ovato acuto glabris — „S. Sea Islands“, Catlett, 37, h. s. sp. — Leaves lancet-shaped, short, straight, from 3 to 5 on each side. Spikes shorter than the stems, in fruit nodding and very dense.

31. MALAXIS IMBRICATA Blume Bijdr. p. 395. Huc l. c.: *Oberonia imbricata* (L. O. 17); „caule simplici folioso, foliis compressis vaginatis conferte imbricatis, labelli limbo ligulato denticulato“ — Java, Blume (Damp woods on Mounts Gede and Salak) flowering from September to December — Of this I know nothing certain. If a sketch from Kuhl and Hasselt's collection, for which I am indebted to Prof. Rehb. fil., really belongs to it, then it has oblong acute entire bracts, as long as the flowers, entire narrow petals, and an oblong emarginate lip, without any denticulation. The leaves are also so completely imbricated that even their points do not spread away, but form one unbroken line from the root to the origin of the spike.

32. MALAXIS APOROPHYLLA. Huc l. c.: *Oberonia aporophylla* (Rehb. fil. in Bonpl., Mar. 1, 1857); sepalis petalisq. aequilongis acutis, labello pandurato obtuse sagittato, apice latiore orbicordato denticulato — Philippines, Cuming, h. s. sp. — Leaves short spreading 6" by 3" at the base, acute, about 9 on a side. Spike sessile drooping, covered with flowers to the very base. Huc porro.

Oberonia aporophylla Rehb. fil. in Bonpl. III. 223: aff. *O. ancipiti*: foliis triangulis margine superiori prope rectilineis, parte subdimidia libere ascendente, spica subverticillata, bracteis ovatis apice ciliatuloerosulis, pluribus in inflorescentiae parte inferiori congestis fatuis. Summus character nobis videtur positus in foliorum ratione, quae in affinis ancipitibus Lindl., brevifolia Lindl. valde diversa. In *O. ancipiti* (e. g. Cuming 2115) folii apex adhuc latus, margo inferior valde extrorsum curvatus; apex ipse obtuse acutus, inaequalis — spica aequalis densa more *O. iridifoliae* Lindl. — In *O. brevifolia* lamina libera bene longior, nervoso striata, dum in nostra corrugata. — *O. imbricata* Lindl. — saltem illa, quam habet ill. Wight (1629), ab ancipiti Lindl. vix recedit. — Folia in nostra subsemipollicaria. Racemus bipollicaris. Bracteae vaginaeque oblongae apice denticulatae ovaria aequantes. Sepala oblongolanceolata. Tepala ligulata basi dilatata. Labellum panduratum apice emarginatum, lateribus denticulatis. 2113. Cuming. Phil.

33. MALAXIS ANCEPS. Huc l. c.: *Oberonia anceps* (Lindl. Sertum Orch. sub. t. 8; *O. imbricata*, Wight, ic. 1629 non Blumei; *O. Griffithii*, Wight, 1 c.); bracteis subrotundo-ovatis denticulatis, petalis serrulatis acutis sepalis aequalibus, labello subrotundo breve sagittato emarginato — Philippines, Cuming; Burma, Griffith. 1097; Malacca, Griffith, according to Wight, h. s. sp. — Leaves broad, blunt, slightly curved inwards, projecting very little beyond each other. Spikes short, extremely dense. Capsules very small, globose, absolutely sessile. Huc porro:

Oberonia imbricata? Blume, Wight. Ic, V. I. t. 1629. (1851): „stem simple, leafy, leaves compressed, sheathing, closely imbricated, limb of the lip ligulate, denticulate.“ Blume, Malacca Griffith. — The leaves correspond well with the above too brief and imperfect character, but scarcely the lip, which is my reason for attaching the mark of doubt to the species. Should it be found not to be Blume's plant, it might then be called —

Oberonia Griffithii R. W.: stem leafy, leaves imbricating: spike slender, drooping, bracts large, sheathing, broad ovate, denticulate: sepals broad ovate denticulate; sepals broad ovate, obtuse, as long as the ovate lanceolate petals: lip broad, linear, obtuse, emarginate. The dissections of the flowers are taken from some obtained from a very young spike, the older spike shown in the plate is in fruit.

34. MALAXIS MINIATA. Huc l. c.: *Oberonia miniata* (Lindl. in Bot. Reg. 1843, misc. 8): bracteis ovato-lanceolatis acuminatis, petalis integris obtusis sepalis erectis brevioribus, labello carnoso basi dilatato concavo in laminam linearem emarginatam producto. — Singapore, Loddiges, Philippines, Cuming. h. s. sp. and v. v. c. — Leaves broad falcate acute, four or five on a side. Spikes long, slender, thin-flowered, drooping. Pedicels hairy. Flowers orange-coloured.
35. MALAXIS MICROPHYLLA. Huc l. c.: *Oberonia microphylla* (L. O. 17, Rehb. fil. in Bonpl., March 1, 1857); „subcaulescens, foliis paucis angusto-ensiformibus basi vaginatis subincurvis, petalis erosis, labelli limbo producto rotundato emarginato“ — Java, Blume (on the higher parts of M. Salak) — M. Rehb. who saw this species, adds nothing to the brief character given by Blume.
36. MALAXIS BREVIFOLIA. Huc l. c.: *Oberonia brevifolia* (L. O. 16, Cymbidium equitans, Thouars, t. 92. Pleurothallis disticha, Ach. Rich. Orch. Maurit. t. 8, f. 1, Ad. Brong. Voy. Coquille, t. 40); bracteis linearibus acuminatis margine asperis, petalis sepalisq. glabris, labello subhastato apice dilatato dentato — Mauritius. Bouton, Thouars, Richard, h. s. sp. — Leaves lanceolate, acute, nearly straight. Spikes long, drooping, very slender.
37. MALAXIS GLANDULOSA. Huc l. c.: *Oberonia glandulosa*: bracteis setaceis margine scabris, petalis sepalis hispidis minoribus, labello apice latiore subdentato — Otaheite, Kartalsky (Prescott); Mathews (on branches of trees, 158) h. s. sp. — This is probably the *Epidendrum equitans* of Forster, rather than *O. brevifolia*, from which it is distinguished, inter alia, by its longer straighter leaves and hispid flowers. The latter appear to be pale yellow.
38. MALAXIS SPATHULATA. Huc l. c.: *Oberonia spathulata* (L. O. 16, Malaxis equitans, Blume, Bijdr. 395); bracteis concavis floribusq. hispidis, petalis sepalis brevioribus, labello basi rotundato medio constricto apice in laminam denticulatam subrotundam expanso — Java, Lobb, h. s. sp. — Leaves like those of *O. brevifolia*. Flowers very small, green, somewhat verticillate. The hispidity of the flowers is very striking. It agrees well enough with Blume's short definition.

** *Labello bifido.*

39. MALAXIS CAULESCENS. Huc l. c.: *Oberonia caulescens* (L. O. 15); petalis linearibus, labello elongato cuneato bilobo basi carnoso utrinque dentato — Nepal, Wallich; Khasya at 4000–5000', J. D. Hooker and T. Thomson, h. s. sp. — Leaves grassy, distant. Spikes very slender, thin flowered, naked at the base. Flowers slightly whorled.
40. MALAXIS SPIRALIS. Huc l. c.: *Oberonia spiralis*; petalis ovatis integris sepalis subaequalibus, labello brevi cuneato bifido integerrimo — Java, Kuhl and Hasselt. — Of this apparently very distinct species I have only seen a sketch for which I am indebted to Prof. Reichenbach. The leaves are straight, blunt, 4–5 on each side, about 2" \times 5". The spike is erect, 4 inches long, with distant perfect spires of minute flowers, which are represented as being smooth. The lip is broader at the end than it is deep, and divided less than halfway down.

*** *Labello tri-quadrifido.*

NB. All these species have narrow grassy leaves, and might be almost placed among ACAULES.

41. MALAXIS ANTHROPOPHORA. Huc l. c.: *Oberonia anthropophora* (L. O. 16); bracteis ovatis subdenticulatis, petalis linearibus integerrimis, labello elongato quadrifido lacinis lateralibus brevibus carnosis falcatis, intermediis setaceis divergentibus — Tavoy, Wallich, h. s. sp. — In foliage this resembles *O. angustifolia*, Nr. 29; but has even less tendency to lengthen its stem. The leaves are about 2 on a side, 1½" \times 1½". The spikes are 4" long, dense at the base, open and nearly flowerless at the point, with a naked terete peduncle rather more than ½" long.

42. *MALAXIS PUMILIO*. Huc l. c.: *Oberonia pumilio* (Rehb. fl. in Bonpl., March 1, 1857); bracteis lineari-subulatis floribus aequalibus, petalis ovatis acutis hinc lobulatis crenatis erosis, labello pandurato lobis posticis ligulatis antice obreniformi c. apiculo. — Java, Rehb. fl. — „Allied to *O. microphylla*. Leaves equitant, linear ligulate acute, 4 on each side. Raceme long, interrupted, somewhat whorled. Sepals and petals green. Lip vermilion“. Seems to differ from the next in the ligulate side lobes of the lip, its broader central piece, eroded petals, and shorter bracts.
43. *MALAXIS OBCORDATA*. Huc l. c.: *Oberonia obcordata*; bracteis setaceis floribus longioribus, petalis linearibus acuminatis integerrimis, labelli tripartiti basi bicarinati lobo medio obcordato, lateralibus angustis lanceolatis brevioribus — Sikkim, J.D. Hooker and T. Thomson (at 2000', 112): Griffith (Dorjeeling); Khasya, Griffith (Myrung, h. s. sp. — A small, slightly caulescent species, with the foliage of *O. anthropophora*.) Nr. 41. Spikes verticillate. Flowers deep rose colour (Hooker), or orange coloured (Griffith). The Sikkim specimens are leafy at the base of the spikes in consequence of the elongation of the stem; those from Khasya are much less evidently so.
44. *MALAXIS CIMICINA*. Huc l. c.: *Oberonia cimicina* (Griffith, Not. III. 275); bracteis lineari-lanceolatis subintegris, petalis oblongis denticulatis sepalis obtusis aequalibus, labelli 4-lobi scabri lobis lateralibus inaequaliter multifidis intermedio elongato acute bipartito. — Martaban, Griffith (Moulmein, in damp places on *Lagerströmia*); Tenasserim, Id. (Mergui, 772), h. s. sp. — Another grassy leaved species resembling *O. anthropophora*, Nr. 41. Spikes long, slender, erect, somewhat verticillate. „Sepals and petals pale, streaked with brown. Lip darker,“ Griffith.
45. *MALAXIS LOBBIANA*. Huc l. c.: *Oberonia Lobbiana*; bracteis minutis subdentatis ovario brevioribus, petalis filiformibus sepalis ovalibus aequalibus, labelli lobis lateralibus rotundatis intermedio quadrato bidentato — Borneo, Lobb, h. s. sp. — A very small species. Scarcely caulescent. Leaves 1 or 2 on each side, thin, blunt. Flowers very minute, apparently yellow, in erect spikes rising much above the leaves.
46. *MALAXIS SIMILIS* Blume Bijdr. 394. Huc l. c.: *Oberonia similis* (L. O. 17); „foliis paucis ensiformibus basi vaginatis subrectis, labelli limbo semitrifido eroso, lobo medio elongato bifido, capsulis obovatis globosis“ — Java, Blume (on the trees of M. Salak) — One of Kuhl and Hasselt's sketches, Nr. 37, possibly belongs to this plant, with which it agrees in every thing mentioned except having an eroded lip. The figure shows a linear lip without any trace of erosion, bidentate at point, with a short acute falcate lobe near the base on each side.
47. *MALAXIS TITANIA*. Huc l. c.: *Oberonia Titania* (*Titania miniata* Endl. Fl. Norf. p. 31); Norfolk Island, Ferd. Bauer — Evidently some species of this section.

The following are insufficiently known.

48. *OBERONIA SPIRALIS*, Griffith, Not. III. 275.
49. *OBERONIA TRILOBATA*, Ib. 273. A plant found on trees near Nowgong in the Khasya hills, with leaves a foot and more long. It seems to belong to the *Acaules*, and has a clavate spike longer than the leaves themselves, dense brownish yellow flowers, sunk in oblong excavations of the axis! and a flat 3-lobed lip with the lateral lobes rounded and resembling the petals; while the terminal one is broadly obcordate with a deepish denticulate sinus. Is it an *Oberonia* at all? notwithstanding Griffith's comparison of it to *O. iridifolia*.
50. *OBERONIA*, 120; from the hills and plains of Behar, J. D. Hooker.
51. *OBERONIA*, from the Brisbane River in New Holland; F. Müller.
52. *OBERONIA MYOSURUS*, L. O. 16, said to be found both in Nepal and the Society Islands. Flowers unknown. Requires re-examination, but evidently a very distinct species among the *ACAULES*.

53. MALAXIS QUERCI, De Vriese, ic. 238; a small stemless species with purplish brown verticillate flowers. Structure unknown.

The following are to be excluded from the genus.

54. OBERONIA LINDLEYANA, Ad. Brongn. Voyage de la Coquille, t. 40, is probably Adenoceros virens as Rehb. fl. has suggested.
55. OBERONIA GLADIATA, A. Richard in Sert. } appear to be Phreatias, another sug-
Astrol. t. 2, } gession of the learned Leipsig botanist.
56. OBERONIA MICRANTHA, lb., t. 3,

1338. **NEPHELAPHYLLUM** Bl.

(Bijdr. 372. Tabellen 22.)

1. NEPHELAPHYLLUM TENUIFLORUM Bl. De Vriese Illustr. t. 12. f. 3.

Obs. 1. Nephelaphylli genus ad Epidendreas pertinet!

Obs. 2. Nephelaphyllum a Lindleyo et a me ex icone tam pessima, quam falsissima Blumeana felicissime recognitum. Non satis mirandum, Blumeum in libro novo, quo icones illustrationibus suis edit, aliorum icones urgere, dum ipse imagines protulit, quibus falsius quid nemo reperiet.

1339. **CORALLORHIZA** Hall.

(Hist. 2. 159. — Walp. Ann. III. 526.)

1. CORALLORHIZA MACRAEI Gray Manual 453 (18561). Plant purplish, stout (6'—16' high), bearing 15—20 large flowers in a crowded spike, on very short pedicels; lip oval, very obtuse, rather fleshy (purple), 3 nerved, perfectly entire, concave, the margins incurved, the sessile base obscurely auricled and with 1—3 short lamellae; spur none at all; pod ovoid (½' long). — Woods, along Lakes Huron and Superior (Mackinaw C. G. Loring, Tr. Whitney etc., West Canada, W. F. Macrae). — Sepals and petals 6"—8" long, conspicuously 3 nerved; but this cannot be *C. striata*, Lindl., which is said to have a three lobed and acute lip etc. Flowers the largest of the genus.

1340. **LIPARIS** L. C. Rich.

(Rich. Orch. Eur. 30. f. 10. — Walp. Ann. II. 527.)

Obs. Lubenter *Sturmia* nomen postpono. Etenim nomina haud cognitissima (e. g. Equus, Bos, Elephas, Scorpio, Tinea) certe in utroque regno organico adhiberi posse nunc quidem omnes sentire debemus, ubi neutrum regnum uni homini bene cognitum.

Sect. I. STURMIA: folia plicata.

1. LIPARIS ODORATA Lindl. Orch. 26. Cf. Hooker Journ. of Bot. VII. Lindl. in Benth. Flor. Hongk. p. 33: „very near *L. nervosa*, but the column has an even, not an acutely toothed margin, the sepals are oblong and very fleshy, the flowers also appear to be whole coloured and green. It is the same as the plant found in Chi-Kiang by Fortune.
2. LIPARIS NERVOSA Lindl. Orch. p. 26. — Rehb. fl. in Bonpl. III. 250 (sub *Sturmia*). Planta spithamaea. Folia tria lanceolata acuminata bene plicata. Pedunculus elongatus angulatus apice distanti racemosus. Bractee acuminatae ovariis pedicellatis subbreviares. Sepala lateralia semiovata acuta; sepalum dorsale lineare acutum. Tepala linearia acuta. Labellum flabellatum apice obtusangulum, retusum, cum apiculo, margine hinc subtiliter crenulatum; falculae geminae ante basin. Gynostemium supra labelli basin adnatum ab apice membrana hinc denticulata medium versus alatum. Hongkong. Hance!

3. *LIPARIS BITUBERCULATA* Lindl. Bot. 882. Rehb. fl. in Bonpl. II. 22. (sub *Sturmia*). Caracas Wagener.
4. *LIPARIS WAGENERI* Rehb. fl. in Bonpl. III. 73. (sub *Sturmia*): aff. *Liparidi ramosae* Pöpp. pedunculo validiori omnino et ubique exalato, ovariis pedicellatis bracteis suis ter brevioribus, labello cuneato flabellato. Terrestris serpens. Folia plantaginea gemina sub pedunculo, petiolis laminae aequalibus seu brevioribus, lamina ovalis acuta basi cuneato rotundata. Pedunculus spithameus, dimidio superiore racemosus. Sepala et tepala angustiora linearia. Bractee anguste triangulae. „Flores albi, folia violacea.“ — Blüthe von der Grösse derer der *Sturmia liliifolia* (*Liparis liliifolia* Rich.). Die ganze Pflanze viel kräftiger als *ramosa*, es fehlt auch der dünne Hautrand um die Blätter. Diese unterhalb violett, Blüthen weiss. — Ocanna. 5000'. März. Wagener.
5. *LIPARIS BILOBA* R. Wight. Ic. VI. 1633. 1851: leaves 2 or 3, ovate, acute, undulate, plicate; cucullate; raceme erect, few flowered: sepals ovate, acute; petals narrow linear, blunt pointed, lip spreading deeply 2 lobed. Flowers dull plumb colour. — Neilgherries, nestling among moss on the branches of trees, flowering in July and August. Flowers longish pedicelled, in proportion to the rest of the plant. It comes very near *L. atropurpurea*, but the deeply 2 lobed lip keeps it distinct.
6. *LIPARIS ELLIPTICA* Rehb. fl. Linnaea XXII. 833 (sub *Sturmia*). — Rehb. fl. Bonpl. II. 22. Caracas. Wagener.
7. *LIPARIS KAPPLERI* Rehb. fl.: huc *Sturmia Kappleri*. Rehb. fl. l. c.
8. *LIPARIS PARADOXA* Rehb. fl. Huc: *Empusa paradoxa* Lindl. B. Reg. 825.

Sect. II. *CESTICHIS*: folia pergamenea.

9. *LIPARIS WIGHTII*. Huc *L. elliptica* R. Wight. Ic. V. 1735 (1851): pseudobulbs oval, compressed, costate on one side, 2 edged, truncated at the apex, two leaved: leaves elliptic, cuspidate, nerved, subplicate, about half the length of the scape: scape suberect, raceme many flowered: bracts ovate, subulate, about the length of ovary: sepals subequal, ovato elliptic, cuspidate, petals narrow, linear, pointed: lip irregularly 3 lobed: lobes undulated, pointed, the middle one larger. Flowers greenish yellow, approaching to straw colour. — Branches of trees about Cocroar, Neilgherries. Aug. — Oct. — Allied to *L. viridiflora* of Ceylon. The pseudobulbs are naked, fleshy, costate on one side, two edged i. e. tapering off towards each side. Figur 10 is a transverse section of a pseudobulb.
10. *LIPARIS LONGIPES* Lindl. Orch. 30. Rehb. fl. in Bonpl. III. 150 (sub *Sturmia*) Hongkong. Seemann. — Lindl. in Hook. Journ. VII. l. c.: Hongkong in clefts of rocks in the spring of the year. Champion. The species is common all over those parts of Asia, wick produce epiphytes.

1341. **DENDROCHILUM** Bl.

(Bijdr. 398. Tabellen 522). — Walp. Ann. I. 775.)

1. *DENDROCHILUM GLUMACEUM* Lindl. B. M. 1853.
 Obs. 1. *Dendrochilum roseum* Dalzell cf. sub *Dendrobiis*.
 Obs. 2. Totum *Dendrochili* genus est *Epidendrearum* ut sequentia.

1343. **COELIA** Lindl.

(Orch. 36. — Walp. Ann. III. 527.)

1. *COELIA MACROSTACHYA* Lindl. Orch. 36. B. M. 4712. Van Houtte IX et Obs.
 2. *COELIA BELLA*. Huc: *Bifrenaria bella* Lem. — Lem. jard. fl. III. tab. 325. — Pseudobulbis jun. ovatis subcompressis, adultis tereti oblongo-ovatis b. radicali annulatum subattenuatis, f. junioribus radicalibus breviter squamaeformibus vaginantibus

bifariis deinde terminalib. 4-5 bifariis quoque longe convoluto - vaginatis cartilagineis crassis ensiformibus longe acuminatis et subpungentibus plicato - 3-5 - venatis; scapo trifloro (vel amplius) brevi basi bifariam vaginatim bracteata, segmentis floris crassis, lateralibus externis in mentum perlongum antice basi gibbosum bracteolis obductum productis, bracteolis oblongo - obliquo - dimidiatis, labello basi producta cavitate cucullata magna donata trilobo oblongo lobis lateralibus brevibus quadratis, terminali linguiformi acuto calloque carnoso luteo elevato penitus occupato, de fossa ad callum costa elevata notato. — Lem. ad vivum.

Bifr. bella Lem. sub praes. tab. — (*Bothriochilus bellus* Lem., an genus novum?)

Primus coluit Ambr. Verschaffelt.

Huc porro: Lem. Illustration horticole III. p. 30: *Bothriochilus bellus* Ch. Lem. (Orchidaceae § Vandae §§ Maxillariae). Nous avons publié, dans le troisième volume de notre Jardin fleuriste (Pl. 325), sous le nom de *Bifrenaria bella*, une rare et jolie Orchidée, que nous venions d'observer en fleurs dans une des serres spéciales pour la culture de ces plantes de l'établissement Verschaffelt, et qui provenait des recherches faites par son collecteur, M. F. Devos, dans l'île St.-Catherine. Tout en la rapportant au genre *Bifrenaria*, nous faisons nos réserves, en raison du nombre des pollinies de notre plante, qui en montrent quatre doubles, c'est-à-dire huit! Nous induisons de ce fait insolite, que notre plante pourrait fort bien devenir le type d'un nouveau genre, que nous proposames dès lors sous le nom de *Bothriochilus*. M. Reichenbach, fils, qui s'occupe avec un zèle infatigable et un talent supérieur, auquel, tout le premier, nous rendons hommage, de la révision et de la classification des plantes de cette famille, approuva (in litt.) la formation de ce genre, si la disposition des pollinies était telle que nous l'avions figurée dans notre planche!

Or, en décembre dernier, notre ancien *Bifrenaria bella* vient de refleurir dans l'établissement Verschaffelt, avec une grande luxuriance; chaque épi offrait six et sept fleurs à la fois, et nous avons pu de nouveau constater l'existence de quatre pollinies doubles. En conséquence, nous proposons ici définitivement le genre *Bothriochilus* *) qui ne renfermerait encore que l'espèce en question.

Rappelons en peu de mots que les fleurs en sont grandes (0,07 de long. 0,05 de diam.), nettement tricolores (blanc, rose, jaune!) et émettent une odeur extrêmement suave. Nous souhaitons fort que M. A. Verschaffelt puisse promptement multiplier cette plante et la répandre dans les collections.

Obs. Species jam diu in Anglia apud cl. Bateman floruit, uti in herbario Lindleyano vidi.

3. COELIA GUATEMALENSIS: foliis lanceis, pedunculo dense vaginato, bracteis flores non aequantibus, sacco mentali ovarii dimidium aequante seu superante, labello rhombeo - lanceo. Guatemala (v. sp. sicc. in herb. Lindleyano).

*) Perigonii segmentis subconformibus inaequalibus subcarnosis de medio ad basin⁹ tubulatim conniventibus dein subpatulis lanceolatis subobtusis; supremo (externo) subfornicato multo brevius ad pedicellum (ovarium) abrupte terminato; lateralibus 2 (internis) postice longissime cum ovario parallelis productis labelli basim obvolvuntibus cum gynostemio de medio ad basin in alas comitanter connatis in calcar grossum obtusumque ventre canaliculatum desinentibus; labelli basi prolongata abrupte retro plicata alte cucullata (inde nomen); laminae ejus oblongae canaliculatae lobis lateralibus brevibus truncatim quadratis, terminali linguiformi acuto convexo callo maximo elevato discolorare fere in totum occupato; gynostemio late cuneato apice in tres grossos dentes fisso; pollinibus paribus quatuor geminatis, paribus super. majoribus, caudiculis parium duorum distinctis.

Bothriochilus Nob. hic et antea l. c.

Species adhuc unica observata (v. supra l. c.) floribus 6-7 (an amplius?) dense breviterque spicatis tricoloribus suaveolentibus, unquoque bractea maxima scariosa cito desiccata de basi ad medium involuta. . . etc. v. supra.

Bothriochilus bellus Nob. etc.

1346. **EARINA** Lindl.

B. Reg. XXI. 1835 sub 1999.

A. Lindleyana et W. J. Hookeriana.

Bot. Reg. l. c. : **EARINA** (ἑάρτινος). Sepala erecta, aequalia, acuta, membranacea, carinata. Petala carnosa, obtusata. Labellum carnosum, posticum, cucullatum, trilobum, disco nudo, cum columna continuum et subparallelum. Columna teres, nana, stigmatis obliqui labio inferiore prominulo. Clinandrium proclive. Anthera bilocularis. Pollinia 4, per paria cohaerentia, collateralia. Herba caulescens, rhizomate articulato-repente. Folia linearia, disticha, vaginantia. Flores parvi, paniculati, bracteis cartagineis, striatis, cucullatis („auriculatis“ Hook. Ic. V. 631.) Lindl. B. M. Comp. II. 24. 377. — Malaxidea related to Coelogyne and Dilochia, of the latter of which in particular it has much the habits on a small scale. From the former its wingless column and from the latter the number of its pollermasses, sufficiently distinguish it, independly of other points of difference.

1. **EARINA MUCRONATA** Lindl. in Bot. Reg. XXI. 1835 sub 1999: Epidendrum autumnale Forst. Prodr. n. 319. Cymbidium autumnale Sw. nov. act. ups. 672. — W. Sp. pl. III. 98. — Nova Zelandia (hab. s. sp. comm. cel. Cunningham). — Rhizomata inter muscos mortuos repentia, articulata. Caules ascendentes, palmares pedalesque, pennae corvinae crassitudine, maculati, basi vestigiis laceris vaginalium vestitii. Folia lineari-ensiformia, apice leviter obliqua, mucronulata. Flores e bracteis rigidis cucullatis mucronatis emergentes, parvi, ovario recto costato bracteolarum longitudine. Sepala omnia libera, angusta, mucronata, carinulata. Petala latiora, carnosa, obtusiora, aequilonga. Labellum posticum carnosum, cucullatum, inappendiculatum, basi liberum, cum columna continuum et parallelum, trilobum, nudum; lobo intermedio bipartito laciniis oblongis crenulatis mucrone intermedio. Columna suberecta nana, antice teres, clinandrio subcucullato membranaceo-marginato; stigmate excavato, rostello obtuso. Anthera ovata, 2 locularis. Pollinia 4, per paria cohaerentia, cereacea, collateralia, materie viscida rostello adhaerentia.

Growing commonly in moist woods upon the shores of the Bay of Islands, New Zealand, on mossy rocky banks and on the limbs of trees, flowering in Sept. Oct., which in New Zealand is the season of spring. Mr. Cunningham.

Bot Mag. Comp. II. 376 : A. Rich. Fol. Nov. Zel. p. 169. — New Zealand North. Island) 1769. Sir Joseph Banks. Moist woods, on rocks and trees, Bay of Islands, Wangaroa etc. 1826. A. Cunningham 1834. — R. Cunningham (Middle Island) Dusky Bay 1773. G. Forster.

All. Cunningham. in Hook. Journ Bot. III. 300. 1841 : Beyond the trunks of the larger trees to my joy a charming plant of E. m., with very narrow elongated leaves bearing white flowers, which were however beyond my reach, but of which I shall secure plants on my return again to the colony. New Zealand up the Wycaddy river. Hook. Ic. V. 432. 1842.

2. **EARINA SUAVEOLENS** Lindl. Bot. Reg. XXIX. 1843. Misc. 88. Spica oblonga densa basi subcomposita, labello transverso, rhombeo, versus basin bicalloso obsolete trilobo lacinia intermedia rotundata undulata emarginata.

New Zealand. Bidwill Loddiges. A tufted species with stems 4 — 12" high, clothed with narrow distichous somewhat rigid leaves about 3" long. The stems are terminated by dense oblong spikes of white flowers, having a double spot on the lip.

It grows near Roturoa in New Zealand on trees not very densely covered with leaves. Very rare; exceedingly beautiful, most deliciously perfumed. From E. mucronata it differs in the form of the lip and the size of the flowers, which are collected in dense spikes, and not in slender branched ones.

B. J. Hookeriana. Fl. of New Zealand, 239.

Earina Lindl. Perianthii foliola patentia, subcarnosa, subaequalia. Labellum posticum, cucullatum, trilobum, columnae subparalellum, basi subtuberculatum, disco nudo. Columna nana, stigmatis labio inferiore prominulo. Anthera bilocularis. Pollinia 4 ceracea, collateralia, per paria cohaerentia. — Herbae epiphytae, caulescentes; rhizomate articulato, repente; foliis rigidis, distichis; floribus racemosis paniculatisve; bracteis cucullatis. — Rigid epiphytical plants, growing in great tufts on the branches of trees etc. Rhizoma creeping, sending out long white simple fleshy or hard roots. Stems compressed, single, erect, covered with distichous, linear, coriaceous green leaves. Flowers in terminal simple or branched bracteate racemes, small, white. Perianth of six nearly equal pieces, all spreading; sepals equal, oblong, subacute; petals ovate, more fleshy; blunt; lip three lobed, retuse, lateral lobes curved inwards. Column short. Pollen masses four, united, in pairs, to a very small strap shaped caudicle, powdery. — This genus is confined to New Zealand. (Name from *ἐαρῖνος*, spring flowering.)

1. *EARINA MUCRONATA* Lindl.; caule gracili ancipiti, foliis longe lineari-ligulatis acuminatis, panicula gracili, sepalis lineari-oblongis, labello profunde trilobo. Lindl. Gen. et Sp. Orchid. A. Cunn. Prodr. Epidendrum mucronatum Banks et Sol. MSS. et Ic. Hab. Throughout the Islands, as far south as Otago, Banks et Solander etc. Stems slender, 1—3 feet long, two edged. Leaves 4—6 inches long, $\frac{1}{2}$ broad, acuminate. Panicle slender, sparingly branched. Bracts remote, obtuse. Flowers $\frac{1}{4}$ inch diameter; sepals and petals linear oblong; labellum deeply lobed, spotted. *
2. *EARINA AUTUMNALIS* Hook. fil.; caule robusto lente compresso, foliis linearibus rigidis subacutis acuminatisve panicula subdisticha ramosa, sepalis late oblongis, petalis late ovatis, labello obtuse trilobo subquadrato. Epidendrum autumnale Banks et Sol. MSS. et Ic.

Hab. Throughout the Islands, to Stewarts Islands, Banks et Solander etc.

A shorter, more robust plant than *E. mucronata*. Stem $1\frac{1}{2}$ foot high, slightly compressed. Leaves $2\frac{1}{2}$ — $3\frac{1}{2}$ inches long, $\frac{1}{3}$ broad, rigid, nerved and striated, sharp or acuminate. Panicle rigid, rarely simple, usually with many diverging many flowered distichous branches. Bracts crowded, imbricated. Flowers white, speckled. Sepals broadly oblong. Petals ovate. Labellum broad, obscurely three lobed, retuse.

Obs. Ex illis, quae attuli, apparet, cl. Hooker fil. et Lindley de „Epidendro autumnali“ Forsteri (Florul. ins. austr. Prodr. auct. Georgo Forster p. 60) dissentire. Ex descriptione praecedentis, Epidendri biflori, apparet, cl. Forster bene discernere folia lineari-lanceolata et lanceolata, ex 323, Epidendro Clypeolo apparet, eundem bene discernere labellum apice emarginatum, dum in 319 retusum dicitur. Cum jam folia linearia et labellum emarginatum in *Earina mucronata*, folia linearia-lanceolata, et labellum apice retusum, in *Earina suaveolenti* occurrant, patet, cl. Hooker fil. bene *Erinam autumnalem* dixisse illam plantam, quam cl. Lindley suaveolentem dixit.

Quod autem attinet ad characteres *Earinae*, totum genus *Coelogyni* certe valde affine. Columnam tamen habet *Liparidis*, ea tamen lege, ut margo androclinii utrinque descendat in lineam, ex qua surgit parva auricula. Pollinia in *E. autumnali* reperio quaterna et in unum fasciculum conferruminata apiculo pulvereo; in *E. mucronata* autem tela illa non apiculata, sed laxior. Haec omnia non bene sufficiunt. Anthera autem sat videtur egregia ad condendum genus. Loculamenta enim septulum habent, quod prope rectangule imminet in septa loculorum. Pollinia inde minime collateralia! Quod autem majus, utrinque extus juxta septulum emergit uncus parvus. Haec si colligis, genus servari potest. Characteres hucdum nemo dederat.

1347. **COELOGYNE** Lindl. Folia I. V.:

(Gen. et Sp. Orch. 38.)

Sepala conniventia vel patentia, libera, (nunc invicem agglutinata) aequalia, petaloidea, saepius basi obtusa. Petala conformia, aut multo angustiora. Labellum cucullatum, trilobum vel indivisum, petaloideum, basi saepe saccatum, venis 2—3 pluribusve parallelis cristatis; nunc cum basi columnae connatum. Columna erecta, libera, alata, apice membranaceo-marginata. Stigma prominens, alte excavatum, bilabiatum. Pollinia 4, libera, incumbentia, materie granulosa cohaerentia. Anthera infra apicem columnae inserta, mobilis, vix decidua.

Herbae epiphytae vel terrestres Asiae tropicae, pseudobulbosae. Folia 1—2, nervosa. Racemi, aut flores solitarii, terminales, saepe e squamis corneis erumpentes. Flores albi, rosei, flavidi aut brunneo maculati, immo virescentes, saepissime speciosi.

ANALYSIS OF THE SECTIONS.

§ 1. NEOGYNE. Flowers closed. Sepals carinate, saccate. Lip bisaccate.

§ 2. COELOGYNE. Flowers expanded. Lip unisaccate.

1. *Flaccidae*. Racemes pendulous.

2. *Erectae*. Racemes erect, simple. Petals similar to the sepals.

3. *Proliferae*. Racemes emerging from imbricated scales immediately below the flowers, and proliferous.

4. *Filiferae*. Racemes erect, simple, or flowers solitary. Petals filiform.

5. *Flexuosae*. Racemes erect, very flexuose, finally naked, with adpressed floriferous bracts at the point.

§ 3. PLEIPNE. Flowers large, membranous, appearing before or after the plaited leaves which are membranous and quickly perishable.

§ 1. NEOGYNE, Rchb. fil., in Bot. Zeit., 1852. 931.

1. COELOGYNE GARDNERIANA Lindl., in Wall. Pl. as. rar., I. 33, t. 38. l.O., p. 9. Folia I. n. 1.:

C. pseudobulbis elongatis ampullaceis teretibus, foliis lanceolatis 5-nerviis acuminatis longe petiolatis, racemis nutantibus densifloris terminalibus radicalibusque foliis multo brevioribus, bracteis latis oblongis cucullatis sterilibus carnosus, floriferis petaloideis persistentibus, floribus clausis, sepalis oblongis carinatis basi saccatis, petalis lineari-oblongis, labelli denticulati basi bisaccati lobo medio bilobo lateralibus minore, crista duplici flexuosa infra medium evanescente.

C. trisaccata Griffith, itin. notes, p. 72.

Wild in Nepal Wallich; Khasia at Mamloo in woods Griffith; at the height of 4000 feet. J. D. Hooker, and T. Thomson, (v. v. c. et s. sp.). — This noble plant has large pure white flowers, with a yellowish stain at the end of the lip; they scarcely ever expand, but are placed in long nodding racemes, supported by great fleshy snow-white bracts. The pseudobulbs are very long, and narrow, resembling long flasks. The leaves are as much as eighteen inches long, by three inches broad. The saccate base of the sepals is very remarkable, but hardly enough for the establishment of a new genus.

Huc: Rchb. fil. l. c. *Neogyne*, Ovarium cylindraceum, trialatum. Perigonium carnosum-membranaceum, campanulatum, apice vix apertum, phylla externa oblongo-ligulata linea media carinata, acuta, basi saccata, phyllum summum altius in ovario insertum, quam phylla lateralia, phylla l. i. breviora, linearia, acuta, sub apice dilatata; labellum oblongum, apice trilobum, lobis lateralibus obtusangulis, lobo medio producto, subquadrato, longiori, margine antico denticulato, basi ima conico-sacca-

tum, cum pede gynostemii continuum, marginibus elevatis canalem efformans; nervi 2 laterales interni lamellas crenulatas, crispulas gerentes; gynostemium semiteres sub apice postice gibbum, marginibus apicem versus obtusangule alatum, ala androclinium omnino cingens, denticulata, rostellum triangulum, supra stigmatis foveam rotundam, inferne limbigeram; anthera oblonga, dorso valde elevata, bilocularis, loculi obscure bilocellati; pollinia quaterna, oblongo-pyriformia, depressa, postice linea media sulcato-exsecta, transsectione igitur convoluta (nec farcta Coelogynarum more), per paria incumbentia, sessilia in glandula pulverea. — Blüthe schön weiss, 3 Zoll lang. Lippenspitze gelb. Coeogyne Gardneriana Hort. Booth. num Lindl.? Im letzten Falle wäre die Abbildung in Wall. Pl. As. ganz flüchtig. — Allein ich glaube durchaus nicht daran und würde die Pflanze unbedenklich als *C. trisaccata* Griff. bestimmen, wenn das wichtige Moment des ovarium trialatum nicht unerwähnt geblieben wäre.

§ 2. COELOGYNAE VERAЕ.

1. Flaccidae.

This section is known by the long pendulous racemes. *C. incrassata*, No. 28, may possibly belong here.

2. COELOGYNE FLACCIDA LO., n. 1. Bot. Mag., t. 3318. Bot. Reg. 1852, t. 31. Fol. I. n. 2:

C. pseudobulbis oblongis angulatis squamis coriaceis ustulatis vestitis, foliis lanceolatis vel oblongo-lanceolatis longe petiolatis coriaceis, racemo flexuoso nutante, bracteis deciduis, petalis lineari-lanceolatis, labello ovato trilobo: lineis tribus elevatis flexuosis: lobo medio ovato duplo angustiore basi denticulato.

Wild in Nepal; near Noakote, on trees. Wallich, (v. v. c. et s. sp.). — Flowers in long drooping racemes, with a peculiar and disagreeable odour. Bracts soon thrown off leaving the flowers naked. Sepals white, linear oblong, scarcely acute. Petals of the same colour, but not more than one-third the breadth, and curved backwards. Lip channelled, ovate, three-lobed, with the middle lobe ovate, acute, wavy, toothed at the base, and turned back at the point; near its base are several crimson veins; towards the apex it is yellow in the centre; along the middle run three raised wavy lines which terminate abruptly a little within the base of the middle lobe. The scales at the base of the raceme are remarkable for their brown scorched appearance.

3. COELOGYNE ROCHUSSENI De Vr. Illustr. t. 2. et tab. 11. fig. 6: „pseudobulbis ovatis vel oblongis, angulatis, sulcatis, diphyllis; foliis ellipticis, lanceolatis vel oblongo-lanceolatis, petiolatis, coriaceis, racemo longissimo, flexuoso, pendulo; bracteis ovatis, conduplicatis, persistentibus persicinis; floribus pedicellatis, pendulis; sepalis lineari-lanceolatis, carinatis, acuminatis; petalis minoribus, basi angustatis, lobis acutis, medio maximo elongato, lineis tribus elevatis, muricatis, denticulatis praedito; massarum pollinarum facie interna planiuscula, ad punctum conjunctionis paululum excavata; antherae margine denticulato.“ Eine sehr stattliche Pflanze, die wir bereits längere Zeit als neu im Herbar liegen hatten.

4. COELOGYNE TESTACEA Lindley, in Bot. Reg. 1842, misc. 34. Folia I. n. 3:

C. pseudobulbis ovalibus angustis angulatis, foliis lanceolatis 3-nerviis, racemo pendulo, bracteis ovatis cucullatis ovarii longitudine persistentibus, sepalis petalisque subaequalibus, labelli oblongi lobis lateralibus rotundatis obsolete intermedio obtuso: venis 4 ad apicem usque papilloso-cristatis,

Wild in Singapore Loddiges, (v. v. c.). — Leaves lanceolate, nine inches long, distinctly petiolate. Flowers not larger than in *C. fimbriata*, in drooping racemes five to six inches long, dirty white with fulvous bracts and some brown blotches on the lip. — Huc B. Mag. 4785.

5. COELOGYNE PLANTAGINEA Lindl. in Gard. Chronicle 1855, 20.

C. pseudobulbis elongatis teretibus, foliis oblongo-lanceolatis costa-

tis, undulatis, petiolatis patentibus, racemo pendulo glabro multifloro, bracteis „parvis fuscis acutissimis“ deciduis, petalis lineari lanceolatis, sepalis paulo latioribus carinatis, labello ovato oblongo trilobo lamellis hypochilii 3, epichilii 4-fimbriatis.

The flowers appear in a long pendulous raceme, not unlike that of *Cymbidium pendulum*. greenish yellow with a white lip streaked with brown. The latter has a taper pointed middle lobe and is crested with perpendicular fringed plates. The pseudo-bulbs are six inches long.

6. COELOGYNE LENTIGINOSA Lindl. Folia I. n. 4.

C. racemo paucifloro, bracteis linearibus convolutis persistentibus, petalis linearibus, labello obovato plano lineis duabus elevatis continuis lobis lateralibus rotundatis intermedio subrotundo unguiculato duplo latiore emarginato.

Wild in Montmeim Lobb, (v. v. c. comm. dom. Veitch.). — I only know this very distinct species from a fragment communicated by Messrs. Veitch. The flowers are the size of *C. flaccida*; the lip is white finely freckled with brown near the base; the short lateral lobes are bordered with the same colour; the middle lobe is tinted with yellow and is rather wavy. The two lamellae reach about half way up the middle lobe, are slightly curved, and perfectly even.

7. COELOGYNE TOMENTOSA Folia I. n. 5.:

C. racemis longissimis laxis pendulis, bracteis magnis longe distantibus convolutis, labelli lobo medio ovali lateralibus obtusis lineis 3 elevatis serratis, ovario tomentoso.

Wild in tropical Asia (place unknown), T. Lobb, n. 187 (v. s. sp. in hb. Hooker). — Of this remarkable plant one specimen exists in Sir Wm. Hooker's herbarium. It consists of a raceme about eighteen inches long, having nineteen or twenty flowers with a downy ovary; the bracts are broad convolute bodies fully an inch long. Nothing is known of its colour. The sepals are lanceolate and very acute, as are the petals which are shorter as well as narrower. The flowers spread widely and are about two inches or more in diameter.

8. COELOGYNE ASPERATA Lindley, in Journ. Hort. Soc., IV. 221. Folia I. n. 6.:

C. racemis pendulis dense multifloris subpubescentibus, bracteis subrotundo-ovatis concavis duris siccis, sepalis lanceolatis carinatis, petalis angustioribus conformibus ecarinatis, labelli lobis lateralibus erectis ovatis obtusis intermedio oblongo obtuso crispo: disco dense verrucoso costis 3 inaequalibus laevibus pone basin.

C. Lowii Paxton's Mag. Bot., Sept. 1849, p. 225.

Wild in Borneo. Low, (v. v. c.). — Flowers full three inches in diameter, in drooping racemes a foot long; pale cream colour except the lip, which is richly marked with brownish yellow veins springing from a rugged bright orange central ridge. There is no doubt that *C. Lowii*, above quoted, was this; but the figure is a very bad one. — Huc' Pescatorea I. 27.

9. COELOGYNE PANDURATA Lindley, in Gard. Chron., Dec. 10. 1853. Fol. I. n. 7.:

C. foliis maximis multinerviis, racemo longo pendulo, bracteis oblongis cucullatis distantibus persistentibus, petalis sepalisque lineari-oblongis, labello basi concavo cordato-oblongo retuso cis apicem crispo setaceo-mucronato (lateribus deflexis pandurato) lobis basilaribus nanis acuminatis disco laevi tricarinato utrinque crista alta duplici verruculosa aucto citra cristam copiose verrucoso.

Wild in Borneo. Loddiges; common on trees in shady places overhanging water. Low, (v. v. c. et s. sp. in hb. Hooker). — A very fine species, with leaves and raceme respectively eighteen and twenty inches long. The flowers, which are about two inches apart, are green, in a pendent raceme furnished with brown cucullate deci-

duous bracts as long as the peduncle. Each flower is about four inches across if fully expanded, with pale green sepals and petals, and a singularly warted lip, marked with deep, broad, black veins and stains, upon a greenish yellow ground. The crests are two deep doublewarted lines on each side of a three-ribbed central disk; these crests converge towards the middle of the lip, where they lose themselves in a field of pallid, rugged, irregularly situated, often two-lobed warts. The column is green, slightly expanded into thin rounded edges. The lip, although really oblong, yet, in consequence of the manner in which the sides are bent down, has much the form of a violin. A memorandum in the Hookerian herbarium states the flowers to „emit a beautiful perfume“.

10. COELOGYNE APICULATA Rehb. fil. Huc *Panisea apiculata* Lindl. Fol. I. n. 3.:

P. folio anguste ovali petiolato racemo nutante bifloro multo longiore, bracteis linearibus canaliculatis ovario triptero brevioribus, sepalo dorsali reflexo, labello oblongo retuso apiculato ungue sigmoideo saccato.

Wild in Moulmein, at 5000 feet. T. Lobb, (v. s. sp.). — „Flowers greenish brown,“ rather smaller than in the next.

Obs. Nonne hic inserenda est haec sequens species?

11. COELOGYNE CROOCKEWITH Teissm. et Binnendyk Naturk. Tijdsch. voor Nederl.

Ind. Decemb. V. 1853: *bulbis tetragonis ovatis monophyllis, foliis lato-lanceolatis coriaceis glabris, racemi bracteis deciduis, phyllis perigonii externis ovatis concavis carinatis, interioribus linearibus reflexis, labelli trilobi lobo medio obovato bifido undulato, lateralibus parvis acutis reflexis intus lineis elevatis, columna dilatata apice crenulata.* Salak.

Obs. Icon, quam habeo, potius „*Pholidotam*“ refert.

2. *Erectae.*

The species grouped under this section resemble each other nearly, and perhaps are too much subdivided. No evidence, however, exists in Europe to show the nature of their variation, if any. They are only known from the Filiferous race by their petals not being extremely narrow; in general the flowers of the latter are almost solitary.

12. COELOGYNE THUNIANA Rehb. fil. in Otto et Dittrich Allg. Gartz. 1855. pag. 145:

nullis affinis: uniflora, pseudobulbis lagenaeformibus rugoso sulcatis impressivis concoloribus, foliis synanthiis lineari ligulatis, nervo dorsali carinatis, labello ligulato, obovato, ante basin utrinque falcula antrorsa trifido, carinis geminis a basi in disscum papula interjecta, gynostemio utrinque juxta foveam unidentato (tamen Coeologyne).

13. COELOGYNE TRINERVIS Lindl. L.O., n. 11. Fol. I. n. 8.:

C. pseudobulbis ovatis in rhizoma crassum squamosum, foliis longis 3-nervibus lanceolatis plicatis in petiolum longum angustatis, racemo brevi stricto vagina imbricata, bracteis deciduis, petalis lineari-lanceolatis, labelli trilobi lobis rotundatis: intermedio subrotundo undulato lineis tribus flexuosis elevatis aequalibus e basi labelli ortis.

Wild in Tavoy, on the Tenasserim Coast. Wallich, (v. v. sp.). — A very pretty species. Leaves fifteen to sixteen inches long, straight and narrow. Raceme not more than five inches high, with about five flowers, the colour of which is unknown.

14. COELOGYNE BREVISCAPA Lindl. Fol. I. n. 9.:

C. pseudobulbis ovatis corrugatis monophyllis, foliis anguste lanceolatis coriaceis petiolatis, scapis paucifloris strictis basi imbricatim squamatis, bracteis latis oblongis concavis persistentibus, labelli lobis lateralibus obtusis intermedio duplo majore subrotundo apiculato venis 2 flexuosis apice incrassatis intermedia filiformi, columna apice tantum denticulata.

C. angustifolia, Wight, ic. t. 1641; nec A. R.

Wild in Ceylon Walker; Nilgherries, on branches of trees in clumps of forest near Neddawuttim Wight (v. s. sp. in hb. Hooker and Wight.) — This very distinct spe-

cies is, as Dr. Wight conjectures, distinct from the *C. angustifolia* of Richard (see No. 10). It is readily known by its coriaceous narrow leaves with two lateral longitudinal folds imitating so many nervures. The inflorescence resembles that of *C. ovalis*. The details of the lip in the Icones are in some respects very inaccurate.

Huc: *Coelogyne angustifolia* A. Richard. Wight. Ic. V. I. 1851. N. 8. tab. 1641: pseudobulbs aggregated, ovoid oblong, the older ones naked, the youngs sheathed, one or two leaved at the apex; leaves lineare, lanceolate, acute, channelled at the base, spotted beneath with white points, scape terminal, length of the leaves, 2-4 flowers; bracts linear, persistent, divaricate; lip erect 3 lobed, lateral lobes oblong, obtuse, middle one larger, acute, narrower below, furnished with 2 sinuous longitudinal crests. The white lip tinged with yellow. — Nilgherries, on branches of trees, in clumps of forests, near Nedda wullin. — My fig. diff. from Richards as to lead me to doubt their identity, esp. as regards the form of the lip, acute in his, very obtuse in mine. If I have erred, it is from confounding two specimens much alike.

15. COELOGYNE ODORATISSIMA Lindl. LO., n. 11. Fol. I. n. 10.:

C. pseudobulbis ovatis sulcatis, foliis 1—2 membranaceis nervosis racemo erecto 2—3-floro brevioribus, bracteis angustis cymbiformibus divaricatis, labelli trilobi 3-cristati lobo medio obtuso subundulato lateralibus brevioribus planis.

(A) Leaves oblong. Middle lobe of lip rounded.

Coelogyne odoratissima Wight, ic. t. 1640.

(B) Leaves much narrower. Middle lobe of lip slightly acute and narrower.

Coelogyne angustifolia A. Rich., in Ann. des Sc., ser. 2, XV. t. 6. Wight, ic. t. 1641.

Wild A, Ceylon: on the mountain Nuera Ellia, Macrae; Nilgherries, on trees Wight; B, Nilgherries Wight, Perottet, 868, 522, (v. s. sp.). — Whole plant from four to six inches high, in dense tufts. Flowers pure white, very fragrant. There is no doubt, that *C. angustifolia* is a slight variety; A. Richard's figure, from whom I have an authentic specimen, is very erroneous, especially as to the parts and in the condition of the lip.

Huc *Coelogyne odoratissima* Lindl. Wight. Ic. V. I. 1851: pseudobulbs caespitose, ovate, leaves lanceolate, petiolated, length of the 2 or 3 flowers raceme: bracts boat-shaped, divaricate, petals linear, lanceolate, lip 3 lobed, 3 crested, middle lobe undulated, orbicular, column entire. Flowers white, lip tinged with yellow. — Dodabella, Nilgherries on branches of trees. Flowers rainy season May — Oct. — Large masses covering several feet of branch. Pet. narrower than sepals.

Obs. Nescio, cur ill. Lindl. huc iterum citaverit iconem Wight. 1641, quam antea sub breviscapa citaverat.

16. COELOGYNE OCHRACEA Lindl. Lindley, in Bot. Reg. 1846, t. 69. Bot. Mag., t. 4661. Fol. I. n. 11.:

C. pseudobulbis ovatis apice tetragonis, foliis anguste lanceolatis in petiolum angustatis, racemo paucifloro basi squamis nitidis vaginato apice nutante longioribus, sepalis petalisque anguste lanceolatis, labelli trilobi intus pubescentis lobis lateralibus rotundatis intermedio ovato acuminato obtuso sinu denticulato integrove lamellis 2 rectiusculis integris cis medium apicem evanescentibus linea brevi elevata apice dentifera prope basin interjecta.

Wild in Bootan, Khasia; common on Thumathaya and Lamplangthaya Griffith, (v. v. c. et s. sp.). — Flowers pure white, with bright orange yellow blotches on the lip, very pretty, and extremely sweet-scented. In colour this appears to be variable, sometimes having yellow-brown ocellated blotches on the lip, sometimes having a dull brownish lip with a white border. The absence of supplemental processes to the elevated ridges of the middle lobe of the lip assists much in distinguishing it from *C. ocellata* etc. — Huc: Lem. Jard. fl. t. 312.

17. COELOGYNE NITIDA Lindl. LO., n. 7. Fol. I. n. 12.:

C. pseudobulbis oblongis obtusis squamis nitidis vestitis, foliis lanceolatis basi longe angustatis, racemis strictis basi squamis coriaceis laevigatis imbricatis arctissime vaginatis quam folia multo longioribus, bracteis deciduis, sepalis petalisque oblongis obtusis membranaceis, labelli lobis lateralibus rotundatis intermedio subrotundo cordato-ovato lineis 2 elevatis rectiusculis in limbum interruptis adjecta parvula utrinque.

(?) *Cymbidium nitidum* Roxb. Fl. Ind., III. 459. — *Coelogyne ? nitida* Lindley, Coll. Bot., p. 33.

Wild in Nepal Wallich; Sikkim-Himalaya, at 4 — 7000 feet J. D. Hooker, (v. s. sp.).

What I understand by this name is that distributed by Dr. Wallich under his number 1984. It has the leaves of *C. ocellata*, but much shorter and more dense racemes arising from polished conical imbricated sheaths. The texture of the flowers is much thinner, and the parts so much rounder, that the flowers must be almost globular when fresh. They are said to be white and sweet-scented, with a stain upon the lip like those of *C. ochracea*.

18. COELOGYNE GLANDULOSA Lindl. Fol. I. n. 13.:

C. pseudobulbis ovatis sulcatis, foliis 2 oblongo-lanceolatis nervosis subsessilibus racemo erecto nutante multifloro subaequalibus, scapo basi laxe vaginato, bracteis persistentibus oblongis acutis floribus subaequalibus, labello ovato-lanceolato lobis lateralibus obtusissimis intermedio linguaeformi lineis 3 elevatis glanduloso-dentatis, columna subbiloba.

C. nervosa. Wight, Ic. t. 1638; nec A. R.

Wild on the Nilgherries Wight, (v. s. sp. in hb. Wight.) — A larger plant in all respects than *C. nervosa*, with leaves of another form. The lateral lobes of the lip are much more distinct, there is never more than three crested lines, and these are bordered by short teeth resembling glands; the lateral crests are deeper than the middle one.

Huc: *Coelogyne nervosa* A. Rich. Wight. Ic. V. I. 1638. 1851; pseudobulbs ovate, covered with coriaceous scales, leaves broad elliptic acute, or sub-acuminate, striated and nerved, coriaceous, usually two, sheathing at the base: scape somewhat longer than the leaves, 2 — 6 flowered: fl. large, bracts shorter than the flowers, ovate acute, persistent, striated: sepals oblong elliptic, about equal, acute: lip, like sepals, 3 lobed, lat. lobes small, the middle one oval, lanceolate. Flowers pure white, bracts reddish brown. — Nilgherries, May, Juny. — Flow. white, lip tinged with orange. Abounds on the rocks overhangs the falls of Pycarrales also at the Avalanche. The spec. repres. flowered at Cimbatore, the roots having been brought down some weeks before.

19. COELOGYNE NERVOSA Lindl. A. Rich., in Ann. Sc., ser. 2, XV. p. 16. Fol. I. n. 14.:

C. pseudobulbis ovatis, foliis 2 coriaceis subrotundo-ovalibus sessilibus racemo erecto 2—4-floro brevioribus, bracteis cymbiformibus patulis ovario longioribus, sepalis petalisque oblongis conformibus, labelli 3—5-cristati lobo medio ovato acuto lateralibus rotundatis obsolete.

Wild in the Nilgherries, on rocks near Neddoubeta Perrotet, (v. s. sp. comm. b. Richard.) — A species with the habit of *C. odoratissima*, but with roundish sessile coriaceous leaves, and flowers twice as large. Their colour is unknown. The plant figured under this name in Wight's Ic., t. 1638, is different (see n. 13).

20. COELOGYNE CORRUGATA Lindl. Fol. I. n. 15.: Wight, Ic. t. 1639.

C. pseudobulbis ovatis rugosissimis, foliis 2 oblongis membranaceis undulatis racemo erecto trifloro longioribus, bracteis cymbiformibus oblongis, sepalis petalisque subaequalibus oblongis acutis, labelli medio tricristati lobis lateralibus acutiusculis intermedio ovato acuminato obtuso.

Wild in Khasia Lobb.; Courtallum, Pulney Mountains, Nilgherries Wight, (v. s. sp.

comm. cel. Wight et Lobb.) — Very near *C. nervosa*, but different in having singularly rugose pseudobulbs, and membranous wavy leaves. „Flowers pure white, except the crests and veins of the lip, which are yellow“.

Huc *Coelogyne corrugata* R. Wight. Ic. V. I. 1639. 1851: pseudobulbs caespitose, ovate, reticulately corrugate; leaves oblong, elliptic, subacuminate, racemes about the length of the leaves, 1—6 flowered, bracts caducous or wanting: fl. large, sepals and petals conformable, oblong, ovate, acute: lip 3 obed, lateral lobes small, middle one produced, ovate, obtuse, the claw furnished with three longitudinal undulate crenate coloured crests. — Courtallum, Pulney Mounts, Neilgherries, Aug. Sept. — Limb of lip marked with orange and yellow lines like the crests, the rest of fl. white. Peculiar feature of the spec. is the deeply corrugated, wrinkled pseudobulb whence I have taken the name.

21. COELOGYNE CORYMBOSA Lindl. Fol. I. n. 16.:

C. pseudobulbis oblongis teretibus, foliis ovalibus basi in petiolum brevem angustatis, racemis 3—4 floris e vagina laxa imbricata corymbosis, bracteis cito deciduis, sepalis petalisque lanceolatis, labelli lobis lateralibus rotundatis apice denticulatis intermedio ovato-lanceolato plano integerrimo, lineis 3 elevatis quarum 2 longioribus crispis altera abbreviata ad sinus labelli utrinque acutis.

Wild in Sikkim-Himalaya, common at 6—9000 feet of elevation; Khasia at 4—5000 feet J. D. Hooker, (v. s. sp. comm. cel. J. D. H.) — Much resembles *C. ocellata*, from which it differs in the pseudobulbs, short leaves, corymbose racemes, and much longer middle lobe of the lip. Flowers „white, sweet-scented; lip with red veins on the lower half and six ocellate spots at the base of the lower lobe“. — Ic. Hook.

22. COELOGYNE BREVIFOLIA Lindl. Fol. I. n. 17.:

C. pseudobulbis ovatis subangulatis nitidis, foliis ovato-oblongis utrinque acutis racemis paucifloris basi nudis brevioribus, racemo laxo erecto paucifloro bracteis deciduis, sepalis petalisque anguste lanceolatis, labelli trilobi intus pubescentibus lobis rotundatis lamellis 2 rectiusculis cis apicem medium evanescentibus adjecta parvula utrinque linea alta membranacea in axin inferiorem.

Wild in Khasia; at the height of 4—5000 feet J. D. Hooker, and T. Thomson, (v. s. sp. comm. cel. invent.) — Very like *C. ochracea*, but the leaves are broad and short, the flowers twice as large, and the additional tubercles of *C. ocellata* are present on each side of the middle lobe of the lip.

23. COELOGYNE OCELLATA Lindl. LO., n. 8. Bot. Reg. 1839, misc. 25. Bot. Mag. t. 3767. Fol. I. n. 18.:

C. pseudobulbis ovatis angulatis squamis nitidis vestitis, foliis lanceolatis basi longe angustatis racemis strictis basi nudis aequalibus, bracteis cito deciduis, sepalis petalisque oblongo-lanceolatis, labelli lobis lateralibus truncatis intermedio ovato, lineis tribus elevatis rectiusculis altera abbreviata dentata ad sinus labelli utrinque acutis.

Wild in Sylhet and Sermore Wallich; Khasia Lobb; Bootan Griffith; Sikkim-Himalaya, at 7000 feet J. D. Hooker, (v. s. sp. et v. c.) — Leaves nine or ten inches long, very narrow towards the base. Sepals and petals pure white; the lip also white, but with two very bright orange yellow spots on each lateral lobe, and two others smaller, and of the same colour at the base of the middle lobe, besides which there are some lateral streaks of brown. The column is bordered with brilliant orange yellow. The crests of the lip are three, which converge towards the base of the middle lobe, and there the lateral ones diverge again over a pair of convexities, beyond which they disappear; on each side of them, at the base of the said convexities, and on the outside, is an additional short curled crest. The flowers grow in erect narrow racemes about six inches long, and are themselves an inch or more long. They

have none of the loose corymbose arrangement of *C. corymbosa*, nor do they proceed from lax sheaths of imbricated scales. The figure in Bot. Mag. is from a starved specimen.

24. COELOGYNE CUMINGII Lindl. Lindley, in Bot. Reg., 1840, misc. 178, 1841, t. 29. Bot. Mag. t. 4645. Fol. I. n. 19.:

C. pseudobulbis ovatis, foliis geminis lanceolatis 5-nerviis utrinque acuminatis racemo paucifloro longioribus, scapo basi nudo, bracteis convolutis floribus longioribus, petalis lineari-lanceolatis, labelli trilobi lobis lateralibus rotundatis intermedio ovato acuto revoluto basi crispo, lamellis 3 crispis continuis adjectis 2 abbreviatis prope apicem.

Wild in Singapore Cuming, (v. v. c.) -- Flowers handsome, snow-white, except the middle of the lip, which is yellowish, with orange tips to the crested lamellae. Closely allied to *C. trinervis*, which is however readily known by its very long narrow leaves, its shorter bracts, smaller flowers, and much shorter middle lobe to the lip, which also appears to want the outlying processes on either side of the ridges. — Huc: Van Houtte VIII. 764. Lem. Jard. fleur. t. 337.

25. COELOGYNE CRISTATA Lindl. Lindley, Coll. Bot., p. 33. LO., n. 2. Bot. Reg., 1841, t. 57. Paxton's Fl. Gard., ic. xyl., n. 312 Fol. I. n. 20.:

C. pseudobulbis oblongis demum angulatis, rhizomate crasso squamoso, foliis lineari-lanceolatis, racemo erecto 3—5-floro foliis brevioribus basi squamis corneis vaginato, bracteis oblongis divaricatis persistentibus, petalis oblongo-lanceolatis undulatis, labelli trilobi crista triplici interrupta: infima brevi 5-lamellata intermedia multifida pectinata suprema bilamellata denticulata, lobo medio rotundato parvo plano obtuse subtridentato.

Cymbidium speciosissimum. Don prodr. nep. 35.

Wild in Nepal, Sylhet, Kamaon Wallich; at Champawat at 5500 feet Strachey and Winterbottom; Darjeeling Griffith; Sikkim, at the elevation of 5—8000 feet J. D. Hooker (v. v. c. et s. sp.) — One of the most striking of the white-flowered Indian Orchids. It forms oblong or ovate two-leaved pseudobulbs upon a hard scaly rhizome. The leaves are lanceolate, tough and flaccid, with some waviness at the edge. The flowers appear in imbricated racemes, in the beginning concealed by brown dry spathes, which afterwards sheathe the ovary and its stalk. When expanded they are each fully four inches in diameter. The sepals and petals are white, lanceolate, and acuminate. The lip, also white, is concave, and three-lobed; the lateral lobes half-oblong, truncate at the upper end, and somewhat wider than the transverse roundish middle lobe. Along the middle run five parallel veins covered by delicate yellow glandular fringes; at the base of each of the three central is a wavy plate, and at the upper end of the two which stand on each side the middle vein is another solid plate terminating abruptly in front and more or less toothed.

3. Proliferae.

All the species here collected agree in having a number of hard imbricated scales immediately below the flowers, and not at the foot of the scape. They often, perhaps always, produce a second scaly sheath beyond the first series of flowers, and out of that sheath arises a second series of flowers. *C. barbata* distinctly combines this group with the last, through *C. cristata*.

26. COELOGYNE BARBATA Lindl. Griffith, Itin. Not., p. 72; Notul., p. 280; ic. t. 291, fig. 2. Fol. I. n. 21.:

C. pseudobulbis subampullaceis, foliis oblongo-lanceolatis longe petiolatis valde coriaceis undulatis, scapo stricto rigido apice squamis coriaceis arcte imbricato, racemo subflexuoso sessili, bracteis maximis cucullatis cito deciduis, sepalis oblongis, petalis lanceolatis, labello trilobo basi saccato margine anteriore costisque tribus ciliato-fimbriatis.

Wild in Bootan Griffith; Khasia, near Mamloo Id., Lobb., 4—5000 feet, J. D. Hooker

and T. Thomson. *Churra Punjee Griffith*, (v. s. sp. comm. W. G., J. D. H. and T. T.) — This is perhaps the finest of this fine genus. The coriaceous leaves are more than fifteen inches long; the scapes are erect, very stiff, as long as the leaves, and furnished at the apex with an imbricated sheath of hard scales, out of which appears a flexuose raceme four to six inches long, composed of very large blunt deciduous bracts. The flowers are fully two inches and a half in diameter, pure white, except very long hairy fringes, which are brown at their base where they border the lip, and wholly brown where they cover the veins, and form three shaggy crests. Judging from excellent dried specimens, I should suppose that the whole of the middle lobe of the lip is brown also; but this is not mentioned by Griffith, whose figure is a bad one.

27. COELOGYNE ELATA Lindl. LO., n. 5, Wall. Pl. As., III, 12, t. 218. Bot. Reg. 1839, misc. 151. Fol. I. n. 22.:

C. pseudobulbis oblongis angulatis, foliis oblongis coriaceis basi attenuatis longe petiolatis, scapo rigido stricto foliis brevior apice squamis distichis coriaceis vaginato, racemo rectiusculo sessili, bracteis „lanceolato-navicularibus“ cito deciduis, petalis lineari-lanceolatis, labelli plani medio bicristati lobo medio cordato-ovato crenulato lateralibus obsolete.

Coeologyne — Griffith, ic. t. 290.

Wild in Nepal and Sylhet Wallich; Bootan Griffith; Sikkim-Himalaya, 4—6000 feet J. D. Hooker; Kamaon in the Sarjee Valley, at 3700 feet Strachey and Winterbottom, (v. v. c. et s. sp.) — Leaves more than a foot long; scape seated upon a large oblong pseudobulb, and terminated by a sheath formed of numerous imbricated bracts, out of which appear eight or nine white flowers, stained with yellow near the point of the lip, and having an unpleasant smell, very like that of the Barberry blossom. The two wavy crests proceed from the base to half way up the middle lobe: they are rich orange yellow towards the point, white otherwise. I presume this is Nr. 840 of Griffith's Itinerary Notes, p. 163, found on rocks near Panukka, in Bootan.

28. COELOGYNE PROLIFERA Lindl. LO. n. 6, Fol. I. n. 23.:

C. pseudobulbis elongatis subcompressis teretibus, foliis lanceolatis longe petiolatis, scapo terminali gracili erecto foliis duplo longiore saepius prolifero sub quoque racemo squamis distichis arcte vaginato, bracteis deciduis, sepalis oblongis discoloribus, petalis linearibus, labelli trilobi lobo medio retuso denticulato lateralibus obtusissimis lineis 2 elevatis continuis.

Wild in Nepal, near Neakote and Toka, on trees and rocks Wallich; Khasia, at 5000 feet — J. D. Hooker and T. Thomson; Sikkim-Himalaya, 2—4000 feet J. D. H., (v. v. c. et s. sp.) — When fresh the flowers are greenish yellow; when dried the sepals are dark glaucous purple, and almost glumaceous. The specimens, which I have examined vary in the condition of the point and margin of the lip, which is finely toothed or entire, and retuse or slightly acute.

29. COELOGYNE FLAVIDA J. D. Hooker, ined. Fol. I. n. 24.:

C. pseudobulbis ovatis subangulatis, foliis lanceolatis petiolatis, scapo terminali gracili erecto foliis subaequali prolifero sub quoque racemo squamis distichis arcte vaginato, bracteis deciduis, sepalis ovalis, petalis filiformibus, labelli trilobi oblongi obtusissimi lobis lateralibus nanis obtusis intermedium cordatum imbricantibus: lineis 2 elevatis in sinus abeuntibus, columna subaptera.

Wild in Khasia Lobb.; Sikkim-Himalaya Cathcart, (v. s. sp. et ic. pict.) — Flowers pale green, not larger than in *Pholidota*, to which this species forms a transition, by its almost wingless column and obsolete short crests.

30. COELOGYNE LONGIPES Lindl. Fol. I. n. 25.:

C. pseudobulbis cylindraceutibus, foliis lanceolatis acutissimis

in petiolum gracilem angustatis, scapo terminali filiformi foliis longiore prolifero sub quoque racemo squamis distichis arcte vaginato, bracteis deciduis, sepalis ovatis, petalis filiformibus, labelli trilobi lobis lateralibus obtusis divergentibus intermedio obovato-subrotundo; lineis 2 elevatis ad basin decurrentibus, columna late alata.

Wild in Khasia, at 4—5000 feet J. D. Hooker and T. Thomson, (v. s. sp. comm. cel. inventores). — The very long narrow pseudobulbs distinguish this from the other proliferous species. The flowers are intermediate in size between *C. prolifera* and *flavida*. The sepals and lip are as much saccate at the base as in *G. Gardneriana*.

4. *Filiferae*.

Erect, solitary, or racemose flowers, with extremely narrow, usually thread-shaped petals are characteristic of this little group, which, moreover, never has the hard shining pseudobulbs and sheathing scales of the erect section.

31. COELOGYNE FUSCESCENS Lindl. LO., n. 10. Fol. I. n. 26.:

C. pseudobulbis elongatis teretibus, foliis latis oblongis plicatis utrinque acutis, racemo nutante paucifloro, bracteis deciduis, petalis acuminatis linearibus, labelli lobo medio amplo ovato acuto undulato lateralibus nanis; lineis 3 elevatis juxta basin.

A. Lateral lobes of lip quite obsolete.

B. *brunnea*. Lateral lobes of the lip acute, dull brown. Elevated lines of the crest reddish orange.

C. brunnea. Lindley, in Gard. Chron 1848, p. 71, c. ic.

Wild, A. in Nepal on trees Wallich. B. Khasia, at the height of 3000 feet J. D. Hooker, and T. Thomson; Sikkim-Himalaya, 4000 feet J. D. Hooker (v. s. sp. comm. cel. invent. et v. c.) — Leaves ten inches long by three broad. Raceme drooping, five to sixflowered. Flowers brownish green. The dorsal sepal broader than the others. Lip with four cinnamon spots, one on each of the small lateral lobes; and two at the base of the middle lobes. The *C. brunnea* differs in having short, well-defined lateral lobes to the lip; but its habit is so much the same that I can now only regard it as a variety.

32. COELOGYNE SPECIOSA Lindl. LO., p. 39. Bot. Reg. 1847, t. 23. Bot. Mag. 4889. Fol. I. n. 27.:

C. pseudobulbis ovato-oblongis costatis monophyllis, foliis oblongo-lanceolatis 5—7-nerviis, pedunculis 1—2-floris pseudobulbis parum longioribus, petalis linearibus reflexis, labelli trilobi laciniis lateralibus antice denticulatis intermedia biloba rotundata cristis duabus muricatis crassis sub apice ipso labelli confluentibus tertia brevi tenui basilari interjecta.

Chelonanthera speciosa. Blume, Bijl. 354, t. 51.

Wild in Java; in the woods of M. Salak Blume, Lobb, (v. v. c.) — Flowers in pairs at the end of a slender peduncle, about four inches long. Sepals and petals pale tawny; lip pitch-brown. Column broad, white; lip with a pure white termination. Flowers nearly four inches in diameter when fully expanded.

Huc De Vriese Illustrat. t. I. f. 2. et tab. XI. f. 7.

33. COELOGYNE INCRASSATA Lindl. LO., n. 4. Fol. I. n. 28.:

C. „bulbis oblongis subtetragonis, foliis lanceolatis nervosis, pedunculo nutante multifloro, labello intus bicristato nudo, limbi lobo medio ovato incrassato“. Blume.

Chelonanthera incrassata. Blumé, p. 384.

Wild in Java; in woods on M. Pantjar Blume. — „Flowers dirty white, transparent. Limb of the lip brown, wavy“. I have never seen this. It is placed by the learned author of the name next *C. speciosa*. Can it be *C. tomentosa*, Nr. 52.

34. COELOGYNE FIMBRIATA Lindl. Lindley, in Bot. Reg., t. 868. Ib. 1838, misc. 172. Bot. Cab., t. 1425. Fol. I. n. 29.:

C. pseudobulbis subrotundo-oblongis estriatis, foliis ovali-lanceolatis undulatis acutis pedunculo basi vaginato paucifloro longioribus, bracteis concavis cartilagineis deciduis floribus longioribus, petalis filiformibus reflexis, labelli trilobi lobis lateralibus rotundatis in fronte denticulatis, intermedio angustiore ovato pilis fuscis fimbriato, lamellis 2 elevatis rectis parum denticulatis.

Wild in China J. D. Parks; Khasia Mountains, at 4000 feet J. D. Hooker, and T. Thomson (v. v. c. et s. sp.) — An inconspicuous creeping species, the smallest in the genus. Pseudobulbs perfectly even. Flowers pale dirty yellow, with a dull purple fringed lip in the Chinese plant; „pale olive brown, with the lip paler, fasciated, crested and fimbriated with dark purple“ (J. D. H.) in the Khasia plant.

Huc: Lindl. in Champion Fl. Hongkon. Hook. Journ. b. VII. p. 34. „a pretty species, flowering abundantly in ravines about October. The sepals are lucid white, and the lip white, with the fimbriated portion puce coloured. It has no perfume.“

var. *acuminata* Regl. MSS. in Ind. Sem. Petrop. 1855. Differt sepalis acuminatis, labelli lobo intermedio acuto. (Sepala *C. fimbriatae* acuta et labelli lobus intermedius retusus).

35. COELOGYNE OVALIS Lindl. Lindley, in Bot. Reg. 1838, misc. 171. Fol. I. n. 30.:

C. pseudobulbis fusiformi-ovalibus striolatis, foliis ovali-lanceolatis acutis spica longioribus, pedunculo basi vaginato sub-4-floro, bracteis concavis cartilagineis floribus longioribus, petalis reflexis filiformibus, labelli trilobi lobis lateralibus in fronte pectinatis intermedio ovato emarginato pilis fuscis villosis et fimbriato, lamellis 2 elevatis crispis, columna apice subintegra.

C. fimbriata. Lindley, in Wall. Cat., n. 1957, Griff. ic., t. 291, 1

Wild in Nepal and Kamaon Wallich (v. v. c. et s. sp.) — Much like *C. fimbriata*, but far larger in all its parts. The pseudobulbs are narrowly oval, not roundish oblong; the flowers are twice the size with a far more shaggy lip, and crisp not straight crests. It is sometimes known in continental gardens as *C. fuscescens*, which is a totally different species.

36. COELOGYNE PILOSISSIMA Hort. Donat. 144 :

„Pseudobulbis rotundo-ovalibus basi inflatis striatis, bracteis paucilongioribus, rhizomate ramoso squamis coriaceis vestito ascendente, foliis ovali-lanceolatis acutis; pedunculo basi vaginato erecto 2—00 flore longioribus, petalis filiformibus reflexis, bracteis deciduis, labelli trilobi lobis lateralibus erectis angulatis intus striatis, intermedio rotundato pilis fusco nigris villosissimo et margine ciliato fimbriato, medio linea fusca notato, lamellis elevatis crispis, columna apice subdentata.“

„Cette espèce a été envoyée de Calcutta avec nombre d'autres Orchidées recueillies par un amateur; c'est une belle espèce; elle produit des fleurs couleur de paille de 10 centimètres de diamètre; le labellum est brun, couvert de magnifiques poils très nombreux, presque noirs. Elle est entre le *Coelogyne ovalis* et *fuliginosa* Lindl. Elle se distingue particulièrement de cette dernière espèce par la continuation (non interrompue) des deux lamelles; elle développe deux fleurs successivement.“

37. COELOGYNE FULIGINOSA Lindl. in Lodd. Cat. — Bot. Mag., t. 440. Fol. I. n. 31.:

C. pseudobulbis angustis fusiformibus rhizomate ramoso ascendente, foliis lanceolatis undulatis racemo 2—00-floro longioribus, bracteis deciduis, petalis filiformibus, labelli trilobi lobis lateralibus vix intermedio latioribus acutis in fronte fimbriatis intermedio oblongo retuso fimbriato, lamellis 2 flexuosis versus basin subito interruptis.

Wild in the Khasia Mountains, at 5000 feet J. D. Hooker and T. Thomson; Sikkim-Himalaya, on rocks, in valleys, at 5000 feet J. D. Hooker (v. v. c. et s. sp. comm. cel. invent.) — A fine species, with broad orange-yellow flowers and a brown lip.

It is very near *C. fimbriata* and *ovalis*, from which its crests, interrupted somewhere above the base, seem to distinguish it clearly. The Sikkim and Khasia specimens from Hooker and Thomson have flowers much smaller than the cultivated plant; but beyond size, I find no marks of distinction.

In like manner there is among Hooker and Thomson's Khasia plants (Nr. 130) a very large-flowered imperfect specimen of this breed, beyond size undistinguishable by the materials before me. It is probably another species. — Huc: Lem. Jard. B. t. 7.

38. COELOGYNE SIMPLEX Lindl. Fol. I. n. 32.:

C. pseudobulbis ovalibus elongatis teretibus, foliis 2 oblongis multinerviis racemis erectis paucifloris basi imbricatis vaginatis longioribus, bracteis elongatis cito deciduis, floribus campanulatis, petalis filiformibus, labello ovali vix trilobo acuto subcarnoso plano lineis 2 continuis elevatis tertia brevi ad basin lobi medii adjecta.

Wild in Java Lobb. (v. s. sp. comm. dom. Veitch.) — Flowers about the size of *Hyacinthus nutans*, four to six in an erect raceme; the flower-buds only wrapped in bracts; as in *C. longifolia*.

39. COELOGYNE MINIATA Lindl. LO., n. 16. Fol. I. n. 33:

C. pseudobulbis ovatis sulcatis in rhizoma ramosum annulatum, foliis 1—2 oblongo-lanceolatis racemo erecto brevi flexuoso longioribus, sepalis ovatis, petalis linearibus „labello intus lineis 2 elevatis; limbo erecto acutiusculo“.

Cheloneanthera miniata. Blume, p. 385.

Wild in Java; near the cataracts of the R. Tjikundul, on M. Gede, and on the lofty parts of M. Salak on trees Blume. — There is a drawing among Professor Reinwardt's, under the name of *Dendrobium miniatum*, which I suppose to be this plant. It has the habit of *Pholidota articulata*, with racemes from one to two inches long, and pinkish flowers three-quarters of an inch long. The bracts are deciduous and like those of *C. odoratissima*.

40. COELOGYNE MICRANTHA Lindl. in Gard. Chronici. 1855. 173. a.

C. (§. filiferæ) pseudobulbis oblongis angustis diphyllis, foliis linearilanceolatis racemo sessili (?) basi imbricato longioribus, sepalis ovatis aequalibus, petalis filiformibus brevioribus, labelli trilobi lobo medio subrotundo emarginato, disco lamellis pluribus in fimbriis solutis apice bilamellato, basi bidentato.

Dick. Dal. Park. — Malay? approaches *C. miniata* of Java, which has a lip with a pair of clav. lobes. — Flowers very small, pale brown, with the back of lip marked with the sooty brown stain so characteristic of *filif. Coel.*

5. *Flexuosae.*

41. COELOGYNE LONGIFOLIA Lindl. LO., n. 15. Fol. I. n. 34:

C. pseudobulbis sulcatis ovatis, foliis striatis longo-lanceolatis, racemo elongato flexuoso multifloro, bracteis cum floribus simul deciduibus supra flores arctissime imbricatis, sepalis carinatis, petalis filiformibus, labello oblongo emarginato plano bilamellato.

Cheloneanthera longifolia. Blume Bijdr. 385, t. 51.

Wild in Java Lobb; near the source of the river Tjiburree on M. Gede, and on M. Salak, near Passir Java, on trees Blume. (v. s. sp. in hb. Hooker, et ic. pict.) — Leaves eighteen inches long, or less. Raceme from five to fifteen inches long, with a flexuose rhachis like that of a grass, or a *Pholidota*. Only one flower opens at a time, all the previous ones having fallen off, while the upper part of the inflorescence is included in long closely imbricated glutaceous bracts. Flowers cinnamon-brown about an inch long, with a greenish stain between two raised lines. A figure of it occurs among Professor Reinwardt's valuable collection of drawings, marked *Cymbidium stenopetalum*.

42 COELOGYNE RUMPHII Lindl. Fol. I. n. 36:

Angraecum nervosum. Rumph. Herb. Amb., VI. t. 48.

Wild in Amboyna; on trees Rumphius. — I only know this from the above figure It is evidently very near *C. bilamellata* and *longifolia*, to the latter of which Blume refers it. But it bears a broad ribbed leaf twelve or fifteen inches long by four wide and the racemes are only three or four-flowered. It is nearest *C. bilamellata*, but its flowers are four times as large, resembling a flying hornet, according to Rumphius, who states them to be yellowish white outside, and variegated with brown in the inside.

§ 3. PLEIONE. Don. Prodr. Nep., 37. — *Gomphostylis*, Wallich.

There is something so peculiar in the plants called Pleione by Don, that it would be desirable to find some means of separating them from Coeogyne. Occasionally I have imagined, that they might be defined by such characters as a saccate lip, an undivided lip furnished by bearded not lamellate veins, or by the divisions of the flower tapering to the base instead of being obtuse. But the last peculiarity, on which I had most relied is so entirely set aside by *C. Hookeriana*, which has the form of *C. cristata*, that after all I find it necessary to leave them as an Alpine form of Coeogyne, in the hope that future observers will discover some sound generic character. All the species are Alpine. Dr. Royle describes the *P. praecox* as being found ornamenting with its large, richly-coloured flowers the branches of Oaks on Loudour, at 7500 feet of elevation, in 30° N. Lat., but only during the moisture of the rainy season. The secret of their successful cultivation in England lies in keeping them cool and dry while at rest, and forcing them with heat, moisture and bright light as long as they are inclined to grow.

43. COELOGYNE HOOKERIANA Lindl. Fol. I. n. 37:

C. pseudobulbis ovatis glabris, foliis synanthiis oblongis scapo longioribus vaginis laevibus, bractea ovario brevior, sepalis petalisque erectis oblongis acutis, labello transverso rhomboideo retuso basi circulari serrato venis 7 villosis, clinandrio cuneato.

Wild in Sikkim-Himalaya; Darjeeling, on rocks in woods at 7—10,000 feet J. D. Hooker (v. s. sp. comm. cel. invent. et ic. pict.) — A pretty little plant, about four inches high, with almost the habit of *Cypripedium guttatum*. Flower more than an inch and a half long, with bright rose-coloured sepals and petals, and a white lip tinged or daggled with pink. The lip is not united to the column in any degree, the parts of the flower do not taper to the base, and the leaves and flowers all appear at the same time, in which circumstances this differs from other Pleiones.

44. COELOGYNE DIPHYLLA Lindl. Fol. I. n. 38:

C. pseudobulbis oblongis medio constrictis, foliis geminis angustis subcoriaceis acuminatis, pedunculo flore ter longiore, bractea obtusa inflata apiculata ovarii longitudine, labello obtuse trilobo emarginato venis fimbriatis 5—7 interruptis altera brevi adjecta utrinque juxta apicem.

Pleione diphylla. Lindley, in Paxton's Fl. Gard., sub t. 51.

Wild in Khasia Griffith (v. s. sp. comm. beat. invent.) — I have specimens of this plant from Mr. Griffith, who found it on the Khasia Mountains, in shaded rocky places at Churra: and whose memorandum appears in his Itinerary Notes, p. 44, Nr. 684. From this it appears that the leaves are somewhat coriaceous, and grow in pairs on the summit of oblong pseudobulbs, contracted in the middle, and spotted with purple on a green ground. The flowers are said to be very handsome, and white; the lip being stained and lined inside with violet and crimson, and decorated with from seven to nine lines of yellow fringes.

45. COELOGYNE LAGENARIA Lindl. Lindley, in Paxton's Fl. Gard., t. 39, fig. 2. Fol. I. n. 39:

C. pseudobulbis lagenaeformibus nebulosis, bractea cucullata acuta

basi longe angustata, sepalis petalisque lineari-lanceolatis acuminatis, labello rotundato integerrimo emarginato lineis 5 barbatis.

Pleione lagenaria. Lindley, in Paxton's Fl. Gard., t. 39, fig. 2.

Wild on the Alps of India T. Lobb (v. v. c.) — Flowers deep rose-colour with very acuminate segments. Lip white, with a yellow disk and crimson streaks at the edge.

Huc Lem. Jard. Fl. I. tab. 93. n. 2.

46. COELOGYNE MACULATA Lindl. Lindley, in Wallich, Pl. as. rar., I. 45, t. 53. Bot. Mag., t. 4691. Griffith, Not. III. 281. Fol. I. n. 40.

C. pseudobulbis unicoloribus umbonatis crassis basi angustatis, bractea brevi subrotunda cucullata inflata, sepalis petalisque ovalibus acutis, labello rotundato integerrimo emarginato lineis 7 barbatis.

Pleione maculata. Lindley, in Paxton's Fl. Gard., t. 39, fig. 1.

Wild in Khasia, on the trunks of trees and among moss Wallich; 4—5000 feet: Hooker and Thomson; Assam Simons (v. v. c. et s. sp.) — Flowers pure white except the lip, which is yellow on the disk and marked with crimson streaks at the edge. The native name is Atia-Chakarpate according to Wallich.

Huc: Lem. Jard. Fl. I. tab. 93. n. 1.

47. COELOGYNE HUMILIS Lindl. L.O., p. 43. Fol. I. n. 41:

C. pseudobulbis lagenaeformibus, bractea oblongo-lanceolata petaloidea ovario longiore demum retracta, pedunculo denudato, sepalis petalisque lineari-lanceolatis patentibus planis, labello ciliato emarginato lineis 6 fimbriatis distantibus venis totidem coloratis interjectis.

Pleione humilis. D. Don. Fl. nep. p. 37. Paxton's Fl. Gard., t. 51.

A. Lip spotted and veined with rose-colour.

B. Lip spotted and stained with yellow. Column with a few crimson spots.

Wild on the Indian Alps; Upper Nepal, among moss, on the trunks of trees Buchanan Hamilton; Bootan mountains, in dense forests towards Santagong at the elevation of 8000 feet above the sea Griffith; the Khasia hills at Sanahda, at the height of 7000 feet T. Lobb; Sikkim, at 7—8000 feet J. D. Hooker and Cathcart (v. v. c. et s. sp.)

This differs from both *C. maculata* and *lagenaria* in the form of its pseudobulbs, in the narrowness of the sepals and petals, and especially in the long fringes that border the lip, and which also occur upon six of the veins on the inside of the lip. The bract too is quite different, petaloid and pale violet at first, then shrinking and shrivelling till it leaves the peduncle naked, remaining at the base of the peduncle like an old-fashioned leather buskin. Flowers white with orange veins and spots on the lip. Dr. Hooker observes that the lip is very distinctly adnate to the base of the column, and that the flowers vary somewhat in colour and spotting.

Huc: Lem. Jard. Fl. X. tab. 158.

48. COELOGYNE PRAECOX Lindl. L.O. 20. Fol. I. n. 42:

C. pseudobulbis turbinatis umbonatis, foliis 3-plurinerviis vaginis tuberculatis, bracteis obovatis ovario longioribus, labello subrepando apice bifido dimidia apicali lacera, venis 5 disci dentato-cristatis, clinandrii 4-partiti laciniis intermediis inflexis.

A. Leaves green. Bracts very deciduous. Lip lacerated at the end; with the crests reaching nearly to the point.

Epidendrum praecox. Smith, Exot. Fl. t. 97. — *Pleione praecox*. Don. prodr. t. 37. — *C. Wallichiana*. Griffith, notul. p. 402. Bot. Mag., t. 4496.

B. SANGUINEA. Leaves crimson. Bracts more permanent. Lip as in A.

C. WALLICHIANA. Leaves green. Bracts deciduous. Lip plaited and toothed at the end, with the teeth of the crests very short and confined to the disk.

C. Wallichiana. L.O., p. 43. Wall. Pl. as. rar. I. t. 54. Bot. Reg. 1840, t. 24.

— *Pleione Wallichiana*. Lindley, in Paxton's Fl. Gard., sub t. 51.

Wild in the Himalayas; A Khasia at 4—7000 feet Hooker and Thomson; Myrung wood

on rocks Griffith; Nipal Buchanan Hamilton; branches of oaks on Loudour; at 7500 feet, during the moisture of the rainy season Royle; B. Sikkim, on trees at 5—8000 feet J. D. Hooker; C. Pundua Wallich (v. v. c. et s. sp.)

Flowers very showy, deep rose-coloured, fully three inches long, solitary, or occasionally in pairs. The two first varieties above mentioned differ not only in the colour of the leaves, which are green in the one and crimson in the other, but in the form and texture of the flowers which are shorter and more fleshy in B. than in A. In both the pseudobulbs are richly spotted with crimson. A most beautiful plant, with faintly scented flowers. — J. D. H. Called Caybu swa in Nipal according to Buchanan Hamilton.

With regard to *C. Wallichiana*, I am obliged to confess that it must be regarded as a mere variety. I have seen no wild specimen, unless perhaps a plant gathered by Griffith, and forming n. 1017 of one of his series. Undoubtedly it has the end of the lip more abruptly separated from the sides than in A. or B., and plaited as well as toothed; and, moreover, the crests of the lip are very short and confined to the disk. But these are not distinctions upon which it is safe to rely. Griffith's *C. Wallichiana* is in all respects A. Mr. Bateman has well described the general appearance of C. „The pseudobulb has much the form and hue of a truffle, and loses its leaf before the appearance of the flowers, which come up one on either side. They are almost as large as those of *Cattleya labiata*, and are of a uniformly rich transparent rose-colour, except in the interior of the lip, which is decorated with a broad streak of yellow on its disk and traversed by five parallel ridges of white tubercles. There are also a few deep crimson stains scattered on its surface“. The native name is *Atia-Palangcha*, according to Wallich.

Obs. Ad *Wallichiana* adde Lem. l. c. 153.

Doubtful species.

49. *COELOGYNE CAULESCENS*, Griffith, *Notulae*, p. 282, from swampy places at Malacca, near Pulo Bisar, on the coast, is certainly not a species of this genus. It is said to have tolerably large, white, very fugitive flowers; and to be three to four feet high. I possess a specimen, but not in a state for examination. The inflorescence is that of *Bromheadia*. It may be a *Pholidota*.

Coelogyne uniflora }
 „ *parviflora* } = *Panisea*.

Obs. Quae dicitur l. c. a cl. Lindley *Coelogyne javanica* sub n. 43. est *Pogonia*.

Haec quidem *Coelogyne* Lindleyanae. Reichenbachianae satis distant. Afferuntur enim haud paucae species ex aliis „generibus.“

Sect. *OTOCHILUS*. Columna clavata apice minute alulata. Labellum basi utrinque auriculatum, ceterum lanceum.

55. *COELOGYNE NERVILLOSA*. *Pholidota nervosa* Rehb. fl. *Acanthoglossum nervosum* Bl.

56. COELOGYNE CLYPEATA. Huc; *Pholidota clypeata* Lindl. Paxt. I. p. 12.

Flowers resemble those of *P. imbricata*, but stand in a spike not more than 3 inches long. The column is very like a 3 lobed petal bordered with brown, and gives the flower the appearance of having two opposite lips. Pseudobulbs about 2 inches long, with a dark green leaf.

Borneo. — J. H. S. V. 37.

57. COELOGYNE VENTRICOSA. *Pholidota ventricosa* Lindl. *Chelonanthera ventricosa* Bl.

58. COELOGYNE GIBBOSA. *Pholidota gibbosa* Lindl. *Chelonanthera gibbosa* Bl. — De Vriese Illustrat. t. I. f. 1. et tab. XI. f. 62.

59. COELOGYNE CONCHOIDEA. Huc: *Pholidota conchoidea* Lindl. B. Reg. XXVI. 1840. Misc. 198.

Spica pendula disticha imbricata, bracteis oblongis concavis apiculatis, sepalis lateralibus carina limbo aequali, epichilio 3 lobo laciniis lateralibus rotundatis, intermedio obsolete, hypochilio utrinque in lobum ascendentem producto basi intus lineis 3 elevatis distantibus.

Manilla. Cuming. Knypersley. Very like *P. imbricata*, but its flowers are nearly twice as large, and the keels of the lateral flowers are so deep and concave, as to give the lower side of the flower the appearance of a bivalve shell.

60. COELOGYNE PHOLAS. Huc: *Pholidota Pholas* Rehb. fil. — „*Pholidota chinensis* Lindl. in Journ. Hort. Soc. II: 308. Misc. 16. 1847.“ Rehb. fil. in Bonpl. II. 250.

Pseudobulbi bipollicares oblongo tetragoni. Folia post anthesin prope semipedalia a basi lineari teretiuscula oblonga acuta trinervia anthesi abhuc valde tenuia margine undulata gemina. Pedunculus curvatus bracteis aequidistantibus cymbiformibus acutis scariosis. Flos illi *Pholidotae imbricatae* duplo major. Sepala oblonga acuta dorso carinata. Tepala linearia acuta. Labellum basi saccatum; trilobum; lobi laterales semiovati, lobus medius ovatus acutus. Gynostemium depresso anceps utrinque alatum, androclinii limbo erecto supra androclinium more *Coeologynis*; rostellii processus obtuse triangulus, limbus inferior foveae obtuse triangulae productus. Anthera obtuse triangula more generis quadrivalvis.

Hongkong. Hance! Seemann!

Sect. *CHINENSES*. Columna anguste alata. Labellum ligulatum.

61. COELOGYNE CHINENSIS. Huc: *Pholidota chinensis* Lindl. Hook. Lond. Journ. Bot. VII. p. 34.: Abundant on rocks, Victoria Peak, and other places. — Porro: Lindl Journ. Hort. Soc. II. 308.: „*Coeologyne* species with yellow flowers, from mountain side, Hongkong. This species has long been known from Chinese drawings, in which it is represented as bearing yellow flowers, with as they are pale greenish white, changing to white tinged with cinnamon. — Flowers in drooping racemes, not more than 2—3 inches long; opening earliest at the point of the raceme instead of the base.“

Caespitosa rhizomate brevi, pseudobulbis obtuse tetragonis ovatis rugosis 1—2 phyllis, foliis oblongis undulatis acuminatis trinerviis, racemis brevibus recurvis, bracteis cucullatis membranaceis obtusis persistentibus, floribus centrifugis, sepalis ovatis, petalis linearibus, labello oblongo acuto basi concavo laevi apice refracto et quasi bilobo.

62. COELOGYNE CARNEA. Huc: *Pholidota carnea* Lindl. *Crinonia carnea* Bl.

63. COELOGYNE RECURVA. Huc: *Pholidota recurva* Lindl.

Obs. Forsan hic inserenda: *Pholidota membranacea*: Tejism. et Binnendyk. Naturh. Tijdsch. vor Nederlandsch Ind. Deel V. 1853. p. 487 sq.

Pseudobulbis oblongo fusiformibus, foliis lanceolatis subplicatis, spi-

cis erectis foliis longioribus, floribus bifariis, bracteis ovato-acutiusculis, phyllis perigonii internis acutiusculis, labello lato-ovato-cuspidato.

Auf Bäumen in der Umgebung von Boitenzorg.

Sect. *UNDULATAE*. Columna stenoptera. Labellum breve trilobum.

64. COELOGYNE UNDULATA. Huc: *Pholidota undulata* L. O. 37. Misc. 19. — Wallich sent to Lodd. It has ovate pseudobulbs tapering to the base; a pair of narrow leaves; and a drooping raceme of small pale dull reddish flowers. Little beauty."
65. COELOGYNE RUBRA. Huc: *Pholidota rubra* Lindl.

Sect. *IMBRICATAE*. Columna platyptera. Labellum bene trilobum excavatum.

66. COELOGYNE IMBRICATA. Huc: *Pholidota imbricata* Lindl. B. Reg. XXI. 1777.:
Pseudobulbis oblongis corrugato-sulcatis obtusis, foliis solitariis oblongo lanceolatis plicatis acutis, spicis pendulis foliorum longitudine, bracteis membranaceis concavis acutis, spicis pendulis foliorum longitudine, sepalis lateralibus ovatis carinatis, labello subgloboso cucullato: lobis lateralibus parvis erectis intermedio bilobo: laciniis rotundatis.

P. imbricata Lindl. in Hook. Exot. Fl. t. 138. Lodd. Bot. Cab. t. 1934.

It has pointed bracts, yellowish flowers with a dash of violet, very strong long leaves and grows and flowers most freely. — Wight Ic. pl. Ind. Or. Vol. III. P. II. 1844. Courtallum. — also frequent in other stations, also in Ceylon.

67. COELOGYNE TRIOTOS. Huc: *Pholidota triotos* Rehb. fil.: aff. (*P.*) *imbricatae* labelli lobis lateralibus angustis sinu angusto a lobo medio reniformi sejunctis, carinis ternis a basi lobi medi, gynostemii alis angustis, androclinii processu postico et lateralibus anticis ligulatis retusis abbreviatis, alis lateralibus angustis, tepalis linearibus acutis supra basin marginis superioris angulatis. — Manilla. — hort. Schiller.
68. COELOGYNE PALLIDA. Huc: *Pholidota pallida* Lindl. Bot. Reg. XXI. sub 1777.: has very round blunt bracts, white flowers, smaller leaves, than *P. imbricata* and grows very weakly and unwillingly under ordinary circumstances. Huc Bot. Reg. 1213. Indica.
69. COELOGYNE CALCEATA. Huc: *Pholidota calceata* Rehb. fil.
70. COELOGYNE CROTALINA. Huc: *Pholidota crotalina* Rehb. fil.
71. COELOGYNE LORICATA. Huc: *Pholidota loricata* Rehb. fil.

Sect. *ARTICULATAE*. Columna alata. Labellum angustum, ante apicem dilatatum subito constrictum.

72. COELOGYNE ARTICULATA. Huc: *Pholidota articulata* L. O. 38. Bot. Reg. XXV. 1839. Misc. 57. — Introduced to Chatsworth by Mr. Gibson. Of no beauty. Its flowers are small and dirty white, with a little yellow. Differs in habit from *Pholidota imbricata* the stem being jointed like an *Otochilus*, and not pseudobulbous.
73. COELOGYNE KHASYANA. Huc: *Pholidota khasyana* Rehb. fil.

Sect. *CAMELOSTALIX*. Columna gracilis *Otochili* recurva. Labellum calceiforme.

74. COELOGYNE CAMELOSTALIX. Huc: *Pholidota camelostalix* Rehb. fil.

Tandem *Coelogyne suaveolens* ad *Coelogynas flaccidas* bene videtur pertinere. Huc: *Pholidota suaveolens* Lindl. *Gardners Chronicle* 1856. 372.:

P. pseudobulbis conicis obtuse angulatis diphyllis, foliis oblongis, racemo erecto flexuoso 10-floro floribus distantibus, bracteis linearibus convolutis pedicellis longioribus cito deciduis, sepalis ovatis subcarinatis petalisque conformibus angustioribus ecarinatis erectis, labello basi concavo oblongo lamina acuta deflexa crispa lineis 5 elevatis flexuosis.

This charming plant may be almost described as an Orchid in the disguise of a Lily

of the Valley, so alike are leaves, flowers, colour, stature, and fragrance. It is however a genuine *Pholidota*, approaching *P. chinensis*, but larger in all its parts, and bearing 5 elevated wavy lines on the surface of the lip. The pure white of the flowers changes by degrees to clear cinnamon brown.

For our knowledge of the species we are indebted to the Lord Bishop of Winchester, who forwarded a beautifully grown specimen from the garden at Farnham Castle, where its origin is unknown. It has been cultivated there many years, but flowered for the first time last year. It has much the appearance of a small *Coelogyne*, from which the pedicellate pollen masses and bilabiate dehiscence of the anther remove it.

Sect. *CYMBIDINA*. Labellum cum columna semiconnatum, lineis in disco geminis inter se trabeculis transversis conjunctis.

COELOGYNE CYMBIDIOIDES:

Pseudobulbo nitido sicco rugoso, foliis subcoriaceis lanceis acutatis basi petiolatis subpedalibus, pedunculo dense squamis multis ochraceis obtuse acutis vestito, apice racemoso, bracteis lanceolatis triangulis ovaria aequantibus, labello cum columna semiconnato, antice trilobo, lobo medio retuso, lobis lateralibus rotundatis, lineis geminis in disco, per trabeculas transversas conjunctis.

Ovarium pedicellatum pollicare. Sepala naviculari ligulata. Dorsale dorso laeve, lateralia a medio apicem usque alato carinata. Tepala lanceolata obtuse acuta. Labellum cum gynostemio apice tantum libero in cylindrum connatum, apice libero trilobum; basi gibboso saccatulium infra tricarinatum (an tantum ex siccando? — saepe vidi), medio constrictum, apice ampliatur; lobus medius retusus emarginatus hinc denticulatus, lobi laterales breviores semiovati; carinae duae per discum ante lobos et postice abruptae, utrinque linea transversa clavata conjuncta, linea elevata longitudinali inter utramque; ansulis antice et postice transversis extrorsum utrinque abeuntibus a finibus carinarum. Gynostemium *Coelogyne* apice libero utrinque semiovato dilatatum, apice trilobum: lobi laterales acuti, lobus medius obtusus emarginatus; rostellum bilobum dependens, supra foveam marginatum; lobi semiovati extus utroque latere revoluti. Anthera apice bidentata, vertice obtuse apiculata. Pollinia depresso pyriformia, per paria incumbentia. — Ex Moluccis.

1347 b. **PANISEA** Lindl. Folia l. 5.:

(LO., p. 44. *Coelogyne* sect.)

Sepala membranacea; lateralibus basi obtusis v. obliquis. Petala conformia, parum minora. Labellum indivisum, membranaceum, omnino calvum, basi sigmoideum, omnino liberum. Columna *Coelogyne*. Pollinia 4, collateralia, cereacea; caudicula glandulaeque nullis (nisi materies pulverea saltem in quibusdam). Anthera membranacea, mobilis, bilocularis, infra apicem columnae inserta.

Herbae epiphytae Indicae, caespitosae, pseudo-bulbosae. Folia saepius graminea semper tenuia. Racemi radicales, erecti, 1—00-flori; bracteis membranaceis. Flores mediocres, pallidi.

The absence of crests or elevated lines from the lip of the plants now assembled under this name, together with the membranous texture, the perfectly simple form and the sigmoid base of that organ, afford ample points of distinction from *Coelogyne*.

1. PANISEA PARVIFLORA Lindl. LO., p. 44, sub *Coelogyne*. Folia I. n. 1.:

P. foliis anguste ovalibus, racemis multifloris bracteis ovatis pedicellis brevioribus, sepalis petalisque erectis obtusiusculis, labello lineari-lanceolato.

Dendrobium demissum. Don Prodr. 34.

Wild in Nepal, and Gossain Than Wallich. (v. s. sp.)

2. PANISEA REFLEXA Lindl. Folia I. n. 2.:

P. foliis ovalibus solitariis longe petiolatis racemis nutantibus multo longioribus, bracteis ovatis setaceo-acuminatis pedicellis longioribus, sepalis petalisque reflexis, labello lineari spathulato versus basin margine crispo.

Androgyne. Griffith, Notul. III. 279.

Wild in Assam, on oaks, among species of *Microstylis*, *Oberonia*, etc., in Nov. Griffith; Khasia, at Myrung in woods Id. (v. s. sp.). — Pseudobulbs diaphanous, cellular-membranous; lip white, with yellow spots near the base Griffith. The same author mentions a pair of bracts to each flower, but this seems to be accidental.

3. PANISEA UNIFLORA Lindl. LO., p. 42, sub *Coelogyne*. Folia I. n. 4.

P. pseudobulbis bifoliis vaginis scariosis imbricatis, foliis gramineis, pedunculis unifloris ultra vaginas parum exsertis, sepalis carinatis petalisque patulis acutis, labello obovato obtuso, ovario angulato.

Wild in Nepal Wallich; Sikkim-Himalaya, in hot valleys J. D. Hooker, (v. s. sp. comm. cel. J. D. H.). — Of this rare plant I possess very imperfect specimens. The leaves in pairs, and the obovate lip are peculiar. According to Wallich's MSS. the lip has three orange-coloured blotches from which four slightly elevated lines descend; but I can now find in the Sikkim plant neither these lines nor the short falcate lateral lobes of the lip spoken of in LO. It is not improbable that some confusion exists among the specimens bearing this name. Of the original *C. uniflora* I never examined a flower.

4. PANISEA BILAMELLATA. Huc: *Coelogyne billamellata* Lindl. Folia I. V. sub C. n. 35.

C. foliis oblongis 5-nerviis racemo elongato flexuoso multifloro brevioribus, bracteis c. floribus simul decidentibus supra flores arcissime imbricatis, sepalis carinatis, petalis filiformibus, labelli angusti basi sigmoidei lobis lateralibus falcatis lamella duplici apice rotundata intermedio ovali bilineato apice crispo.

Wild in the Philippines Cuming, (v. s. sp.). — The broad leaves and 3-lobed lip with a double lamella distinguish this from *C. longifolia*, of which it has all the habit. I have only seen a single flower.

Obs. Characterem generis non quaero in labello laevi, sed in basi sigmoidea ejusdem. Pollinia certe incumbentia erunt.

Supplementum ad

DENDROCHILUM Bl. pag. 218.

Juvat hic addere species quasdam in herbariis triste latentes.

1. DENDROCHILUM MAGNUM:

Folio oblongo-lanceolato acuto basi attenuato, pedunculo nutanti (?) densifloro, bracteis infimis ovatis obtusis, superioribus oblongis acutis densis, sepalis triangulo lanceolatis, tepalis subaequalibus subcrenulatis, labello cuneato flabellato, basi utrinque unidentato, antice tridentato, dente medio maximo, ad basin utrinque obtuso angulo prosiliente inter hujus basin et dentes laterales breviores, lineis elevatis . . . , dentibus erectis ad mediam cotumnam. — Cuming. (Herb. Lindl.!)

2. DENDROCHILUM BRACTEOSUM.

Folio ligulato obtuse acuto, spica nutante, sepalis ovato triangulis, tepalis subaequalibus, labello oblongo antrorsum dilatato, dente uncatō utrinque ante basin contractam lobi medii cuneati ovati apiculati, carina utrinque juxta marginem baseos; carina una inter utramque, antrorsum in duas divisa, columnae brachiis in apice columnae. (Herb. Lindl.)

3. DENDROCHILUM EROSUM: affīne *Dendrochilo cornuto*.

Foliis longe petiolatim attenuatis oblongo-lanceolatis acutis in bulbo cylindraco, squamis punctatis vestito, pedunculo longe nudo apice spicato, bracteis ovatis acutis, sepalis triangulis apiculatis, tepalis paulo latioribus, labello rhombeo seu trapezoideo, omnino denticulato, callo in basi transverso utrinque antrorsum prosiliente, columnae brachiis e media columna progredientibus, androclinii limbo bilobo seu retuso.

Java. Comm. Lindl. sub Nr. 56.

1348b. **BOLBOPHYLLARIA** Rehb fil.

in v. Schldl. B. Z. 1852. p. 934:

Perigonii phyllum summum oblongo-acutum galeatum, ph. l. ext. basi oblique connata, triangula, l. i. squamaeformia, ovata, acuta, multo breviora, phyllulis triangulis basi utrinque obtusatis superpositis cum marginibus phyllorum externorum imbricantibus, labello brevissime unguiculatum, triquetrum, acutum inferne medio serratum; gynostemium abbreviatum, apice utrinque unidentatum; pollinia inaequalia, per paria incumbentia, superpositis duplo majoribus.

a. Rhachis clavata.

1. BOLBOPHYLLARIA BRACTEOLATA Rehb. fil. l. c. (ad *Bolbophyllum bracteolatum* Lindl. B. R. XXIV. 1838. 57.).

2. BOLBOPHYLLARIA OERSTEDII Rehb. fil. in Bonpl. III. 223.:

Similis *Bolbophyllo* clavato Thouars tepalis triangulis nec linearibus, labello compresso cordato acuto limbo, per discum unicarinato. Pseudobulbus tetragonus ultrapollicaris diphyllus. Folia ligulata acuta—quadri-pollicaria, medio prope pollicem lata. Pedunculus basi paucivaginatus, superne clavato incrassatus multiflorus. Bractee triangulae acutae seu acuminatae ovariis subaequales membranaceae siccae violaceo subirroratae visae. Sepala triangula acuminata. Gynostemium breve apice intrusum antice bifalcatum. Commissura inter sepalum summum et sepalum lateralia a geneticis squamulis basi tecta.

Ad Esquipulas in Segovia. Oersted.

3. BOLBOPHYLLARIA PACHYRRHACHIS Rehb. fil. — *Pleurothallis? pachyrachis* A. Rich. in Ramon de Sagra Cub. 234. Vol. I. Tab. 74:

Pseudobulbis ovoideo compressis, squamis vestitis, apice 1—2 phyllis; foliis elliptico-oblongis obtusis, coriaceis, subtus subcarinatis; scapo radicali simplici, spithamaeo, foliis cum pseudobulbo longiori, squamato, in parte florifera incrassato-carnoso; floribus sessilibus, parvulis, spicatis, squamis basi lata semiovalibus concavis acutis; sepalo supremo concavo, apice longissime apiculato, laterilibus basi inter se coalitis, obliquis, recurvis, longissime acuminatis; internis (petalis) multo brevioribus obovalibus obtusis, tenuissimis, utrinque lateri gynostemii applicatis; basi externe appendice triangulari auctis, angulis inferioribus in nervos seu alas in ovario decurrentibus; labello unguiculato gynoste-

mio parallelo, ejus basi longe productae affixo, tertia parte inferiori erecto, caeterum explanato crasso, carnosio, linguiformi obtuso; gynostemio oblongo, clavato, ad partem superiorem antice longe bidentato.

Crescit in cortice arborum sylvarum ins. Cuba.

4. BOLBOPHYLLARIA SORDIDA Rehb. fil. Huc *Bolbophyll. sordidum* Lindl. B. Reg. XXVI. 1840. Misc. 217.

Pseudobulbis tetragonis,, spica carnosia acuminata conica, floribus sessilibus carnosissimis, bracteis ovatis obtusis adpressis ovario longioribus, sepalis ovatis acutissimis, petalis linearibus apice rotundatis, labello unguiculato ovato plano convexo basi auriculato, columna utrinque biseta.

Guatemala, near Bolb. clavatum of Thouars. It grows with a spike 6" long, upon a scape about half as long again. The flowers are very fleshy, a dull olive brown externally, but brightly mottled with purple in the inside. I owe my knowledge to Mr. Bateman.

Obs. *Bolbophyllum clavatum* P. Th. certe huc pertinebit.

b. Rhachis filiformis.

5. BOLBOPHYLLARIA BISETA Rehb. fil. Huc *Bolbophyllum bisetum* Lindl. Ann. Nat. Hist. X. 1842. 186.

Pseudobulbis inverse pyriformibus, folio lanceolato basi angustato spica paulo longiore, scapi filiformis erecta vaginis 3 distantibus laxis acutis, spica densa brevi nutante, sepalis alte carinatis, lateralibus connatis semiorbicularibus, dorsali oblongo minore, petalis spatulatis unguiculatis, labello convexo linguiformi villosio basi cordato, columnae dentibus setaceis, bracteis filiformibus sub flore.

Khasya Griffith. A very singular plant, with flowers as large as a small pea, and very deeply keeled sepals.

1348c. **XIPHIZUSA** Rehb. fil.

v. Mohl et v. Schldl. B. Z. 1852. 919.

Perigonii phylla externa membranacea elongata, lateralia nunc omnino connata, p. ph. l. i. abbreviata. Labellum cum basi gynostemii producta abrupte articulatum, trilobum, lobi laterales basi erecto-auriculati, per lineam mediam carnosio elevati, lobus medius ligulatus, cum lobis lateralibus elongatis plicula transversa (fere more *Euothonaeae*) articulatum. Gynostemium liberum: androclinium postice (an in omnibus?) unilobum, utroque margine antico in subulam erectiusculam productum, rostellum prominens supra foveam stigmaticam oblongam, rotundato-retusum; denticulus utrinque in margine gynostemii pone foveam stigmaticam. Anthera rotunda, mitrata, apice seu postice apiculato-mitrata, antice excisa, obsolete bilocularis. Pollinia duo, oblongo-cuneata, apice nunc bilobula.

(Char. ad *X. chloroptera*, comparatis char. *X. gladiatae* [Did. g. Lindl.] et *X. Weddellii* [Did. W. Lindl.]).

1. XIPHIZUSA CHLOROPTERA Rehb. fil. l. c.

Pedunculo nutante, filiformi, paucifloro, p. ph. summo ligulato pandurato acuto, p. lateralibus externis subaequalibus apicem usque connatis, paulo latioribus, (flavoviridibus), p. l. i. ovatis acutis margine pulcherrime papilloso-ciliatis, (flaveolis purpureo-guttulatis); labello trilobo elongato, lobis lateralibus elongatis, inferne medio carinatis postice utrinque erecto-auriculatis, lobo medio lineari-ligulato acuti-

sculo glabro, mobili, trinervi (purpureo), gynostemio ph. l. i. non aequante.

Bolbophyllum chloropteron Rehb. fil.

Brasilia. — Siquidem ego, dum tot genera Blumeana, imo Lindleyana sepono, genus meum servo, non ex vili egoismo, sed propter labelli miram fabricam facio, quae ab omnibus Bolbophyllis lamina medio sigmoideo inflexa recedit. Quod in nullis Lindleyanis. Didactylibus cerni potest, quo fit, ut conjunctio Didactylis gladiatae cum Bolbophyllo meo chloroptero omnino sit falsa.

1848 d. **BOLBOPHYLLOPSIS** Rehb. fil.

in v. Mohl et v. Schldl. B. Z. 1852. 933.

Perigonium carnosum-membranaceum, prope bilabiatum, phyllum supremum oblongum, galeatum, phylla lateralia externa basi ima connata, dein ligulata, deflexa, superiore multo longiora, interstitia inter summum et laterale magna; ph. l. i. oblonga, acuta, supremo p. breviora, linea antrorsa triangula in ima basi incrassata, lineolae apice libero (prope more Bolb. setigeri); labellum unguiculatum, triangulo-ligulatum, postice obtuse humeratum, linea media per longitudinem bicarinata, limbus argutus, gynostemium humile, apice utrinque oblique descendens; rostellum retusum, anthera depressa, mitrata, bilocularis, connectivum latum; pollinia 2, obtuse triangula, a lateribus compressa, sessilia in glandula spuria transverse pandurata.

1. **BOLBOPHYLLOPSIS MACULOSA** Rehb. fil. Huc: *Bolbophyllopsis Morphologorum* Rehb. fil. l. c.:

Blüthenstiele schlank, unten 2-scheidig, zu oberst zwei längliche, spitze Vorblätter sehr nahe beieinander. Fruchtknoten langgestielt. Blüthe einzeln, braun mit rothen Punkten, wenig kleiner als bei *Trigonidium* ringens.

Huc: *Cirrhopetalum maculosum* Lindl. Bot. Reg. 1841. misc. 173. — Bot. Reg. 1843. sub 49.

Floribus geminis solitariisque, sepalo supremo oblongo acuto, lateralibus lineari-oblongis obtusis margine anteriore pone basin uniplicato, petalis sepalo supremo brevioribus oblongis obtusis, labello ovato obtuso convexo apice recurvo, columna bidentata? (pollinis 4 subaequalibus).

East Indies. Wallich (158) Loddiges. — This is a species with the habit of *Bolbophyllum affine*, or *leopardinum*, but with the long lateral sepals of a *Cirrhopetalum*. It has the flower-stalks and flowers of a very pale green, finely speckled with dull purple. — The lateral sepals are nearly 1" long, and have a single fold on their inner margin near the base.

1352. **BOLBOPHYLLUM** Thouars.

Orch. Afric. tab. 97 — 110.

Uniflora.

§. *Sarcopodium*: Lindl. Folia l. Fasc. 2. Jan. 1853:

SARCOPODIUM Lindley, in Paxton's Flower Garden: gleanings, n. 199.

Sepala ringentia, coriacea vel carnosum, lateralibus basi productis columnae pedi adnatis dorsali aequalibus vel minoribus. Petala minora. Labellum nanum, cum basi producta columnae articulatum, carnosum, mobile, canaliculatum, basi subcordatum, nunc lamellis 3 brevioribus

auctum, nunc inappendiculatum. Columna nava, semiteres, mutica, basi in pedem producta. Stigma fovea sub rostello excavata. Pollinia 4, collateralia, 00 00, subaequalia, cereacea, omnino libera. Anthera 2-ocularis.

Herbae epiphytae, Asiae tropicae, pseudobulbosae. Folia solitaria, coriacea. Flores solitarii vel pauci, conspicui, pedunculis radicalibus.

A genus intermediate between *Dendrobium* and *Bolbophyllum*, having the large flowers of the former, and the peculiar creeping habit of the latter. The species agree with *Dendrobium* in having four nearly equal pollen-masses, and a hornless column; but they have coriaceous, not thin half-transparent flowers, and a tough leathery lip, enlarged not contracted at the base. If they had a caudicle and gland to their pollen-masses, they would almost be Asiatic *Maxillarias*. Their flowers form neither horn nor spur, but are simply inflated and expanded at the base of the sepals. One of them has been published by Dr. Blume as an *Ephippium*, a group which he now regards as a mere form of *Bolbophyllum*. That generic name cannot be conveniently applied here; because all the other species formerly collected under it belong either to *Bolbophyllum*, or *Cirrhopetalum*, or to some *Vandeous* race, for which alone, if it proves hereafter to be distinct, should the name *Ephippium* be retained.

§ 1. Labellum concavum 3-lamellatum.

1. *BOLBOPHYLLUM AMPLUM* Rehb. fil. Huc: Lindl. l. c.: *Sarcopodium amplum* Lindley, in Paxton, l. c.

S. pseudobulbis ovatis squamatis diphyllis, foliis oblongis emarginatis petiolatis, pedunculo bracteis petaloideis multo longiore, sepalis ovatis acuminatis obtusis, petalis angustioribus, labello cordato sessili trilobo basi lamellato: lobis lateralibus abbreviatis rotundatis intermedio ovato acuto.

Dendrobium amplum. Wallich Cat., n. 2001; Pl. As. rar., vol. I., p. 25, t. 29; LO., p. 74; Griffith Ic., t. 304; Notulac, p. 307.

Wild in Pundua and Nepal; on Mount Sheopore, on stones and rocks in moist shady situations Wallich; on rocks, in the valleys of the Sikkim Himalaya, at 4—5000 feet J. D. Hooker; Khasia hills, at Churra Griffith; at an elevation of 4—5000 feet Hooker and Thomson, (v. s. sp.). — Flowers straw-coloured, spotted internally, three inches wide when fully open. Lip with three lamellae in the middle, of which the central one is shorter than the others; its middle lobe deep purple. Griffith observed two protuberances inside the lower edge of the stigma.

2. *BOLBOPHYLLUM FUSCESCENS* Rehb. fil. Huc: Lindl. l. c.: *Scaropodium fuscescens*.

S. pseudobulbis ovatis acuminatis squamatis diphyllis, foliis oblongo-lanceolatis emarginatis petiolatis apice semitortis, pedunculo bracteis membranaceis multo longiore sepalis oblongo-lanceolatis acuminatissimis reflexis, petalis angustissimis, labello trilobo sessili basi lamellato-lobis lateralibus oblongis columna longioribus intermedio ovato acuminato medio carnoso.

Dendrobium fuscescens. Griffith Ic., t. 309, not. p. 308.

Wild on the Khasia hills T. Lobb; 4—5000 feet — J. D. Hooker and R. Thomson; near Churra Griffith, 1123, (s. s. sp.). — Middle of lip fragile at the base, breaking off readily at that situation. Sepals one and a half inch long; petals about a line shorter; both brownish flesh-colour. Lateral lobes of lip chesnut-colour; middle lobe pale chesnut, purplish towards the base; crests white. Column with two pale orange spots in front. Griffith. Very near the last, from which Griffith first distinguished it. Both have a strong tooth at the back of the anther-bed.

3. *BOLBOPHYLLUM ROTUNDATUM* Rehb. fil. Lindl. l. c.: *Sarcopodium rotundatum*.

S. pseudobulbis ovatis squamatis diphyllis, foliis ovalibus obtusis emarginatis petiolatis, pedunculo bracteis membranaceis brevioribus, sepalis petalisque carnosissimis ovatis acutis erectis aequalibus, labello trilobo sessili basi lamellato: lobis rotundatis lateralibus minoribus.

Wild in the Sikkim-Himalaya, at the elevation of 6000 feet J. D. Hooker, (v. s. sp. comm. ecl. inv.). — Very like *S. fuscescens*, but the foliage is broader; the peduncles are much shorter than the bracts which envelope them; the lateral sepals are not acuminate, and the dorsal tooth of the column is wider.

§ 2. Labellum canalicularum inappendiculatum.

4. BOLBOPHYLLUM GRANDIFLORUM Blume Rumphia IV. 42. — Huc: Lindl. l. c.: *Sarcopodium grandiflorum*.

S. pseudobulbis prismaticis, folio lanceolato vel retuso, scapo vaginis 2 maximis aucto, sepalis maximis inaequalibus dorsali latissimo obtuso lateralibus acuminatissimis supra medium refractis, petalis nanis acutis, acutis, labello linguiformi obtuso compresso.

Bolbophyllum grandiflorum Blume Rumphia IV. p. 42. — *Ephippium grandiflorum* Id., tt. 195 and 199.

Wild in woods on the coast of New Guinea Blume. — Flowers the largest of the genus, above eight inches in diameter, pale yellowish green. Scape six inches high. The dorsal sepal brownish above the base, with a strong pallid netting; the others not netted. Lip glaucous spotted with sanguine. Blume:

5. BOLBOPHYLLUM LOBBII Lindl. B. Reg. — Huc: Lindl. l. c.: *Sarcopodium Lobbii*. Lindley, in Paxton l. c. ic. 98.

S. folio petiolato obovato-oblongo coriaceo, pedunculo folio brevioribus nudo basi subglanduloso e bracteis squamaeformibus cucullatis falcatis subglandulosis erumpente, sepalis oblongis acutis lateralibus falcatis, petalis conformibus minoribus reflexis, labello longe unguiculato cordato ovato acuto canaliculato apice recurvo.

Sestochilus Hb. Hooker. — *Bolbophyllum Lobbii* Lindley, in Bot. Reg. 1847, sub t. 29; Bot. Mag. t. 4532.

Wild in Java T. Lobb, (v. v. et s. sp.). — Flowers full four inches across, yellow, shaded with cinnamon, spotted with light brown, and speckled outside with brown-purple. Pseudobulbs ovate, nearly as large as a pigeon's egg. Scape yellowish, spotted with brown, shorter than the leaf, its base sheathed with imbricated, convex, spotted scales. Sepals deep yellow, the upper one externally marked with purple spots running in lines; the lateral ones falcate, streaked and clouded with purple. Petals resembling the upper sepal, but smaller and streaked with purple lines. Lip cordate-ovate, acuminate, reflexed, yellow, with minute orange dots.

Huc porro: *Sarcopodium Lobbii*? var. *Henshallii* Henfr. gard. mag. of bot. III. 269 c. iconè. — Lem. jard. fl. tab. 183.

Sarcopodium Lobbii Lindl. Lem. Jard. fl. tab. 63. — *Bolbophyllum Henshallii* G. Chronicle 1852. p. 422.

6. BOLBOPHYLLUM MACRANTHUM Lindl. Huc: Lindl. l. c.: *Sarcopodium macranthum* Lindley in Paxton l. c.

S. foliis petiolatis oblongis planis coriaceis, pedunculo petiolo longiore, sepalo dorsali plano ovato acuminato lateralibus petalisque subconformibus hinc tortis, labello minimo unguiculato subtrilobo acuminato.

Bolbophyllum macranthum Lindley in Bot. Reg. 1844 t. 13.

Wild at Singapore Loddiges (v. v. c.). — Allied to both *B. leopardinum* and affine; from each it differs in its much more fleshy and larger flowers, whose stalk is considerably longer than the petiole. The flowers expand so flat, that they seem as if

they had been pressed. In the centre, they are a pale lemon-colour, but towards the tips they are much mottled with dark chocolate-coloured spots.

7. **BOLBOPHYLLUM CHEIRI** Lindl. Huc: Lindl. l. c.: *Sarcopodium Cheiri* Lindley in Paxton l. c.

S. foliis oblongis coriaceis basi canaliculatis apice emarginatis, sepalis elongatis lanceolatis, lateralibus basi ventricosis patalisque e lata basi linearibus acuminatis in manus speciem velut digiti conniventibus, labello basi ovato concavo apice longo rostrato.

Bolbophyllum Cheiri Lindley in Bot. Reg. 1844, misc. 66.

Wild in Manilla Loddiges (v. v. c.). — Sepals an inch and a half long, a clear olive green, marked with brownish stripes. The lip jointed so loosely with its support, that it falls forward every time the flower is waved by the wind. Both sepals and petals are so arranged that they converge much like the human fingers, when they are brought together without being bent.

8. **BOLBOPHYLLUM MEGALANTHUM** Griff. Huc: Lindl. l. c.: *Sarcopodium megalanthum*.

S. pseudobulbis fere obsoletis monophyllis, foliis oblongis crassis emarginatis basi canaliculatis marginibus recurvis, pedunculo stricto aphylo unifloro basi squamato, sepalis oblongo-linearibus acuminatis, lateralibus invicem falcatis basi auriculatis, petalis linearibus acuminatis incurvis, labelli lobis lateralibus erectis dentiformibus intermedio lineari longe rostrato.

Bolbophyllum megalanthum Griffith Ic. t. 292; Notulae p. 186.

Wild in Malacca; on trees and rocks at Pulo Bissar, common — Griffith. — Flowers very large, light brown with purple spots and dots. The lateral sepals are uppermost and cross each other like a pair of scythe blades. I have seen no specimen.

9. **BOLBOPHYLLUM REINWARDTII** Rehb. fl. Huc: Lindl. l. c.: *Sarcopodium Reinwardtii*.

S. pseudobulbis sulcatis cylindræis, folio oblongo petiolato acuto multinervi, pedunculo pseudobulbis aequali trivaginato, sepalis ovatis acuminatissimis, petalis conformibus setaceo-acuminatis, labello ovato acuminato.

Dendrobium grandiflorum Reinwardt ic. ined.

Wild in Java Reinwardt; T. Lobb 174 (v. s. sp. et ic. pict.). — There are two varieties known to me, one with leaves eight and a half inches by three and a half inches — Reinwardt; the other with leaves six and a half inches by one and three-eighths of an inch, and thinner — T. Lobb. Flowers greenish, one and three-fourths of an inch from tip to tip of sepals. Column, column-foot, and lip, crimson.

10. **BOLBOPHYLLUM PILEATUM** Lindl. Huc: Lindl. l. c.: *Sarcopodium pileatum*.

S. foliis . . . , floribus solitariis glabris, sepalis oblongis obtusis lateralibus convexis longioribus, petalis conformibus duplo angustioribus, labello linguiformi obtuso laevi pone basin bijugato inter juga subsæpera nectare lucido obducto, columna tereti mutica, anthera conica.

Bolbophyllum pileatum Lindley in Bot. Reg. 1844, misc. 73.

Wild at Singapore Loddiges (v. v. c.). — Flower large yellow-ochre coloured, with a nearly flat moveable labellum stained with two purple ridges near the base, between which is a little bright yellow valley, secreting a mucilaginous matter along its whole length. The anther is conical, like an old-fashioned high-crowned hat.

11. **BOLBOPHYLLUM AFFINE** Wall. Cat. Huc: Lindl. l. c.: *Sarcopodium affine* Lindley in Paxton l. c.

S. pseudobulbis oblongis teretibus, foliis coriaceis rigidis oblongis solitariis petiolatis emarginatis, floribus solitariis, sepalis petalisque

aequalibus ovato-lanceolatis, labello carnosio ovato-lanceolato obtuso integerrimo.

Bolbophyllum affine Wallich Cat. n. 1982; LO. p. 48.

Wild in Nepal Wallich; Khasia Mountains, at the elevation of 3000 feet on Gordonia Hooker and Thomson, (v. s. sp.). — Nearly related to the following, with which it agrees in the position and size of its flowers, but it differs from it in their being solitary, in the more lanceolate figure of the floral envelopes, and especially in the petals being as long as the sepals. (Perianth white, streaked with red. Labellum red-brown. Column yellow. Hooker and Thomson.)

12. BOLBOPHYLLUM LEOPARDINUM Lindl. Wall. Cat. Huc: Lindl. l. c.: *Sarcopodium leopardinum* Lindley in Paxton l. c.

S. pseudobulbis caespitosis ovato-oblongis, foliis coriaceis rigidis oblongis solitariis petiolatis, floribus fasciculatis globoso-campanulatis, sepalis ovatis guttatis subaequalibus, petalis minoribus conformibus, labello carnosio ovato obtuso integerrimo basi utrinque denticulato.

Dendrobium leopardinum Wallich Tentamen vol. I. p. 39. t. 28. — *Bolbophyllum leopardinum* Lindley in Wall. Cat. n. 1981.

Wild in the Himalaya; upon Mount Chandaghiry, on the trunks of trees Wallich; Khasia Mountains, 4—6000 feet Hooker and Thomson (v. s. sp.). — Flowers globose, pale yellowish brown, closely dotted with purple. Lip deep purple.

13. BOLBOPHYLLUM GRIFFITHII Rehb. fil. Huc: Lindl. l. c.: *Sarcopodium Griffithii*.

S. pseudobulbis oblongis, foliis ovalibus emarginatis, bractea parva membranacea obtusa cucullata, floribus subglobosis, sepalis petalisque minoribus ovatis concavis, labello ovato.

Bolbophylli sp. Griffith Ic. t. 296. f. 2.

Wild on the Khasia hills of India T. Lobb; at 5000 feet Hooker and Thomson; Myrurg wood Griffith (v. s. sp.). — Flower fleshy, whitish, with numerous rosy-purple blotches. Lip white, tremulous, blotched in the same way. Column white. — Griffith. The figure above quoted has nothing to do with the reference given by Griffith's editor at p. 294 of his „Notulae.“ It is no doubt the *Dendrobium Bolbophylli* of that author's „Itinerary Notes,“ p. 65 n. 1019. The specimen from T. Lobb, communicated by Messrs. Veitch, has but one flower, which I am unable to examine.

14. BOLBOPHYLLUM UNIFLORUM Griff. Huc: Lindl. l. c.: *Sarcopodium uniflorum*.

S. pseudobulbis angustis oblongis teretibus monophyllis, foliis lineari-oblongis coriaceis emarginatis, pedunculo unifloro filiformi pendulo, sepalo dorsali oblongo lateralibus recurvis duplo majore, petalis lineari-spathulatis revolutis, labello trilobo basi calloso auriculato lobo intermedio majore ovato.

Bolbophyllum uniflorum Griffith Ic. t. 295; Itin. p. 110.

Wild in Bootan; on the Mishmee hills towards Lung; on the mango-tree on Dewangiri Griffith (v. s. sp.). — „Sepals orange-colour, with red spots inside; petals of the same colour at the base, whitish at the lip. Lip tongue-shaped, sanguine at the point.“ Griffith. The small cartilaginous ears at the base of the lip, and the great dorsal sepal, are very remarkable. Griffith's figure of them is not good.

15. BOLBOPHYLLUM CORNUTUM Rehb. fil. Huc: *Ephippium cornutum* Bl.

In tot floribus ne vestigium quidem caudiculae reperi.

Icones nuper in Java confectae eam bene monstrant. Sed illae omnes videntur reliquose ad Blumei Tabellas confectae. Ita e. gr. „Cistellae“ (Geodori) falsa analysis ibi iterum offertur.

Obs. *Sarcopodium triadenium* Lindl. et *Sarcopodium striatum* Lindl. sub specibus spicatis inveniuntur.

§. *Cirrhopetala uniflora*: sepala lateralia longe extensa.

16. BOLBOPHYLLUM ANTENNIFERUM. Huc: *Cirrhopetalum antenniferum* Lindl. Bot. Reg. 1843. sub. t. 49.

Folio, scapo unifloro, sepalo dorsali lineari-lanceolato abrupte acuto, lateralibus cohaerentibus canaliculatis falcatis hac multum longioribus, petalis in setam tenuissimam apice clavatam productis.

Philippines (Cuming). — The flowers the largest in the Genus, the back sepal $1\frac{1}{2}$ " in length. I have only seen a single flower.

17. BOLBOPHYLLUM MAXILLARE. Huc: *Cirrhopetalum maxillare* Lindl. Bot. Reg. 43. sub t. 49.

Folio oblongo scapi uniflori longitudine, sepalo dorsali setaceo-acuminato ciliato lateralibus obtuse acuminatis disjunctis, petalis acutissimis.

Philippines (Cuming). — Upper sepal 9"', lateral 17"' long. Petals about $1\frac{1}{2}$ "

§. *Oxysepala*: floribus hyalinis inter squamas absconditis.

18. BOLBOPHYLLUM CLANDESTINUM Lindl. B. Reg. XXVII. 1841. Misc. 166:

Rhizomate repente squamis membranaceis cucullatis vestito distanter pseudobulbifero, pseudobulbis minimis 1—2 phyllis, foliis mucronulatis oblongis carnosis dorso convexis, floribus minimis geminis e squamis rhizomatis. sepalis clausis ovatis aequalibus in setam mollem productis, petalis ovalibus obtusis, labello anguste ovato obtuso laevi, anthera 1-loculari, poll. 2.

Curious, inconspicuous Orch. from Singapore Lodd. flw. It is a form of the genus *Bolbophyllum* in which the pseudobulbs almost disappear, and the flowers are only just protruded from among the withered scales, with which the rhizoma is covered. All. to tortuosum, a plant, which I never have seen. The minute flowers are pale straw-col. with the ends of the same lengthend into soft yellow bristles. The leaves are hard, thick, and rounded at the back. The whole habit of the plant is that of some creeping Fern, such as *Marginaria* (*Polypodium*) *piloselloides*.

Huc: *Oxysepala* R. W. Ic. V. I. 1367:

Sepals equal, ovate, long subulate acuminate, subconnate at the base. Petals narrow, linear, obtuse, scarcely half the length of the sepals. Lip unguiculate, cordate lanceolate, entire, ecalcarate, reticulated with the prolonged base of the short column. Stamen posterior, free to near the base, anther globose. Scandent, ramous, jointed epiphytes; stems clothed with sheathing scariose scales from beneath which the flowers protrude. Pseudobulbs scattered on the branches, 1 leaved. Leaves obovato-elliptic, obtuse, emarginate, coriaceous. Flowers short pedicelled, one or two from each scale covered at the base with minute scales and furnished at the apex with a large, somewhat boatshaped ovate bract. Sepals membranous (in dried specimens translucent) much attenuated towards the point.

This is an interesting plant from its so clearly explaining the structure of the column on orchideous plants through the separation of the stamen from the stigma. In most Orchids these two sexual organs are united into a single body, with the variously formed anther laying on the top. Here the two sets of organ are respectively free and distant, as in other bisexual flowers. I cannot refer it to any existing genus, though I think it approaches, *Cochlia* in some points, which however has not, so far as I can learn from the character, the free stamens of my plant.

Oxysepala ovalifolia R. W. Griffith. Label lost. Malacca? Khassya?

Obs. Huc locorum, forsan ad ipsum *B. clandestinum* Lindl. pertinebit:

BOLBOPHYLLUM MEMBRANACEUM Tejsmann et Binnendik Naturk. Tijdschr. vor Nederl. Ind. Deel V. 1853.

Bulbis minutis approximatis, foliis solitariis ovatis acutis, floribus solitariis minutis, pedunculis bulbis aequalibus, sepalo supremo luteo cuspidato, lateralibus subsulcatis et labello atropurpureis, petalis minutis membranaceis.

Salak.

§. *Napelli*: flore majusculo „postico“.

19. **BOLBOPHYLLUM NAPELLI** Lindl. Ann. Nat. Hist. X 1842. pag. 185.

Pseudobulbis conicis, folio oblongo obtuso, scapo unifloro, folii longitudine, apice ipso sub flore bibracteato, bracteis setaceis inaequalibus sepalis lateralibus dorsalibus galeatis ovatis acutis, petalis conformibus paulo minoribus, labello lineari obtuso unguiculato, columna basi utrinque in dentem acuminatum producta.

Brazil, Descourtilz, Miers. — Flower with violet stripes, $\frac{1}{2}$ " long. In form it resembles the flower of *Aconitum Napellus*, which suggested to Mr. Descourtilz its name.

§. *Pygmaeum*: flore parvulo coriaceo brevi antico.

20. **BOLBOPHYLLUM PYGMAEUM** Lindl. O. Huc: Hook. fil. Fl. of New Zeel.: „trough-out the island, as far south as Dusky Bay: Banks and Solander etc. Nat. name „Piri-Piri“ Col. — B. Mag. Comp. II. 377: New Zealand. — New Zealand (North. Island). At Wangaroa and Hokianga, on *Avicennia tomentosa* and *Vitex litoralis*, C. — trees of the sea shore Waimate, remote from the sea, on salt timber. 1831. R. Cunninghamham.

§. *Trias*: flore majusculo antico, sepalis aequalibus, lateralibus supra dorsale imbricantibus.

21. **BOLBOPHYLLUM OBLONGUM** Rehb. fil. MSS.:

Labello oblongo medio utrinque antrorsum dentato, columna apice retusa.

Trias oblonga L. O. 60. et ? *Trias ovata* L. O. 60.?

22. **BOLBOPHYLLUM MOULMEINENSE**:

Labello oblongo, edentulo, columna apice tridentata.

Pseudobulbi breve conici monophylli. Folia oblonga acuta. Pedunculi subaequilongi apice uniflori. Sepala oblongo-triangula. Tepala ligulata acuta abbreviata. Labellum oblongum complicatum. Columna apice triloba.

Moulmein. Griffith. (herb. Lindl.)

Obs. Num huc pertinebit haec litteraria miseries?:

Cirrhpetalum compressum B. Reg. XXIX. 1843. sub 49. (Ephippium uniflorum Blume Bijdr. p. 309.)

„Bulbis oblongis compressis, foliis lato-lanceolatis, pedunculo unifloro, sepalis ovatis acuminatis.“

Java. — Probably of this genus, since it is associated by Blume with his *Eph. ciliatum*.

Spicata seu Racemosa.

I. Rhachis filiformis.

aa. Flores a bracteis occulti.

23. **BOLBOPHYLLUM IMBRICATUM** Lindl. Bot. Reg. XXVII. 1841. Misc. 65.

Scapo erecto distanter obtuse vaginato, spica fusiformi subtetragona vix compressa, bracteis ovatis obtusis imbricatis demum marcescentibus,

alabastro cornuto pubescente, sepalo supremo lineari lateralibus ovalibus brevioribus, petalis filiformibus hirsutis, labello ovato basi pectinato.

Sierra Leone (171) Lodd. — It approaches closely to the Mauritius *B. occultum*, and with it and some others form an analogy with *Megaclinium*. The flower stem is a foot high, stout and nearly erect; the flowers are deep dull purple. Like many others of the genus, the spiral vessels are extremely strong, and tough in the sepals and which is very remarkable, they are of a rich purple colour. I am not at present acquainted with any similar case, for in general the spiral thread of the tracheae is peculiarly colourless and silvery.

bb. Flores a bracteis liberi.

α. Columna utrinque bidentata.

Huc descriptio genetica Lindleyi Folia I. 1. Oct. 1852:

DIDACTYLE.

Sepala coriacea, subaequalia: lateralibus basi obliquis nunc connatis. Petala nana, libera. Labellum cum basi producta columnae articulatum, 3-lobum, per axin in jugum carnosum sulcatum vulviforme elevatum. Columna libera, semiteres, apice in cirrhos 2 (staminodia) extensa, basi in pedem producta, infra apicem digitis duobus marginalibus aucta. Pollinia 4, ceracea, libera: duobus interioribus minutis. Anthera saepius rostrata. Herbae epiphytae, Americae tropicae, pseudobulbosae. Folia coriacea. Scapi radicales, apice tantum spicati; bracteis herbaceis.

Among the numerous forms which have been referred to *Bolbophyllum*, this seems especially to demand separation as a peculiar genus, on account of its somewhat peculiar habit, and very singular column and lip. The column, in addition to the two cirrhi essential to *Bolbophyllum*, has two others a little lower down, and projecting towards the lip like a pair of fingers. The lip has a large fleshy ridge running along its middle, and in the species I have examined, slit from end to end: that is to say, the two customary lateral lamellae are united in front, and are so deep as to produce this appearance.

24. *BOLBOPHYLLUM EXALTATUM* Lindl. Ann. Nat. Hist. Huc: *Didactyle exaltata* Lindl. l. c.

D. pseudobulbo tetragono folio oblongo obtuso paulo brevior, scapo vaginato stricto longissimo (pedali et ultra), vaginis obtusis supremis laxioribus, spica multiflora, bracteis ovatis concavis acutis herbaceis, sepalis ovatis acuminatis, petalis oblongis ciliatis, labello obovato obtuso pubescente, columnae dentibus supremis cirrhosis digitis brevibus incurvis, anthera mucronata.

Bolbophyllum exaltatum Lindley, in Ann. Nat. Hist., vol. X. p. 186.

Wild in Guayana — Schomburgk, (v. s. sp.). — The leaf of this remarkable plant is not much more than an inch long, while the scape is more than a foot high. The flowers are purple, and half concealed by the large permanent bracts.

25. *BOLBOPHYLLUM ANTENNIFERUM* Rehb. fl. Huc: *Didactyle antennifera* Lindl. l. c.

D. pseudobulbo tetraptero, folio oblongo plano coriaceo apice recurvo scapo triplo brevior, spica densa nutante, bracteis oblongis obtusis ovario longioribus, sepalis acuminatis, petalis ovato-oblongis ciliatis, labello oblongo basi ciliato auriculis 2 membranaceis apice rotundato dentato, columnae dentibus supremis longissimis porrectis digitis subulatis.

Wild in Brazil; Minas Gerães — Widgren, 764, (v. s. sp. comm. cel. Rehb, fl.). — Resembles *D. exaltata*, but the lip is smooth except at the base, and its end is

strongly toothed. The fleshy ridge in the middle of the lip is singularly large. The teeth of the column are as long as the column itself, its foot included.

26. BOLBOPHYLLUM MERIDENSE Rehb. fil. Huc: *Didactyle meridensis* Lindl. l. c.

D. pseudobulbo ovato, folio parvo oblongo apiculato scapo pluries brevioris, spica elongata, bracteis coriaceis acutis recurvis ovario longioribus, sepalis apice subulatis, petalis ovatis ciliatis, labello panduriformi piloso basi auriculato apice rotundato integerrimo barbato, columnae dentibus filiformibus digitis subulatis.

Bolbophyllum meridense Rehb. fil., in *Linnaea*, XXII., p. 836.

Wild in Venezuela; in the province of Truxillo, near Timotes and Chachopo, at the height of 6000 to 8000 feet — Funk and Schlim, n. 735; in Merida, at the height of 4000 feet — Rehb. fil. (v. s. sp. comm. cel. Linden). — I have to thank Mr. Linden for a specimen of this singular species, remarkable for its great bearded lip. The flowers are said to be reddish, bordered with violet.

Obs. *Didactyle*? *Claussenii* ex omni analogia juxta *Bolbophyllum coccinum* pertinet.

27. BOLBOPHYLLUM GLADIATUM Lindl. Huc: Lindl. *Folia* I. 1. Oct. 1852: *Didactyle gladiata* (false quidem allato *B. chloroptero*!):

D. pseudobulbo ovato tetragono, folio oblongo carinato spica longe pedunculata multo breviori, spica secunda multiflora, rachi subclavata, sepalis linearibus lateralibus connatis, petalis obovatis ciliatis limbatis, labello unguiculato cordato in processum angustum gladiatum villosum elongato, columnae digitis e medio brevibus.

Bolbophyllum gladiatum Lindley, in *Ann. Nat. Hist.*, vol. X. p. 185. — *Bolbophyllum chloropterum* Rehb. fil., in *Linnaea*, XXII. p. 835.

Wild in Brazil — Descourtilz; near Rio Janeiro — Reichenbach. (v. ic. pict. in bibl. De Lessert.). — A most singular plant, the appearance of whose flowers is thus described by M. Descourtilz: — „The upper sepal is very long, very narrow, channelled at its base, acute at the point, lemon-coloured, as well as the two lateral, which are joined by their edges into one, two-toothed at the point. From the position constantly assumed by the flower these three sepals are placed right and left of the axis. The petals are short, spatulate, touching at both base and point, leaving between them a heart-shaped space; they are white edged with purple, and fringed with purple hairs on their outer edge; in the middle is a large heart-shaped violet spot. The lip is hinged with the column, moveable, and consists of a channel with broad wings, white edged with purple, and of a very long process, shaped like a sword-blade hanging down, brownish and velvety with hairs.“

28. BOLBOPHYLLUM WEDDELI Rehb. fil. Huc Lindl. l. c.: *Didactyle Weddellii*.

D. pseudobulbo pyramidali brevi obtuso, folio oblongo plano coriaceo spica longe pedunculata 8—10-flora multo breviori, rachi subclavata, sepalis linearibus obtusis liberis, petalis . . . , labello unguiculato subcordato in processum angustum ensiformi-spathulatum (laevem?) elongato, columnae cirrhis erectis digitis e medio nanis.

Wild in Brazil; Minas Gerães — Weddel, ic. n. 12, (v. ic. pict. in bibl. herb. mus. Paris.). — At first sight much like *D. gladiata*; but the leaves are broader, the spike not secund, the sepals all disjoined, and the lip broader; the rachis also seems much more clavate. It appears from Mr. Weddell's sketch that the leaf is about three inches long; the scape about eighteen inches, and the spike rather less than four inches. The sepals are olive-green spotted with brown; the lip white with a purple base, and numerous oblong spots of the same colour.

29. BOLBOPHYLLUM TRIPETALUM Lindl. Huc Lindl. l. c.: *Didactyle tripetala*.

D. pseudobulbo tetragono, folio oblongo acuto racemo brevioris, scapo 6—7-floro flexuoso erecto, bracteis ovatis scariosis ovario longioribus, sepalis linearibus acutis patulis, petalis minimis squamaeformibus, labello

ciliato unguiculato apice oblongo obtuso basi ima utrinque auriculato, columnae digitis dentiformibus.

Bolbophyllum tripetatum Lindley, in Ann. Nat. Hist., vol. X. p. 185.

Wild in Brazil; in the province of St. Paul's — Descourtilz, (v. ic. pict. in bibl. De Lessert.). — A good figure of this exists among M. Descourtilz's drawings, in the library of Monsieur De Lessert. Like *Bolbophyllum saltatorium*, its lip appears to be delicately and elastically articulated with column. The sepals are pale yellow, three-quarters of an inch long. The lip is bright yellow with crimson spots. It is stated by its discoverer to be scentless and to cover whole trunks of trees.

β. Columna utrinque unidentata seu submutica.

1. 1. Labellum oblongum.

† Labellum plumosum seu papillis filiformibus hirsutum.

30. BOLBOPHYLLUM CALAMARIUM Lindl. — Bot. Reg. XXIX. 1843. Misc. 109.

Pseudobulbis tetragonis, folio oblongo plano coriaceo obtuso basi canaliculato, scapo stricto longissimo apice florido, bracteis membranaceis emarcidis ovarii longitudine, sepalis anguste triangularibus margine pubescentibus, petalis cornuformibus subteretibus glabris, labello sessili mobili lineari basi sulcato margine omni tomentoso supra medium villis longissimis crinito, columnae cornubus falcatis.

Allied to *Bulb. saltatorium*, like that species having a moveable lip fringed with long purple hairs, which raises and falls spontaneously as the stem sways about the wind. Its scape is full 2' long, stiff and erect. Flowers are dirty yellow ochraceous with a little purple upon them; lip dull purple. — Sierra Leone Col. Fielding.

31. BOLBOPHYLLUM TREMULUM R. Wight. Ic. V. I. 1851. 1749: pseudobulbs ovate, somewhat corrugated, leaf ovate, lanceolate acute; scape straight, bracts small, ovate, acute: sepals ovate lanceolate, acute, pubescent: petals rhomboid-ovate small, densely ciliate: lip articulated with the prolonged base of the column, linear, obtuse the back toward the apex, covered with long tremulous hairs. Flowers yellow, passing into purple towards the margins of the sepals: lip purple. Wynand on trees. Jerdon and Major Cotton. — Allied to *Bolbophyllum Calamaria*. — Fig. by Mrs. Jerdon. Hairs of lig jointed at the base.

32. BOLBOPHYLLUM SALTATORIUM Lindl. — Bot. Reg. XXIII. 1837. 970.

Pseudobulbis ovatis compressis ancipitibus, foliis solitariis acutis, racemis brevibus, bracteis ovatis membranaceis appressis emarcidis ovario subaequalibus, sepalis ovato-oblongis pubescentibus subaequalibus, tepalis subulatis columna longioribus, labello ovato acuminato sepalis longiore villosa apice stuposo.

Perigonium viridi brunneum, labellum postice viride antice brunneo rubrum.

33. BOLBOPHYLLUM BARBIGERUM Lindl. — Bot. Reg. XXIII. 1837. 1942.

Pseudobulbis lenticularibus, foliis solitariis racemo erecto brevioribus, bracteis ovatis amplexicaulibus ovario subaequalibus, sepalis lineari-lanceolatis acuminatis, petalis subulatis columna brevioribus, labello lineari lanceolato acuminato villosa apice stuposo-barbato.

Sierra Leone. Loddiges. — Perigonium virens kermesinumque. Labellum flavum, barba kermesina.

†† Labellum eplumosum.

34. BOLBOPHYLLUM EUBLEPHARUM Rehb. fil. MSS.:

Pseudobulbo-subtereti (?) elongato monophyllo, folio oblongo-lanceolato acuto, pedunculo gracili apice nutante (? in vivo?) folium ter supe-

rante, distanter vaginato, apice racemoso per quintam longitudinis partem, bracteis lineari-lanceis ovaria pedicellata subaequantibus, sepalis ovatis acutis integerrimis, tepalis ovatis obtuse acutis limbo serrulato-fimbriatis, labello oblongo obtuse acutiusculo complicato (?) basi rotundato, columna apice utrinque erecto aristata, dentibus utrinque duobus suppositis altero sub altero.

Flores illis Bolbophylli Carayani aequales; verosimiliter sepala maculata. Pseudobulbus duos pollices altus, folium quinque pollices longum. Pedunculus ultra pedalis.

Darjeeling. Griffith (Herb. Lindl.).

35. BOLBOPHYLLUM LONGIPES Rehb. fil. MSS.:

Rhizomate squamoso valido, pseudobulbis distantibus obturbatis monophyllis, folio oblongo-lanceolato, pedunculo folium bis superante gracili erecto basi paucivaginato, per duas tertias laxe racemoso, ovariiis pedicellatis bracteis multoties superantibus, sepalis ligulatis obtuse acutis, inferioribus aliquid longioribus, tepalis triangulo-ligulatis, brevioribus, labello ligulato basi rotundato, apice obtusato velutino pilosulo, columna apice utrinque acuta.

Pseudobulbus pollicem longus. Folium quinque pollices longum. Pedunculus undecim pollices altus. Ovaria pedicellata sesquipollicaria.

Moulmein. Lobb. 4 — 5000' (Herb. Lindl.).

36. BOLBOPHYLLUM MICROTAPALUM Rehb. fil. MSS.:

Pseudobulbo obturbato, folio oblongo obtuse acuto basi angustato, pedunculo brevioris basi dense vaginato, medio ac sursum univaginato, spica densissima cylindracea, sepalo summo triangulo acuminato, sepalis lateralibus triangulis acuminatis obtuse acutis, tepalis ovato-triangulis sexies usque septies brevioribus, labello triangulo obtuse acuto, basi rotundato, pilosulo columnae aristis antrorsus.

Pseudobulbus ultra pollicaris. Folium prope quinque pollices longum. Pedunculus quatuor pollices longus.

Moulmein. Lobb. (Herb. Lindley).

37. BOLBOPHYLLUM TRISTE Rehb. fil. MSS.:

Pseudobulbo subsphaerico, folio (foliis?), pedunculo tenui distanter paucivaginato, spica densa nutante, ovariiis brevibus, sepalis oblongo triangulis, lateralibus subcarinatis, tepalis oblongo triangulis dimidiam longitudinem aequantibus, labello oblongo obtuse acuto ante basin refracto, basi rotundato.

Flores ex minoribus.

Khasiya. Lobb. (Herb. Lindley).

38. BOLBOPHYLLUM CARINIFLORUM Rehb. fil. MSS.:

Pseudobulbo obturbato diphylo, foliis oblongis acutis, basi cuneatis, pedunculo folia superante apice subtransverso dense spicato, vaginis in basi nonnullis distantibus, sepalo summo triangulo apiculato, sepalis lateralibus carinatis, subconnatis, tepalis duplo brevioribus triangulis argute acutis, labello oblongo ligulato basi rotundato curvato.

Khasiya Hills. Lobb. (Herb. Lindl.).

39. BOLBOPHYLLUM CONCHIFERUM Rehb. fil. MSS.:

Pseudobulbo oblongo, folio oblongo ligulato obtuse acuto, pedunculo erecto distanter vaginato, spica cylindracea erecta, sepalo summo triangulo obtuso, sepalis lateralibus ovatis coalitis apice bitriangulis, tepalis linearibus acutis, labello basi replicato oblongo acuto uti sepala intus tuberculato.

Khasiya Hills. Lobb. (Herb. Lindl.).

40. BOLBOPHYLLUM SCEPTRUM Rehb. fil. MSS.:

Pseudobulbo?, folio longe petiolato cuneato oblongo ligulato acuto, ultra bipedali, pedunculo densius vaginato, vaginis ancipitibus, inflorescentia cylindræa, bracteis oblongis ovaria superantibus, sepalis oblongo-ligulatis, lateralibus subfalcatis, tepalis linearifalcatis, labello trilobo, lobis lateralibus obtusangulis, lobo medio triangulo-ligulato, columna apice trifida.

Folium magnum, ultra bipedale, Petiolus quinquepollicaris trigonus. Lamina subbipedalis apice oblique acuminata, sed brevius. Nervus medius dorso carinatus. Pedunculus ultra bipedalis. Vaginae ancipites in basi congestæ, ceterum usque sub inflorescentiam sparsæ: quatuor aggregatæ, quatuor distantes; summa sub inflorescentia. Flores ex majoribus, illis Maxillariæ pallidifloræ subæquales.

Tepalum dorsale ligulatum acutum supra dorsum subcarinatum. Sepala lateralialia falcata acuto margine undulata (saltem in sicco) curvato deflexa. Tepala falcata linearia basi latiora apice paulo dilatata, quasi attenuata, sepalis paulo breviora. Labellum sepalis multo brevius, ab ovata basi lineare obtusatum hinc trilobulum, apice marginibus revolutis convexum obtusatum, ante basin infractum, carinae geminae majores lineam elevatam mediam obcelantes per medium in aream incrassatam communem exeuntes. Gynostemium apice trifidum: dens posticus uncinatus brevis urinque denticulo minuto auctus, dentes laterales longiores, ascendentes utrinque denticulo minori aucti. — Insul. Sondaic. — (Adest in hb. Lindl.)

41. BOLBOPHYLLUM HERMINIOSTACHYS Rehb. fil. MSS. Huc: *Taurostaxis* Rehb. fil. in v. Mohl et v. Schldl. Bot. Z. 1852. p. 933.

Perigonii membranaceo-carnosi phylla externa lanceolata acuminata, lateralialia externa curvula, ima basi coalita, omnia elongata, l. i. abbreviata, ligulata, apice triangula, basi utrinque obtusangula, labellum unguiculatum, trilobum, lobi laterales trianguli, postice rotundati antice sensim in lobum medium ligulatum microscopice denticulatum transeuntes, callulis 3—5 in ima basi labelli, carina gemina carnosa, basi ex-torsa, dein parallela, apice confluenta, lobi laterales erecti, margines lobi medii revoluti; gynostemium humillimum, androclinium tridentatum, dente postico minuto, anticis dentibus elongatis, teretiusculo-subulatis, erectis, gynostemio ipso longioribus, in basi antica interna minus denticulatis, dein decurrentibus in membranam anticam basi confluentem, gynostemii frontem cum stigmatem rotundo obvelantem, rimam interstitii lineam basi acutam linquentem; rostellum obtusum; anthera depressa, rotunda, dorso carinata, pollinia duo, depresso-globosa, arctissime con-nata, lobulo elliptico divisibili in margine interno superiori utrinque.

Taurostaxis Herminio-stachis. Eine schlanke, vielblüthige, ziemlich dichte, fünf Zoll lange Aehre. Blüthen so gross, wie bei *Herminium Monorchis*. Deckblätter lanzettlich, spitz, so lang als Fruchtknoten. Blüthenhülle purpurfarbig. — Blatt länglich, spitz, unten keiltörmig. — Aus der Sierra Leone.

42. BOLBOPHYLLUM RECURVUM Lindl. p. 53. n. 30. — Bot. Reg. XXX. 1844. Misc. 70. Mss. Loddiges received it from Guiana 1839, the specimens that have just flowered having proved to be identical in all respects with the African plant.

43. BOLBOPHYLLUM SETIGERUM Lindl. — Bot. Reg. XXIV. 1038. Misc. 24.

Pseudobulbis ovatis monophyllis, foliis ovalibus acutis scapo erecto radicali spicaque pendula multo brevioribus, rachi filiformi, sepalis ovatis acutis erectis, petalis setaceis patentissimis basi extus tuberculatis, labello oblongo recurvo medio incrassato et elevato apice tridentato, columna bicorni, anthera pedicellata.

Obt. by Mrs. Loddiges from Demerara. Flowers small, dull purple, upon a light green ground. One very remarkable circumstance in its structure is the presence

of a minute tubercule at the base of the petals on the outside, which in an other species, *B. bracteolatum*, from the same country, is in the form of a distinct scale.

Obs. Cf. *Bolbophyllariae* genus. Flores nullos teneo.

44. *BOLBOPHYLLUM QUADRISSETUM* Lindl. n. sp. — Hook. Lond. Journ. 1843. p. 70.

Folio oblongo-lanceolato basi angustato, spica pedunculata rectiuscula, pedunculo 2—3 vaginato aequali, rachi tenui, bracteis ovatis floribus subaequalibus, sepalis acutissimis, petalis linearibus acuminatis serrulatis, labello oblongo marginato bilamellato, columna biseta.

Flores coriacei resupinati. Petala et columnae setae subsimilia. Antherae callo cristatae. — British Guiana Schomburgk.

45. *BOLBOPHYLLUM HIRTUM* LO. 51. — Bot. Reg. 47. adn. ad 66. :

Pseudobulbo elongato ovato, foliis lato ligulatis obtusis scapo glabro brevioribus, spica caudiformi multiflora cernua pubescente, sepalis acuminatis hirsutis et glandulosis, petalis nanis acutissimis fimbriatis, labello oblongo-lineari emarginato obtuso supra hirsuto, anthera glandulosa.

46. *BOLBOPHYLLUM COCOINUM* Bat. — Bot. Reg. XXIII. 1837. Tab. 1964.

Pseudobulbis ovatis tetragonis, foliis solitariis lanceolatis, spica stricta multiflora brevioribus, bracteis membranaceis linearibus acutis ovario longioribus, sepalis aristatis, petalis linearibus denticulatis, columna bicorni longioribus, labello ovato-lanceolato obtuso basi ciliato, sub apice foveato.

Sierra Leone imp. ex Loddiges. Filling the house with the scent of a cocoa-nut. Flores rosei.

47. *BOLBOPHYLLUM ADENOPETALUM* Lindl. — Bot. Reg. XXVIII. 1842. Misc. 95.

Foliis oblongis obtusis petiolatis basi vix bulbosis, spica secunda basi laxe vaginata multiflora folio sublongiore, sepalis acuminatis, petalis spathulatis acutis intus glandulosis, labello ovato angusto obtuso acuminato ciliato basi canaliculato.

Singapore, rec. Loddiges. The flowers are yellowish and slightly sweetscented. Resembles *B. cocoinum* from which its want of a pseudobulb at most its extremely small one and its petals not serrated but glandular inside readily distinguish it. One of the plants included by Dr. Blume under his *Diphyes flavescens* ?

48. *BOLBOPHYLLUM LIMBATUM* Lindl. — Bot. Reg. XXVI. 1840. Misc. 171.

Pseudobulbis ampullaceis depressis, foliis , racemo cylindraco multifloro longe pedunculato, squamis pedunculi sursum nudi duabus distantibus parvis vaginantibus, bracteis minimis, sepalis ovatis obtusis ciliatis, petalis multo brevioribus obovatis margine superiore villosa, labello ovato crasso obtuso petalis longiore basi bidentato: disco laevi nitido limbo scabritie minuta opacato.

The flowers of this plant are deep dull purple, in a rather loose raceme. The sepals and petals are both fringed with whitish hairs. The label is remarkable for being polished in the middle, and surrounded by a broad belt of minute points, which give it an opaque shagreen appearance. Like most of the genus it is a plant of little beauty. Singapore imp. Loddiges.

49. *BOLBOPHYLLUM LASIANTHUM* Lindl. — Gardn. Chronicle 1855. 53: — *Alias Anisopetalum lasianthum* De Vriese ic. 249. ined.

B. (bulbosum, de Repens, spiciforme, sarcanthum), foliis latis oblongis coriaceis scapo valido laxe vaginato aequalibus, racemo pubescente, floribus carnosis, sepalis oblongo-lanceolatis acuminatis lateralibus longioribus setis piliformibus carnosis vestitis, petalis linearibus setaceo-acu-

minatis multo brevioribus, labello linguiformi anguste marginato basi crassissimo crista ovali foveata, columnae angulis angustissimis integris.

Drawing from Sumatra, in De Vriese's hands. — Manilla imp. Loddiges. — Leaves 7 inches by 2; the scape somewhat taller, and the flowers nearly 2 inches long. The latter are dull purple and copiously covered with long fleshy hairpointed bristles. — Belongs to the group of *B. Carayanum*, *quadrisetum*, *setigerum*, *Khasyanum*, *nilgherrense*, *imbricatum*. — Huc: De Vriese Illustr. tab. XIII.

2. 2. Labellum tridentatum.

50. BOLBOPHYLLUM FUSCOPURPUREUM R. Wight Ic. V. 1651.

Rhizoma creeping, pseudobulbs ovate, angular, congested; leaves broadly elliptic, contracted at both ends, emarginate, raceme much longer than the leaves, 4—6 flowered, drooping towards the apex: flowers longish pedicelled; lateral sepals about twice as large as the ovate lanceolate posterior one: petals ovate at the base prolonged into a long filiform acumen, terminating in a little fleshy knob: lip 3 lobed, lateral lobes short obovate or subspathulate; middle one fleshy, nearly equaling the sepals, subspathulate or tongue shaped, entire, hispid. Flowers dark reddish brown, lip brownish purple.

Neilgherries on trees and rocks along the bank of the Kartairy river below Kaitri, and also below Neddawuttim on the N. western slopes, where Mr. Jerdon detected it. The petals of this species are very unusual, and the middle lobes of the lip in the fresh plant gives so much the idea of a tongue, that the „Tongue Orchis“ is the name by which it is known to Mrs. Jerdon.

51. BOLBOPHYLLUM NEILGHERRENSE R. Wight Ic. V. I. 1851. 1680.

Rhizoma creeping, pseudobulbs ovate, irregularly angled somewhat corrugated; leaves oblong, elliptic, obtuse, emarginate; spikes cylindrical, shorter than the leaves: flowers numerous congested: bracts lanceolate, acute: lateral sepals much larger than the posterior, oblique: posterior broad, ovate, subacute: petals small, broad at the base, ovate acuminate, subdenticulate: lip three lobed, lateral ones spreading, triangular, acute, much smaller than the broad ovate obtuse somewhat tongue shaped, hispid middle one. Flowers dull yellowish green.

Neilgherries and Malabar. — Lip too acute in the representation. — Sepals dull brownish yellow, lip dirty brownishgreen, sprinkled with short hair. — Near *B. Carayanum*.

52. BOLBOPHYLLUM FUSCUM Lindl. — B. Reg. XXV. 1839. Misc. 5.

Pseudobulbis oblongis obtuse tetragonis diphyllis, foliis lineari oblongis patentibus emarginatis, spica pedunculata disticha ancipiti glabra pendula, bracteis ovatis cucullatis acutis coloratis distantibus florum longitudine, sepalis triangularibus, labello trilobo carnosio lacinia intermedia convexa rotundata lateralibus brevioribus magis membranaceis acutis serrulatis.

Nearly related to *B. tetragonum*. Sierra Leone. Flowers deep dull chocolate colour. Like *Liparis pendula* they are studded with large transparent cells, containing raphides in cubical parcels, and they are more over filled with short spiral vessels, so closely filled with air, that it is difficult to drive it out even with the aid of the air pump. Loddiges importavit.

53. BOLBOPHYLLUM CAREYANUM Sprg. — Bot. Mag. III. Ser. I. Vol. 1845. 4166.

Rhizomate repente, pseudobulbis oblongo-ovatis laevibus membranaceo-vaginatibus, folio solitario oblongo lanceolato obtuso basi angustiore, racemo pseudobulbi longitudine, pedunculo perbrevis squamoso, flori-

bus imbricatis, sepalis ovatis acuminatis lateralibus duplo majoribus conniventibus, petalis minimis acuminatis, labello ovato longe unguiculato utrinque unidentato, columna bicornuta.

Anisop. C. Hook. Ex II. 149. *B. Careyianum* Spr. Syst. Veg. III. p. 732. Wall. Cat. 1990. L.O. 51 Nepal, Martaban. Wallich. — Griffith. Flores flavi sanguineo maculati, labelli ungue (s. pede columnae) purpureo.

54. BOLBOPHYLLUM CUPREUM Lindl. — Bot. Reg. XXIV. 1838. Misc. 183.

Folio angusto solitario scapo longiore, racemo brevi oblongo nutante, petalis setaceo-acuminatis serrulatis, labello ovato dente utrinque setaceo, columnae angulis aristatis.

A native of Manilla, whence Mrs. Loddiges received it from Mr. Cuming. The flowers are copper-coloured, and have a smell extremely like that of Valeriana root.

55. BOLBOPHYLLUM FLAVIDUM Lindl. — Bot. Reg. XXIV. 1840. Misc. 195.

Pseudobulbis oblongis compressis vaginis 2 membranaceis vestitis, folio basi angustato spicis laxis longiore, sepalis acuminatis, petalis oblongis obcordatis acutis, labello bicarinato recurvo: lobis lateralibus undulatis obsolete, columna bicorni.

Pale yellow-flowers. Sierra Leone imp. Loddiges. It has flowers in size and form like those of *B. coccinum*, but they are arranged in a lax spike.

55b. BOLBOPHYLLUM TRIADENIUM Rchb. fil. MSS. Huc: *Sarcopodium triadenium* Lindl. Fol. n. 4.

S. pseudobulbis parvis ovatis diphyllis, foliis lineari-oblongis retusis basi canaliculatis, pedunculis apice racemosis trifloris folio brevioribus, squama unica in medio, sepalis lineari-lanceolatis acuminatis patentibus, petalis linearibus acutissimis aequilongis, labello trilobo lobis lateralibus oblongis intermedio ovato acuto basi tricalloso.

Wild in Java — Junghuhn, 301, (v. s. sp. comm. cel. de Vriese). — I have not seen the anther and pollen-masses of this. The dried flowers are cartilaginous.

55c. BOLBOPHYLLUM STRIATUM Rchb. fil. MSS. Huc: *Sarcopodium striatum* Lindl. Folia n. 12.

S. pseudobulbis subglobosis monophyllis, foliis oblongis planis emarginatis petiolo lineari subaequalibus, racemis paucifloris debilibus prostratis laxe bracteatis, sepalis ovatis subaequalibus, petalis linearibus patentissimis obtusis duplo brevioribus, labello lanceolato integerrimo basi utrinque obsolete dentato.

Dendrobium striatum Griffith Notulae, p. 318.

Wild in Khasia; at an elevation of 4 — 5000 feet — Hooker and Thomson; at Myrung on trees, Mumbree $\frac{146}{263}$, — Griffith, (v. s. sp.). — The flat long-stalked leaves, and two-to-three-flowered weak prostrate racemes are remarkable. Flowers the smallest of the genus, greenish, lined and dotted with sanguine. Lip greenish white, with three straight central sanguine lines and crimson lateral veins. — Griffith. Pseudobulbs dark brown, smooth. Lines on flower dingy purple. — Hooker and Thomson.

II. Rhachis foliiformis. (*Megaclinium* Lindl.)

56. BOLBOPHYLLUM COLUBRINUM Rchb. fil. MSS. Huc: *Megaclinium colubrinum* Rchb. fil. in Bonpl. III. 223. : aff. *M. Bufoni*, sepalis laevissimis, glaberrimis cuspidatis, tepalis falcatis acutis tertia brevioribus, labelli lamina ligulata lateribus mediis subtriloba carnosissima. Rhizoma validum lignosum vaginis emarcidis tectum. Pseudobulbi obtusissime trigoni, faciebus ovalibus. Folium cuneato oblongum apice subemarginatum carnosum quatuor pollices longum, plus unum latum. Pedunculus

spithamæus nigro violaceus guttulis plurimis albis aspersus (unde nomen) medium usque teres, septemvaginatus, apice anceps, marginibus flexuosis. Bractee ligulatae deflexae emarcidæ. Flores nigroviolacei vernixii illis *Megaclinii* falcati majores. Sepala intus flavidiviridia. Labellum flavum nigroviolaceo guttulatum. Gynostemium canaliculatum alatum utrinque pone apicem obtusangulum, androclinium obtuse tridentatum; flavum nigroviolaceo guttulatum. Fovea more generis ligulata. — Cultur der Herren Booth und Söhne zu Flottbeck.

57. BOLBOPHYLLUM OXYPTERUM Rehb. fil. MSS. Huc: *Megaclinium oxypterum* Lindl. Bot. Reg.

Pseudobulbis monophyllis acutissime tetra-pentagonis oblongis, folio oblongo coriaceo caulis sine rachi longitudine, rachi ensiformi arcuata crispata apice tetragona pyramidali, bracteis reflexis, sepalis lateralibus ovatis intermedio lineari acuminatissimo, petalis nanis linearibus falcatis, labello crasso linguiformi apice recurvo margine pone basin fimbriato.

A fine species. Sierra Leone. Loddiges. Nearly related to *M. maximum*.

58. BOLBOPHYLLUM VELUTINUM. Huc: *Megaclinium velutinum* Lindl. — Bot. Reg. 1847. t. 32. adn.

Pseudobulbis ovatis trigonis (3.—4 gonis?), foliis oblongo-lanceolatis emarginalis, rhachi lineari-oblonga crenata, sepalis pilosis, supremo recurvo obtuso callosa marginato lateralibus refractis ovatis acutis, intus velutinis; petalis linearibus acuminatis; labello ovato transverse corrugato obtuso; columna utrinque dente obtuso aucta.

In Cape Coast Castle. Differs from *M. falcatum* by its lateral sepals velvety inside. Flowers deep purple as well as the rhachis, except the upper sepals and petals, which are dull yellow.

59. BOLBOPHYLLUM FALCATUM. Huc: *Megaclinium falcatum* Lindl. B. R. 989. — Huc — Morren: Ann. sc. nat. XIX. p. 91. 1843.

Le Labellum a un mouvement

- a. mécanique: lorsque on l'a touché.
 b. spontané: par les cellules diachymateuses du dessous du filet, qui s'allongent pour relever le labellum, en même temps que celles du dessus se raccourcissent et vice versa, dans le mouvement où le labelle d'abcide. C'est le double mouvement du liquide intracellulaire lui-même, destiné a entrer dans une cellule pour le nourrir et pour en sortir ensuite? Le liquide sort de la fleur pour entrer dans la labelle, et sort ensuite du labelle pour entrer dans la fleur: ce mouvement est ici rendu sensible aux yeux par l'extrême élasticité de l'organe où s'opère ce double transport? Cela n'est pas improbable et dans ce cas l'abaissement du labellum s'accorderait avec un afflux de liquide nutritif, et son élévation avec un reflux de ce même liquide. — Le labelle flétrit en 2 jours en suite de son action vitale, le reste de la fleur reste en bon état 8 jours!

60. BOLBOPHYLLUM BUFO. Huc: *Megaclinium Bufo* Lindl. — Bot. Reg. XXVII. 1841. Misc. 82.

Rachi maxima lanceolata, floribus nigro-pilosis, sepalis acutissimis supremo laevi lateralibus intus pubescentibus, petalis minimis acutis glabris, labello ovato carnosio rugoso.

Let the reader imagine a green snake to be pressed flat like a dried flower, and then to have a row of toads, or some such speckled reptiles, drawn up along the middle in single files their backs set up, their fore legs sprawling right and left and their mouths wide open, with a large purple tongue wagging about convulsively; and a pretty considerable approach will be gained to an idea of this strange plant, which if Pythagoras had but known of it, would have rendered all arguments about

the transmigration of souls superfluous. It is a native of Sierre Leone, whence Lodd. received it. The figure will be published in some future number of the Gardener's Chronicle.

61. **BOLBOPHYLLUM MAXIMUM.** Huc: *Megaclinium maximum* Lindl. — Bot. Reg. 1909. L.O. 47. — B. Mag. 4028/43.

Sepalo supremo acuto lateralibus margine involutis acuminatissimis reflexis, labello lineari revoluto.

Facies M. falcati, sed paulo robustius, et folia minus emarginata et margine subrevoluta. Rhachis ensiformi falcata, dentata, multiflora, 9 pollices longa, pallide viridis. Flores herbacei. Pedicelli et calyx extus sanguineo maculati. Sepalum supremum erectum oblongum, acutum, denticulatum utrinque callosum, lateralibus duplo longius; lateralia triangularia, e lata basi acuminatissima, reflexa, marginibus involutis, petala parva, plana, linearia acuta, pallide viridia. Columna lata, discoidea, tenuis, marginata, basi cum labello lineari fusco revoluta mobilis elastice articulata. Anthera unilocularis. Pollinia solida, geminata, nec lobata, nec linea exarata.

Bot. Mag. 4048. 1843: We are informed by M. Lindley that the present kind was first collected by Smeathman in Sierra Leone. It was afterwards sent to M. Loddiges, through whose means living specimens were sent. The plant is now known in our collection. — Floret Jun. Jul. — Perigonium flavum purpureo pictum.

UMBELLATA.

Sect. *CIRRHOPETALUM*: sepala lateralia longe extensa. Inflorescentia seu umbelliformis seu subracemosa.

Lindl. B. Reg. XXIX 1843 Oct.: *Cirrhopetalum* is a name proposed in the year 1824 for the *Bulbophyllum longiflorum* of Du Petit Thouars, a Mauritius plant, remarkable for the great length of its lower sepals. 1825 Professor Reinwardt gave the same or some nearly allied species the name of *Zygoglossum*, but of course *Cirrhopetalum* took precedence on account of its primity of date. — In 1830 one knew 6 species; now 21 species (14 living, 2 dried and 5 upon credit of others).

a. *Tepala ciliata.*

aa. Sepalum dorsale laeve.

62. **BOLBOPHYLLUM WALLICHII.** Huc: *Cirrhopetalum Wallichii* 1843 sub 49. — L. n. 5. Bot. Reg. 1839 misc. 119. et l. c.

Foliis lanceolatis apice fissis scapi erecti longitudine, racemo multifloro pendulo, bracteis linearibus, sepalis glaberrimis supremo acuminato lateralibus linearibus ligulatis vix acutis, petalis acuminatis subciliatis, labello

Nepal. — Bot. Reg. XXV. 1839. Misc. 118. — The charact. of *C. Wallichii* in L.O. is erroneous in consequence of bad specimens and an Indian drawing having been misunderstood, it is necessary to correct the details.

63. **BOLBOPHYLLUM REFRACTUM.** *Cirrhopetalum refractum* Zoll. flora 1847 p. 457. Cf. Walp. Ann. I. 776.

64. **BOLBOPHYLLUM SCABRATUM.** Huc: *Cirrhopetalum caespitosum* Wall. MSS. B. Reg. XXIV. 1838. Misc. 53.

Pseudobulbis ovatis monophyllis, foliis anguste ovalibus obtusis basi angustatis scapo longioribus, scapo filiformi erecto vaginis paucis membranaceis carinatis acutis distantibus laxe vestito apice umbellato, sepalo supremo obovato fornicato acuto margine scabro, lateralibus acuminatis convolutis triplo longioribus, petalis ovatis apiculatis, pectinato serratis, labello minimo solido triquetro apice recurvo angulis superioribus marginatis.

A little epiph. from East Indies imp. by the Duke of Devonshire now preserved at Chatsworth. It has small, pale yellow-ochre coloured flowers, without any thing striking about them. April.

65. BOLBOPHYLLUM NUTANS. Huc: *Cirrhopetalum nutans* Lindl. in Bot. Reg. 1839. misc. 118.

Pseudobulbis ovato-subrotundis rugosis, foliis ovato-subrotundis e-marginatis coriaceis humi pronis, scapo erecto elongato, umbella multiflora nutante, bracteis linearibus acuminatis, sepalis glaberrimis: supremo acuminato lateralibus linearibus ligulatis vix acutis, petalis ovatis acutis serrulatis, labello obtuso convexo bicristato, columnae angulis obsolete bidentatis.

Manilla. — This has a nodding umbel of pale straw-coloured flowers, at the end of a weak scape about 6" high. The leaves are from 1½" to 2" long, very thick, e-marginate, and lying almost flat upon the ground. The species is near *C. Wallichii*. — Manilla. Cuming, Loddiges. — B. Mag. 44. 18.

- 65 b. BOLBOPHYLLUM CHINENSE. Huc: *C. chinense* Lindl. B. R. 1842. XXVIII. misc. 29.

Foliis lanceolatis, umbella multiflora, sepalo supremo galeato petalisque oblongis brevioribus obtusis serrulatis apiculatis: lateralibus lanceolatis, labello linguiformi obtuso carnosio convexo laevi tremulo.

China. — Flowers rather large, pale fawn colour, with dorsal helmet-shaped sepals and petals spotted with crimson. — Labellum viride petalis violaceis, sepalis flavis, supremo apice purpureo.

66. BULBOPHYLLUM LONGIFLORUM Thouars Orch. Tab. 98.: Huc: Lindl. B. Reg. 1843. sub 49.: *Cirrhopetalum Thouarsii*. L. n. 1. Bot. Reg. 1838. t. 11.

Epidendrum umbellatum Forst.

Bulbophyllum longiflorum Thouars.

Zygoglossum umbellatum Reinw.

Cymbidium umbellatum Spreng.

Pseudobulbis 4-gonis, folio oblongo petiolato, umbella subdimidiata, sepalo dorsali setaceo-acuminato lateralibus oblongo-linearibus, petalis ovatis serratis setaceo-acuminatis, labello ovato retuso, columnae auribus bidentatis.

Otaheite, Java, Mauritius, Madagascar. — Flowers pale cinnamon-colour, with a little purple dotting about the sepals and petals. — Society Island Mathews! Java Reinwardt. Isle de France, Manilla Cuming. — Perigonium ochraceum, sepala brunneo maculata, labellum violaceo pictum. — B. Mg. 4237.

bb. Sepalum dorsale fimbriatum.

67. BOLBOPHYLLUM FIMBRIATUM. Huc: *Cirrhopetalum fimbriatum* Lindl. Bot. Reg. 1839. Misc. 120.

Pseudobulbis ovatis subtetragonis, foliis ovalibus . . . , scapo erecto bracteis linearibus acuminatis, umbella multiflora, sepalis lateralibus ligulatis vix acutis cohaerentibus, supremo petalisque ovatis acuminatis fimbriatis, labello crasso linguiformi nudo obtuso, columnae angulis cornutis edentulis, anthera papillosa.

Bombay. — A very pretty species, with the long lower green sepals united into a channelled rather stiff stragg, while the upper sepal and the petals are broken up at the margin into beautiful purple fringes. — Bombay, imp. Lodd. — Pollen masses in both this and *nutans* 4 collateral, and adhering together, with the interior pair much smaller, than the two others. — Bot. Mag. 4391.

Huc: *Cirrhopetalum fimbriatum* R. Wight Ic. V. 1851. tab. 1655.: leafless? pseudobulbs caespitose, irregularly angular depressed: scales slender, erect, furnished with remote appressed scales: umbels many flowered, orbicular, lateral sepals long

linear, cohering to near the point; posterior ovate acuminate, and, with the conformable but smaller petals, fimbriate on the margin: lip ovate, obtuse, fleshy, shorter than the petals. Lateral sepals often cohering, cream coloured with darker lines, petals, lip and posterior sepal red. — Coorg Jungles. Jerdon. Jan. „Umbrella Orchis“ Mrs. Jerdon.

68. BOLBOPHYLLUM CORNUTUM. Huc: *Cirrhopetalum cornutum* Lindl. — Bot. Reg. XXIV. 1838. Misc. 138.

Pseudobulbis ovalis angulatis scapo paulo brevioribus, sepalis lateralibus in cornu connatis superiore petalisque ovatis ciliatis, labello angusto triangulari supra sulcato subtus carinato.

The leaves are 6—8" long, and the flowers dull purple. It was found by Mr. Gibson at Nungclow, on the Khoseea hills, growing upon rocks and flowered at Chatsworth in August last.

Huc: B. Mag. 47523.: *Cirrhopetalum cornutum* Lindl.

Pseudobulbis oblongo-ovatis laevibus vaginatis, foliis solitariis oblongo ligulatis in petiolis attenuatis, scapis radicalibus vaginatis gracilibus folio brevioribus, fl. terminalibus eleganter radiatim umbellatis, sepalo superiore ovato concavo ciliato, sep. lat. maximis linearibus elongatis in cornu connatis purpureo sanguineis, petalis parvis ovatis concavis ciliatis, labello ovato acuminato carnosio recurvo, columna bicuspidata.

Cirrh. c. Lindl. B. Mag. 1838. Misc. 138. 1843. sub t. 49. n. 4. — Khasya, Simons. Neer Macraei.

69. BULBOPHYLLUM CUMINGII. Huc: *Cirrhopetalum Cumingii* Lindl. — B. Reg. XXIV. sub 49.

Pseudobulbis tetragonis, folio oblongo obtuso scapo brevioribus, umbella dimidiata multiflora, sepalo dorsali petalisque ovatis acuminatis fimbriatis, lateralibus lineari-lanceolatis, labello ovato 3-sulcato pone basin bituberculato.

Philippines. — Flowers deep purple, whole coloured, with long yellow hairs on the petals and back sepal. Flowered in March 1841 with Messrs. Loddiges.

70. BOLBOPHYLLUM AURATUM. Huc: *Cirrhopetalum auratum* Lindl. in Bot. Reg. 1840. misc. 107.

Pseudobulbis oblongis angulatis, folio oblongo convexo, floribus umbellatis, sepalo supremo petalisque setaceo acuminatis fulvo ciliatis lateralibus acutis, labello lineari recurvo, columnae auriculis rotundatis integris.

Manilla. — Very like the last, picturatum, but much larger in the flowers, which are fringed with golden yellow hairs, giving them quite a distinct appearance. — Bot. Reg. 1842. XXIX. 61. — Bot. Reg. 1840. Misc. 107: Manilla. Loddiges March, 1841. — Perigonium flavum labello purpureo ut plurimum ornato sulco apice, sepalis supremis et petalis purpureo striatis, sepalis lateralibus purpureo adpersis, columna violacea.

71. BOLBOPHYLLUM VAGINATUM. Huc: *Cirrhopetalum vaginatum* L. n. 3. B. Reg. 42. sub t. 12. — Bot. Reg. XXIX. 1843. 49. Oct.

Pseudobulbis pyramidatis truncatis, folio oblongo convexo emarginato, vaginis scapi oblongis ventricosis distantibus, sepalo supremo ovato inferioribusque longissimis pendulis ciliatis, petalis oblongis ciliatis, labello oblongo bicarinato, columnae auriculis setaceis.

Singapore. — C. vaginatum differs from C. Medusae in its flowers being ciliated, the petals oblong, not triangular and acuminate, and in the distant sheathes of the scape to which may be added that its flowers are not speckled with pink as in C. Medusae. — Bot. Reg. XXVI. 1840. Misc. 173: Singapore. Cuming. Lodd. — Pale straw-coloured.

red flowers in heads, with their anterior sepals prolonged into a fine thread nearly 2" long. Pseudobulbs are in the form of a truncated pyramid, the leaves coriaceous and emarginate.

Huc inserendum: *Cirrhopetalum caudatum* Wight Ic. V. 1856. n. 1658. — Pseudobulbs ovate, leaves from oblong elliptical to strapshaped, obtuse, emarginate: scape filiform, clothed with sheathing scales: bracts subulate, about the length of the ovary, lateral sepals very long, ending in very long spirally convolute filiform tails; posterior one and petals about equal, ovate, obtuse, and with the base of lateral sepals ciliate with remote bristly hairs: lip oval, 3-crested. Malacca Griffith. — Nescio, an sit praecedens, nec ne. In una figura saltem basis labelli valde cordata, in aliis non.

72. BOLBOPHYLLUM WIGHTII. Huc: *Cirrhopetalum grandiflorum* R. Wight Ic. V. 1851. tab. 1656. — Pseudobulbs conical, leaf pedicelled, linear, subtruncate, emarginate, scape nearly twice the length of leaves, 3-6 flowers, lateral sepals long, ovate, lanceolate, tapering to a point (about 1½ inch long), posterior sepal ovate, acute and with the narrow almost subulate petals ciliate, lip short, fleshy, recurved, cordato ovate. Column of the flower greenish streaked and speckled with crimson, tending to purple; lip deep red, posterior sepal and petals yellow. — Ceylon: Nuera Ellia. — Walker.

73. BOLBOPHYLLUM PICTURATUM. Huc: *Cirrhopetalum picturatum* G. Loddiges in Bot. Reg. 1840. misc. 106. — B. Reg. XXIX. 1843. sub 49.

Pseudobulbis oblongis angulatis, folio oblongo convexo emarginato, floribus umbellatis: sepalo supremo ciliato setaceo-acuminato lateralibus oblongis obtusis, petalis acuminatissimis ciliatis villosis, labello lineari recurvo secus medium elevato, columnae auriculis obtusis integris.

East Indies. — A little plant with purple flowers, growing in flat umbels, and deeply stained with dark red. Its habit is that of a Bolbophyllum, its scape from 5-6" high. — Parad. Vind. fasc. XV.

b. *Tepala calva.*

74. BOLBOPHYLLUM BIFLORUM Tejsm. et Binnendik Naturk. Tijdschr. vor Nederl. Ind. Deel V. 1853: Bulbis approximatis ovatis quadrangularibus sulcatis, foliis solitariis loricatis acutiusculis basi contractis, scapis erectis foliis brevioribus bifloris, phyllis perigonii exterioribus lateralibus longissimis filiformibus acuminatis, supremo cucullato cirrifero, int. minutis subovato emarginatis acutatis, labello cordato acuminato integerrimo apice recurvato, gyn. apice bidentato. Salak Jav.

75. BOLBOPHYLLUM MEDUSAE. Huc: *Cirrhopetalum Medusae* Lindl. in Bot. Reg. 1842. tab. 12.

Pseudobulbis ovatis tetragonis, folio oblongo convexo emarginato, vaginis oblongis ventricosis supremo pedunculo longiore, floribus dense capitatis, sepalo supremo acuminato inferioribus longissimis pendulis, petalis triangularibus acuminatis, labello ovato acuminato bicarinato, columnae auriculis acutis.

Singapore. — This in some respects resembles *C. vaginatum*, but is a much larger plant, and very different in the form of its flowers. — Labium flavuum, perig. ochraceum, rubro pictum. — Huc: De Vriese Illustr. t. 12. f. 2.

76. BOLBOPHYLLUM KAITIENSE. Huc: *Cirrhopetalum neilgherrense* R. Wight Ic. VI. 1851. n. 1654. — Leaves linear, obtuse, emarginate 3 nerved: scape shorter than the leaves: umbelled, 6-8 flowered: lat. sepals very long, broad, ovate, at the base tapering to a point, posterior one ovate acute nearly twice the length of the broad, subobovate blunt petals: lip short cordate, ovate, recurved, hairy on the back: prolonged base of the column pubescent within. Flowers first greenish yellow, tinged with pink marked with darker lines, afterwards becoming reddish or light rusty coloured, process of the column red. — Kartairy below Kaitie on moist rocks.

79. BOLBOPHYLLUM MACRAEJ. Huc: *Cirrhopetalum Macraei* L. n. 6. Bot. Reg. 1841. misc. 105.

Folio oblongo petiolato, umbella pauciflora, petalis oblongis apiculatis falcatis nudis, sepalis acuminatissimis, labello a lata basi angustato carnosio canaliculato obtuso recurvo.

Ceylon. — This has the habit of *C. Thouarsii*. It has dull brownish yellow sepals, and purple petals, which are sulcate and the point turned forwards. — Bot. Reg. XXVII. 1841. 105: — Ceylon Lodd. (175).

Huc: *Cirrhopetalum Macraei* B. Mag. 442.

Pseudobulbis ovatis laevibus, f. solitariis oblongis acutis in petiolum attenuatis, scapis folio longioribus, racemis vix umbellatis laxifloris, sep. lanceolatis acuminatis, lateralibus longissimis, supremo apice acuminatissimo incurvo, petalis ovatis acuminatis, columna utrinque alata apice longe bidentata, labello ovato-acuminato carnosio recurvo.

1357. **EPICRANTHES** Blume.

Bijdr. 306. Tab. 9.

1. EPICRANTHES BARBATA Rchb. fil. Huc: *Monomeria barbata* Lindl. Sert. Frontisp 1840: Imperfect spec. from Nepal. Wallich. — Abs. of pet! Fimbrias petaloideas Lindl. non reperit in pl. suis, uti Wall. delin. — Habit of a large Bulbophyllum. From a large creeping rhizoma spring ovate pseudobulbs covered with the ragged remains of the scales out of which they originally proceeded; each 2" long, bears a single leaf. Leaf rather less than a foot long, oblong, leathery, deep green, veinless, obtuse, a little downy beneath, with the channelled foot stalk nearly as long as the blade. Raceme rather shorter than the leaf, erect, proceeding from the base of a pseudobulb, pale green, spotted with dull purple, with about 2 sheathing scales below the origin of the flowers. Each flower is about an inch long, with respect to the axis of growth. Of the sepals the upper is triangular, acuminate, nearly plain, dull olivegreen, much shorter than the 2 lateral ones, which are placed below the lip, a little united with each other at the base, where they are fixed upon the long foot of the column in such a way as to form a kind of blunt spur; on the outside they are very light green, smooth and dotted with light purple; on the inside they are hairy, yellowish, and irregularly spotted with bright purple. The petals appear to me to be wholly absent, but in Dr. Wallich's figure they are represented as two ragged lines. The labellum is articulated with a very long foot of the column, horizontal, dull yellow, three lobed, the lateral lobes being falcate and emarginate, the intermediate one ovate, with continuous acute plates, united into pairs, parallel with its margin. The column is short, half round, extended at the base into a long slender curved foot, on which the sepals and labellum are inserted; with the 2 upper angles in front produced into short points. Anther is downy, one celled, with a fleshy even crest. The pollenmasses are 4 on the same plane, 2 interior being the smallest, and all consolidated into a roundish oval ball, without the slightest trace of a caudicle or gland.

1362 b. **PORPAX** Lindl.

Bot. Reg. XXI. 1845. Misc. 66.

Sepala subaequalia, in tubum connata, lateralia basi oblique et pedi producto columnae adnata. Petala nana, libera. Labellum carnosum, cum pede columnae articulatam, basi tuberculo auctum. Columna nana, teres, aptera. Pollinia 8, per paria inaequalia.

Pseudobulbi depressi, dense catenatim consociati, diphylli. Flores solitarii, sessiles, terminales. — Nearest *Eria*, habit of *Trias*, calyx of *Masdevallia*.

PORPAX RETICULATA Lindl. l. c.

Pseudobulbi depressi, mutua pressione subangulati fibris pallidis pulchre reticulati. Labellum serratum, tuberculo basali cornuto.

Pseudobulbs produced a pair of little oblong leaves at their point, and between the leaves peeped forth a small dull red flower, $\frac{3}{4}$ " long.

Sepals: the lateral ones a little oblique and prominent at the base. Petals ovate, dull purplish red, very short. Labellum articulated loosely with the extended foot of the column, ovate, hastate, fleshy, serrate, with the sides of the base erect, and a single slender tooth standing up between the side in the middle of the base. Column short, extended in a long foot, earless, and wingless. Anther opercular membranous. Pollinia 8, in pairs, one mass in each pair being smaller than the other. — Huc porro (cf. etiam Lindl. Garden. Chronicle 1861. 538):

AGGEIANTHUS R. Wight Ic. V. I. (1851) 1737.

Sepals equal, cohering, tubular; the lateral ones connate, with the prolonged base of the column, broad ovate rounded, papilose hispid at the apex, truncated and furnished at the base with a subulate tooth-like process, 3 nerved in axis. Column erect, concave above. Anther 2 celled, cells obsoletely 4 celled with 4, or by abortions? fewer obovate pollinia in each. Stemless plants. Pseudobulbs aggregated, depress flattened, netted all over; leaves small 2—5, sheathing, ovate, acute, membranous: bracts suborbicular; cuspidate, parallelly many-nerved: flowers tubular, vase shaped (whence the name), dull brick red colour, externally glabrous, pilose within: petals obovate, spatulate with a longish claw, pubescent; the lip when spread out is somewhat trowel shaped at the base and orbicular at the point.

The horn-like process at the base of the lip not well shown in the fig. 13. is very peculiar. The number of pollinia seems inconstant as shown in the two fig. 12 and 13, and I have seen as few as four, always presenting spatulate outline shown in the plate. Fig. 14. was introduced by the artist, without reference to me on the usual form of which in the order it does not much resemble but which it may be. As I did not see it, I thought it best to retain it, when preparing the drawing for transmission to the press.

AGGEIANTHUS MARCHANTIODES. R. Wight l. c. 1737; Growing in broad patches somewhat resembling a *Marchantia* (which suggested the name) on moist rocks on the Iyamally Hills towards Paulghat. Jul. Aug.

1363. **ERIA** Lindl.

(Bot. Reg. 904. — Walp. Ann. III. 530.)

Vastissimum genus, quod hodie ad illas notulas, quas dedit cl. Lindley in „contributions to the orchidology of India“ ex parte quidem digere placet.

§ 1. *Conchidium* Griff. „Thin leaves, almost stemless habit, smooth flowers.“

1. **ERIA BRACCATA** Lindl. l. c. 46. *Dendrobium braccatum* Lindl. Orch. 75. Huc: *E. uniflora* Dalzell Hook Journ. Bot. III. p. 111.

Pseudobulbis sphaericis depressis apice diphyllis, foliis oblongis planis basi angustatis complicatis, scapo gracili foliorum longitudine apice unifloro, sepalis lateralibus falcatis acutis, sepalo supremo petalisque subaequalibus linearibus acutis, labello petalis brevioris, lobis lateralibus abbreviatis lunatis purpureo-marginatis lobo intermedio lineari obtuso intus longitudinaliter bicristato. — Fl. temp. pluviali.

This pretty species grows in clusters on the bark of the Mango and other trees; the flower is white and very large for the size of the plant, viz., two inches across. The pollinia are eight in number, wedgeshaped, and united by threads at their narrow end; the leaves are one and a half to two inches long, and the scape about the same length, and furnished at its base with a keeled obtuse linear sheath.

Huc porro : ERIA RETICOSA R. Wight Ic. V. 1. 1637. (1851.):

Caespitose, stemless, pseudobulbs orbicular, depressed, enclosed in a net-like sack; leaves about two, elliptic, spreading; scape filiform, 1 flowered furnished at the apex with a large somewhat boat shaped bractea: flowers larger, resupinate, expanding; sepals and petals about equal, exceeding the obscurely 3 lobed lip. Flowers pure white, lip and column yellow, bract brownish.

On branches of trees about Pycarrah in profusion, fl. May, June. It seems to be met with more or less in flower the greater part of the year. It is very remote in habit from other Eria.

2. ERIA JERDONIANA. Huc : *E. Lichenora* Lindl. l. c. Huc : *Lichinora* R. Wight. l. c. Ic. V. 1738.

Sepals adhering at the base, posterior one longer, somewhat galeate; lateral ones connate with the prolonged base of the column, ovate, obtuse, petals linear, lanceolate, shorter than the sepals; lip subrhombic-ovate, acutish, articulated, with the long base of the column. Anther terminal, 2 celled, with 4 pollinia in each. Stemless plants, pseudobulbs thin, flat, adhering like lichens to the branch on which they grow (whence the name), leaves paired, broad, ovate, suborbicular, cuspidate pointed, reticulately veined, large in proportion to the rest of the plants, glabrous: flowers axillary, paired, short pedicelled, hairy; bracts obovate, somewhat boat-shaped, densely ciliate, lateral sepals hairy within.

Leaves at first green, afterwards changing to purplish brown. Flowers tawny coloured.

— 1738 LICHINORA JERDONIANA R. W. Malabar Mountains, on branches of trees. Mrs. Jerdon.

3. ERIA PUSILLA Lindl. Contrib. to Orchid. of India. Huc ; *Phrealia uniflora* R. Wight. Ic. V. I. 1734 (1851):

Repent, pseudobulbs globose, about 2 leaved, leaves obovate cuspidate: scape longer than leaves, one flowered: bract large, cordato ovate, acuminate: lip lanceolate acuminate, 2 nerved.

Khassia Hills and Chunassang : Griffith.

3b. ERIA MICROCHILLOS Lindl. Contrib. to the orchidology of India p. 47. *Dendrobium microchilos* Dalzell in Hook. Journ. Bot. III. 345 :

Pseudobulbis profunde bilobis, lobis orbiculatis valde depressis reticulatis epidermide albida, foliis 3—4 linearibus obtusiusculis superne subplanis basi angustatis ibique scapum floriferum vaginantibus, floribus alternis secundis spicatis, bracteis ovato-subulatis ovario longioribus, capsula sessili ovata glabra, sepalis e basi lata acuminatis, petalis conformibus aequilongis angustioribus, labello ovato indiviso subduplo longioribus.

Herba pusilla, 2—3-uncialis. Scapus filiformis, multiflorus. Flores straminei, mi-

nuti. Folia $\frac{1}{2}$ —2 poll. longa, $2\frac{1}{2}$ —3 lin. lata, pseudobulbi folia non gerentes. — Crescit supra arbores, praecipue in ramis Mangiferae Indicae, in regno Warreensi; fl. Aug.

4. ERIA FILIFORMIS. Huc: *Dendrobium filiforme* R. Wight. Ic. V. 1. (1851) 1642:

Caespitose, pseudobulbs depressed, flattened, suborbicular, netted on the surface; leaves 2—3, ovate oblong, somewhat obtuse, slightly cuspidate; raceme erect, filiform; few, 2—3-to many (10—12) flowered; bracts ovate, acute, longer than the ovary; sepals much attenuated subulate, pointed, dilated at the base, adnate to the process of the column forming a short obtuse saccate spur: petals about equalling the sepals and nearly thrice as long as the narrow ovate lip. Flowers straw colour.

Neilgherries and Jyamally Hills near Coimbatore, on branches of tree Bombay-tay. Bracts more boatshaped, than represented. The Figure of column and lip more highly magnif., than the other dissections.

Huc porro: *D. Dalzellii* Hook. in Hook. Journ. Bot. IV. 292 (1852). *D. fimbriatum* Dazl.

Pseudobulbis caespitosis orbiculatis valde depressis reticulatis epidermide albida, foliis paucis (4—5) linearibus obtusiusculis mucronatis basin versus complicatis, scapo centrali solitario tereti apice florifero folio intimo brevior, bracteis alternis bifariis subulatis ovario sessili triplo longioribus, floribus 10—20 secundis stramineis minutis, sepalis petalisque subaequalibus falcatis acutis patentibus margine glandulis capitatis fimbriatis, labello petalis duplo brevior oblongo basi carnosio etuberculato medio apice margine membranacea lacerata reflexa alba terminato.

Folia suprema (1—2) 3—6 poll. longa, 5 lin. lata, inferiora valde abbreviata. Flores $2\frac{1}{2}$ lin. longi. — Crescit in arboribus ad Ram Ghât; fl. Julio.

On my first gathering this Orchid I thought it was merely a robust variety of *Dendrobium microchilos* (mihi), described in vol. III. of this Journal, but a nearer examination proved it to be a distinct species. The margins of the petals and sepals are beautifully fringed with capitate glands in a double row, while in *D. microchilos* the margin is naked; but the greatest distinction is in the lip, which in *D. microchilos* is fleshy throughout, much narrower towards the apex, and furnished with two tubercles at the base. The habit of both plants is well illustrated by Wight's „Icône, s“ No. 1642, which represents one of them, though I am really unable to say which.

5. ERIA SINICA Lindl. Contr. 48. Huc *Conchidium Sinicum* Lindl. sp. n.: Bentham Flora Hongkongens. in Kew gard. misc. VII. 34.

Foliis membranaceis scapo bifloro subaequalibus, labello serrato, bracteis acuminatis.

This curious little plant forms pale green tufts, which easily escape observation. It is distinguished from *Conchidium pusillum*, Griff., which is *Phreatia uniflora* Wight, by its thin leaves, and very short two-flowered scapes; the lip is moreover very distinctly serrated. (Lindl.)

On bare rocks, on the top of Victoria Peak, flowering in November. It is caespitose, with numerous aggregated pseudo-tubers. Leaves minute, oblong, apiculate, veinless except the midrib, 3—4 lines long, in pairs on each tuber. Scape filiform, about as long as the leaves, solitary on each tuber, bracteate at the top, and having two flowers nearly as large as the leaves, of a dirty yellowish-green, and slightly fetid. Sepals and petals nearly equal, the side sepals broader at the base and cohering with the saccate spur. Column very short and rounded. Anther-case somewhat 3-lobed, imperfectly 4-celled. Pollen-masses 8, cohering by pairs into two sets. (Champ.)

6. ERIA NANA A. Rich. Ann. Sc. nat. nouv. Ser. XI. 1842. 19.

Pseudobulbis nudis ovoideis; foliis saepius binis, membranaceis; inferiori breviori obovali-oblongo obtuso, basi sensim angustato, superiori longiori subacuto; scapo gracili, foliis vix longiori, 2—4 floro; floribus subsessilibus, spicatis, sepalis lineari-lanceolatis, acutissimis, labello unguiculato, sepalis dimidio breviori, arcuato, erecto, columnae approximato lineari-lanceolato, acutissimo, supra unguem dilatato.

In sylvis humidis inter muscos in monte vulgo des Condas Nilgherries. Oct. Perrotet. Affinis *E. pumilae* Lindl., sed glaberrima. Folia tenuia, membranacea, non plicata, sepalia linearia.

§ 2. *Acervata*: Pseudobulbosa foliis coriaceis floribus solitariis laevibus. Inter pseudobulbosas quasi *Callostylis*!

7. ERIA ACERVATA Lindl. Paxt. Fl. G. I. 170. — Journ. Hort. loc. VI. 57. — Walp. Ann. III. 530: diagnosis. — Peculiar the stem when fully formed being nothing more than a collection of pseudobulbs or compressed bodies in form not unlike a flat flask, and piled one over the other in a singular manner. — Flowers white, smooth, slight tinge of green. The foot of the column is neither chambered nor toothed. In all respects this plant is so entirely an *Eria*, that it is referred to that genus, although in the flowers examined the number of pollenmasses was 4, instead of 8. But this may have been accidental. In its three ridged lip, reflexed bracts, it so strongly calls to mind that genus, as to raise a reasonable presumption that the number of pollenmasses would in more perfect flowers be as usual.

§ 3. *Xiphosium* Lindl. l. c. Pseudobulbosae foliis coriaceis floribus spicatis seu racemosis laevibus sublaevibusve.

8. ERIA ROSEA Lindl. B. Reg. 978: Lindl. in Hook. Journ. Bot. VII. 34: Hongkong, on rocks. M. Gough; flowering in January. It is also a Khasiya plant, it being undoubtedly the *Xiphosium acuminatum* of Griffiths Ic. 316.

9. ERIA STELLATA Lindl. B. Reg. 904. B. Mag. 3605.

10. ERIA COCHLEATA Lindl. — Bot. Reg. XXX. 1844. Misc. 23.

Foliis lanceolatis coriaceis 5 costatis, sepalis glabrusculis petalisque lineari-lanceolatis, labello basi costis 5 apice 3 undulatis lineato: lobis lateralibus obtusis intermedio oblongo-spathulato, scapo elongato radicali multifloro ovarioque alte costato cochleari glabris.

Manilla. With very much the appearance of *E. stellata*, from which it differs in having smaller flowers, a smooth scape and a shining ovary with high ribs, which are twisted, so as to have the appearance of a very deep pale threaded screen. Sepals are very green, petals and lip white, the latter painted with crimson veins at margin.

Loddiges imp.

11. ERIA SPECIOSA Rehb. fl. MSS. *Tainia speciosa* Bl. Bjd. *Mitopetalum speciosum* Bl. Mus. Lugd. Bat. II. 185.

12. ERIA BICORNIS Rehb. fl. MSS. *Ania bicornis* Lindl. B. Reg. XXVIII. 1842. Msc. 41

Folio oblongo lanceolato carnosco scapo brevioro, labelli lobo medio emarginato apiculato ecalcarato basi billamellato, lamella altera versus apicem interjecta, anthera bicorni.

Ceylon. coll. Rev. J. Clowes. Flowers green except the lip, which is bright yellow. — Appearance of *Eulophia macrostachya*. — Bot. Reg. XXX. 18448: Labellum cum basi producta columnae articulatam. Anthera bilocularis. — It belongs to a little group of the Epidendrous section, of which *Bletia* is the type, and is nearly allied to *A. latifolia*, a sylhet plant, at present only known from dried specimens; from that it differs in having much smaller flowers and leaves, an entirely different la-

bellum, and a two celled anther, that of *A. latifolia* being eight celled. In the latter circumstance indeed it corresponds with the neighbouring genus *Cytheris*, whose distinctive character is therefore not to be taken from the cells of the anthers, but from its resupinate flowers and truly calcarate labellum. In *Ania* the labellum if it appears to have a spur, as is *A. angustifolia*, owes that appearance to the extension of the foot of the column. — *Bl. Mus. Lugd. Bat. II. 185: Mitopetalum bicorne.*

13. *ERIA ANIA* Rehb. fl. Mss. *Ania latifolia* Lindl. Orch. 130. Huc: *Calanthe viridifusca* Hook. (Bot. mag. t. 4669). Lem. jard. fl. t. 336. — Lindl. in Paxt. Fl. 9. III. 118. Gleanings N. 591: Assam, Sylhet. Nearly allied to *Bletia* and *Phajus*, from which the spur on the one hand, and the three-lobed lip accompanied by a 6—8 celled anther distinguish them on the other. — By some oversight that now mentioned has been referred to *Calanthe* in *B. Bot. 4669.*

Rehb. fl. in Bonpl III. 250. *Ania latifolia* Lindl.? Ein einziges Exemplar mit verwelkten Blüten und ohne Antheren. Hongkong. Hance! — Lindl. in Hook. Journ. of Bot. VII. 35: Major Champion states that this or an allied species grows on the island; but he has preserved no specimen.

14. *ERIA WIGHTII* Rehb. fl. Mss. Huc: *Ania latifolia* Lindl. Wight. Ic. Pl. Or. 1844. Vol. III. II. 914. — Not having the original drawing by me, I am at present unable to give the station of this plant, but believe Pulney mountains. I suspect it is not the species described by Dr. Lindley, differing as it does so materially in the character of the lip and its lamellae, neither do I feel quite certain that the structure of the anther case is the same as in his, but as I have not the specimen at hand to ascertain that point by examination, I am for the present compelled to leave the matter in a state of uncertainty. — Huc: *Mitopetalum Wightii* Bl. I. c.

15. *ERIA BARBATA* Rehb. fl. Mss. *Tainia barbata* Lindl. Gardn. Chronicl. (Erioidea Griff.)

16. *ERIA PAUCIFOLIA*. Huc *Mitopetalum plicatum* Bl. Mus. Lugd. Bat. II. 185. *Octomeria paucifolia* Kuhl V. Hass. Tab. XI. — Huc: *Tainia fimbriata* Tejsem. et Binnend. Naturh. Tijdsch. Neederl. Ind. V. 1853.

Foliis ovalibus acuminatis longe petiolatis membranaceis plicatis, scapis lateralibus spicatis 8—14 floribus; phyllis perigonii oblongis acutiusculis, labelli trilobi lobo medio obovato acute crenato intus lineato fimbriato lateralibus acuminatis.

Salak.

§ 4. *Dendrolirium*: Pseudobulbosae foliis coriaceis, spicis tomentosis.

17. *ERIA ORNATA* Lindl. G. et Sp. Orch. 66: Huc: *E. armeniaca* Lindl. B. Reg. XXVII. 1841. Misc. 70:

Pseudobulbis ovatis compressis triphyllis, foliis oblongo-lanceolatis coriaceis laevibus, racemo tomentoso radicali basi vaginato stricto foliis aequali vel longiore, foliis scapi bracteisque lanceolatis acuminatis subcoriaceis (armeniacis), labelli lobis lateralibus dentiformibus intermedio rhombeo crispo; lamellis 3 rectis haud crispatis lateralibus abbreviatis divergentibus intermedia versus apicem labelli producta. Labellum apice rubrum, lamella violacea, laminae pars posterior alba violaceo marginata.

Beautiful. Philippines: island of Negros and elsewhere abundantly: Cuming. Lodd. Its flower stem, 1', bears a great number of large tough apricot-coloured scales and bracts. Flowers are a dull dirty brown, not at all pretty. This is the first of the *Erias* with large coloured bracts, that we have seen; several exist in Java accord. Dr. Blume. The species is near *Dendrolirium ornatum* of the author, but the bracts are not red, nor revolute at the margin, the leaves are not strongly ribbed, nor are the lamellae of the lip at all the same. — Huc: De Vriese Illustr. tab. XVI.

18. *ERIA PROFUSA* Lindl. Bot. Reg. XXVIII. 1842. Misc. 3.

Pseudobulbis ovalibus apice diphyllis, foliis oblongis striatis racemis pubescentibus multifloris brevioribus, bracteis squamaeformibus pedicellis brevioribus, sepalis tomentosis, petalis lineari-oblongis obtusis, labello trilobo laciniis lateralibus erectis laevibus, intermedia subrotunda rugosa apice tuberculo solitario oblongo cristata.

Ceylon, found by Mr. Nightingale, sent to His Grace the Duke of Northumberland. Flowers appear in numerous racemes, nearly a foot long, and are soft with brown down. The labellum is bright light green.

19. *ERIA PULCHELLA* Lindl. in Wall. Cat. 7407. — Bot. Reg. XXVII. 1841. Misc. 106.

Pseudobulbis ovatis stipitatis diphyllis, foliis oblongo-lanceolatis obtusis, racemo lanato erecto terminali et laterali, bracteis ovato-subrotundis patentibus, perianthio explanato subaequali incano, labello subrotundo-ovato apiculato plano medio convexo discolore, basi trilineato.

Rhizoma repens, pennae anserinae crassitudine. Racemi 2" longi. Perianth. luteum intus et extus lanatum. Petala sepalis parum minora. Labellum medio elevatum, fuscum, limbo luteo, subcordatum, apiculatum, planum. Pes columnae luteae rugosus fuscus. — This little species was originally described from a specimen brought from India by Dr. Wallich, who had received it from Mr. Finlayson without a locality. It was then gathered at Singapore by Mr. Cuming, from whom we have some fragments, and it has flowered with Lodd. The flowers are in spikes, which in Mss. Lodd. specimen proceeded from the side of the pseudobulbs, but which also appear to be terminal, they are dull clayey yellow of no great beauty.

§ 5. *Mycaranthes* Rchb. fil. in Bonpl. V. 55: Caulis foliosus. Racemi laterales. Sepala lateralia non obliqua sed recta.20. *ERIA TOMETELLA* Rchb. fil. Mss. Huc *Eria javensis* Zoll. Mor.21. *ERIA OBLIQUA* Rchb. fil. Mss. Huc *Mycaranthes obliqua* Lindl. Bot. Reg.

Foliis lato-linearibus carnosis canaliculatis apice oblique emarginatis scapo brevioribus, sepalis lateralibus carinatis, labelli cuneati 5-lobi callo apicali majore axi pube densa decidua farinam referente vestita.

A fleshy leaved plant from Singapore, with very small white flowers, covered slightly with rusty down. Cuming imp., flw. Loddiges (124).

22. *ERIA STRICTA* Lindl. Coll. Bot. 41. B. Huc: *Mycaranthes stricta* Lindl. in Wight Ic. V. 1851. 1733:

Stem terete: spike secund, dense manyflowered; lip with a scrotiform callosity in the middle: perianth woolly, short; margins of the column winged, introflexed, leaves 1—2 linear lanceolate sessile.

Communicated by Mr. Griffith from Malacca, from Mergui, Assam; Khasia.

§ 6. *Trichosma*: Caulis teres diphyllus. Folia laevia glabra. Spica terminalis pauciflora.23. *ERIA CORONARIA* Rchb. fil. Mss. Huc: *Coelogyne coronaria* Lindl. B. Reg. XXIX. 1841. Misc. 178.

Pseudobulbis teretibus angustissimis diphyllis, foliis lanceolatis acuminatis undulatis coriaceis obsolete trinerviis, racemi pedunculo basi tantum squamato longioribus, bracteis setaceis apice spathulatis, labelli lobis rotundatis lateralibus planis, intermedio undulato, cristae lamellis crispis in lobum intermedium 5 in hypochilium 4 tantum geminatis; clinandrio trilobo, anthera antice rotundata fornicata.

From the Chirree district of the Khoseea hills of India, found by Mr. Gibson for the Duke of Devonshire. It has firm bright green, not shining, leaves of a leathery

texture and very pale greenish yellow flowers, whose lip has a yellow centre, and a border beautifully streaked and spotted with crimson.

Huc porro B. Reg. XXVIII. 1842. 21 :

TRICHOSMA Lindl.

Sepala patula, aequalia, lateralibus basi producta columnae pedi adnata. Petala conformia, erecta. Labellum trilobum, cristatum, cucullatum, cum pede columnae articulatum. Columna carnosa, marginata. Anthera carnosa, fornicata, bilocularis, valvis verticalibus margine sphaclatis. Poll. 8, quaternatim cohaerentia, duobus cuique phalangi minoribus difformibus. Epiphyta, ebulbis, caule squamis verrucosis vestito diphylo. Folia subcarnosa petiolata. Spica terminalis, basi spathacea.

Differs from *Coelogyne* in the projecting foot of the wingless column, in the singular fleshy anther and in the 8 pollens. It is more nearly allied to *Ceratium*, but the genus according to Blume has a two celled anther, 4 of the pollenmasses very small, a siliqueous fruit, and the inflorescence opposite the leaves. Indeed as it is described as caulescent, with sessile lanceolate coriaceous leaves, it seems to be altogether a different kind of plant.

Trichosma suavis Lindl. l. c.

Columna semiteres, carnosa, marginata. Anthera carnosa, antice prociens rotundata, fornicata, bilocularis, valvis verticalibus, margine nigrosphaclatis. Poll. 8, cereacea, libera, quaternatim cohaerentia; duobus cuique phalangi ovalibus, duobus cuneatis emarginatis.

Leg. Gibson: Chirra district of the Khoseea, and grows upon trees in densely shaded woods near the summit of the hills.

24. ERIA EPHEMERA Rchb. fl. Huc: *Eria bicolor* Lindl. in Contributions to the Orchidology of India pag. 58. — *Dendrobium bicolor* Lindl. (Jam exstat et *Eria bicolor* Lindl. Orch. pag. 65 — imo etiam cingalensis, sed racemosa!)

25. ERIA PAUCIFLORA R. Wight Ic. V. 1. 1851. 1636.

Caespitose, stems erect, succulent, joints thickened at the apex, with a leaf at each joint, last joint thickened, tuberous, surmounted by two leaves, from between which rises the short 1- or 2 flowered raceme: leaves ovate, oblong, obtuse; flowers longish pedicelled: sepals about equal or slightly longer, than the narrow linear petals: lip somewhat corrugated furnished with 2 lamellae near the base. Flowers white.

Growing on moist rocks, forming dense masses exposed to the spray of the river below the Kaitie Falls, Neilgherries. Flowers Aug. Sept. Stems become like pseudobulbs at the apex.

26. ERIA NUTANS Lindl. — Bot. Reg. XXVI. 1840. Misc. 196.

Caule tereti folioso, foliis oblongis undulatis substriatis basi canaliculatis, flore campanulato solitario terminali nutante glabriusculo, bractea plana patente carnosa subrotundo-ovata, sepalis lateralibus duplo latioribus basi rotundatis apice petalisque obtusis, labelli trilobi lobis lateralibus erectis, intermedio transverso carnoso, apiculato: linea una per axin producta infra apicem interrupta et magis elevata, duabus lateralibus abbreviatis prope sinus.

Flower white, beneath it a roundish ovate flesh coloured thick bract. The tip of petals and labellum is yellow. Singapore. Cuming. Loddiges. (129).

§ 7 *Cylindrolobus* (nec Lindl. nec Bl.): Caulis foliosus. Folia laevia glabra. Racemi seu spicae oppositifoliae pauciflorae.

+ *Tonsus*.

27. ERIA MUCRONATA Lindl. — Bot. Reg. XXVIII. 1842. Misc. 27.

Caulibus elongatis flexuosis, foliis distichis lineari-lanceolatis acuminatis, floribus solitariis glabris oppositifoliis, bracteis 3—5 ovato-lanceolatis patentibus coloratis, sepalis petalisque ovatis erectis, labelli subrotundi 3 lobi lacinia intermedia ungue scopulifero, lamellis 3 membranaceis integerrimis quarum intermedia in mucrone libero abit, lateralibus abbreviatis.

Habit of *Dendrobium chrysanthum*. Singapore, Cuming. Leaves are long, fleshy, finely acuminate, deep green. Flowers are white, with a faint tinge of pink, deliciously sweet like violets, and produced singly opposite the leaves, on stalks about half an inch long, covered with dull red spreading bracts. — The intermediate lamella extended into a short horn, which runs up from the surface of the lip a little below its apex. On the foot of the lip is placed a small brush consisting of numerous fine yellow glandular hairs. In addition to the usual number of pollenmasses are a few extra of very small size.

++ *Lunatus*.

28. ERIA PANNEA Lindl. — Bot. Reg. XXVIII. 1842. Misc. 79.

Ebulbis, foliis distichis pugioniformibus, scapo unifloro (?) dense lanato quasi panneo longioribus, sepalis lateralibus triangularibus supremo petalisque pluries majoribus, labello lanceolato acuminato carnosopubescente disco farinaceo.

Singapore imp. Lodd. (252). It has narrow dagger-shaped leaves of a pale yellow green, and a single greenish-yellow flower, woolly on the outside, and seated on a short scape covered with whitish cloth-like substance. The label is purplish slightly hairy, and has a broad patch of a mealy hairiness a little below its point.

§ 8. *Trichotosia* Bl. Mus. Lugd. Bat. II.: Praecedens, sed ipsa folia vulpino pilosula.

29. ERIA FEROX Blume Mus. Lugd. Bat. II. huc: *Trichotosia ferox* Bl. De Vriese Illustr. tab. 9 et tab. 11. 5.

30. ERIA CILIATA Miq. Ind. bat. „1856“. Huc: *Trichotosia ciliata* Tijsm. et Binnen-dijk. Naturk. Tijdsch. Nederl. Ind. V. 1853.

Caule elongato ad insertiones foliorum pilis ferrugineis annulatis, foliis alternis lanceolatis acuminatis carnosis rufo-ciliatis, utrinque pubescentibus subtus punctatis, phyllis perigonii exterioribus rufo pilosis apicibus carinatis, int. linearis (ibus?) membranaceis, labelli limbo erecto emarginato.

Salak.

31. ERIA VULPINA Rehb. Bl. in Bonpl. III. 222.:

Aff. *E. vestitae* Lindl., labelli ungue lineari lamina longiori, lamina obtuse quadrata basi utrinque unidentata, tuberculo in basi ante unguem. Caulis calamum anatinum crassus. Vaginae uti folia. Bracteae, pedunculus, ovarium, sepala rufo pilosa. Folium oblongum acutatum nervosum quinque pollices longum, duos latum. Pedunculus ultra bipollicaris. Bracteae oblongae acutiusculae (cymbiformes?), ovariis tertia breviores. Sepala in saccum obtusum elongata. Tepala lineari falcata. Labelli unguis supra apicem pedis gynostemii brevissimi adnatus.

2071. Cuming. Phil.

32. *ERIA VELUTINA* G. Lodd. in litt. — Bot. Reg. XXVI. 1840. Misc. 209.

Caulis tereti velutino, foliis distichis carnosius ovato-lanceolatis margine revolutis junioribus utrinque velutinis adnatis supra glabris, flore solitario oppositifolio inter squamas herbaceas obtusas villosas sessili, sepalis petalisque linearibus apice recurvis extus hirsutis, labello cuneato elongato canaliculato apice rotundato subtrilobo supra pubescente inappendiculata.

Singapore. Cuming. Loddiges. It has pale dirty yellow flowers growing singly among hairy bracts opposite the leaves. It is probable, that Wallich's *Dendrobium vestitum*, of which I have only seen fragments of flowers, is a species of *Eria* allied to this, and it is certain, that among the distributed specimens of that plant are branches of the present species without flowers.

Huc: Regel in Sem. bot. petrop. 55: Caulis elongatus foliis bracteis floribusque velutino-pilosis. Folia disticha, oblongo-lanceolata, utrinque attenuata, sessilia, obtusiuscula, $2\frac{1}{2}$ — $3\frac{1}{2}$ pollices longa, $\frac{3}{4}$ —1 pollicem lata, obscure viridia. Racemi oppositifolii, foliis multoties breviores, erecti, paucillori, bracteis subrotundis herbaceis muniti. Flores parvi, luteo-brunnei, sepalis erecto-patentibus, lanceolatis, obtusiusculis, vix $\frac{1}{2}$ lineam longis, lateralibus subfalcatis, basi cum pede columnae connatis, calcar obtusum aemulantibus; petalis lineari-ligulatis, obtusis, sepalis minoribus; labello cuneato-oblongo, apice obtuso, supra lineis duabus conniventibus pilosis notato, petalis brevioribus. Columna semiteres, aptera, basi longe producta. Anthera terminalis, bilocularis. Pollinia 8.

33. *ERIA FERRUGINEA* Lindl. — Bot. Reg. XXV. 1839. 35.

Caulibus teretibus articulatis vaginatis, foliis oblongis obtusis, racemo erecto laterali multifloro basi squamato, bracteis ovatis acutis ovario villosissimo brevioribus, labelli lobis lateralibus erectis truncatis, intermedio ovato serrato subplicato: disci cristis 4 dentatis, intermediis carnosius incurvis.

Sepala viridia, petala et labellum et gynostemium alba roseo picta. — Calcutta. Loddiges imp.

34. *ERIA VESTITA* Lindl. — *Dendrobium vestitum* Walfl. Cat. 2005. L0. 33. — Bot. Reg. XXX. 1844. Misc. 79.

E. caulibus pendulis villis deciduis dense vestitis, foliis coriaceis lanceolatis apice obliquis obtusis integris supra parce, subtus densissime villosis, racemis elongatis multifloris flexuosis bracteis ovatis coriaceis persistentibus floribus capsulisque villosis, sepalis lanceolatis lateralibus in cornu obtuso porrecto connatis mucronulatis, petalis conformibus obtusis brevioribus glabris, labelli trilobi laciniis lateralibus obtusis, intermedia subrotunda crispa emarginata pilosa per axin linea elevata interrupta velutina dentibusque paucis aucta, lamellis 7 quarum duae lanceolatae sinus fere attingentes et quinque parvae dentiformes.

Structure of a woolly *Eria*, habit of a pendulous *Dendrobium*. A native of Indian Archipelago. Wallich's collection had it from Singapore, Cuming sent it from Manilla (?). It is singularly clothed with a thick reddishbrown hairiness. The flowers are reddishbrown externally, white inside, and hang down in pendulous spikes, which are longer than the leaves.

Bot. Reg. XXXI. 1845. 2. — Philippines: „Lagune“ in a [small flowered state: Cuming. (Perigonium intus albidum, labelli lamina medio flava, perigonium extus minutum.)

§ 9. *Eriura* Lindl. l. c.: Caulis foliosus. Folia glabra. Racemi laterales floribus extus lanatis, labello per axin furfuraceo, apice seu apice et basi tuberculato.

35. *ERIA PANICULATA* Lindl. in Wall. Pl. As. rar. Vol. 1. p. 32. t. 36. — Bot. Reg.

XXVIII. 1842. Misc. 33. — Flow. Lodd. Had exactly the appearance of Dr. Wallich's figure with long narrow taper pointed leaves and panicles of small greenish flowers slightly freckled with purple. They have a line of fine white powder formed all along the middle of the lip, and burrying the tubercle, which occurs at the base. This powder consists of a vast multitude of pyriform bodies visible only under the microscope, and of the same nature as those which occur on *Polystachya*. They are in fact extremely short hairs of one joint tapering to the base; in appearance they resemble fine powdery dust.

§ 10. *Hymeneria* Lindl. l. c. et *Urostachya* l. c.: Caulis foliosus. Folia glabra. Racemi laterales floribus extus calvis seu subcalvis. Labellum non furfuraceo-callosum.

36. ERIA RINGENS Rehb. fil. in Bonpl. 222.:

Aff. *Eriae pubescenti* Wight., glabra, bracteis ovatis acutis, labelli ungue brevissimo, lamina oblonga acuminata basi rotundata, gynostemii androclinio utrinque semiovato brachiato, angulis anticis medio omnino mucicis. Caulis carnosus bulbosus (cylindraceus? planus?), siccus dimidium pollicem latus. Folia oblongoligulata basi cuneata, apice inaequali acuta, tres quatuorve pollices longa, unum pollicem lata. Spicae oppositifoliae duos tresve lineas longae apiculatae reflexae ovariis pedicellatis subaequales. Perigonia longiuscula (tres lineas longa); glaberrima. Mentum obtusum. Sepala et tepala lancea acuta!

2129 Cuming. Phil.

Obs. Haec species ab ill. Lindley in Contrib. to the Orchidology of India refertur ad *Eriam* ovatum Bot. Reg. Vidi specimen *Eriae* ovatae in herbario Lydleyano et habeo etiam ejusdem auctoris analysin depictam. Plantae meae labium ovatum acuminatum laeve, planta Lindleyanae oblongum subtrilobum apiculatum, carina obliqua utrinque in basi.

37. ERIA PUBESCENS Bot. Reg. Wight Ic. V. 1. 1851 1634. — (*E. polystachya* in Icon) Stem leafy, short, clothed at the base with sheathing scales: leaves lanceolate tapering at both ends, acute, marked with strong longitudinal veins: racemes slender, drooping; rachis and pedicels pubescent, flowers resupinate, bracts as long as the pedicels, lanceolate acuminate: sepals and petals a little longer than the lip, glabrous, falcate, attenuated towards the point, threenerved: lip oblong, threenerved, subcoriaceous at the base, contracted in the middle; limb lanceolate, acute, margins membranous reflexed. Flowers white, perianth tipped with pink. — Western slopes of the Neilgherries, flowering in Aug. et Sept. — Very nearly all. to the next (*polystachya*).

38. ERIA POLYSTACHYA A. Rich. — Ann. sc. nat. nov. Sr. XI. 1841. p. 20. tab. 9.:

Caulis brevi incrassato pseudobulbiformi subtereti, basi laxè vaginato; foliis subterminalibus, membranaceis, elliptico-oblongis, acutis, venosis basi vaginantibus; floribus albis, pedicellatis, spicatis, bracteatisque; spicis axillaribus, foliorum longitudine aut paulo brevioribus, bracteis ovalibus longe acuminatis, pedunculi longitudine, sepalis externis pubentibus, acutis; internis tenuissimis trinerviis, oblongo linearibus, obtusis; labello breviori, oblongo integro, subcanaliculato, acuto, basi interne bicristato.

Crescit supra arbores et saxa in sylvis humidis et umbrosis circa Neddoubetta. Sept. Neilgherries Perrotet. — Diff. ab *E. flava* florib. minoribus, labello elongato, prope integro.

Huc: *Eria polystachya* Ach. Richard. Wight Ic. V. 1. (1851) tab. 1635. — *E. pubescens* in Ic.). — Stem thickened, pseudobulblike at the base, loosely sheathed; leaves terminal, from oblong elliptical acute to obovate-elliptical, somewhat obtuse,

glabrous: spikes axillary, about the length of the leaves, erect, clothed with short pubescence, bracts lanceolate acute: sepals ovate, attenuated at the point; pubescent, exceeding the lanceolate petals: lip ovate lanceolate, about half the length of petals. — Neilgherries, western slopes, flowers in August. Septb. — Lip in analysis should be only half the size.

39. *ERIA FLORIBUNDA* Lindl. Wall. Cat. n. 7408. — Bot. Reg. XXIX. 1843. Misc. 56.

Caulibus carnosus subflexuosis teretibus, foliis lanceolatis acuminatis, racemis oppositifoliis patulis multifloris pubescentibus foliis brevioribus, bracteis defloratis ovatis concavis retrorsis, sepalis triplo latioribus, labello angusto nudo basi saccato: laciniis lateralibus ascendentibus abbreviatis intermedia cuneata tridentata,

A caulescent species, with lanceolate leaves 7—8". The flowers are small, pink, smooth, in close spreading racemes much shorter than the leaves. The column is dark purple at the top. Mr. Prince originally found it at Singapore, and communicated it to Dr. Wallich. Mrs. Loddiges have since received it from the same place through Mr. Cuming. — It is a pretty plant, worth cultivation. — Bot. Reg. XXX. 1844. 20: Labellum basi cyathiforme, melliferum, bidentatum, columnae adpressum, sursum unguiculatum, cuneatum, apiculatum, inflexum, columna paulo brevius. — Along with *E. polyura*, bipunctata, profusa, and some others it forms a small group of species which are very different in habit from such plants, as *E. pannea*, *armeniaca* etc.

Huc. b. var. *leucostachya* Lindl.: *Eria leucostachya* Lindl. Journ. H. Soc. III. 1848. p. XV. xyl. — Paxt. Fl. G. III. 116. Xyl. 286. — Borneo: Sarawak in large masses of trees. Flower spikes not unfrequently from 8—10 inches, each stem has several. — In absence of leaves, there was no means of determining how far it might be distinct from *E. floribunda*: its flower spikes were much more dense, and the flowers were wholly destitute of the pink tinge conspicuous in that species.

40. *ERIA BRACHYSTACHYA* Rehb. fl. in Bonpl. III. 223.

Caule ac foliis prope *Eriae* paniculatae Lindl., spicis oppositifoliis plurimis abbreviatis, bracteis lanceolatis acutis ovaria glabra aequantibus superantibusve, labello cuneato flabellato, antice trilobo, lobo medio semiovato acutiusculo, lobis lateralibus obtusangulis, carinulis geminis curvato divergentibus a basi in medium, carina per discum lobi medii tomentosi.

Caulis adest spithamaeus. Folia lineari-lanceolata acuminata, subcoriacea apice inaequaliter bilobula, quatuor sive quinque pollices longa, quatuor lineas lata. Pedunculi semipollicares tenues, quadri-quinqueflori, Bracteae pergameneae. Flores illis *Eriae* profusae duplo majores, glabri. Mentum modicum obtusum. Sepala ovato lanceolata. Tepala duplo angustiora. Labellum sepalis brevius. Gynostemium brevissimum apice antice trilobum. 2063. Cuming. Phil.

41. *ERIA CONVALLARIOIDES* L. O. 70. — Bot. Reg. XXVII. 1841. 62.

Caulibus compressis junioribus dense et laxè vaginatis, foliis oblongo lanceolatis multinerviis, racemis densissimis oblongis cernuis breviter pedunculatis, floribus subglobosis leviter pubescentibus, labello subcordato ovato acuto inappendiculato. — Perigonium album.

Lodd. It has small whitish flowers, collected in close heads in the axils of broad striated leaves; they have no smell, and the species proves much less pretty than was expected. The specific characteristic L.O. 70. made up chiefly from bad Indian drawings considered correct, especially as regards the flowers, destituted of hairs and the lip which is entire, and not 3-toothed. I also find that the anther is not dorsal, but merely contracted towards the back of the column, so as to expose the pollenmasses. The name *convallarioides* is unfortunate, for it can only bring to mind in India the

sweet Lily of the Valley of Europe and it is libel on the latter to compare it with this species. — Bot. Reg. XXVII, 1841. Misc. 121.

β. *major* Lindl. Bot. Reg. 1847. t. 63. Caulibus duplo majoribus spicis longius pedunculatis, floribus clausis globosis.

42. ERIA MULTIFLORA Lindl. Gm. et Sp. Orch. p. 68. — Bot. Reg. XXIX, 1843. Misc. 72.

Caulibus teretibus clavatis 2—3-phyllis, foliis lineari-lanceolatis canaliculatis, spicis multifloris, bracteis minimis sphacelatis, floribus pubescentibus, labello cuneato-obovato indiviso basi excavato nectarifluo supra foveam dentibus 2 membranaceis erectis aucto.

A rare little plant, from Mr. Van Houtte of Ghent, who received it from Java. It has small white flowers, covered externally with fine down. The only coloured part is the column, which is deep violet. In habit it resembles a small specimen of *Eria floribunda*.

43. ERIA BRACTESCENS Lindl. — Bot. Reg. XXVII, 1841. Misc. 46. — Bot. Reg. XXX, 1840. T. 29.

Pseudobulbis brevibus ovatis apice subdiphyllis, foliis oblongis undulatis racemis subaequalibus, bracteis margine revolutis superioribus linearibus reflexis, racemis erectis, labelli trilobi lamellis duabus abbreviatis intermedia producta lobo medio truncato rugoso obtuse apiculato.

Singapore. Loddig. imp. (214). — Erect racemes of delicate straw-coloured flowers, and is readily distinguished by its large bracts. It is nearly allied to *E. flavescens*. The same plant has been found in Burmea by Mr. Griffith, from whence I have specimens, no 1055. It is rather pretty, but not strikingly handsome.

Huc: ERIA DILLWYNI Hook. Bot. All. 4163. — Bot. Reg. XXXI, 1845. Misc. 67.

Pseudobulbis oblongis laevibus 2—4 phyllis, foliis oblongis racemis subaequalibus, bracteis membranaceis oblongis obtusis reflexis, racemis erectis, petalis sepalisque erectis, labello trilobo basi lamellato, lobo medio obtuso rotundato 5 lamellato.

Philippines. Cuming. — Habit of *E. long*: labris. Profuse flowerer: two spikes of flowers on each of 8 pseudobulbs.

44. ERIA OVATA Lindl. — Bot. Reg. XXX, 1844. sub 29.

Foliis oblongis obtusis basi angustatis, racemis pubescentibus multifloris, bracteis parvis ovalibus reflexis, sepalis petalisque acuminatis, labello ovato-oblongo indiviso basi bicalloso.

This plant found in the Philippines by Mr. Cuming, evidently differs from the three others in the shape of the lip, which has no lobes, but an ovate-oblong form and a couple of little diverging plates near the base. It is nearest to *E. longilabris* in general appearance.

45. ERIA LONGILABRIS Lindl. — Bot. Reg. XXVII, 1841. Misc. 69. — Bot. Reg. XXX, 1844. sub 29 et in Tab. 29 fig. 3.

Eriae bractescensis facie sed sepalis petalisque magis acuminatis, labelli trilobi lamellis tribus ad apicem fere productis aequalibus lateralibus abbreviatis lobo medio ovato acuminato.

Panay in the Phillip., whence it was sent to Msr. Loddiges by M. Cuming, Bears more flowers, than *E. bractescens* and is distinguished at once by its lip.

46. ERIA OBESA Lindl. Wall. Cat. 1926. LO. 15. — Bot. Reg. XXX, 1844. sub 29.

Caulibus crassis ovalibus, sepalis petalisque lanceolatis acutis subglabris, labelli trilobi ecallosi lobis lateralibus obsolete rotundatis: intermedio ovali retuso, racemis paucifloris pubescentibus, bracteis ovatis lanceolatis pedicello capsularum longissimarum vix aequalibus.

Martaban Wallich impf. ex. — Moulmein and Merg in Griffith. — Pseudobulbous stems are

27" long; the bracts ovate, reflexed, greenish dull purple; the flowers white with a tinge of pink and a yellow lip; they are arranged in short spreading racemes.

47. *ERIA CLAVICAULIS* Wall. in litt. — Bot. Reg. XXVI. Misc. 220.

Caulibus clavatis, foliis lanceolatis acutissimis, bracteis ovato-oblongis concavis recurvis, floribus glabris, sepalis lateralibus triangularibus acutis, dorsali petalisque subaequalibus ovalibus subundulatis, labelli trilobi lobis lateralibus ascendentibus rotundatis, intermedio oblongo supra carinato tomentoso infra sinus 2 tuberculato.

White. Its lip is downy along the middle, and all over the central lobe, and is bordered with pink round the lateral segments. Dr. Wallich sent it to Mr. Loddiges.

48. *ERIA PLANICAULIS* Wall. — Bot. Reg. XXVI. 1840. Misc. 4.

Caule compresso folioso erecto, foliis coriaceis aveniis obtusis emarginatisque, floribus glabris intra bracteas siccas striatas subsessilibus, labello reniformi supra unguem bicalloso, petalis linearibus, sepalis ovatis acutis multo angustioribus.

Forwarded by Dr. Wallich from the East Ind. Comp. Botanic Garden Calcutta 1838.

Flowers cream-coloured, produced in a recurved massy cluster at the extremity of the stem, nearly concentrated by the brown scales and bracteas in which they are enveloped.

49. *ERIA PUMILA* LO. p. 68. — Bot. Reg. XXIV. 1838. Misc. 147.

Foliis anguste lanceolatis acuminatis, caulibus teretibus erectis subaequalibus, spicis capitatis lateralibus subsessilibus, ovario villosa, sepalis petalisque ovatis acutis basi tantum pilosis, labelli trilobi basi bilamellati pubescentis lobis lateralibus subulatis patentibus, intermedio quadrato bilobo apiculo interjecto.

Loddig. flowered it, who received it without name from the Bot. Gard. Calcutta. It has small capitate flowers, membranous and slightly tinged with pink: the horns of the labell, the column and anther being also pink. It was originally described in the above work from bad and broken dried specimens and is stated to have the middle lobe of the labellum ovate; but in reality that part is two-lobed with an intermediate point each lobe being ovate.

50. *ERIA BIPUNCTATA* Lindl. — Bot. Reg. XXVII. 1841. Misc. 179.

Caulibus ovalibus compressis, foliis lanceolatis acuminatis 11-nerviis, racemis axillaribus cylindraceis multifloris, bracteis ovatis acuminatis reflexis, alabastris globosis, sepalis petalisque ovatis obtusiusculis, labelli trilobi laevis laciniis lateralibus intermedio carnosio convexo rotundato angustioribus.

Chiaral distr. of the Khosea hills in India, Gibson. — Duke of Devonshire. Flowers of a *Liparis*, foliage of an *Eria* so far as general aspect goes. The stems are flat, oval, partially covered by the sheathes of fallen leaves, when full blown between two and 3 inches long, at first they are green, but they become, when old, of a light purplish brown colour. The leaves in size and form are very like those of *Eria floribunda*; to which this species is nearly allied. Flowers are arranged in cylindrical drooping racemes rather shorter than the leaves; they are perfectly free from downiness, except just at the base of the raceme, and are about the size of a grain of pepper, very pale, yellowish white, with the tip of the column purple, and the point of the labellum deep yellow, by which means the flowers seem as if they had two spots upon them, when they are looked at from the front.

51. *ERIA ACUTIFOLIA* Lindl. — Bot. Reg. XXVIII. 1842. Misc. 32.

Caulibus oblongis abbreviatis, foliis lanceolatis coriaceis acutissimis scapi longitudine 2—3" longis, racemo erecto (5—6) paucifloro pubescente, bracteis oblongis reflexis floribusque glabris, labelli lobis acutissimis erectis intermedio oblongo obtuso concavo glabro: venis tribus elevatis carnosis, clinandrio profunde excavato.

A small unattractive species imported from India by Msr. Loddiges (n. 209). — Flowers of a dirty white, with violet veins. The lip has a purple base, and a dull yellow tip. Classed near *E. clavicaulis*.

52. *ERIA POLYURA* Lindl. — Bot. Reg. XXVII, 1841. Misc. 114. — Bot. Reg. XXVIII, 1842. 32.

Caule elongato folioso, foliis lanceolatis acutis patentibus striatis, spicis oppositifoliis multifloris nutantibus foliis aequalibus v. brevioribus, bracteis ovario duplo brevioribus, adpressis, petalis sepalisque ovatis acutis erectis laevibus, labello cordato ovato acuto basi bicarinato.

Manilla. Cuming. Lodd. — Flowers small, white, lip deep crimson yellow at the point. However graceful in consequence of every leaf producing a long drooping spike, from the opposite side of the stem. Near *E. multiflora* and *micrantha*.

1369. **DENDROBIUM** Sw.

Nov. Act. Ups. VI. t. 5. f. 5.

Generis nuper ab ill. Lindley in „Contributions to the orchidology of India“ redacti supplementa edo, quae ad annum 1855 post edita genera et species Lindleyi nova edita sunt mutatis quidem mutandis in ordine.

Sect. I. *APORUM* Lindl.

Folia equitantia.

1. *DENDROBIUM MICRANTHUM* Lindl. Contr. Orch. p. 3. — *Aporum micranthum* W. Griff. Calcutt. Journ. IV. 1844, 276 :

Foliis spatuliformibus acutis, floribus solitariis terminalibus, sepalis lateralibus reflexo-revolutis, petalis anguste linearibus, labello porrecto trilobo intus processu carnoso truncato, lobo centrali erecto bilobo lobis crenulatis.

Hab. Insula Penang. — Planta rubro tincta. Caules spithamei aggregati. Folia subuncialia, fere verticalia. Flores minuti, inconspicui, viridescenti albidis, postici. Pedicelli solitarii, e paleis erumpentes, longiusculi. Sepala oblonga, subacuta. Petala multoties angustiora. Labellum albidum, cum pede columnae continuum, sublingulatum, lobo centrali erecto. Appendix (vel processus) carnosa lamelliformis basin lobi centralis versus praemorsa. Columna semiteres, pede longe curvato. Rostellum truncatum. Clinandrii brevis dens posticus minimus. Pollinia 4, oblonga per paria collateralia. — Penang intr. Lowes, Assist. Resid. in May. Flow. July. No beauty. The smallest flowered species of the genus I am acquainted with, and appears abundantly distinct.

2. *DENDROBIUM NATHANIELIS* Rehb. fil. MSS. in Schill. Cat. Orch. ed. 3. 1857 p. 26: Huc: *Aporum cuspidatum* Wall. in litt. — Bot. Reg. XXVII, 1841. Misc. 7.

Foliis lanceolatis, floribus solitariis axillaribus, labello emarginato apice crispo per medium obsolete bilineato.

A plant of no beauty, with the habit of *Aporum anceps*, but with much smaller flowers. It was sent by Dr. Wallich to Msr. Loddiges with the name it now bears.

3. *DENDROBIUM ANCEPS* Roxb. Ind. 497. (Sw. Act. Holm. 1800 p. 26?) Lindl. B. R. 1239. Bot. Mag. 3068. — Perigonium flaveolum basi sepalorum lateralium rubella. Alabastra multum rubra.

4. *DENDROBIUM ALOEFOLIUM* Rehb. fil. MSS. Huc: *Oxystophyllum macrostoma* Hasskarl, Tijdschrift voor Naturligre Geschiedniss X. 1. 122. (*Macrostomium aloefolium* Blume.)

5. *DENDROBIUM LEONIS* Lindl. — Huc: *Aporum Leonis* Lindl. — Bot. Reg. XXVI. 1840. Misc. 126. — (*A. indivisum* L.O. 70. nec Blumii).

Foliis coriaceis ovatis vel brevissime cultratis obtusis, floribus solitariis terminalibus, labello lineari-oblongo emarginato ecristato apice ciliato-dentato et minutissime pubescente.

Singapore, found by Mr. Prince, who comm. it to Wallich with a rude drawing, upon which it was admitted by me into the L.O. as synon. with *A. indivisum* of Dr. Blume. It having lately been brought home from the same place in a living state by Mr. Cuming, under the name of „Lions mouth“ and Msr. Loddiges having sent it to me in flower, I am now able to state, that it is in reality a species distinct from that of Blume, in its labellum not having a transverse crest, and probably in other circumstances. It has therefore received a name in allusion to that just mentioned, which has arisen from a fancied resemblance between the reddish brown ringent flower and the narrow blunt undivided lip, which are compared to the jaws and tongue of a lion. However, notwithstanding this high sounding comparison, the plant is of no beauty.

6. *DENDROBIUM SINUATUM* Lindl. — Huc: *Aporum sinuatum* Lindl. — Bot. Reg. XXVII. 1841. Misc. 3.

Foliis lanceolatis aequilateris approximalis acutis, floribus solitariis axillaribus, labello cuneato elongato intra apicem linea hippocrepica crassa sinuata circumdato.

Singapore. Cuming. — Habit of *A. anceps*, but its leaves are much narrower and longer, and the flowers are pale yellowish green. Loddiges (132).

7. *DENDROBIUM COMPLANATUM* All. Cunn. — Bot. Reg. XXV. 1839. Misc. 36. — An epiphyte growing in tufts. It has a flattened base and cultriform, distichous leaves; the whole plant although healthy, is of a yellow green colour. On dead trees in shaded woods, at Moreton Bay. 1828. Flowers not seen. New South Wales. All. Cunn.

8. *DENDROBIUM CARNOSUM* Rehb. fil. MSS. — *Oxystophyllum carnosum* Bl. Tab. 38. Bijdr. 336.

9. *DENDROBIUM RIGENS* Rehb. fil. MSS. — *Oxystophyllum rigidum* Bl. Bijdr. 1. c. 336.

Sect. II. *STRONGYLE* Lindl. 1. c.

Folia teretia.

12. *DENDROBIUM TERETIFOLIUM* R. Br. Prodr. Nov. Holl. 333. Huc. B. M. 4711. Huc:

Dendrobium calamiforme G. Lodd. — Bot. Reg. XXVII. Misc. '26.

Caule repente annulato, foliis teretibus pungentibus, racemo laxo terminali folio brevior, bracteis minimis, sepalis petalisque erectis acuminatissimis, labello trilobo lineari lanceolato: lobo medio setaceo acuminato crispato: lamellis axeos 3 membranaceis planis versus apicem crispis.

A pretty and graceful Epiph. New Holland. Loddig. imp. Leaves 8" long. The flowers are seated on foot stalks nearly an inch in length, including the ovary, and a light yellow or cream colour, with the base stained with purple. The labellum is purple beautifully crisped and spotted towards the upper end.

13. *DENDROBIUM STRIOLATUM* Rehb. fil. in Otto Hbg. Gtz. 1857. 313. Huc Lindl. B. Reg. XXV. 1839. Misc. 29.:

Dendrobium teretifolium R. Br. Prodr. N. Holl. — Well defined by Dr. Brown. Small creeping species with deep green fleshy taper leaves, 2—3" long, solitary flowers of a dull yellow, streaked and spotted with dull purple; the labellum is white.

14. DENDROBIUM CANALICULATUM R. Br. Prodr. 333.

15. DENDROBIUM TERES Lindl. — Bot. Reg. XXVI. 1840. Misc. 111.

Caulibus gracilibus glabris, foliis carnosis teretibus obtusis, racemo terminali nudo, bracteis coriaceis spathaceis, floribus semiclausis longe cornutis, sepalis petalisque erectis acuminatis, labello cuneato apice truncato serrulato longius cuspidato: venis tribus pone apicem subcristatis; columna versus basin dente deflexo aucta.

Sincapore. Lodd. imp. Leaves of *Vanda teres*. Slender plant, with the leaves of *Vanda teres*, whitish fragrant flowers in terminal naked racemes. Lip is deeply stained with orange inside near the apex.

16. DENDROBIUM ACICULARE Lindl. — Bot. Reg. XXVI. 1840. Misc. 188.

Caule basi conico angulato sursum tereti, foliis acicularibus, flore solitario? terminali galeato, labelli postici trilobi per medium tricarinati lobis lateralibus rotundatis antice et intermedio ovato serrulatis.

Little species with the base of the stems angular and conical, while the whole of the upper part suddenly tapers and becomes very slender. It bears about 3 acicular leaves, from the axil of the uppermost of which springs the short peduncule, bearing at its end a cluster of small dry scales, from which proceed a single yellowish flower slightly tinged with pink. — Sincapore. Cuming. Loddiges (174).

17. DENDROBIUM JUNCEUM Lindl. — Bot. Reg. XXVIII. 1842. Misc. 41.

Caulibus fusiformibus erectis apice ramosis, foliis teretibus acutis pungentibus, pedunculis terminalibus bifloris, sepalis obtusis, labellii trilobi lobo medio rotundato emarginato subundulato disco scabro.

Sincapore. Lodd. (356 *). — Rather large green flowers with faint purple veins on the side lobes of the labellum. Stems fusiform, erect and branched above the swelling; many of the ramifications being terminated by a pair of flowers.

18. DENDROBIUM ACEROSUM Lindl. — Bot. Reg. XXX. 1841. Misc. 86.

Caulibus brevibus teretibus glabris, foliis carnosis teretibus obtusiusculis, racemo terminali brevi paucifloro, bracteis membranaceis convolutis, floribus semiclausis longe cornutis, sepalis petalisque erectis acutis, labello cuneato emarginato apice cristato calvo.

A small plant from Sincapore, imp. by Loddiges, who bought it of Cuming. (357.)

19. DENDROBIUM CUCUMERINUM W. Mac Leay in litt. Lindl. Bot. Reg. 42. XXVIII. Misc. 631 — Bot. Reg. XXIX. 1843. 37.

Nanum, intricatum, caespitosum, racemis brevissimis articulatis cylindraceis monophyllis, foliis oblongis teretibus seriatim tuberculatis, pedunculis brevissimis trifloris, sepalis pedalisque linearibus acuminatis obtusis, labelli trilobi lobis lateralibus triangularibus intermedio ovato crispato lamellis 5 undulatis in medio, clinandrio denticulato.

New South Wales. — New Holland, sent to Mr. Loddiges from Mr. Wm. Mac Leay. Locality? Strange bodies are apparently leaves terminating the short articulated stems, but they require further examinations, for they may be of the nature of pseudobulbs. — Perigon. album, purpureo striatum. — B. Mag. 4619.

20. DENDROBIUM MODESTUM Rehb. fil. in Bonpl. III. 222.

Affine *D. aciculari* Lindl. caule gracillimo flexuoso, foliis acicularibus acutissimis bi-tripollicaribus, fasciculis florum oppositifoliis, sepalis lateralibus in calcar extinctoriiforme productis, labello cuneato flabellato per discum tricarinato, antice trilobo, lobis lateralibus obtusatis antice denticulatis, lobo medio producto semiovato denticulato, hoc et parte anteriori loborum lateralium puberulo papulosis, gynostemio utrinque apice uncinato.

Caulis adest spithameus. Fasciculi florum erumpentes ex squamis abbreviatis albi-
VI.

dis. Ovaria pedicellata duas pollicis tertias longa. Flores illis Galeandrae gracilis subaequales. Sepalum superius lanceolatum acutum. Sepala lateralia acuta; aequilonga, basi producta. Tepala sepalo dorsali subaequalia. — Flores sicci flavo virides. *Dendrobium aciculare* recedere videtur flore solitario terminali postico — haud ita accurate descriptum: de pubescentia labelli nil affertur. Manilla. Llanos.

Sect. III. *CARNIFOLIA* Rchb. fl. MSS.

Folia carnosae crassa, non teretia. (*Rhizobium* Lindl. ex p.)

21. *DENDROBIUM LINGUAIFORME* Sw. — Bot. Reg. XXV. 1819. Misc. 26. — Near Sidney, New South Wales, where it was found by the earliest Botanist, who visited that colony. It has hard, thick tongue shaped leaves, lying flat upon the rhizoma, which creeps upon the rock or tree it grows on; they have the texture of an Aloe, and probably indicate, that the spec. does not inhabit damp shaded places, but rather such not dry situations, as Mr. Cunningham assigns to *Dendrobium aemulum* and *undulatum* see Bot. Reg. 1699. obs. Flowers greenish white, with long slender sepals and petals, and appear from the young ends of the rhizoma. They have no smell, nor any feature of beauty.

Obs. Huc? : *Dendrobium? crassulaefolium* All. Cunn. — Bot. Reg. XXV. 1839. Misc. 35. — „Of this I have no specimens or description. It is a plant growing on trees in ravines of the Blue Mountains. Never seen in flower. The pseudobulbs are oval and oneleafed; the leaf is small and oval“. — All. Cunningh. (in New South Wales Orch. Epiphytes).

Sect. IV. *PLANIFOLIA* Rchb. fl. MSS.

Folia bene plana.

A. Caulis plurifoliosus.

- a a. *Eudendrobium* Lindl. Inflorescentia lateralis pauciflora. Tepala sepalis aequalia. — Labellum dilatatum. Mentum amplum.

I. Labellum idivisum.

a. Flos albus, roseus, brunneus, non aureus.

22. *DENDROBIUM SUPERBUM* Rchb. fl. MSS. Huc: *Dendrobium macrophyllum* Lindl. Bot. Reg. XXV. 1839. Misc. 46.

Caulibus pendulis, foliis ovato oblongis obtusis nervosis basi subcordatis, sepalis lanceolatis lateralibus parum productis, petalis oblongis acutis, labello pubescente convoluto denticulato subunguiculato ovato, callo baseos elevato transverso obsolete trilobo.

Manilla. Cuming. Loddiges. — Flowers 9" circumf. and will probly be still larger, when the plant becomes more healthy. The sepals and petals are a clear and bright rose-colour, the lip is downy and deeply stained with 2 large broad blood-red blotches at its base.

Huc: Lindl. Ser. 1840. N. 35: Flowers like those of nobile, purple all over; leaves full 4" long by two in breadth; stems pendulous. — At the base of the lip there is a threelobed callosity, which lies across the channel, that leads from the apex to the unguis. It is worthy of the especial consideration of Botanists, that this callosity is absent in *D. coerulescens* and *nobile*; we learn that the absence or presence of such projection is not of generical importance. The hairy ridge, which runs down the middle of the lip in many allied species is missing. — 12 fl. on one stem. — Huc: Pescatorea t. 40.

Huc „*D. macranthum* Bot. Mag. 3970. Lindl.“ — Van Houtte Flore des Serres VIII. 757 et Pl. 3 (habitus).

b. ANOSMUM. Rehb. fl. Huc: *Dendrobium anosmum* Lindl. — Bot. Reg. XXI. 1844. Musc. 41.

Facie omnino *D. macrophylli* et colore; sepalis ovato-lanceolatis, petalis oblongis planis nec oblongo-lanceolatis undulatis, labello subrotundo acuto.

Philippines. — Its app. is = *D. macrophyllum*, but

- 1) its flowers are scentless and have not the strong smell of rhubarb.
- 2) they are smaller
- 3) all the divisions of the flower are shorter, broader, and even, instead of being undulated.

Whether or not it is really a species, experience will show; it is at all events a remarkable variety.

c. GIGANTEUM. Huc: *Dendrobium macrophyllum* var. *giganteum*. Lindl. G. Chronicle 1844. 219. — At the last meeting of Hort. Soc. MSS. Veitch produced a variety of this well known species with flowers fourtimes as large as usual. From Continent.

d. PURPUREO MARGINATUM. Huc: *D. macrophyllum* Lindl. var. *purpureo marginatum*. De Vriese Illustr. tab. 17.

23. DENDROBIUM NOBILE LO. 24.

Caulibus teretibus acutis, foliis oblique emarginatis obtusis, floribus geminatis, sepalis ovalibus, petalis duplo majoribus undulatis, labello ovato subrotundo cucullato villosos.

China. — Flowers large, showy, violet, with a very dark purple stain in the interior of the lip.

Lindl. Sert. t. 3: M. Reeves bought it on the market at Macao. — Stems erect, clustered, light green, a foot and more high, compressed, with deeply furrowed joints about $\frac{3}{4}$ of an inch. Leaves rather distichous. Peduncles axillar, 2-3 flowered. — Petals oblong, obtuse, rather wavy, very delicate and transparent, the same colour as the sepals. — Lip rolled up, very shortly unguiculate, downy both inside and outside, in form obovate, with a deep notch on each side separating it into three obscure lobes, of which the laterals are crisp at the edge, the central one even rounded obscurely cuspidate in colour, deep bloodred in the tube, pale greenish yellow at the edges and disk, tinged with purple at the end; a linear downy space passes upwards along the centre from the unguis still it loses itself in the disk.

Huc: *Dendrobium coerulescens* L. Sert. n. 17. — Bot. Reg. XXX. 1844. Misc. 62.

Facie omnino *D. nobilis*, floribus nunc ternatis, petalis angustioribus margine reflexis valde undulatis, labello ovali acuminato intus villosos.

E. Indies. — The petals and the lip principally distinguish it from *D. nobile*. Its flowers are also smaller.

Sert. n. 17: Caule erecto carnosos tereti, foliis oblongis obtusis emarginatis subundulatis, racemis horizontalibus 2-3 floris foliis paulo brevioribus, perianthio explanato, sepalis lineari-oblongis obtusis emarginatis lateralibus basi paulo productis, petalis latioribus oblongis apice recurvis, labello ovali subundulato utrinque pubescente apice constricto plano glabro recurvo, anthera pubescente.

Dendrobium coerulescens Wall. MSS. — Sepals and petals have a delicate tinge of very pale bluish lilac, on their back especially. Form more slender. Specific differences are furnished by the shape of the lip and sepals, both of which are much narrower, than in *Dendr. nobile* and the former has quite a different outline. — Nungklow, on the northern face of the Khoseea range of hills, where it grows upon rocks and trunks of trees at an elevation of 4000' (30-40 flw.!). — Sepals $1\frac{1}{2}$ " long $\frac{1}{2}$ " wide, delicate bluish lilac, tinged with deeper purple at their end and slightly pitted all over between the veins as to acquire a somewhat tessellated appearance, notched at the apex. Pet. coloured like the sepals, except that they are rather darker and less tessellated. Lip oval, concave, sides rolled round the column at the base,

curved outwards and undulated; rich crimson in the middle, yellow at the edge, deep rosecol. at the apex, covered with conspicuous pubescence every where exc. at the point. Column is very short, flat, sloped forwards in front, convex at the back; termin. by a peaked, purple, hairy anther.

Sert. 18. 1838.

24. DENDROBIUM LINAWIANUM Rehb. fl. MSS. Huc: „*D. moniliforme* Sw.“ Lindl. B. Reg. XVI. 1830. 1314 et Hook. B. Mag. Ser. III. Vol. 1. 4153:

Caulibus erectis clavatis ramosis foliosis internodiis demum tumidis, foliis distichis oblongis obtusis oblique emarginatis, floribus ex articulis supremis caulium geminatis folio longioribus, sepalis oblongis acutis, petalisque ovalis striatis, disco elevato pubescente.

Perigonium roseum, basi albidum, labellum albidum apice intense kermesinum maculis quibusdam kermesinis.

Obs. De vero *D. moniliformi* Sw. l alio loco.

25. DENDROBIUM TORTILE Lindl. Gard. Chron. 1847 p. 797 e. ic. — B. Mag. 4477.

Caulibus clavatis articulatis sulcatis vaginatis, foliis linearibus retusis subcoriaceis, pedunculo bifloro, sepalis oblongis acutiusculis undulatis tortilibus (petalis conformibus), 2 lateralibus in calcar retusum decurrentibus, labello magno pubescenti villosa obovato-cochleariformi basi intus pulvinate.

Perigonium albidum, labellum lilacinum et albidoflavum.

Obs. Planta obscuro obscurior est haec: *Dendrobium tortile* All. Cunningh. — Bot.

Reg. XXV. 1839. Misc. 31. — On the upper branches of the lofts and trees of Flindersia australis, 100' high; in shaded woods, Brisbane River, Moreton Bay. Oct. 1824. June 1828. New South Wales: — All. Cunningham.

26. DENDROBIUM PULCHELLUM Roxb. LO. 35. — Bot. Cab. t. 1935.

- b. DEVONIANUM. Huc: *Dendrobium Devonianum* Paxt. Mag. I. 169. — Bot. Reg. XXX. 1844. Misc. 62.

Caulibus pendulis, foliis ovato lanceolatis acutis, pedunculis 2—3 floris, sepalis oblongis acutis integris, petalis duplo latioribus fimbriatis, labello maximo cochleariformi margine plumoso.

The King of Dendrobium: Khosea Hills of India. — Sepals rose-colour. Petals and lip lemon-colour, tipped with purple, the latter with a broad yellow blotch in the middle.

Dendrobium Devonianum B. M. 4429.

Caulibus elongato-cylindraceutis articulatis striatis proliferis, junioribus foliiferis, foliis lineari lanceolatis distichis submembranaceis acuminatis, floribus (5—6) aggregatis, sepalis lanceolatis integerrimis, petalis ovalis acutis ciliatis apice purpureo-maculatis, labello cucullato amplo latissime cordato pulcherrime plumoso fimbriato intus maculis 2 aurantiacis apice emarginato purpureo, calcare brevissimo.

Huc: Van Houtte VII. tab. 647. — Lem. Jard. fl. tab. 11.

27. DENDROBIUM PIERARDI Roxb. LO. 79. N. 22. — Bot. Reg. XXI. 1836. 1756: Delta of the Ganges on Mangoe Trees. — The lip is rounded and very blunt, and its basis is rolled into a much longer stalk, which quite conceals the column; it is more over remarkably incurved. — Pendulous from trees. — Wight Ic. Pl. Ind. Or. III. II. 908. 1844.

var. *latifolium*: Van Houtte Flore des Serres IX. 955,

28. DENDROBIUM CUCULLATUM Brown. — Bot. Reg. XXI. 1835 sub 1656 (huc B. R. (548). — Bot. Reg. XXX. 1844. Misc. 62.

Facie omnino *D. Pierardi*, sed labello subrotundo-ovato basi in unguem brevem convoluto.

E. Indies. — Extremely like *D. Pierardi*, but it has larger flowers with a broad roun-

dish ovate lip, the base of which is rolled up into a sort of short stalk; while in *D. Pierardi* the lip is rounded and very blunt, with its base rolled into a much longer stalk which quite conceals the column. It is moreover remarkably incurved.

29. *DENDROBIUM CRETACEUM* Lindl. B. R. 1847. 62:

Foliis lanceolatis apice oblique emarginatis obtusiusculis; floribus solitariis (?), sepalis lineari-lanceolatis patentissimis obtusiusculis; labello subrotundo indiviso cucullato fimbriato-dentato, utrinque pubescente, basi foveato et obsolete trilamellato; mento brevi obtuso.

Ind. or. at Mergui and Khasiya hills. Flores candidi, lineae labelli purpureae. — V. H. VIII. 818. — B. Mag. 4686. — Lem. III. n. 334.

30. *DENDROBIUM EGERTONIAE* Lindl. Bot. Reg. 1847. t. 36. adn.

Caule tereti erecto, basi ebulbi; foliis?, floribus binis-quaternis, sepalis linearibus obtusis, petalis angustioribus, labello ovato obtuso unguiculato, parum undulato basi ciliato, superne margine laeviusculo, intus villosa, columna antice glabra, basi bicamerata; anthera pubescente, calcaris apice etuberculato.

Crescit in India or.? — Near *D. mesochlorum*, but the flowers not $\frac{1}{2}$ size. The sepals are pale pink outside, there is very little appearance of a purple stain on the tip of the petals and lip, and the middle of the lip is dull yellow, not green; there is moreover no tubercle at the back of the point of the spur, and the lip is not fringed except on its base. If it is less showy a species than *D. mesochlorum*, it is not on that account less valuable, for its flowers are delightfully scented towards evening. Obt. from Saharampore. — Paxt. Fl. G. I. xyl. 44.

31. *DENDROBIUM MESOCHLORON* Lindl. — Bot. Reg. 47. t. 36 adn.

Caule tereti erecto basi ebulbi, foliis lanceolatis acuminatis; floribus subquaternis, sepalis ovali linearibus obtusis; petalis angustioribus, labello ovato obtuso unguiculato undulato fimbriato praesertim basi intus villosa; columna antice glabra, basi bicamerata foveata; anthera pubescente; calcaris apice a tergo gibboso.

India Veitch. — Allied to *D. crumenatum*. — Flowers white, with a violet spot at the end of petals and lip, and with a green stain in the centre of the latter. — Paxt. Fl. 9. Xyl. 43.

32. *DENDROBIUM CREPIDATUM* Lindl. — Paxt. I. 63. N. 99. xyl. 45.

Caulibus teretibus erectis, foliis . . . , floribus geminis, sep. oblongis obtusis firmis, labello oblongo integro subsinuato obtuso lateribus erectis intus levissime pubescente, basi utrinque plicato venoso, cornu brevi obtuso.

Flowers white, tipped with pink, deep yellow in the middle of the lip. Firm texture of a Lycaste. Lip has form of old-fashioned slippers, which, without a hollow for the foot, were merely latched.

33. *DENDROBIUM TRANSPARENS* Wall. Cat. n. 2008. — Bot. Reg. 1844. Misc. n. 62 (XXX).

Caulibus pendulis teretibus, foliis ovato-lanceolatis acuminatis apice obliquis, floribus geminatis, sepalis acuminatis, petalis obtusis, sepalo supremo majoribus, labello oblongo undulato ciliolato obtuso intus levissime pubescente.

Nepal. — Flowers pale rose-colour, with a lip of the same tint. Very like *D. Pierardi*, from which it is distinguished by its leaves being longer and emarginate at the apex, by the petals being obtuse and the labellum much less hairy, and pink; not yellow. The stems are also shorter. — Paxt. Fl. G. I. p. 134. Tb. 27: Nepal. Wall. Stem formerly described as pendulous. — Veitch imported it from Myrong, Garrow hills, 5300'.

Huc: *D. Henshalli* Rehb. fil. Bonpl. III. 226:

Aff. *D. heterocarpo*, labello ab ungue obtusato subito dilatato ob-

tusangulo hastato antrorsum oblongo obtuso subtilius et rarius velutino, petalis angustioribus, mento breviori.

Blüthen so gross, wie die des *D. heterocarpum*, weiss; Lippe mit rosafarbigen Adern, zwei violett-purpurne Flecken beiderseits der Mitte, vorn gelbweiss. — Cultur des Hrn. Lüdde mann in Hrn; Pescatore's Garten.

Huc: B. Mag. 4663. Lem. J. Fl. tb. 68.

34. *DENDROBIUM AMOENUM* Wall. L.O. 21. — *Limodorum aphyllum* Roxb. Corom. I. t. 41. — *Cymbidium aphyllum* W. sp. f. 4. — Bot. Reg. XXXI. 1844. Misc. 62.

Stems clouded with dusky brown when in blossom. Dr. Wallich remarks in his MSS., that its delicate fragrance is exquisite, not unlike that of *Olea fragrans*.

Caulibus pendulis gracilibus nebulosis, floriferis aphyllis; foliis lanceolatis acutis; floribus geminalis racemum spurium formantibus longe pedunculatis divaricatis; sepalis oblongis obtusis; petalis obtusis sepalo supremo paulo majoribus: labelli cucullati limbo ovato obtuso crenulato leviter ciliato, disco villosa.

Flowers of a delicate white, with obtuse segments, each of which is beautifully tinged at its apex with violet. Lip cucullate marked internally towards the base with greenish yellow.

35. *DENDROBIUM MACROSTACHYUM* (Lind.) Wight Ic. V. I. 1851. 1647.

Stems terete, pendulous: leaves oblong, acute, flat: flowers paired, fragrant, forming a spurious raceme: sepals linear oblong, acute, the upper sepal larger: lip unguiculate, limb somewhat fiddle shaped, silky to the touch, middle lobe elongated, acuminate, flat.

Ceylon. July. — Flowers greenish yellow, lip and points of sepals and petals tipped with pink. — Mrss. Walker.

36. *DENDROBIUM GEMELLUM* L.O. n. 28. — Bot. Reg. XXX. 1844. Misc. 62. — Bot. Reg. XXVI. 1840. Misc. 192. — *Pedilonum biflorum* Blume p. 322.

Foliis membranaceis lanceolatis acuminatis, pedunculis oppositifoliis subbifloris, labello ovali acuto apice subcrispo, lamellis tribus serrulatus inconspicuis.

Singapore, Cuming 158. Java. — A longstemmed grassy-leaved plant, with small pale yellowish green flowers, growing in pairs from short rigid twovalved truncated compressed spathes, placed opposite the leaves. In this respect it is like *D. biflorum*, of which it has all the habit, but the lip is perfectly entire and threelobed.

37. *DENDROBIUM CANDIDUM* Wall. MSS. — Bot. Reg. XXIV. 1838. Misc. 54. — Part. Fl. G. I. 43.

Caulibus erectis flexuosis teretibus, fol. ovato lanceolatis apice obliquis obtusis, pedunculis axillaribus erectis bifloris, sepalis patulis, lateralibus basi parum productis, pet. conformibus, labello ovato-lanceolato obtuso medio barbato supra basin calloso lateribus erectis cucullatis.

Duke of Devonshire sent flowers; — Mr. Paxton a sketch. Found by Mr. Gibson, his Gracens collector in India, at Nungelw, on the north side of the Khoosea Hills, growing on rocks, sand, and decayed trees. The flowers, which are pure white, are most exquisitely scented. The habit is that of *D. nobile*; that is to say, erect, not pendulous, as is *D. Pierardi* and that race. The stems are about, high, and lose the principal part of their leaves before flowering.

38. *DENDROBIUM NUTANS* L.O. n. 73.

39. *DENDROBIUM FOLIOSUM* Ad. Brogn. in Duperr. Voy. t. 41.

40. *DENDROBIUM ALBOSANGUINEUM* Lindl. — L. P. Fl. G. II. t. 57. p. 93.

Caulibus crassis erectis, floribus geminis nutantibus, bracteis herbaeis squamaeformibus, sepalis lineari-lanceolatis, lateralibus in mentum

breve obtusum productis, petalis oblongis incurvis pluries latioribus, labello obovato subrotundo plano retuso apiculato integerrimo.

Atran river, Moulmein. Lobb.

Huc: Lem. Jard. Fl. tab. 203. Van Houtte Fl. des Serres VII. 721.

Sect. V. *CHRYSANTHA*.

41. *DENDROBIUM CHRYSANTHUM* Wall. Cat. n. 2012. Bot. Reg. 1299. LO. 25. Huc: *Dendrobium Paxtoni* Lindl. — Bot. Reg. XXV. 1838. Misc. 56.

Caulibus teretibus sulcatis, foliis ovato-lanceolatis acuminatis apice hinc obsolete emarginatis, pedunculis bifloris, sepalis oblongis acutis lateralibus basi parum productis, petalis latioribus obovatis acutis serrulatis, labello unguiculato ovato concavo indiviso villosa margine multifido fimbriato.

Orange - yellow flowers with a deep brown spot in the middle of the lip. It is related to *D. chrysanthum*, from which it differs in having the petals serrated, and in the surface and margin of the label. It was found at Pundua, at the foot of the Khoseea hills of India by Ms. Joh Gibson, at whose request it was named after Mr. Paxton. April.

42. *DENDROBIUM OCHREATUM* Lindl. Wall. Cat. 7410. — Bot. Reg. XXI. sub 1756.

Caulibus brevibus e squamis membranaceis ventricosis erumpentibus, foliis ovato-lanceolatis acutis, vaginis ventricosis, floribus geminatis, sepalis petalisque majoribus lanceolatis acuminatis, labello rhomboideo ovato cucullato intus tomentoso.

Hab. in Chittagong, Wallich (hab. sp. s. e Museo Anglo Indic.). — Species vaginis laxis, alioquin facie *D. Pierardi*, primo intuitu distinguenda. Flores expansi fere 3 uncias lati, pallidi. Labellum purpureomaculatum; ungue intus supra medium calloso. — A beautiful plant.

Huc: *Dendrobium Cambridgeanum* Paxt. Mag. Bot. VI. 265. — Bot. Reg. XXVII. 1841. Misc. 171.

Caulibus pendulis medio incrassatis, foliis ovalibus acutissimis, pedunculis bifloris, petalis lanceolatis sepalis latioribus, labello cucullato rotundato indiviso supra piloso.

Only known from the Fig. in Paxt. It is said to be a native of the Khoseea hills of India, whence it was brought to Chatsworth by Mr. J. Gibson 1837; it was found on an elevation of 4000' attaching itself to rocks and trees. It is a beautiful species with large rich yellow flowers having a deep purple stain in the middle of the lip, but seems very near *D. Paxtoni* and *chrysanthum*.

Huc: B. Mag. 4450.

43. *DENDROBIUM AUREUM* Lindl. Orch. 78. Wight. Ic. V. (1851) 1846.

Stems round, pendulous, internodes short, leaves linear, oblong, obliquely emarginate at the point; flowers paired: sepals ovate, obtuse: petals undulated, obtuse, larger than the sepals; lip cucullate, limb ovate, obtuse, undulated, entire, pubescent within.

Ceylon; flowering in January.

Huc: *D. heterocarpum* Lindl. in B. M. 4708. Van Houtte Flore des Serres VIII 842. Lem. Jard. Fl. IV. tab. 386.

43b. *DENDROBIUM AUREUM* var. *PALLIDUM* B. Reg. 1839. XXV. 20.

Caulibus teretibus clavatis, internodiis brevibus, foliis lineari oblongis apice obliquis emarginatis, pedunculis subbifloris aggregatis lateralibus, sepalis lineari-ovatis acuminatis obtusis, petalis latioribus ovatis acutis undulatis, labello ovali undulato obtusiusculo indiviso medio serrulato per axin pubescente.

Ceylon near Nuera Ellia. Macrae. Loddig. Varies with pale yellow and white flowers, the latter being represented. — Perigonium candidum labio basi luteo.

Huc: *Dendrobium rhombeum* Lindl. B. Reg. XXIX. 17.

Caulibus teretibus foliosis, foliis lanceolatis, racemis brevibus, 4 floris, sepalis ovalibus obtusis, petalis duplo latoribus ovatis, labello rhombeo undulato acuto medio pubescente, columna utrinque tuberculata pone basin cornu deflexo aucta, anthera pubescente.

Ab aureo differt labello non serrato, floribus minoribus. Flowers in short racemes instead of pairs. — In Manilla leg. Cuming. — Flor. apud Loddiges cat. 319. Aug. 42. — In basi columnae conspicitur antrum quoddam in quod dependet processus odontoideus.

44. *DENDROBIUM OCHROLEUCUM* Tejsem. et Binnendijk Naturk. Tijdsch. Nederl. Ind. Deel V. 1853.

Caulibus compressiusculis erectis, foliis lanceolatis inaequali obtusiusculis, basi semiamplexicaulibus membranaceis 8—10 nerviis, fl. geminatis supra axillaribus, labello erecto oblongo limbo retuso, phyllis perigonii externis oblongo ovatis acutis, internis lineari lanceolatis.

Aff. D. aureum. — Salak.

45. *DENDROBIUM INTERMEDIUM* Tejsem. et Binnendijk Naturk. Tijdsch. Ned. Ind. Deel V. 1853.

Caulibus foliosis compressiusculis, foliis linearilanceolatis oblique obtusiusculis, floribus geminatis foliis suboppositis, phyllis perigonii acutiusculis aequalibus, labello obovato retuso basi axi elevato.

Aff. D. salaccensis. — Salak.

46. *DENDROBIUM SALACCENSE* Lindl. Orch. 56. — *Grastidium salaccense* Blume Bijdr. 333.

47. *DENDROBIUM RUGOSUM* Lindl. Orch. 57. — *Grastidium rugosum* Blume Bijdr. 333.

b. Labellum trilobum.

a. Caulis laevis.

48. *DENDROBIUM RUCKERI* Lindl. — Bot. Reg. 1843. Misc. 38 et tab. 60.

Caulibus teretibus, foliis ovato-lanceolatis; acuminatis planis, floribus gemellis, sepalis patulis obtusiusculis convexis margine reflexis, lateralibus subtriangularibus, labelli trilobi lobis rotundatis intermedio undulato axi elevata villosa.

Perigonii phylla extus albido flaveola, intus ochraceo-flava, labellum extus roseum, intus lobo medio flavo, lateribus intus albis margine flavis, medio aurantiacis, axi elevato villosa albo. — We presume this plant to be one of Mr. Cuming's discoveries in the Philippines, although no trace of it is to be found among his dried specimens. — It belongs to Pierardi with sanguinolentum, chrysanthum, Cambridgeanum, rugosum, salaccense, Paxtoni, aureum. — A Manilla (?) plant, which has lately flowered with Mr. Rucker. It is sweet-scented, handsome, and distinguished by its clear yellow nankin coloured flowers, the lip of which is a little stained with rose colour.

49. *DENDROBIUM SANGUIOLENTUM* Lindl. in Bot. Reg. 1842. XXVIII. Misc. 73. 1843. XXIX. 43. 6.

Caulibus teretibus pendulis, foliis ovato-lanceolatis, floribus gemellis, sepalis petalisque ovatis obtusiusculis patulis, labello trilobo glabro lacinia intermedia retusa nunc utrinque plicata; ungue concavo brevi appendice cornuformi pubescente retrorsa aucto.

Flores flavi, violascenti, purpureo et (medio in labello) rubro picti. — Mr. Nightingale misit ad ducem of Northumberland e Ceylonia. — Adest varietas quaedam ex Lindl. labello quidem diversa (fig. 2), quae violascenti purpureo non picta. Sed facie et omnino aequalis alii plantae. — Flowers as large as these of *D. aggregatum* of a

clear fawn colour, with the tips a deep rich violet. There is more over a scarlat spot in the middle of the lip.

51. *DENDROBIUM AQUEUM* Lindl. Bot. Reg. 1843. Misc. 6. Bot. Reg. 1842. tb. 54.

Foliis ovato-oblongis undulatis acuminatis, floribus patulis cornu brevi obtuso, sepalis petalisque ovatis, labelli trilobi pubescentis lacinia media ovata denticulata basi alte excavata lateralibus latioribus rotundatis margine anteriore serrulato.

Novb. 42. Loddiges imp. from Bombay. — Perigonium albidum basibus apicibusque phyllorum viride, labellum medio flavum. — The habit is that of *D. Pierardi*: the flowers are rather larger, and of a pale watery green colour. It is also a much stouter plant with wavy leaves.

Huc: Lem. Jard. Fl. tab. 262. — B. Mag. 4640.

Huc: *Dendrobium album* R. Wight. Ic. V. 1. (1851) 1645.

Erect, jointed, stems enlarging from the base to the apex, internods much shorter than the leaves, leaves oblong, elliptic, acuminate, flowers axillary, paired, long peduncled, sepals ovate, acute, lateral ones falcate, petals obovato elliptic, obtuse, larger than the posterior sepal: lip 3 lobed, lateral lobes entire, obtuse, middle one cucullate, ovate acute, saccate, at the base ciliate.

Flowers white. — This is one of the handsomest of the genus I have yet met with; the large pure white flowers and dark foliage are very conspicuous. It seems to be rather rare, as I have only once obtained specimens. — Jyamally Hills. Sept. Rare.

Lindl. Paxt. II. p. 175. N. 446. Xyl. 226. — Scarcely distinct from *D. aqueum*, fig. B. R. 1843. t. 54: appearing to differ in nothing except a more narrow middle lobe of the lip, more distinct fringes upon its edge and in absence of the green tinge which has been observed in *D. aqueum*.

52. *DENDROBIUM CUNNINGHAMI* Lindl. — Bot. Reg. XXI. 1835. sub 1756.

Caulibus gracilibus pendulis ramosis, vaginis foliorum corneis transversim corrugatis squamatis, foliis ovato-linearibus obtusiusculis, pedunculis oppositifoliis bifloris foliis multo brevioribus, sepalis ovatis acutis, petalis oblongis acutis latioribus, labelli trilobi lobo intermedio subrotundo undulato basi quinquelamellato, lateralibus nanis acutis.

Supra truncos Callist. ellipt. (A. C.) in insula sept. Novae Zealandiae, juxta mare, incolis Raumanghe. R. Cunningham (hab. s. sp. comm. lel. A. Cunningh.). — This species is nearly allied to *D. biflorum*, of which I had examined no specimen at the time the Gen. and Sp. Orch. was published.

Dendrobium biflorum Ach. Rich. Sert. Astrolabe t. 26. A. Rich. Fl. Nov. Zel. p. 167. t. 62. — Bot. Reg. YYY. 1844. Misc. 62. pag. 54.: — New Zealand (North Isl.) 1768. Banks and Solander.“

53. *DENDROBIUM LANCIFOLIUM* Ach. Rich. Sert. Astrol. tab. 8. — Lindl. B. Reg. XXX. Misc. 62:

Caule erecto ramoso folioso tereti glabro, fol. anguste lanceolato-linearibus acutis, florib. purpurascensibus saepius quaternis pedicellatis subspicatis, sepalis lanceolatis acutis, labelli unguiculati trilobi lobo medio latiore ovato margine subcrispo, lateralibus obtusis subcrispis planis.

A. Rich. l. c. II. p. 20. *D. caule erecto ramoso, folioso, tereti, glabro; foliis alternis lanceolato-linearibus acutis, striatis; floribus purpurascensibus saepius quaternis pedicellatis subspicatis; laciniis exterioribus lanceolato-acutis, labello lato, obsolete trilobo.* — Crescit in insula Bourou.

51. *DENDROBIUM LUZONENSE* Lindl. — Bot. Reg. XXX. 1844. Misc. 62. p. 54.

Foliis distichis anguste lanceolatis apice oblique emarginatis, pedunculis brevibus bifloris, labello spatulato obtusissimo laciniis lateralibus obsolete denticulatis.

Luzone. — A small flowered plant with very closely set distichous leaves.

55. *DENDROBIUM TRIDENTIFERUM* Lindl. in Voy. of the Feejee Islands is Hook. Lond. Journ. of Bot. Vol. II. 43. p. 237.

Foliis oblongo-lanceolatis oblique emarginatis, gemmis paleaceis, floribus geminis, sepalis lateralibus ovatis carnosis obliquis, petalis lanceolato-oblongis acutis membranaceis, labello carnosio trifido, basi tuberculo carnosio lineaque utrinque elevata aucto, lob. acutis, lateralibus antrorsum curvis, intermedio ovato, cornu brevi obtuso.

A broad leaved species looking like *D. biflorum*, to which it is nearly allied. It has fleshy flowers as large as those of *D. Pierardi*, but quite different in structure. — New Guinea, Hinds? (videtur! sed non dicitur a L.)

56. *DENDROBIUM METACHILINUM* Rchb. fil in Bonpl. III. 222.

Caule carnosio, foliis oblongoligulatis pergamenocarnosis apice inaequalibus, flore illi Ddb. calcarati Lindl. haud absimili, labello ligulato-lineariter marginibus infra cum pede gynostemii connatis, antice trilobo, lobis lateralibus minutis dentiformibus supra basin lobi medii ovato reniformis positis, lobo medio carnosio papuloso marginibus lobulato.

Caules foliis dejectis quasi serratonodosi, calamum columbinum crassi; quadripollicares. Folia usque sesquipollicaria, tertiam pollicis lata. Flores illis *D. calcarati* aequales; calcar tamen ovario pedicellato duplo brevius. Labelli lobus medius infra plano triangulo acuto antrorso nudus, limbatus, ceterum papulosus. Gynostemium apice breviter tricornae. 2037 Cuming. Phil.

57. *DENDROBIUM MAC CARTHIAE* Hook. B. Mag. 4886. 1855.

Caulibus pendulis flagelliformibus teretibus striatis versus apicem foliosis, nodis parce tumidis, racemis axillaribus 4—5 floris, floribus magnis dilute purpureis, sepalis lanceolatis acutis petala multo latiora ovato lanceolata longitudine fere aequantibus, labello subtrilobato vel sutrapeziformi apice rotundato retuso, foliis lanceolatis.

Ceylon, sparingly in forests about Ratuapoor and towards Galle „Wissah mel“ (Rainymonth flowers „May flower“. To Mrs. Mac Carthy, lady of Hon. C. T. Mac Carthy Esq. Col. Secret. of the island.)

58. *DENDROBIUM SPHEGIDIGLOSSUM* Rchb. fil. Bonplandia II. p. 88.

Aff. *D. Scopae*: floribus racemosis, labello ecarinato lanceolato flabellato apice trilobo, lobo medio calloso, lateralibus ligulatis abbreviatis, omnibus rite in subulas solutis.

Caulis teretiusculus, sulcatus, foliorum vaginae arctae, racemi laterales pauciflori, basi arcte vaginati, bractee ovatae acutae cucullatae, ovaria pedicellata dimidio aequantes, flores candidi, sepala oblonga acuta medio carinata, lateralia in calcar clavatum extensa, tepala oblongo cuneata acuta microscopice denticulata, labellum a basi triangula canaliculata antice trilobum, lobi laterales anguste trianguli, medius lobus latior ligulatus, in crines laxos crispulos solutus, lobi laterales margine ciliato crispuli, additis quibusdam crinibus in ipsa labelli lamina, discus vernixius, lobi medii apex callosus, asperulus, incrassatus. Gynostemium apice utrinque unicolore, basi foveatum, fovea apice linearis, dein subito dilatata. Blüten weiss, mit Stich in's Rosafarbige: so gross wie die des *D. crepidatum*, aber mehr dünnhäutig. Von Herrn Consul Schiller aus Ostindien eingeführt.

Huc referendum, antiquius quidem, sed false descriptum:

- DENDROBIUM STUPOSUM* Lindl. — Lindl. B. Reg. 1838. XXIV. Misc. 94.

Caule erecto tereti, foliis lineari-oblongis oblique emarginatis, pedunculis bifloris, bracteis obtusis cucullatis, sepalis petalisque erectis, lateralibus carinatis, labello oblongo cucullato obtuso sub apice calloso stuposo.

A native of India, whence it was obtained by his Grace the duke of Devonshire, also from Loddiges. An erect spec. with habit and general appearance of *D. candidum*, the flowers are of the same white colour, and but little smaller: the labellum, however has a deep orange callus below its point, where it is thickly covered with a coarse towlike hairiness.

59. *DENDROBIUM REVOLUTUM* Lindl. — Bot. Reg. XXVI. 1840. Misc. 110. — Paxt. Fl. G. Xyl. 42.

Caulibus obtuse ancipitibus, foliis ovato-oblongis apice obliquis emarginatis basi subcarinatis, floribus solitariis oppositifoliis, sepalis petalisque acutissimis revolutis, labello carnoso convexo obtuso subtrilobo aut rhombeo per medium exarato (s. lamellis duabus inflexis parallelis instructo) lineis tribus discoloribus.

Singapore. Cuming. — Flowers straw-coloured, about the size of these of *D. Pierardi*, but their lip is fleshy, convex, almost lozenge-shaped, and marked with 3 brown lines. Not pretty.

60. *DENDROBIUM EXCISUM* Lindl. — Bot. Reg. XXVII. 1841. Misc. 165.

Foliis lineari-oblongis oblique retusis, floribus (solitariis?) oppositifoliis basi squamatis, sepalis petalisque acuminatis, labello oblongo acuto carnoso basi utrinque exciso: disco late glanduloso, cornu pedicello fere duplo brevior.

A small species with the habit of *Dendrobium pulchellum*, but with white inconspicuous flowers. It is native of Singapore, whence it was brought by Cuming. Loddig. flw. (331.) Nearest aff. *Dendr. revolut.* and *calcaratum*.

61. *DENDROBIUM BILOBUM* Lindl. sp. n. — Lindl. in Voy. of the Feejee Islands by Benth. in Hook. Lond. Journ. of Bot. Vol. II. 43. p. 236.

Foliis linearibus obtusis apice subaequalibus bilobis, floribus membranaceis minutis (solitariis?), sepalis obtusis, petalis duplo minoribus apiculatis, labello libero elongato obovato apice carnoso trilobo: lacinia media verrucosa, cornu elongato obtuso.

A small inconspic. spec. with the appearance of *Is ochilus linearis* New Guinea Mr. Hinds.

62. *DENDROBIUM CRUMENATUM* Lindl. — B. Reg. XXV. 1839. tab. 22.

Caulibus caespitosis erectis basi incrassatis teretibus, foliis ovato-oblongis obtusis emarginatis, racemo terminali (3—5) multifloro, sepalis petalisque ovatis acuminatis subundulatis conformibus, labello cucullato-trilobo: lobis lateralibus truncatis, intermedio ovato acuto, disco lamellato.

Angrecum crumenatum Rumph. herb. amb. VI. 105. t. 47. f. 2.

Onychium crumenatum Blume Bijdr. 326.

Dendrobium crumenatum Sw. W. sp. pl. n. 20. Hort. Trans. VII. 70.

Dr. Blume found it in Java, near Batavia and on the coast of the little island of Nusa Kambangan; and the late Sir Stamford Raffles met with it in Sumatra. Rumphius gives no locality for its referring from the body of his work to a description in the appendix; where however nothing is to be found except a reference back to the body of the work; it is doubtless however an inhabitant of Amboyne. The specimen now figured was sent by Mr. Nightingale from Ceylon to his Grace the duke of Northumberland, in whose coll. at Syon it flowered Aug. 37. — According Blume it varies with white and pink flowers, with leaves more or less oblong and coriaceous. It is one of the easiest of the genus to manage. Why it is called *crumenatum* (literally purse-shaped) I am unable to state. Rumphius with whom the name originated, gives no explanation; but in one place he calls it *A. crumenatum*, and in another *Augrecum angustis crumenis*. — *Perigonium album*, labelli cristulis flavis.

Huc: Bot. Mag. 4013.

63. DENDROBIUM BIFLORUM Sw. — Bot. Reg. XXI. 1836. t. 7. sub 1756.

Caule pendulo gracili tereti, foliis lineari-lanceolatis acuminatis planis, pedunculis bifloris lateralibus e paleis corneis erumpentibus, sepalis petalisque acuminatissimis, labello rhomboideo medio bilamellato trilobo lobis lateralibus acutis nanis, intermedio deltoideo acuminato margine fimbriato.

Otahaiti, Matthews. — Bot. Reg. XXX. 1844. — Epidd. biflorum Forst: Prodr. n. 318.

Dendrobium biflorum Sw. act Holm. 1800 p. 246. W. n. 17. n. 18. — Society Island.

— Leaves very narrow and grassy. Flowers very small, with setaceous points.

b. Caulis hispidus.

64. DENDROBIUM LONGICORNU Lindl. (Wall. Cat. 1997.) Orch. 26. Bot. Reg. 1315. Gard. Chronicle 1848. 785.

65. DENDROBIUM JERDONIANUM R. Wight Ic. V. I. 1851. tb. 1644. — Erect, stems jointed, thickening upwards, internodes about the length of the leaves, leaves ovato lanceolate, succulent, forked at the apex: raceme axillary, short, 2–3 flowered: bracts minute: flowers long pedicelled, calcarate, lateral sepals much produced at the base, posterior one and petals equal, all linear lanceolate, acute, lip sinuately undulated on the margin, obovate, forming with the long base of the column a short conical spur. Flower deep orange colour, lip conforming, or a little redder. — Coorg Jungles. Jerdon. Jyamally Hills. Aug. Sept. (Specimina paulo diversa.)

Huc: *Dendrobium villosulum* Wall. in Paxt. Fl. G. II. p. 82. N. 348. Xyl. 176. — Orange coloured flowers, rough stems. Imported from Tillicherry. Near Wallichs D. angulatum.

Caule erecto nigro villosa, foliis linearibus acute et oblique bilobis, pedunculis bifloris, sepalis petalisque acuminatis recurvis obtusis, lateralibus in mentum breve cornutum connatis, labello lineari-lanceolato trilobo 3 lamellato lobis lateralibus nanis.

66. DENDROBIUM LOBBII Teijsm. et Binnendijk in Naturk. Tijdsch. Nederl. Ind. V. 1853.

Caulibus foliosis teretibus erectis rufopilosis, foliis bifariis sessilibus lanceolatis apice oblique-emarginatis acutiusculis, subtus lepidotis, floribus solitariis foliis suboppositis pendulis, phyllis perigonii externi linearibus acutis, internis minoribus angustioribus recurvatis labello erecto trilobo venis tribus elevatis lobo medio emarginato dentato, lobis lateralibus acutis.

Th. Lobb ex Singapore misit.

67. DENDROBIUM CONOSTALIX Rehb. fil. MSS. Huc: *Dendrobium calcaratum* Lindl. — Bot. Reg. XXVI. 1840 Misc. 219.

Caulibus nigro-pubescentibus, foliis linearibus oblique bilobis, floribus resupinatis, sepalis ovatis, lateralibus revolutis basi in cornu conicum pedicelli longitudine productis, petalis lineari-lanceolatis, labelli linearis carnosae laevis trilobi lacinia intermedia subrotunda marginibus incurvis ungue cum columnae pede in calcar verum connato.

A slender inconspicuous species allied to *D. revolutum* and *biflorum*, with green flowers, growing in pairs opposite the leaves. It was found at Singapore, by Mr. Cuming, and flow. with Mss. Loddiges (n. 158).

bb. *Stachyobium* Lindl.: inflorescentia racemosa.

† Labellum indivisum planum.

* Aurea.

68. DENDROBIUM FLAVESCENS Lindl. Orch. 48. — *Onychium* — Blume Bijl. p. 325.

69. *DENDROBIUM SULCATUM* Lindl. — Bot. Reg. XXIV. 1838. 65.

Caule clavato sulcato subflexuoso compresso, foliis oblongis acutis 3 nerviis, pedunculis lateralibus trifloris, bracteis minimis acutis appressis, petalis oblongis obtusis glabris sepalis subaequalibus, labello obcordato hirsuto ungue canaliculato sulcato.

India. Gibson : Devonshire. Nearly related to *D. Griffithianum* from which it differs in its three flowered peduncles and in the form of the lip. — Perigonium luteum, labello rubro picto.

70. *DENDROBIUM POLYANTHUM* Wall. Cat. n. 2009. L.O. n. 31. — Bot. Reg. XXX. 1844 Misc. 62. p. 57.

Capsulis fusiformis apteris.

Moolmeyn. — This plant is evidently very near *D. moschatum*. It however appears to have smaller flowers with far narrower segments, and as far as can be ascertained from dried specimens, they are nearly colourless, except the lip, which is yellow.

71. *DENDROBIUM GIBSONI* Lindl. in Paxt. Fl. G. II. p. 133. Xyl. 204.

Foliis acuminatis, racemis nutantibus pendulisque multifloris, elongatis, bracteis minutis ovalis obtusis, floribus sucarnosis, sepalis subrotundis basi in cornu brevi connatis, petalis latioribus integerrimis, labello cochleato cucullato obtuso villosio fimbriato.

Differs from *D. clavatum* by obsolete bracts and much smaller flowers. Nearly allied to *fimbriatum*. Like *D. fimbriatum* it bears its flowers in long nodding racemes; their colour is yellow, and they are stained on the inside with a purple blotch in the same manner as those of the plant figured in the Bot. Mag. under the name of *D. fimbriatum oculatum*. But the flowers are smaller, between fleshy and leathery in texture, much blunter in the bud, in consequence of the greater roundness of all the parts, and the petals are entirely destitute of the fringes which accompany those of *D. fimbriatum*. Tenasserim Griffith.

72. *DENDROBIUM FIMBRIATUM* Hook. Ex. n. 71. Wall. Cat. 2011. L.O. 38. — Bot. Mag. III. Ser. I. Vol. 4160 :

Caulibus erectis, fertilibus plerumque aphyllis, foliis lanceolatis striatis, racemis plurifloris, sepalis oblongis patentissimis integerrimis, petalis majoribus undulatis ciliato denticulatis, labello indiviso cucullato fimbriato lacerato.

Var. *b. oculatum*: labello fauce macula lata atrosanguinea. Tb. nostr. 4260.

Huc Paxt. Fl. G. III. 51: *Dendrobium fimbriatum* Hook.

Caulibus teretibus foliosis, foliis erecto lanceolatis, racemis laterali-bus laxis multifloris, bracteis herbaceis minutis, sepalis oblongis patentissimis, petalis majoribus denticulatis, labello indiviso rotundato cucullato villosio fimbriato, fimbriis laceris.

Var. *b. oculatum*: floribus majoribus, labello medio atropurpureo.

Some times known under the erroneous name of *Paxtoni*, which is a twoflowered species. — Wild specimens of the dark eyed: Mergui Griffith. The whole coloured: Nepal. — From *D. clavatum* it is known by its long membranous bracts, by its smaller flowers, *D. Gibsoni* has never open flowers and no fringes on petals.

Huc: *Dendrobium Paxtoni* Van Houtte Fl. des Serres VII. 725 ad Paxt. Mag. VI. 169. — Huc Lem. Jard. Fl. III. tb. 15. 314.

73. *DENDROBIUM CLAVATUM* Lindl. in Paxt Fl. G. II. 104. Xyl. 189.

Caulibus teretibus pendulis, foliis —, racemis laterali-bus laxis quinquefloris flexuosis basi squamatis, bracteis membranaceis oblongis cucullatis internodiis aequalibus, sepalis lineari-oblongis, petalis obovato oblongis rotundatis subundulatis, labello transverso leviter trilobo pubescente margine recto ciliato.

Affinity with *D. fimbriatum* and *moschatum*, to the latter of which we were formerly led by bad specimens to refer it as a synonyme. From *D. fimbriatum* it differs in having large membranous bracts and no deep fringes to the lip. In its bracts it agrees with *D. moschatum* and in the flowers appearing from within hard scales, but the lip has not the inflexed edge and slipper form of that species, and the racemes are much shorter.

** Non aurea.

1. 1. *Mentum triangulum*.

74. *DENDROBIUM DALHOUSIANUM* Paxt. Mag. of bot. XI. t. 145. — Lindl. Bot. Reg. 1846. t. 16.

Caulibus teretibus subfusiformibus striatis; foliis ovato lanceolatis obtusis, racemis horizontalibus 5—7 floris; bracteis squamaeformibus, sepalis ovatis, petalis conformibus multe majoribus, labello indiviso oblongo medio constricto, basi foveato, parte superiore obtuso glanduloso villosulo lateribus erosis glabris, lamellis 3 per medium brevibus laciniisque utrinque uniseriatis inflexis; cornu brevi obtuso.

Ind. or. — Van Houtte Fl. S. VII. 698.

75. *DENDROBIUM FORMOSUM* Lindl. — B. Reg. XXV. 1839. 64.

Caulibus teretibus pendulis pilosis, foliis distichis ovatis apice oblique emarginatis obtusis, racemo brevi terminali 4—5 floro, bracteis brevibus ovatis, (floribus maximis), sepalis oblongis acutis: lateralibus basi longe productis, petalis duplo latioribus acutis, labello obovato dilatato retuso cum basi columnae in calcar obtusum connato. Lindl. in Wall. Pl. As. Rar. p. 34. t. 39.

Dendrobium formosum Roxb. Fl. Ind. III. 485. Wall. Cat. 1998.

Roxburgh found it on trees in the forests of Sylhet, and in the Garrow mountains fl. April, May. — Wallich gathered it on the mountains of Nepal and Sylhet, also in the province of Martaban near Moulmein and in Tavoy on the Tenasserim coast flowering and fruiting in both the dry and rainy seasons. Mr. Griffith also met with it on trees in damp places in the neighbourhood of Moulmein. — *Perigonium candidum* labello medio luteo.

Porro: Lindl. Bot. Reg. XXIV. 1838. Misc. 86. — This noble plant, whose large ivory-white flowers are unrivalled for beauty in even the rich Flore of India, was sent from Chatsworth on the 12. May: having been imported for the Duke of Devonshire by Mr. Gibson, his Graces collector in the East Indies. The flowers grow at the end of a leafy stem, and are between 3—4" in expansion with every part of the purest and most transparent white, except one delicate lozenge shaped, buff-coloured blotch in the centre of the lip. Neither the form, nor the colour of this is correctly given in Dr. Wallich's work above quoted.

76. *DENDROBIUM MUTABILE* Lindl. Orch. 50. Huc: *Onychium mutabile* Bl. Bjd. 324. — *Onychium rigidum* Bl. p. 324. — *Dendrobium rigidum* Lindl. Orch. 51.

Huc: *Dendrobium* (*Onychium*) *tridentium* Lindl. Bot. Reg. 1846. sub t. 64. — Bot. Reg. 1847. 1.

Radicibus villosis, caulibus elongatis teretibus ramosis basi fusiformibus, foliis ovato-oblongis obtusis, panicula brevi terminali confertiflora, racemosa, sepalis ovatis acutis, petalis labelloque oblongis undulatis rotundatis emarginatis, hoc glabro utrinque unidentato medio tuberculo tricrenato aucto, mento brevi obtuso, columna apice dentata, stigmate villosulo.

Flores albi, crena aurantiaca, striolae roseae. — East Indies.

77. *DENDROBIUM JAPONICUM* Lindl. Orch. 89. — *Onychium japonicum* Bl. Bijdr. 328.

78. *DENDROBIUM NUDUM* Lindl. Orch. 85. — *Onychium nudum* Bl. Bijdr. 325.

79. DENDROBIUM HERBACEUM Lindl. — Bot. Reg. XXVI. 1840. Misc. 153.

Caulibus ramosis teretibus glabris, foliis lineari-lanceolatis acuminatis apice oblique bilobis, racemo paucifloro terminali, sepalis lateralibus basi paulo productis, dorsali petalisque linearibus, labello lanceolato integerrimo nudo, clinandrio biauri.

A small branching plant with leaves from 2 — 3" long, and inconspicuous green flowers. Imp. from East Indies by Loddiges.

80. DENDROBIUM CUMULATUM Lindl. Gardn. Chronicle 1855. p. 756.

D. cumulatum (*Stachyobium*) racemis densis lateralibus, petalis obtusis obtusis sepalis multo majoribus, mento sepalis aequali angusto incurvo acutiusculo, labelli glabri ungue lineari pone basin unidentato lamina oblonga obtusa.

A most beautiful addition to our collections. We first received a specimen in September last from Mr. Charles Junkermann, who found it growing in the garden of Mr. F. Coventry, of Shirley, near Southampton, and who describes the plant as having a dark stem covered here and there with Vanilla-scented blossoms. Since that time we have also had it from Mr. C. E. Warner. It appears to have been bought at one of Mr. Skinner's sales; but its real history is unknown to us. The flowers are nearly 2 inches long, with the delicate pink colour and transparent texture for which *Dendrobium transparens* is remarkable. They grow in lateral compact clusters, five or six together, in the same manner as in *D. aduncum*. The depth of colour in them varies; Mr. Warner's specimens having been very much darker than those from Mr. Coventry, and moreover having the delicate lip itself freckled with rosecolour. The leaves have not been seen by us. The species must stand next *D. aduncum*, from which it differs in its large flowers, incurved acute chin, and perfectly hairless obtuse lip. There is more than one nearly allied unpublished species in our possession from Java, whence this perhaps has come.

81. DENDROBIUM ADUNCUM Wall. — Bot. Reg. XXVIII. 1842. Misc. 62.

Caulibus pendulis, foliis lineari-lanceolatis acutis integris, floribus ternis patentibus, sepalis petalisque ovatis obtusis lateralibus duplo latioribus, cornu rotundato, labello unguiculato ovato concavo apiculato columnae arcte appresso intus villosa glabro, columna apice bialata sub stigmatate villosa, anthera glandulosa.

All. to *D. Pierardi*, received by Loddiges, from Dr. Wallich. The flowers are almost transparent, and of a most delicate pink, they are nearly as large as in *D. moschatum*.

2. 2. Mentum perulaceum elongatum.

82. DENDROCIUM THYRSODES Rehb. fl. Huc: *Dendrobium Kuhlii* Lindl. — Bot. Reg. 1847. 47.

„Foliis ovali-oblongis acutis subseptemnerviis apice inaequalibus, racemis brevibus plurifloris, sepalis ovatis patulis petalis latioribus, labelli limbo lineari spatulato acuto imberbi, calcare crasso ovarii fere longitudiné.“

Java. Lobb.

83. DENDROBIUM RAMOSUM LO. n. 34. — Flowers have a long and conspicuous spur.

Obs. „*Dendrobium bursigerum* a new *Dendrob.* near secundum Gard Chr. 1852. 8.

84. DENDROBIUM VIRIDIROSEUM Rehb. fl. in Bonpl. III. 226.

Aff. *D. secundo* Lindl. et *Kuhlii* Lindl.: labello ligulato acuto canaliciformi per medium septo transverso membranaceo divisio.

Racemi rhachis crassa brevis; bractee triangulae pro genere magnae scariosulae. Flores rosei apicibus perigonii viridibus; labellum album roseo striolatum. Perula cylindracea ampla antice usque supra basiu fissa. Pollinia viridia. Aus Java? eingeführt von Hrn. Consul Schiller, cultivirt von Hrn. Stange. Amboyna?

85. *DENDROBIUM SECUNDUM* Lindl. Bot. Reg. 1291. — Bot. Reg. XXVII. 1841. Misc. 169. — Flowered with Mr. Knight of the King's Road. Lateral sepals and base of the lip are so united in a spur, that their separate nature is entirely concealed towards the point of the spur. The rostellum is a deep two-lobed lip curved down over the stigmatic surface. The pollenmasses are in two pairs, and deep purple and which is extremely curious, they lie upon a loose hard transverse gland, which seems to replace the gland and caudicula of Vandeeae, and which projects beyond the anterior edge of the anther resting upon the two-lobed rostellum. The anther-bed itself is deeply excavated, and 3-lobed, the anther adhering to the back lobe, which is the narrowest.

Huc: B. M. 4352. — De Vriese Illustr. t. 6.

86. *DENDROBIUM EROSUM* Lindl. Orch. 52.

87. *DENDROBIUM HYMENOPHYLLUM* Lindl. Orch. 53.

88. *DENDROBIUM HASSELTII* Lindl. Orch. 59.

89. *DENDROBIUM CALCARATUM* A. Rich. Sert. Astrol. t. 7. Voyage. Botanique II. p. 18. D. caule ramoso, quasi articulato, glaberrimo, bipedali, florifero, aphylo; foliis linearilanceolatis acutis glaberrimis, basi vaginatis, caducis; floribus spicato-corymbosis, spica multiflora; bracteis linearibus acutis glabris: sepalis lateralibus basi in pseudocalcar recurvum, fissum productis, labello lineari-subspathulato, plano, acuto. — Crescit in insula Vanikoro.

†† Labellum indivisum calceolare.

90. *DENDROBIUM MOSCHATUM* Wall. Lindl. Orch. 82. — Bot. Reg. XXX. Misc. 82. p. 57.

Dendrobium cupreum Herbert in Bot. Reg. 1779.

Dendrobium clavatum Wall. Cat. n. 2004.

Caulibus teretibus pendulis, foliis linearilanceolatis oblongisque, racemis lateralibus laxis 5—6 floris, bracteis pedicellis 3 plo brevioribus, sepalis patentissimis petalisque oblongis obtusis latioribus venosis reticulatis, labello unguiculato calceolari obtusissimo margine abrupte inflexo pubescente.

Burma, Pegu, Ava, Sylhet. — This beautiful plant with large nankin coloured flowers stained and veined with crimson, is readily known by its labellum, whose edge is turned inwards and delicately fringed with hairs, — Its odour is compared by some to musk, by others to rhubarb, and by others to wood-roof.

Huc: *D. Calceolaria* Hook. Ex. 184. — B. M. 3837.

††† Labellum trilobum

* Tepala extensa, vulgo sepalis longiora. (Folia valde coriacea.)

91. *DENDROBIUM MIRBELIANUM* Gaudich. Voy. t. 38.

Foliis ovato-oblongis obtusis, racemis ovatis longe pedunculatis, sepalis ovato lanceolatis acutis erectis, petalis spathulatis unguiculatis obtusis longioribus, labelli 3 lobi ovato-lanceolati subsessilis lobis lateralibus rotundatis intermedio lanceolato undulato acuto, lineis 3 elevatis, lateralibus versus basin duplicibus.

New Guinea by Hinds! — Gaudichaud's fig. is not a good one. The racemes, including their peduncle, are more than a foot long. The pet. 1½" long.

Lindl. in „Vegetat. of the Feejee Islands by Bentham in Hook. Lond. Journ. of Bot. Vol. II. 1843. p. 235. — This plant, but ill figured by Gaudichaud's artist, belongs to a very curious and beautiful section of *Dendrobium*, of which I have several species, including *D. undulatum* R. Br., *D. macranthum* Ach. Rich. and probably *Onychium affine* Decaisne. The sectional name expresses one of its chief peculiarities, namely, the petals being extended giving the flowers an appearance still more insect-like than is customary in this order. Besides that circumstance the lip is united to the foot

of the column into a pouch or horn, and the anther-bed has a horn on its back. They all have distichous leaves and a rigid raceme of strong flowers. At one time I thought, they might form a genus, but I believe, it is better to regard them as a mere section of *Dendrobium*.

92. *DENDROBIUM VERATRIFOLIUM* Lindl. n. sp. — Lindl. in „Veg. of the Feejee Islands by Bentham in Hook. Lond. Journ. of Bot. Vol. II. 1843. p. 236.

Foliis oblongis obtusis amplexicaulibus 9—11 nerviis, racemo terminali elongato multifloro, sepalis undulatis acutis, petalis spathulatis obtusis planis vix duplo longioribus, labello oblongo membranaceo venis 3 elevatis per axin duabusque minoribus lateralibus, lobis lateralibus nanis obtusis intermedio oblongo undulato.

A most beautiful plant, with racemes a foot and $\frac{1}{2}$ long, loaded with flowers, whose spatule shaped petals are an inch and more in length. New Guinea Mr. Hinds.

Bot. Reg. XXIX. Not. sub 28: New Guinea Hinds. — Flores albi, petala 1" longa. — *D. Mirbeliani* inflorescentia compactior.

93. *DENDROBIUM MACRANTHUM* A. Rich. Sert. Astrol. p. 15. t. 6. — Bot. Reg. 43. XXIX. sub 28. Not.

Foliis ellipticis apice obliquo subbilobis, racemo longipedunculato versus apicem monophyllo, sepalis ovato-lanceolatis, petalis paulo longioribus unguiculatis lanceolatis acutis, labello lanceolato 3 lobo per axin 3 carinato lacinia intermedia acuminata lateralibus nanis rotundatis.

Island of Vanikoro. — Caulis bipedalis et altior. Folia 3—4". Racemi 1'. Flores 3" in diam. Prope Loddiges' *D. veratrifolium*, sed habet petala valde breviora, labellum acutissimum.

Huc: Voyage de l'Astrolob. Botanique II. p. 15: *D.* caule glabro, bipedali, tereti, articulado, subincrassato-bulbiformi glabro; foliis alternis vaginantibus, ellipticis, apice obliquo subbilobis, glaberrimis; floribus maximis pedunculatis laxè spicatis; calycis laciniiis exterioribus aequalibus lanceolatis; labello lanceolato, versus medium coarctato; parte superiore acuta, inferiore latiore. secundum longitudinem facie interna subcristato. Nob. — Crescit in insula Vanikoro.

Descriptio.

Caulis parasiticus teres bipedalis et ultra, ramosus glaber, basi subincrassato-bulbiformis, cicatricibus foliorum elapsorum annulatus et vaginis persistentibus circumdatus. — Folia alterna vaginantia, elliptica, apice subobliquo acutiuscula, glaberrima, subcarnosa, rigidula, striata, 3—4 uncias longa, unam et semis lata, cum vaginis articulata et facillime transversali sectione secedentia. — Flores maximi, longissime pedicellati, spicam longam axillarem, lateralem, subpedalem efformantia. Flores 7—8—9 resupinati, basi bracteola brevi ovali-acuta stipati: pedicellis teretibus biuncialibus; pedunculo communi tereti glabro medietate superiore florifero, inferiore nudo, et vaginulis tribus truncatis circumdato. — Calycis laciniae subpathulae; tres exteriores aequales lanceolatae, acutae, venoso-reticulatae; duae inferiores, basi latiores truncatae, inter se, mediante processu baseos anticae gynostemii, connatae, oblique productae, et quasi calcar aemulantes: duae interiores laterales ejusdem longitudinis oblongo-spathulatae acutae, venoso-reticulatae. Labellum, longitudine laciniarum, circiter e media processu parte enatum, lanceolatum acutissimum erectum, in duas partes divisum; superior ovali-lanceolata, acutissima, late venoso-reticulata, ab inferiore sinu lato obtuse separata; inferior major quasi obcordata, in media facie superiore lineis tribus longitudinalibus prominentibus et subcristaeformibus notata (hae linea continuatae cum processu gynostemii videntur), lateraliter oblique et dense venosae. — Gynostemium breve, postice convexum, antice concavum et lateribus acutum; lateribus in puncto junctionis laciniarum externarum continuis et processum concavum, e quo nascitur labellum, efformantibus. Stigma supremam anticae faciei gynostemii partem occupans, madidum. — Anthera terminalis operculiformis. Oper-

culo superius convexo, inferius concavo, biloculari. Massae pollinis . . . — Ovarium oblongum basi cum pedicello continuum, subcontortum.

94. *DENDROBIUM ANTENNATUM* Lindl. — Lindl. in „Veg. of the Feejee Islands by Bentham, Hook. Lond. Journ. of Bot. Vol. II. 1843. p. 236.

Foliis lanceolatis carnosis oblique emarginatis racemo oppositifolio brevioribus, sepalis acuminatis, petalis linearibus duplo longioribus reflexis, labello trilobo, venis 5 elevatis rectis per axin, lobo medio ovato acuto plano 3-costato.

The horn like petals of this curious plant are 2 inches long, and scarcely $\frac{1}{2}$ a line wide. The leaves are succulent, brittle, and veinless, when fresh. New Guinea, Mr. Hinds.

95. *DENDROBIUM TAURINUM* Lindl. — Bot. Reg. 43. XXIX. 28.

Foliis oblongis emarginatis, racemo oblongo, sepalis ovatis obtusiusculis, petalis linearibus contortis duplo majoribus, labello oblongo apice crispo per axin lineis 3 elevatis intermedia apice flexuosa aucto.

Manilla. Cuming mis. ad Loddiges. 5' high. Flowered at Hackney 43/8. Petala et labellum rubella, sepala et columna et calcar alba.

96. *DENDROBIUM UNDULATUM* R. Br. Prodr. 332. L. n. 62. — Bot. Reg. 43. XXIX. Note sub 29.

Foliis ovato-oblongis emarginatis, racemis longissimis, sepalis petalisque undulatis, labelli trilobi lobis acutis intermedio lanceolato, lineis 5 elevatis intermedia apice flexuosa.

A tropical New Holl. species, with singular dingy yellow-brown flowers, of little beauty. It has also been found in Java.

Hook. Bot. J. III. p. 254. 1841. „and doubling a bluff rocks point, covered with *D. undulatum* and a few *Filices*." — Port Bowen Austral. All. Cunningham.

Huc: *Dendrobium discolor* Lindl. — Bot. Reg. XXVII. 1841. Misc. 50.

Caulibus erectis fusiformibus, foliis oblongis obtuse emarginatis distichis, racemo terminali multifloro, sepalis petalisque lineari-oblongis, petalis crispis, labelli crenulati lobis lateralibus acutis intermedio lanceolato acuto lamellis 5 undulatis.

Although obt. by Msr. Lodd. from the Bot. Gard. at Buitenzorg, I cannot recognize this species among those mentioned by Dr. Blume. It has a most singular appearance with stout erect stems, 4' high, swollen in the middle, and terminal racemes of about 16 dingy yellowish brown flowers, as much curled and wavy as those of a *Gloriosa*. The lip has the same dull dirty colour, except along the middle, where it is decorated with fine deep wavy plates of a brigh violet. It is of the same sect. as the sweetscented *Dd. crumenatum*, now so rare in our garden, if it exists at all.

Bot. Reg. XXVII. 1841. 52. = undulatum Brown. plant. Novae Holland. falso citatur *Dendrob. discolor* B. Reg. 1841. 38. — Bot. Reg. XXVIII. 1842. Misc. 6.

- 97? *DENDROBIUM AFFINE* (*Onychium affine* Descaisne herb. timor. 37). — Lindl. Bot. Reg. 43. XXIX. Not. sub. 28.

„Foliis lineari-oblongis acutiusculis coriaceis, pedunculo foliis triplo longiore oppositifolio? laxifloro, floribus spicatis; perianthio erecto, segmentis exterioribus lineari-lanceolatis acutis, interioribus subobovatis rotundatis mucronulatis, labelli unguiculati lobis 3, medio lineari-lanceolato, lateralibus subrotundis.“

As Mr. Decaisne compares this with *D. Mirbelianum*, it probably belongs to the present section, notwithstanding that he conjectured the stem to be bulbous. Petals are said to be obovate and mucronate. With acute linear-lanceolate leaves.

** Tepala non extensa. (Folia plurium papyracea).

98. *DENDROBIUM HEYNEANUM* LO. 90. — Lindl. Bot. Reg. XXV. 1839. Misc. 41. — This

pretty species has flowered imperfectly with Mrs. Loddiges, who received it from Bombay by the overland conveyance. Its exact locality was not before known; the specimens in Heyne's herbarium, where I found the species, affording no information upon that point. In a healthy state the plant forms a tuft of slender clavate stems, from 4—6" high, loosely covered with the withered sheaths of leaves, that have fallen off. From all sides there appear in the flowering season slender spreading racemes about 3" long, having each from 5—9 smallish white flowers, with a greenish-yellow lip beautifully streaked with violet; they have no smell.

Wight Ic. Pl. Ind. or. III. II. 909. 1844. Epiph. on tree branches in Malabar.

99. *DENDROBIUM BARBATULUM* Lindl. Orch. 44. — Paxt. Fl. G. III. p. 113. c. xyl. 285.

— Bombay. Bateman. — Occurs under the name of *D. Heyneanum*: muslin white flowers, erect spikes. — Lip is three-lobed, very slightly downy with 2 short lateral obtuse lobes and a linear callosity reaching as far upwards as the sinus of those lobes. The middle lobe obovate and obtuse. — A transposition of labels, memoranda, sketches led me into the great error of confounding this with the evidently different *D. chlorops* (B. R. 1844).

100. *DENDROBIUM CHLOROPS* Lindl. — Bot. Reg. XXX. 1844. Misc. 54.

Caulibus teretibus, floribus laxe corymbosis, pedicellis filiformibus glaucescentibus, sepalis lineari-oblongis, petalis duplo latioribus obovatis, labelli trilobi plani lobis lateralibus nanis acutis intermedio lineari-oblongo apice paulo latiore basi villosa, cornu brevi conico.

Bombay. Habit of *D. Heyneanum*. Small flowers of a pale nankin colour, while the base of the lip is a light pea green. This gives the flower the appearance of having a green eye.

Bot. Reg. XXX. 1844. Misc. 62. pag. 59. — When dried the parts of the flowers become extremely thin and difficult to examine, and I was thus led to suppose that the lip was undivided. I have however ascertained that it is really 3 lobed and that my *D. chlorops* is the same species more correctly defined.

Huc: „*Dendrobium barbatulum* Lindl.“ Wight Ic. pl. Or. III. II. 910. (1844.) — Seems to be a handsome species growing on trees, but of which little is yet known, the specimens from which it was taken up having been poor ones. The one figured here was found in Malabar. Flowers pale straw coloured.

101. *DENDROBIUM BICAMERATUM* Lindl. — Bot. Reg. XXV. 1839. Misc. 85.

Caulibus fusiformibus, foliis lineari-lanceolatis apice oblique bidentatis, pedunculis lateralibus squamatis 4 floris, floribus concavis subcarnosis, sepalis petalisque subrotundo-ovatis acutis, labelli trilobi lacinia intermedia rotundata apiculata carnosa, lateralibus triangularibus acutis brevioribus, columnae facie excavata semibiloculari.

North of India. Gibson brought to the duke of Devonshire. Stems grow nearly upright, and are rather short, fusiform, furrowed when old. Flowers little smaller, than those of *Maxillaria stapelioides*, like them in form, their colour is dull yellow, spotted and streaked with purple. — Flowers grew in fours, on a very short peduncle, closely covered with ovate concave bracts, speckled with purple. The excavation of the face of the column and its division into two cells are remarkable.

102. *DENDROBIUM BRISBRANENSE* Rehb. fil. Huc: *Dendrobium elongatum* All. Cunn. — Bot. Reg. XXV. 1839. Misc. 33.

Caulibus articulatis teretibus sulcatis elongatis erectis 4—5 phyllis, foliis ovato-lanceolatis acutiusculis apice obliquis emarginatis, racemo terminali 3—10 floro, foliolis perianthii ovatis obtusiusculis, labelli disco 3-carinato lobo intermedio lato cordiformi.

On trees in shaded dark woods, on the banks of the Brisbane River. Sept. 1828. New South Wales. All. Cunningh.

Bot. Reg. XXVII. 1841. Misc. 53. — Flowered with Loddiges. Has erect stems about

1½' high, at the end of which grow about 4 lanceolate leaves from the midst of which springs a raceme of yellowish flowers spotted with red. They seem unwilling or unable to expand.

103. *DENDROBIUM CATENATUM* LO. 41. — Bot. Reg. XXX. 1844. Misc. 62. pag. 60. — Labello oblongo apice trilobo.

This has regularly jointed stems, 5—6 inches high, small narrow leaves and flowers with green sepals and white petals. I only know it from a Chinese drawing in the possess of the Hort. Soc.

104. *DENDROBIUM DENUDANS* Don Prodr. fl. nep. 34. LO. 84. — Lindl. Bot. Reg. 1838. Misc. 156 (XXIV.)

Labelli trilobi oblongi lobo medio emarginato crispo, lateralibus serratis, disco bilamellato.

Received by His Grace the Duke of Devonshire upon Mr. Gibson's return from his Indian mission, and having been sent subsequently imported to others flowered in several coll. The finest specimens I have seen were sent by Mr. Bateman to Msr. Lodiges. Stems erect, 6" high, not very unlike a small state of *Dendrobium nobile*, and are covered by a profusion of nodding racemes of rather small green and white flowers.

105. *DENDROBIUM ALPESTRE* Royle Illustr. t. 88. fig. 2. — Bot. Reg. XXX. 1844. Misc. 62. pag. 61.

Caulibus brevissimis ovatis 3—4 phyllis, foliis lineari-oblongis, racemis 3—5 floris erectis, sepalis acuminatis, cornu brevi obtuso, petalis minoribus, labelli trilobi lanceolati lobo medio acuminato crispo basi angustato, lateralibus laceris, disco bilamellato.

Himalaya. — Stems and leaves only a few inches high. Flowers white, with a purplish lip.

106. *DENDROBIUM CUSPIDATUM* LO. 43.

107. *DENDROBIUM GRAMINIFOLIUM* Wight Ic. V. 1. 1649 (1851):

Rhizoma creeping, stems ascending, leafy, leaves sheathing at the base, linear, lanceolate, acute: raceme terminal, slender, 4—6 flowered, flexuose, bracts much shorter than the pedicels, ovate, acute: flowers calcarate, sepals and petals equal, acute, petals narrow, lanceolate; lip cucullate, 3 lobed, lateral lobes small, blunt, middle orbicular crenate, somewhat crisp on the margin; claw united with the prolonged process of the column forming a conical spur.

Courtallum. Aug. Sept. — 4—8" high. Flw. white.

108. *DENDROBIUM RAMOSISSIMUM* Wight Ic. V. 1. 1648 (1851):

Erect! ramos, lower part of the stem naked, smooth, dark shining brownish-coloured, ramuli leafy: leaves narrow, linear, lanceolate, acute; racemes terminal, short, few flowered: flowers small: sepals ovate, lanceolate, acute, broader than the lanceolate acute entire petals: lip oblong, obtuse, contracted near the apex, forming a suborbicular terminal lobe.

Flowers yellow. — Coorg Jungles. Jerdon. — 18" — 2'.

B. Caulis apice tantum foliatus.

- §. 1. Caulis basi ima bulbosus, supra bulbum gracilis foliatus.

109. *DENDROBIUM PLANIBULBE* Lindl. — Bot. Reg. XXIX. 1843. Misc. 70.

Caule compresso distiche folioso erecto basi ovali complanato, foliis oblongis obtusis emarginatis, pedunculo vaginato aphylo, floribus ter-

minalibus e paleis glumaceis erumpentibus, sepalis petalisque acumina-
tatis, labelli 3lobi lobis lateralibus dilatato rotundatis intermedio lineari
pectinato basi appendice emarginata aucto.

Singular. Manilla. Cuming. Loddiges. Stems 3" high, flattened at the base into an
oblong thin edged pseudobulb. The leaves are dull greenish red. Flowers small
white veined with purple, placed at the very extremity of a leafless peduncle. It
is very near *D. Blumei*.

110. DENDROBIUM BLUMEI Lindl. Orch. 88. (*Onychium fimbriatum* Bl. Bijdr. 325.)

111. DENDROBIUM TRICUSPE Lindl. Orch. 88. (*Onychium tricuspe* Bl. Bijdr. 32.

Kew. ed. 2 v. 5. p. 212. — Spr. Syst. Veg. V. 3. p. 738. — New Holland plant, long
cultivated, which rarely produced blossoms. — Smithii dissimilis pictura orta videtur
Hookero inertia pictoris.

113. DENDROBIUM AEMULUM Br. — B. Mag. Vol. III. N. S. 1829. 2906. — Diagn. Brown-
neana. — Sent from New South Wales 1823 by Mr. Cunningham to Kew flow. 1825.
Decemb. drawing from Mr. Aiton Esq. — Sepala et petala alba apicibus flava. Labellum
medio viride, purpureo pictum, margine album. Cristulae labelli flavae. Gynotemium
viride.

114. DENDROBIUM KINGIANUM Bidwill MSS. — Bot. Reg. XXX. 1844. Misc. 18.

Pseudobulbis in collum longum extensis apice bifoliis, foliis ovalibus
emarginatis, pedunculo terminali (2—3 floro foliis aequali?), sepalis ova-
tibus mento emarginato, petalis obovatis apiculatis duplo brevioribus, la-
belli trilobi pubescentis laciniis lateralibus acutis intermedia paulo lon-
giore transverse rhombea angulis lateralibus rotundatis apicali acuto axi
elevata trilineata apice tridentata.

New Holl. bought by Ms. Lodd. at the sale of Mr. Bidwill. Pseudobulbs between 4—5
inches long, tapered from an ovate base into a very long and narrow neck, on the
top of which stand two oblong emarginate dark-green rather wavy leaves. Between
those is a flower-stalk having 2—3 pink flowers gayly spotted with crimson in the
inside. — Bot. Reg. XXXI. 1845. 61. — Huc B. M. 4527. Lem. Jard. Fl. t. 143.

115. DENDROBIUM TETRAGONUM All. Cunningham. — Bot. Reg. XXV. 1839. Misc. 30.

Caulibus gracilibus erectis elongatis quadrangularibus apice clavatis
2—3 phyllis, foliis ovato-lanceolatis acutis undulatis striatis s. nervosis
glabris racemo terminali 2—4 floro longioribus, foliolis perianthii elon-
gato-linearibus patentibus, labello vittato: disco tricarinato, lobo medio
dilatato subcordato acuto.

An epiphyte, hanging loosely from the stems of small trees, in dry shaded woods,
Moreton Bay. June 1828. New South Wales. All. Cunningham.

Bot. Reg. XXVII. 1841. Misc. 8. Flowered with Loddiges. A pretty species with
spider like flowers, whose sepals and petals are produced into long tapering points
They are yellowish green, bordered with bronish red. The lip is pale yellow, streaked
with narrow bands of crimson. Msr. Loddiges cult. it on a piece of dry wood in their
Cactus house.

116. DENDROBIUM MACRAEI Lindl. Orch. 75.

117. DENDROBIUM APPENDICULATUM Lindl. Orch. 76. *Desmotrichum appendiculatum* Bl. Bjd. 330.

118. DENDROBIUM LONGICOLLE Lindl. — Bot. Reg. XXVI, 1840. Misc. 172.

Pseudobulbo compresso in collum longissimum extenso, folio oblongo concavo, flore solitario, ovario filiformi cum pedicello articulado, sepalis petalisque patentibus a lata basi in acumen lineare attenuatis, cornu brevi conico, labello trilobo: lob. lateralibus nanis margine anteriore crispis, intermedio apice ovato plicato crispatoque sublobato, lamellis 2 crispis conniventibus per axin.

A singular *Dendrobium* belonging to the same section as *D. amplum*, which is remarkable for combining the habit of *Bolbophyllum* with the entire structure of the former genus. The neck of the pseudobulb is nearly 8" long; the leaf 5"; the ovary $2\frac{1}{2}$ ". The flower is pale straw colour, with the ends of the sepals and petals tapering into a fine purple point. Sent to Msr. Loddiges from Sincapore by Cuming.

119. DENDROBIUM PUGIONIFORME Lindl. B. Reg. XXV. 1839. Misc. 34.

Caulibus repentibus nodoso-articulatis radicalibus setoso-stipulatis, foliis elliptico-lanceolatis apice attenuatis acutis carnosiss infra fere convexis carinatis laevibus nitentibus, floribus (resupinatis) subsolitariis axillaribus, perianthii foliolis oblongo-lanceolatis acutis patentibus, labello longitudinaliter tricarinato, lobo intermedio dilatato undulato-crispato apice acuto recurvato.

A beautiful epiphyte hanging loosely from the stems of trees so as to swing freely to the wind that sweeps through the forests on the summit of the best of mountains bordering the coast district of Illawara, on the west (lat $34\frac{1}{2}$ S) and flowering in August 1818. All. Cunningham.

Obs. This spec. approaches so near *D. rigidum* Br. prodr. (not of LO. 86. n. 51.) that I have often viewed it as the same plant which was described by Mr. Brown, from a fig. in the Banksian coll. It now appears to me distinct. Lindl. Hook. B. Jour n. III. 1841. 289: Toman Austral. 2 Decb. All. Cunningham.

120. DENDROBIUM BIGIBBUM Lindl. in Paxt. Fl. G. III. 1852. 25 c. xyl. 245.

Caulibus elongatis apice 3—5 phyllis, racemis erectis elongatis dis-sitifloris, petalis subtrotundis sepalis duplo latioribus, labelli trilobi lobis rotundatis medio cristato basi gibboso, sepalis lateralibus in calcar productis.

North West coast of tropical New Holland. Lodd. int. — Stems long, narrow, fusiform, tapering at the base, closely invested with dry light brown sheathes, near the end they bear 3—6 long narrow, firm, spreading acute leaves, each with five ribs. The raceme is erect, and consists of 3—4 flowers. Bracts small and scale like. Blossoms rich purple, nearly of same colour as *Bletia verecunda*. — The lip originates in the sinus above. — The spur of the sepals is moveable, and projects outwards at its base in usual way, so that this flower has a kind of double chin. Nearly allied to *D. Kingianum* and *elongatum*.

121. DENDROBIUM HYMENANTHUM Rehb. fl. in Bonpl. III. 222.

Labello flabellatoligulato apice obtuse acuto subdenticulato.

Adest caulis pseudobulbosus tri—quadripollicaris biarticulatus epidermide citrina; forsan ex siccatione angulatus, gracilis, apice diphyllus. Folia a basi angusta oblongoligulata apice obtuse acuta bilobula pollicaria, tertiam pollicis lata, sicca nervosa. Fasciculus bractearum terminalis. Flos hyalinus in perulam obtusam elongatus. Sepalum summum lanceum breve, sepala lateralia perulam efformantia, multo longiora. Sepala lineari falcata. 2135 Cuming. Phil.

122. DENDROBIUM CARNOSUM Tejsm. et Binnendik Naturk. Tijdsch. vor Nederl. Ind. Deel V. 1853.

Pseudobulbis diphyllis oblongis sulcatis basi angustis, foliis oblongis obtusiusculis carnosis mucronatis, floribus solitariis rubro-lineatis, labelli limbo emarginato.

Salak Jav.

123. DENDROBIUM MARGINATUM Tejsm. et Binnendik Naturk. Tijdsch. Nederl. Ind. Deel V. 1853.

Bulbis oblongis quadrangularibus tetraphyllis, foliis loricatis retusis basi angustatis luteo marginatis, racemo solitario 3—5 floro, perigonii phyllis linearioblongis acutis exterioribus latioribus, ovario longissimo, labello trilobo intus calloso, lobis lateralibus obtusiusculis, intermedio multo longioribus acuminatis reflexis.

Salak.

124. DENDROBIUM UNGUICULATUM Teijsm. et Binnendijk. Naturk. Tijdsch. Nederl. Ind. V. 1853.

Bulbis fusiformibus elongatis tetragonis diphyllis, foliis ovato lanceolatis acuminatis coriaceis glabris, floribus solitariis, phyllis perigonii exterioris oblongis acutiusculis, internis obovatis obtusiusculis, labello unguiculato limbo cucullato subtrilobo lobo medio emarginato intus lineolato.

Salak.

126. DENDROBIUM HETEROIDEUM Bl. Rumphia IV. 193. 6. — 198.

127. DENDROBIUM FUNIFORME Bl. Rumphia IV. 193. 5.

** Labellum apice multifido lacerum.

128. DENDROBIUM CRINIFERUM Lindl. — Bot. Reg. XXX. 1844. Misc. 55.

Caulibus teretibus erectis ramosis, foliis oblongis subundulatis emarginatis, floribus axillaribus lateralibusque solitariis cernuis, sepalis ovatis, petalis linearibus acuminatis, labelli trilobi crenulati lobis lateralibus nanis intermedio apice in filis intricatis multifido lamellis binis undulatis.

Small yellowish flowers of little beauty. Introduced by His Grace the Duke of Northumberland, who received it from Mr. Power in Ceylon. It is closely allied to *D. Scopa*, but is readily distinguished by its slender stems, wavy leaves; and the shortness of the labellum. The breaking up the point of the lip into numerous threads is remarkable and resembles what occurs in the bearded *Bolbophyllums*, which are no doubt the *Desmotrichum* of Blume.

129. DENDROBIUM SCOPA Lindl. — Bot. Reg. XXVIII. 1842. Misc. 55.

Caule erecto clavato compresso ramoso, ramis monophyllis, folio oblongo concavo undulato obtuso floribus in fasciculis axillaribus squamatis petiolatis, sepalis petalisque lineari-lanceolatis, labelli trilobi trilamellati laciniis lateralibus hinc serratis, intermedia elongata triangulari basi serrata apice in filis intricatis dissoluta.

Manilla. Lodd. imp. (273). — Stems a foot high, stiff and strong. The leaves are from 5—6" long, and two and a half broad. The flowers are small, whitish in axillary fascicles.

130. DENDROBIUM COMATUM Lindl. G. et Sp. O. 76.

131. DENDROBIUM ANGULATUM Lindl. l. c.

2. 2. Ovarium hispidum.

D. caule simplici brevi, basi vaginato, apice monophyllo; folio oblongo-lanceolato; floribus pedicellatis 1—4 ex axilla folii ortis; calycis laciniis lateralibus basi connatis et calcar breve aemulantibus; labello incluso, basi unguiculato et recurvo, superne subcanaliculato trilobo; ovario subgloboso echinato. Nob.

Crescit supra arbores in insula Vanikoro.

Descriptio.

Herbula supra corticem arborum parasitica, caespites densos efformans. — Radix fibrosa, conferta, fibris longis teretibus, albidis, glabris in rimis corticum et inter muscos lichenesque penetrantibus. — E rhizomate assurgunt caules plurimi erecti, 2—3-unciales, apice truncato monophylli et floriferi; sensim a basi versus apicem paulisper incrassati, obsolete triquetri? (an siccatione); juniores vaginis tribus a basi ad apicem circumdati, vagina inferiore brevior truncata, media hujusce longitudinis oblique truncata, superiore multo longiore, usque ad apicem caulis attingente, laxiuscula, oblique truncata; tribus hisce vaginis in adultis evanidis. — Folium unicum terminale cum apice caulis articulatam et facile separabile, sessile, caule paulo brevius oblongo-lanceolatum, apice obtuso obsolete bilobum, carnosum, glaberrimum avenium. — Ex axilla folii nascuntur flores 1—4 pedunculati, bractea vaginaeformi apice acuto-bifida, hinc fissis, circumdati; pedicelli paulo supra basin articulati, parte inferiore brevior persistenti, parte superiore longiore caduca, versus apicem paulisper incrassata, vagina longiores glabri. — Ovarium ovoideo-globosum, pilis incrassatis dense echinatum. Calycis lacinia superior basi lata sessilis subovali-acuta, vix galeato-convexa. Duae laterales similes suboblique ascendentes obtusissimae, obsolete quadratae, basi antice coalitae et in calcar subrecurvum ovario saepe dimidio brevius apice clausum, superne flossum productae. — Laciniae interiores laterales longitudine exteriorum, oblongo-spathulatae, obtusae, angustae, erectae. — Labello inclusum basi longe unguiculatum, superne concavum, medio longitudinaliter plicatum, subtrilobum; lobo medio multo majore suborbiculari apice acutiusculo; lateralibus minimis obtusis; ungue longiusculo recurvo cum basi producti gynostemii articulo. — Gynostemium breve, postice convexum, semiteres, antice concavum et superne lateraliter quasi bicorne; basi antica cum calcare laciniarum exteriorum continuum. — Anthera terminalis operculiformis, superne convexa, antice obtusa subemarginata, intus bilocularis. Pollinia duo ovoidea, in loculis solitaria, solida, sulco longitudinali quasi bipartita.

134. DENDROBIUM MACROPHYLLUM A. Rich. Voyage de l'Astrolabe Atlas Tab. 9. Texte p. 22.

D. foliis amplis elliptico-oblongis acutis, coriaceis, scapo simplici; floribus magnis spicatis; spica longa interrupta; pedicellis ovarioque hispidis, bractea persistenti lanceolata glabra longioribus; laciniis externis pilosis; interioribus spathulatis acuminatis; labello profunde trilobo, concavo, basi unguiculato. Nob.

Crescit in Nova-Guinea.

Descriptio.

Radix parasitica. — Folia ampla elliptico-oblonga, coriacea, glaberrima, integerrima, striata, apice acuta, basi plicato-vaginantia, subpedalia, circiter 5 pollices lata. — Scapus simplex, teres, bipedalis et ultra, glaber, basi vaginis quibusdam unilatera-liter fissis, erectis acutis amplexatus: superne flores spicam elongatam interruptam efformantes gerens. — Flores ampli longe pedicellati, 2—3 approximati, alterni; ad illorum basin adest bractea oblongo-lanceolata acuta, sessilis, persistens; pedicellis bractea duplo longioribus, basi articulatis deciduis, sicut ovarium dense lanato-hispidis. — Calycis laciniae exteriores longitudinaliter venosae, subreticulatae, facie externa pilosae; superior ovali-oblonga acuta, subconcaeva, erecta; duae laterales

aequales triangulari-oblongae acutissimae, planae, oblique ascendentes, ima basi inter se, mediante gynostemii basi continua, coalitae, non calcar aemulantes. — Duae internae laterales similes, longitudine exteriorum, spathulatae, acuminatae, margine subsinuosae, basi angustatae et longius unguiculatae, erectae, membranaceo-subhyalinae, venoso-reticulatae, glabrae. — Labellum ex apice processus basilaris gynostemii ortum, erectum, basi unguiculatum non articulatum, subrecurvum, facie superiore, lateribus erectis, concavum, profunde trilobum; lobo medio transverse latiore subdiptero apice truncato, apiculato, alis lateralibus obtusissimis rotundatis; lobis lateralibus truncatis, abrupte in unguem desinentibus; supra unguem in regione media adest appendix rigidiusculus, planus, cristaeformis. — Gynostemium brevisculum vix duas lineas altum, antice concavum, et fovea stigmatica superne excavatum, lateribus apice apiculatis, recurvis; basi, ut jam diximus, productum in appendicem laciniis calycis exteriores inter se coadunantem. — Anthera terminalis operculiformis. Pollinia quatuor approximata, ovoideo-oblonga, inter se tantisper subcoalita.

Obs. L'échantillon unique de cette magnifique espèce, que j'ai examiné avait été recueilli à la Nouvelle-Guinée par le capitaine d'Urville. Les énormes feuilles de cette espèce, ses grandes fleurs, dont le pédoncule, l'ovaire et les trois divisions extérieures du calice sont extrêmement velues; sa longue hampe glabre, terminée par un long épi de fleurs, accompagnées chacune d'une bractée persistante, lancéolée, aiguë, glabre, d'un pouce et au-delà forment un ensemble de caractères, qui distinguent facilement cette belle espèce.

Huc: *Dendrobium Veitchianum* Lindl. — Bot. Reg. 1847. Ann. sub. tab. 25. (Ophryde fuciflora):

Caulibus clavatis anguste costatis 2—3 phyllis, foliis sessilibus oblongis apice acutis inaequilateris, racemo erecto multifloro foliis longiore, bracteis ovatis membranaceis acutis, pedicellis sepalisque ovatis acutis extus villosissimis, petalis unguiculatis spathulatis acutis tenuibus glabris, labello maximo alte trilobo, denticulis tribus in medio, laciniis lateralibus ascendentibus rotundatis crenatis flabellatim venosis intermedia convexa rotundata biloba.

We are not sure, that this will not prove a rival to the best of the East Indian Orchids. It is a most beautiful plant, with upright racemes of large mossy flowers nearly two inches in diameter, and a fine stiff habit. Its sepals are a clear dull yellow, the petals pure white, the lip deep green bordered with white, and richly marked with crimson veins. It is from Java, and is in the possession of Messrs. Veitch, to whom we are indebted for the materials, from which the above description has been drawn up. This, too, is one of Mr. Thomas Lobb's fine things. — De Vriese Illustr. tab. 5 et tab. 41. f. 3.

B. Inflorescentia lateralis.

435. DENDROBIUM CHRYSOTOXUM Lindl. — Bot. Reg. 1847. t. 19. adn.

Pseudobulbis clavatis angustis multicostatis 2—4 foliis, foliis oblongis horizontalibus coriaceis; racemis lateralibus laxis gracilibus arcuatim decurvis pseudobulbis aequalibus, bractea basilari parva spathacea, floralibus minimis herbaceis, sepalis petalisque explanatis oblongis obtusissimis planis his duplo latioribus; labello indiviso cucullato rotundato pubescente, margine minutissime pectinato et fimbriato.

Ind. or. — Flores flavi labii basi citrino brunnea. — Differs from *D. densiflorum* in its manyangled pseudobulbs, small bracts and curiously fringed pubescent, not shaggy, lip. — From *D. Griffithii* in its round emarginate fringed lip. — From *D. aggregatum* in the same respects, as well as in its great clubshaped many-leaved pseudobulbs.

436. DENDROBIUM DENSIFLORUM Wall. — B. M. 3418 (N. S. IX.) 35.

Caulibus articulatis clavatis pendulis apice foliosis, foliis oblongis

acutis nervosis, racemis lateralibus multifloris foliis longioribus: junioribus strobiliformibus, bracteis oblongis plicatis recurvis pedicellis longioribus, sepalis patentissimis ovatis obtusis, petalis conformibus majoribus, labello majore rhomboideo unguiculato serrulato retuso.

Dendrobium densiflorum Wall. Cat. n. 2000. Lindl. in Pl. as. Rar. n. 40.

Gen. et Sp. Orch. P. 1. p. 90.

Perig. sulph. labello aureo. — Mart. 35 in Lord Fitzwilliams Collect. at Wentworth. Nepal Wallich.

Bot. Reg. XXI. 1836. 1828. — Perig. luteum, labello medio croceo. — Comes near to Roxb. *Dend. clavatum* (Hort. Beng. p. 63.), but he ascribes bulbs to his plants, of which ours is entirely destitute. In the Calcutt. garden the two plants maintain that character, although in other respects alike.

137. DENDROBIUM GRIFFITHIANUM Lindl. — Bot. Reg. XXI. 1835. sub 1756.

Caulibus erectis elongatis clavatis sursum tetragonis apice diphyllis, foliis lanceolato-oblongis obtusis, racemis laxis flexuosis multifloris pendulis e latere caulium natis, bracteis oblongis membranaceis pedicellis 4-plo brevioribus, petalis oblongis ciliolatis sepalis duplo latioribus, latioribus, labello ovato pubescente denticulato subrepando, capsulis pyriformibus angulatis.

Reg. Burman. supra arbores W. Griffith (hab s. sp. comm. cel. Griffith). — A beautiful species with much the appearance of *D. aggregatum*.

138. DENDROBIUM FARMERI Paxt. Mag. XV. — Bot. Mag. 4659. — Van Houtte Flore des Serres VII. 741. — Pescatorea I. t. 4. — Lem. Jard. fl. tab. 307. — Paxt. Fl. Gard. III. 104.

Caulibus elongatis clavatis articulatis profunde sulcatis basi pseudobulbosis apice foliosis, foliis 2—4 ovatis coriaceis striatis, racemis lateralibus multifloris pendulis, bracteis parvis ovatis concavis, sepalis (albiflavescens roseo tinctis) late ovatis obtusis, petalis conformibus (ejusdem coloris) majoribus, labello majore (pallide flavo disco luteo) rhomboideo obtusissime unguiculato supra pubescente margine denticulato.

Hook. — Sent by Dr. M. Clelland from Calcutta Garden to W. G. Farmer Esq. after whom it was named. Very near *D. chrysotoxum*.

139. DENDROBIUM PALPEBRAE Lindl. Lindl. Paxt. I. p. 45. n. 82. — Flowers white with a lip stained with yellow. In the way of *D. densiflorum*, with the perfume of distant haw thorn. Its stems are more slender than those of the species just named; flowers in loose racemes and white, with a deep yellow stain at the base of the lip, which is not only covered with soft down, but is fringed near the base with long hairs, like eye lashes. These elevated lines pass along the middle and terminate near the base in a 3 lobed tubercle for the purpose of receiving which the base of the column is hollowed out into an oblong cavity. — Veitch. Nov. 1849. Journ. II. S. V. 33.

140. DENDROBIUM AGGREGATUM Roxb. — B. M. 3643 (XII. N. Ser.) 39.

Pseudobulbis caespitosis monophyllis ovatis sulcatis stipitatis cuticulo cinereo vestitis, foliis oblongis emarginatis coriaceis nervosis, racemo laterali cernuo multifloro fere duplo brevioribus, petalis ovatis sepalo latioribus, labello subintegerrimo latiore, quam longo, basi concavo pubescente.

Dendrobium aggregatum Roxb. Fl. Ind. V. 3. p. 477. — Lindl. Wall. Cat. B.

Reg. XX. 1835. 1695!

Perigonium sulphureum. Labellum basi aureum. — The plant was received at the Bot. Gard., Edinburgh from Wentworth the seat of Earl Fitzwilliam in 1836, and flowered in the beginning May 37. — Arracan on the northern border on the trunk of *Lagerstroemia Reginae*. Pierard. Banks of the Chappadones river in the Golf of Martaban. Wallich Bot. Reg. XX. 1835. 1695.

141. DENDROBIUM COMPRESSUM Lindl. — Bot. Reg. XXVIII. 1842. Misc. 76. — B. R. XXX. 1844. 53.

Caule obovato compresso 2—6 phyllo, foliis ovalibus acutis striatis basi dilatatis membranaceis amplexicaulibus, racemis subquadrifloris cernuis, sepalis petalisque ovalis erectis, cornu elongato obtuso, labello cuneato laevi per axin sulcato.

Yellow flowers of middle size, singular compressed stems not more than 3—4 inches long.

§. 3. Caules seu pseudobulbi brevissimi. (*Bolbodium* Lindl.)

1. 1. Labellum indivisum.

142. DENDROBIUM JENKINSII Wall. — Bot. Reg. XXV. 1839. 37.

Pseudobulbis aggregatis oblongis tetragonis monophyllis, foliis oblongis coriaceis marginatis retusis, pedunculis subradicalibus unifloris vel racemosis, sepalis ovatis obtusis petalis multo minoribus, labello cucullato rotundato basi parum producto limbo dilatato serrato villosa emarginato.

Dr. J. Wall. in litt. — „I received it from Capt. Jenkins Nov. 36. He had obt. it at Gualpara“ Wallich.

D. Jenkinsii. Label broader than long, repand, slightly 2 lobed, shaggy, serrated.

D. aggregatum. Label broader than long, scarcely wavy, undivided, downy only near the base.

D. densiflorum. Label cordate, repand, twolobed, reflexed at the point, serrated.

D. Griffithianum. Label ovate, slightly hastate, serrated, downy, except near the edges.

Perigonium totum aureum.

143. DENDROBIUM PYGMAEUM LO. 45. — Bot. Reg. XXX. 1844. Misc. 62. p. 62. — A very small plant, forming tufts. Very near *D. microbulbon*, but different in the form of the lip; and the flowers are much smaller.

Obs.: Non idem est: „*Dendrobium? pygmaeum* All. Cunn. *D. Caleyi* Cunn. in Bot. Mg. Comp. II. 377. On rocks in the Illawara district. Flowers not known. New South Wales.“ All. Cunningham Bot. Reg. XXV. 1839. Misc. 32. — Note. *Dend. pygmaeum* (A. C. Miss. c. 1824) has somewhat longer, acute, smooth leaves; but I possess no specimen in flower to describe it. If it be a *Dendrobium* it may be called *Caleyi*. Mr. Caley found it first in New South Wales.

144. DENDROBIUM PUSILLUM Lindl. Orch. 77. *Desmotrichum pusillum* Bl. Tab. t. 35.

145. DENDROBIUM LAMELLATUM Lindl. l. c. *Onychium lamellatum* Bl. Tab. 10.

146. DENDROBIUM SUBACAULE Reinw. (Nomen solum prius publici juris a Lindley factum.) Descr. Conf. Contrib. to Indian Orchidology.

147. DENDROBIUM PLICATILE Lindl. — (*D. fimbriatum* LO. 76.) — Bot. Reg. XXV. 1840. Misc. 7. — Manilla imp. Rollisson. It has solitary, rather large flowers of a dull yellow a little tinged with red, and a curious plaited labellum. The original name of this plant being the same as that applied to a very different species it has become necessary to substitute another, which I have taken in allusion to the very conspicuous plicature of the label.

2. 2. Labellum trilobum.

148. DENDROBIUM MICROBULBON A. R. T. 8. — Ann. sc. nat. nov. ser. XI. 1841. p. 19.

Pseudobulbis aggregatis, parvulis, ovoideis, sulco transversali in 2 partes divisus, apice acutiusculus, diphyllis; foliis oblongo-linearibus,

submembranaceis, acutis; scapo gracili, foliis longiori, apice trifloro; floribus pedicellatis, basi bracteatis, bracteis lanceolatis, acutissimis, pedunculi longitudine; sepalis interioribus linearibus, obtusis; labello crasso, erecto, arcuato, subcanaliculato, quasi trilobo: lobis lateralibus minimis, medio rotundato obsolete crenulato,

Supra arbores circa Otacamund. Jul. — Sept. Nilgherries. Perrotet. — Planta 3—4 uncias alta; labellum pallide virens, sepalis albedo-subcarnea. — Affine *D. alpestri* Royle. Mais les feuilles sont plus étroites, oblongées; chaque bulbe ne porte qu'une seule hampe, soutenant 3—4 fleurs, tandis que dans le *Dendrobium alpestre* il sont 3—4 hampes ayant chacune 3—5 fleurs.

Huc: *Dendrobium humile* Wight. Ic. V. I. 1643 (1851). — Caespitose, pseudobulbs ovate, covered with the sheaths of fallen leaves, leaves often wanting, when present one or two from the apex of the bulbs linear lanceolate, about the length of the scape; raceme erect, 4—8 flowered; bracts small, linear, subulate, lateral sepals acute subfalcate forming with the process of the column an acute spur, posterior divaricate lanceolate; petals lanceolate, narrower than the posterior sepal: lip large 3 lobed, middle lobe crenulate, crisp, suborbicular, lateral ones entire, or slightly crenate. Flowers greenish yellow, tipped with pink, lip pink with darker crimson lines. — Jyamally Hills, trees. July, August. Except that this belongs to Lindley's first section, having pseudobulbs bearing the leaves, it seems to approach very near *Dendr. denudans* and *alpestre*; from the latter it is certainly distinct. I am not quite so certain in regard to the former; the pointed divaricating spur of this species is its most striking feature.

Huc: *Dendrobium crispum* Dalzell in Hoo4. Journ. Bot. IV. 111.

D. crispum (nobis); foliis serotinis paucis lineari-lanceolatis subcomplicatis, floribus racemosis 6—10, ovario florem aequante basi bractea parva scariosa suffulto, sepalis petalis brevioribus, supremo lineari-lanceolato obtusiusculo, lateralibus subfalcatis, petalis spatulatis, labello sepalis brevioribus 3-lobato, lobis 2 erectis acutis, intermedio truncato margine irregulariter crenato albo roseo-maculato basi cornubus 2 erectis acutis praedito, columna utrinque apice breviter cornuta.

Tota 4—5 poll. alta, floribus albis, labio excepto. — Crescit in arboribus ubique; fr. temp. frigido — The pseudobulbs of this very common plant are small, button-shaped, and green, with a white network over them; the peduncle is delicate, filiform, purple, two and a half to three inches long, glabrous and smooth, with tubular sheaths. The fruit is oval, shining, four lines long. Lindley has sixteen species of this section in his „genera and species“, but not one from Continental India, where they are plentiful.

449. *DENDROBIUM EXTINGTORIUM* Lindl. — Bot. Reg. XXI. 1836 sub 1756.

Pseudobulbis depressis orbiculatis aggregatis, foliis . . . , pseudobulbis terminalibus unifloris, sepalis lateralibus posticis basi longe in calcar extingtoriiforme productis, labelli ungue longissimo tenui, limbo trilobo: lobis lateralibus erectis acutis intermedio oblongo rotundato, capsula pyriformi angulata.

Hab. in Regno Burmano locis humidis supra truncos *Carex* arboreae W. Griffith, (hab. sp. comm. cel. Griffith).

450. *DENDROBIUM CYMBIDIODES* Lindl. — Bot. M. 4755. 1853.

Pseudobulbis oblongo-ovatis 4—5 gonis, foliis binis oblongis retusis pseudobulbos vix excedentibus, scapo terminali 5—9 floro, sepalis petalisque lineari-oblongis obtusis aequalibus patentibus ochraceis, labelli disco basi abrupte calloso lineato, lobo medio ovato tumido.

Lindl. vidit Ic. Reinw. — Rollison. — Gard. Chron. 1854. 219.

Subordo II. **EPIDENDREAE.**

1371. **EPIDENDRUM L.**

Huc: Lindley, Folia Orchidacea Fol. I. Part. II. III. IV.:

Sepala patentia, subaequalia, lateralibus basi haud productis. Petala nunc conformia et aequalia, nunc diversissima. Labellum unguiculatum, cum columna parallelum et omnino v. parte connatum: limbo integro v. diviso, basi saepius callo duplici, costa v. tuberculo nunc interjectis, instructo; nunc verosimiliter in calcar productum pedicello immersum ideoque columnae cuniculum formans. Columna elongata: clinandrio marginato saepe fimbriato, semiteres, ecornis, basi saepius cuniculata. Pollinia 4, cereacea, aequalia, compressa; caudiculis totidem replicatis; glandula libera nulla. Anthera carnosa, 2—4-locularis.

Herbae epiphytae Americae calidioris, nunc terrestres. Caulis nunc pseudobulbosus, nunc elongatus foliosus. Folia carnosa, rarissime venis elevatis striata. Flores solitarii, spicati, racemosi, corymbosi v. paniculati, terminales v. laterales, saepius siccati coriacei, raphidibus farcti.

In this extensive genus, there exist such very remarkable differences in the manner of growth, as would almost justify the creation of several distinct genera for their reception. The three first divisions in the following classification have, for instance, a pseudobulb instead of a true stem, and a lip free from the column instead of being adherent to it; but on the other hand, four other divisions have a pseudobulbous growth combined with an adherent lip, and among the Osmophytes and Encyclian species, the lip adheres to the column in different degrees; so that such distinctions fail when applied to practice. Beyond these differences, I see little that promises to be available for generic purposes; and since it must be admitted that there is something in the peculiar aspect of the genus which usually points it out to even an inexperienced eye, any proposal of new genera seems to me unadvisable.

The essential character of the genus resides in the lip being more or less united by a fleshy base to the edges of a column, which is hornless and considerably elongated, but not petaloid and winged; in the pollen-masses being four, equal, compressed, with as many pulverulent caudicles folded back upon them; and finally in the presence of a cuniculus more or less deep at the base of the lip. Among the genera most nearly allied to Epidendrum, *Isochilus*, of which *Hlexisea* is a section with adnate labellum, has two caudicles to which the pollen-masses adhere by their whole face; *Ponera* is an *Isochilus* with the mentum of a Maxillaria; *Dinema* is remarkable for its two-horned column, etc., and pair of caudicles; *Barkeria*, so like *Amphiglottium* in habit, has a petaloid column; *Physinga* has a scrotiform free spur, etc.; *Broughtonia* differs in having an external adnate spur, and a membranous cucullate lip. As to *Alamania*, the transverse appendage of its lip, and some peculiarity of habit, are all that it can be said to have for its character.

For the reasons above given, I do not think it expedient to regard the following

divisions as anything more than sub-genera; when they possess distinctions beyond what are mentioned in the analytical table, those points will be adverted to at the head of each sub-genus.

ANALYSIS OF THE SUB-GENERA.

Obs. Cum jam otium hand supersit, quo vellem uti ad totum genus denuo ordinandum ad illa principia, quae in Xenii I. 135 explicavi et quae adhuc optima credo, hodie subgenera Lindleyana accipio, deletis bene Lanio et Hormidio, plane inanibus. Subgenera primaria mea in prima linea quidem pono. Spathas in omnibus Epicladiis adesse (e. gr. hastato, citrino) non contendo.

A. *ACRANTHIUM* Rchb. fil. Xenia I. 135.

Inflorescentia terminalis.

§ 1. *Epicladium* Lindl. in Hook. Journ. III. 81.

In this section the structure of the flower is nearly that of *Encyclium*, but the flowers grow out of a great spathe, as in *Spathium*, and the pseudobulbs are evidently assuming the condition of an ordinary stem. In *E. aurantiacum* the calli or linear plates so common in the genus are replaced by three raised lines, the ovary has a very long cuniculus, and the flowers have the regularity of the Hexisean Isochiles.

a. Labellum integrum.

† Pseudobulbi ancipites.

1. EPIDENDRUM HASTATUM Lindl. Hook. Journ. III. 82. Lindl. l. c. sub 21.

E. pseudobulbis . . . , *foliis* . . . , *racemo stricto* 6—7-floro, *sepalis petalisque* discoloribus lanceolatis acutissimis patentibus, *labello* subrotundo subangulato basi utrinque supra unguem lobulo aucto: *venis* baseos elevatis.

Wild in Mexico, in the temperate region, (v. s. sp. comm. h. Zuccarini.) — A species with deep purple striated sepals and petals, and a broad ivory white lip. The latter has generally a short lateral lobe on each side of its base so as to acquire a hastate form, but occasionally the lobes are almost obliterated. (Lobulum non vidit Rchb. fil.)

2. EPIDENDRUM BOOTHIANUM Lindley, in Bot. Reg. 1838, Misc. n. 7. Huc Lindl. l. c. N. 3.

E. pseudobulbis compressis imbricatis ovatis subdiphyllis, foliis ligulato-oblongis undulatis apice subobliquis, racemo laxo sub-7-floro basi spathaceo foliis longiore, sepalis petalisque subaequalibus patulis ovali-linearibus acutis, labello semilibero rhomboideo acuto utrinque deflexo.

Wild in Cuba; in the forests of the coast of Saltadero, Guantanamo — Linden, (v. v. c. et s. sp.). — Pseudobulbs like those of Broughtonia. Flowers nodding, sweet-scented, yellowish orange, spotted with purple. Lip white, spathe green, compressed, about two inches long, rising nearly as high as the lowest flowers.

†† Pseudobulbi fusiformiteretes.

3. EPIDENDRUM BICOLOR Rehb. fil. MSS. Huc: *Cattleya bicolor* Lindl. Bot. Reg. 1836. sub 1919:

Foliis oblongo-loratis caule tereti elato triplo brevioribus, sepalis lanceolatis falcatis acutis, petalis parum latioribus subundulatis obtusis, labello indiviso plano apice dilatato rotundato crenato convexo.

Brazil Descourtilz in Bibl. Deless. 49. Stems 2—3' long. Sepals and petals tawny; label bright purple, with a lanceolate streak on the centre, white slightly spotted with purple. Fragrant. — Lindl. Sert. 1838. V. 1.: From Jesus de Bannal. Aprili, exhales the sweet smell of the garden pink. — Rhizome reddish, cylindrical articulated. Stems often pendulous, 2—3'. Sepals greenish brown, purple or reddish brown. Petals thinner, spatulate, crisp, same colour. Lip pure white, forming a line which extends as far as the middle of the disk, where it is dotted longitudinally with purple. At the level where this line terminates, the disk enlarges and forms a rounded blade of a bright violet; turned downward, and regularly crenelled at the edges. Column very thick, broad, convex above, flat or a little concave beneath, white. — Bot. Reg. XXIV. 1838. Misc. 148. — Flowered with Loddiges. Agrees perfectly with the figure above quoted and is very remarkable for its labellum wanting the side lobes, so that it is only curved downwards, and cannot wrap up the column as is the other species of the genus. — Sepals and petals are a dull tawny olive green; the labellum is of the deep violet, which we find in the centre of that of *Cattl. labiata*.

4. EPIDENDRUM AURANTIACUM Bateman, in Bot. Reg. 1838, Misc. 11; Orch. Mex. and Guat., t. 12. — Lindl. l. c. N. 1:

E. foliis oblongis planiusculis coriaceis caule clavato diphylo duplo brevioribus, spatha maxima cucullata pedunculo longiore, racemo brevi subcernuo densifloro, sepalis petalisque lanceolatis acutis subaequalibus, labello libero oblongo cucullato basi columnam involvente lineis tribus elevatis.

Wild in Mexico, Sierra St. Pedro Nolasco — Jurgensen, 879; Guatemala, on exposed rocks on the precipitous brows of ravines, where it is subject to great extremes of heat and cold — Skinner; on the branches of *Taxodium distichum* — Grisebach, B. 25; Oaxaca, at St. Juan de Nepomuceno — Karwinski in herb. Martius, (v. s. sp. et v. cult.) — Flowers numerous, rich orange-colour.

Huc: *Epidendrum aureum* Lindl. l. c. N. 5:

E. sepalis linearibus acutis, petalis conformibus, labello ovato convoluto acuminato ecalloso venis 3 parallelis centralibus, ovario alte cuniculato:

Broughtonia aurea Lindley, in Bot. Reg. 1840, misc. 22.

Wild in Mexico; in the neighbourhood of Valladolid — Barker, (v. v. c.). — „Flowers bright yellowish red, like *E. vitellinum*.” I still possess the only flower I ever saw of this. Although I can add little to what was stated in the Botanical Register, I can say that it is a species apparently perfectly distinct.

b. Labellum trilobum.

aa. Lobi laterales in ima basi.

5. EPIDENDRUM ACKLANDIAE Rehb. fil. MSS. Huc: *Cattleya Acklandiae* Lindl. — Bot. Reg. XXVI. 1840. 48.

Foliis oblongis, floribus subsolitariis, sepalis petalisque herbaceis lanceolatis aequalibus incurvis maculatis, labelli plani calvi hypochilio dilatato patulo subrependo epichilio orbiculari reniformi emarginato.

Labellum et gynostemium kermesino violacea; perigonii phylla 5 olivacea rufo guttata, folia juniora rufo guttata. — Brazil. Oct. 1839. discov. by Lieut. James of H. M. Ship Spey, and flowered in the stove at Killerton, in the month of July 1840 under the able management of Mr. Craggs, Sir Thomas Aclands gardener. — Together with *Cattleya bicolor* it forms a distinct section of the genus, distinguished by the base of the lip being too narrow, and too spreading, to cover the column.

Bot. Reg. XXX. 1844. sub 5. — Van Houtte Flore des Serres. VII. Tb. 674.

Obs. Ex labelli natura huc esset conferendum E. Walkerianum (*Cattleya Walkeriana* Gardn., C. bulbosa Lindl.). Ex floribus ortu contra inter *Psilanthema* debet migrare, quae confer.

bb. Lobi laterales mediani, prope cum lobo medio (nunc emarginato) confluentes; labellum circa columnam volutum.

6. EPIDENDRUM HUEGELIANUM Rehb. fil. MSS. Huc: *Cattleya Skinneri* Batem. Orch. Mex. 3. Guet. t. 13. — Lindl. B. Reg. XXX. 1844 sub 5.

Caulibus obovatis, longioribus, quam foliis, folia binis ovalibus obtusis, spatha abbreviata, sepalis angustis oblongis-lanceolatis rectis, petalis oblongis 3 plo latioribus, labello integerrimo convoluto emarginato plano „columna nana 3 plo longiore.“

Guatemala. — Flowers deep rich rose colour, with a crimson lip, resembling those of *C. Skinneri* *). This plant inhabits the hot damp coast, on very high trees, and is most difficult to get at, except after a storm that may have chanced to throw down some of the large forests trees. It should be well watered daily, to represent the heavy dews and the rains, which latter are from May to Nov. Mr. Skinner recommends care to be taken, that it may not imbibe too much moisture, as its habitat is on branches of large trees seldom having any lichen, where the heavy rains do not lie. It does not seek too much shade, but rather like *Epid. aurantiacum* exposed places. Climate 80° — 85° and sometimes 95° during the day. — Bot. Reg. XXVI. 1840. Misc. 83: Flowers in Jan. and February; vulgarly called: Flor de San Sebastian, from its being in season and adorning the altars on that saint's day (20 th. of January)“ Skinner.

B. Mag. 4270: *Cattleya Skinneri*. Pseudobulbis valde incrassatis oblongis basi attenuatis, foliis binis oblongis obtusis, pedunculo plurifloro. sepalis oblongis, petalis ovato rotundatis, labello panduriformi obscure trilobo, lobis lateralibus convolutis, terminali lato brevi retuso disco canaliculato, columna perbrevis.

b. *parviflora* Hook. B. Mag. 4916. Huc: *Cattleya Deckeri* Klotzsch in Otto et Dietrich Allg. Gartenz. 1855. XXIII. 81: Pseudobulbis elongatis laevibus compressiusculis, inferne longi attenuatis; foliis binis crasso-coriaceis ellipticis utrinque obtusis, apice subemarginatis; pedunculo brevi 6—8 floro; perigonii foliolis lilacinis oblongis recurvato-acutis, exterioribus tribus angustioribus integerrimis patentibus, basi brevissime-connatis, interioribus latioribus erectis, margine undulato-lobatis; labello oblongo integerrimo laevi saturate lilacino, basi convoluto breviter cordato, apice re-

*) Ita!

curvato-acuto; columna elongata stricta atro-purpurea, dorso convexa, subtus plana, apice albino-tridentata; anthera pallide-lilacina convexa quadriloculari.

7. EPIDENDRUM LUTEOLUM Rchb. fil. MSS. Huc: *Cattleya luteola* Gardn. Chronicle 1853. 774 c. (3. Decb.):

Pseudobulbis ovalibus ancipitibus sulcatis monophyllis, foliis oblongis vel obovato oblongis floribus longioribus, spatha angusta membranacea pauciflora, sepalis petalisque aequalibus concoloribus angustis ovalibus obtusis flavis, labello cucullato indiviso apice rotundato crenulato intus plano velutino, columna utrinque unidentata.

Hanbury Esp. obt. it as a Brazilian plant from Mssr. Backhouse of York. — Largest of pseudobulbs are not more than 2 inches long. — Leaves hard, flat, 6" long. — Flowers have the whole yellow colour of *Laelia flava*, habit and pollenmasses of *Cattleya*. — Velvety lines of tips are delicate and peculiar. — There is no diff. in depth of col. in any part of the flower except in the edge of the lip, which is paler.

Huc: *Cattleya Meyerii* Regl. Index sem. Petrop. 55.

Sepalis lineari-oblongis subfalcatis acutiusculis revurvo-patentibus; petalis subconformibus erectis; labello indiviso lobato cucullato, antice rotundato crenulato crispo.

Planta C. Forbesii habitu et florum colore simillima, flores autem minores et label- lum indivisum. Pseudobulbi oblongi, compressi, utrinque attenuati, longitudinaliter canaliculati, 3—4 pollices longi, $\frac{1}{2}$ — $\frac{3}{4}$ pollices lati, juniores vagina membranacea involuti, folio unico oblongo obtuso coriaceo obscure-carinato $\frac{3}{4}$ — $1\frac{1}{2}$ pollices lato, 4—8 pollices longo terminati. Racemus terminalis, suberectus, abbreviatus (5-florus) vagina membranacea fultus. Pedicelli subhorizontaliter patentes, florem superantes. Sepala pallidiflavescens v. flavo-viridia, circiter pollicem longa. Labellum sepalis paullo brevius, flavescens, utrinque ad nervum striis carmineo-purpurascentibus notatum, antice flavum omnino glabrum. Columna semiteres, alis tenuibus superne paullo latioribus, labello duplo brevior. Anthera 4-locularis, septis membranaceis. Pollinia 4, per paria caudicula reflexa juncta.

8. EPIDENDRUM LABIATUM Rchb. fil. MSS.

a. Genuinum.

Huc: *Cattleya labiata* Lindl. B. Reg. XXVI. 1840. 58.

Sepalis lineari-lanceolatis, petalis membranaceis undulatis multo latioribus, labello obovato crispo-undulato obtuso v. emarginato disco laevi, pseudobulbis oblongis sulcatis.

α. petalis lanceolatis undulatis, labelli disco sanguineo.

Cattleya labiata Lindl. Coll. bot. t. 33. L.O. 118. Hook. exot. fl. t. 157. Lodd. Bot. Cab. 1856. — Hook. B. Mag. 3998:

Pseudobulbis sulcatis, sepalis oblongo lanceolatis, petalis lato ellipticis undulatis, labelli obovati obtusi indivisi lamina superne tota cocc.

Hooker sentit, Lindl. recte huc ducere *Cattl. Mossiae*, at in hac „the uniform deep blotch on the lamina of its labellum remains unaltered.“

Lond. Journ. 1842. p. 540: On rocks near the summit of the Piedra Bonita at Tejucece. Novb. Gardner 244.

var. *superba* Regel. Gartenfl. V. tb. 146.

a et b. genuinum et Mossiae:

Bot. Reg. XXX. sub 5.:

α. petalis oblongo-lanceolatis undulatis, labelli disco sanguineo. C. labiata L. Coll. t. 33. Brazil.

β. petalis latioribus subcrispis, labelli disco luteo sanguineo punctato aut picto. La Guayra.

Var. of what has been called *C. Mossiae* are numerous, and seem to prove that no re-

liance can be placed on the supposed distinctions between it and *C. labiata*. It must however be confessed, the question is open to further examination.

Lindl. *Pact. Fl. G. I.* 6: *C. labiata* Lindl. Coll. B. t. 33. — Bot. Reg. 1859. — B. M. 3988. — Alias *C. Mossiae* B. M. 3669. — B. R. 1840. 58. — The two forms differ in little except colour. In *C. labiata* the lip is stained with a deep uniform tint of crimson; in *Mossiae* it is richly variegated with crimson veins upon a yellowish ground. The first is from swamps of Brazil; the latter is from the Caracas, 3000' about sea. — *C. quadricolor*, in possession of Mr. Rucker, I am not sufficiently acquainted with.

b. *Mossiae*:

Huc: *Cattleya Mossiae* Parker Hook. B. Mag. 3669:

Caule elongato ramoso pseudobulbifero, pseudobulbis oblongis sulcatis, floribus giganteis speciosissimis, sepalis lanceolatis, petalis elliptico-ovatis unguiculatis marginibus oblique crispatis, labello latissimo obovato intus flavo oblique coccineo striato, ungue in tubum superne acutissimum conduplicato, limbo bilobo pulcherrime crispato crenulato.

Fragrance like *Gymnadenia conopsea*, but much stronger. 7½' engl. in diameter from the tip of the upper sepal to the tip of the labell, 8½" from tip to tip of opp. sepals. — 24" circumf. Flowered with Mss. Moss of Otterspool near Liverpool, the name of her is suggested by my friend Mr. Parker. — Introduced through the medium of George Green Esq. of Liverpool 3619' from La Guayra.

Bot. Reg. XXVI. 1840. 58.

C. labiata. β. petalis oblongis subcrispis, labelli disco luteo sanguineo punctato aut picto. (*Mossiae*.) — La Guayra.

The characters relied upon to separate it are: 1) its branching stem; 2) its furrowed pseudobulbs; 3) its broader sepals and petals and larger flowers; 4) its unguiculate petals; 5) its colour: but none of these distinctions can be relied upon.

Lindl. *Orchid. Lindenianae* p. 10. n. 55.: Near Caracas at 3000' March 1842.

Lindl. *Pact. Fl. G. I.* 117. Tab. 24. *Cattleya labiata*: Large importations have been made from Caracas and New Granada of a *C.* with pinker flowers, much crimson, while the spaces between were yellowish or white or both; some of them had crimson veins run together = *C. Mossiae*. — Very diff., but no distinctive character. Our variations are called:

C. labiata candida (white rubby lipped).

C. labiata picta (blotched) (utraque varietas in V. Houthe *Fl. S.* VII. 661 et 660 iterata).

Cattleya labiata Lindl. *Rechb. fl. Bonpl. II.* 21. Caracas 3500'. Nov. Wagener.

c. *Wageneri*.

Cattleya Wageneri *Rehb. fl. Bonpl. III.* 21.

Pseudobulbo cylindraco basi attenuato monophyllo, folio oblongo basi attenuato, spatula elongata acuta (ad iconem), pedunculo bifloro, perigonio patulo, sepalis linearilanceolatis acutis firmis, tepalis sensim cuneatis in laminas oblongas basi latiores sensim paulo attenuatas apice retuso rotundatas, margine subtilissime crenulatas, minute plicato undulatas, labello tota conformatione subaequali, a basi lata cuneato producto, obsolete trilobo, lobo medio magno emarginato bilobo, toto margine valde undulato, disco subvelutino.

Die Verwandten der *C. labiata* zerfallen nach dem Grund der Tepala in zwei Abtheilungen: die mit keilförmig allmählig aufsteigendem Grund sind *C. maxima* Lindl., *lobata* Lindl. und diese. *C. maxima* liegt vor mir in Originalblüthen von Hartweg, Blüthen von v. Warscewicz und in Abbildung B. R. 1846, 1. Die Blüthe ist kleiner, die Sepala sind breiter, die Tepala schmaler, vorn spitz. *C. lobata* kenne ich nur

nach Gard. Chronicle 1848, 403. Sie ist viel kleiner und hat deutlich lappige Tepala, breitere, kürzere Sepala, muss viel kleinere Dimensionen haben. Die vorliegende Pflanze verdankt ihre Haupteigenthümlichkeit der wunderbaren Gestalt der Tepala. 1½ Zoll vom Grund hat die keilig ansteigende Linie die Höhe erreicht, von der sie allmählig abfällt, um von da an manchen Blüten (es liegen mir 5 vor) etwa 6mal so breit aufzuhören, als sie am Grunde ist. Dazu ist das Aderwerk sehr eigen, die letzten überaus zahlreichen Adergabeln stehen am Rande fast rechtwinklig auf der Längelinie der Lippe. Diese prächtige Art hat schneeweisse Blüten, von der Lippenscheibe strahlen goldige Linien divergirend aus. Dazu füge man, dass sie 2—2 mal so gross sind, als die der *Laelia crispa* Rehb. fl. (*Cattleya crispa* Lindl.), und man wird begreifen, dass wir von Herrn Wagener eine neue Schönheit ersten Ranges zu erwarten uns schmeicheln dürfen. Caracas. 4000'. Mai. Wagener.

d. *Warscewiczii*.

Huc: *Cattleya Warscewiczii* Rehb. fl. Bonpl. II. 112.

Aff. *C. labiatae pseudobulbo fusiformi elongato, racemo plurifloro* (4—8) (labello coeruleolilacino).

Pseudobulbus cylindraceus folio oblongoligulato apice attenuato aequilongus seu longior, racemus — 8florus, folium aequans seu eodem longior. Spatha — — usque ad bracteam floris infimi protensa, sepala cuneata lanceolata acuta, tepala a cuneata basi sensim ascendente tertiam usque inde paulo apicem versus attenuata, apice retusiuscula, minutissime crenulata, labellum basi angustiori utrinque subsemicordatum, late oblongum, apice retusiusculo bilobum, utrinque ante medium sinuatum minute denticulatum, undulatum, disco (in sicca) velutinum. — Diese wunderschöne Art hat Hüllblätter von weisslichem Lila; die Lippe ist himmelblau mit einem Stich in Lila und über der Mitte steht beiderseits ein scharf begränztes Goldauge; die Tepala zeigen am Grunde einen andern Schnitt als *C. labiata*; die Gestalt der *Pseudobulbi* und die vielblüthige Inflorescenz sind treffliche Merkmale. Warscewicz. Rehb. fl. Xenia Orchidacea p. 78. tb. 31.

e. *Trianaei*.

Cattleya Trianaei Rehb. fl. — *C. labiata* Lindlgii Karsten.

f. *pallidum*.

Cattleya pallida Lindl. Paxt. Fl. G. II. tb. 48. pag. 51.

Pseudobulbis elongatis sulcatis monophyllis, foliis undulatis oblongis obtusis emarginatis, floribus solitariis e spatha maxima enatis, sepalis lanceolatis petaloideis, petalis oblongis undulatis quater latioribus, labello oblongo emarginato subundulato basi cucullato laevi.

This is the *Cattleya* mentioned in Hartweg's Journal (J. of Hort. Soc. I. 183.) as having been found near Tepic beyond which that miserable document*) gives no information. — Lemaire l. c. 161.

g. *Lemonianum*.

Cattleya Lemoniana Lindl. Bot. Reg. 1846. t. 35.

Pseudobulbis brevibus fusiformibus, foliis brevioribus; foliis aequilateris obtusis; spatha nulla (?); sepalis anguste lanceolatis acutissimis, apice subherbaceis; petalis maximis tenuibus, valde undulatis, labello anguste convoluto, pone apicem tantum in limbum convexum, parce undulatum margine erosum reflexum nullo modo crispum expanso.

Crescit in Brasilia.

h. *Lüddemannianum*.

Aff. *C. labiatae tepalorum cuneo basilari brevissimo, lamina subae-*

*) Sic!

quali oblongoligulata obtusa labello paulo longiori, undulata, apice obtuse truncata; labelli cuneo basilari quam in *Cattleya labiata* duplo longiori, lamina ligulata pandurata, dimidio anteriori apice bilobo denticulata, undulata, plus duplo longiori, quam lata.

Flores rubro purpurei, maximi forsan generis.

9. EPIDENDRUM MAXIMUM Rehb. fil. MSS. Huc: *Cattleya maxima* Lindl. G. et Sp. Orch. B. Reg. XXX. 1844. sub 5:

Caulibus obovato clavatis angulatis, foliis 1—2 ovato oblongis, spatha pedunculo multo brevior, sepalis lineari-oblongis obtusis, petalis subrotundo-ovalibus undulatis membranaceis, labelli maximi crispis oblongi obsolete trilobi lobo medio undulato alte emarginato, disco laevi.

Guayaquil and Colombia. — Fine specimens and live plants brought home by Mr. Hartweg shew this to be a rival of *C. labiata*. — Its flowers are as large, and are described as being of beautiful dark pink. — B. Reg. 1846. tb. 1. — Pl. Hartwegianae 1844:

Flores 3 tantum adsunt, pulcherrime violacei. Ad Rio Grande de Malacotes. Journ. Ht. soc. 1846. p. 64. — Flowers 7 inches across, two. Mr. Hartweg obs. 4—5 in a cluster.

cc. Lobi laterales submediani, lobus medius tota sua latitudine sessilis nec dilatatus. Labellum circa columnam volutum.

10. EPIDENDRUM FORBESII Rehb. fil. MSS. Huc: *Cattleya Forbesii* Lindl. Coll. Bot. t. 37. in textu. — Bot. Reg. tb. 933. LO. 117.:

Caulibus elongatis teretibus, foliis geminis oblongis, sepalis petalisque lineari-oblongis subaequalibus, labelli trilobi lobo medio cordato subrotundo ovato argute dentato undulato apiculato, lateralibus minoribus rotundatis planis, lineis quaternis elevatis pone basin lamellaque membranacea utrinque, columna basi lineis quinque elevatis, quarum duae majores, cristata, clinandrii cardine tuberculo corrugato aucto.

Brazil. Flowers greenish yellow. Lip with bright orange brown veins. Very near *C. Loddigesii*. — Bot. Mag. 3265. — „*Cattleya* in compliment to William Cattley Esq. of London, an eminent cultivator of plants and patron of Botany.“ Introduced to the gardens at Chiswick by their collector Mr. Forbes. Flw. June 32. Lond. Journ. I. 1842. p. 189: on low trees and on rocks, common; generally near the sea. July. Gardener 128.

11. EPIDENDRUM LODDIGESII Rehb. fil. MSS. Huc: *Cattleya Loddigesii* Lindl. Bot. t. 37: Bot. Reg. XXX. 1844. sub 5: (exclusis cit. *C. intermediae* Grah. et *intermediae pallidae*). LO. n. 5. Hook. Bot. Misc. t. 186. Epid. violaceum Lodd. Bot. Cab. 337. *Cattleya ovata* Lindl. Bot. Reg. 1919.

Caulibus elongatis teretibus, foliis 2 ovato-oblongis, spatha brevi membranacea, sepalis oblongis lateralibus falcatis, petalis subconformibus, labelli lobis lateralibus rotundatis intermedio dilatato crispo $2\frac{1}{2}$ longioribus, lineis pluribus clavatis lamellatis pone basin versus apicem evanescentibus.

Brazil and Buenos Ayres. — Flowers some times clear lilac with a whitish lip, sometimes nearly white with a crimson lip, with many intermediate gradations. It always appeared doubtful, whether *C. intermedia* could be distinguished, and more experience in estimating the value of characters among these plants leads to the conclusion, that *C. ovata* must also be reduced to the same species. It seems to be very common in Brazil and to occur as far south as Buenos Ayres. Mr. Gardner found it on trees in marshes at the foot of the Organ mountains (n. 5635 of his herbar). — The size of the leaves is much affected by situation; in all cases however they seem to be broader at the base, than at the point. So far as the charact. of Count Hoffm. *C. Vestalis* can be judged of, that plant is the pale *C. intermedia*.

Huc: *Cattleya ovata* Lindl. B. Reg. 1819:

Foliis binis ovatis obtusis caule cylindraco longioribus (?), sepalis

petalisque lanceolatis acuminatis, labello nudo trilobo laciniis laterali-
bus apice intermediaque oblonga obtusa denticulatis undulato crispis.

St. Catharine's Brazil (M. Hinds). — In the way of *Cattleya labiata*. — Bot. Reg. XXII. 1836. sub 1919.

Huc: *Cattleya maritima* Lindl. B. Reg. XXII. 1836. sub 1919.

Foliis binis ovalibus obtusis spatha parum longioribus, caule sub-
clavato, sepalis oblongis acutis, petalis lanceolatis falcatis obtusis, la-
bello trilobo (nudo?); laciniis lateralibus erectis rotundatis, intermedia
dilata denticulata emarginata.

Sea-beaten rocks, Buenos Ayres (Tweedie herb. Hook.). Flowers fine, rosecoloured
usually in threes; many var. (?). Its small leaves sufficiently mark this, of which I
have only seen one specimen with a single flower. — Bot. Reg. XXX. 1842. sub 4:
Dwarf habit, one flowered peduncles. Possibly it is one of the many var. of *C. Loddigesii*.

12. EPIDENDRUM CITRINUM Rehb. fil. Mss. Huc: *Cattleya citrina* Lindl. Bot. Reg. XXX. 1844. sub 5.

Caulibus ovatis squamis laxis albis membranaceis vestitis, foliis lan-
ceolatis glaucis, pedunculis longissimis solitariis, floribus carnosis pen-
dulis, sepalis oblongo-ellipticis, petalis conformibus paulo latioribus, la-
belli trilobi lobo intermedio ovato undulato emarginato linea media lata
elevata.

Mexico. — A mountain plant remarkable for its rich clear yellow flowers which are
very sweetscented. — Bentham Pl. Hartweg. 72. fasc. 1. 1839. — In montib. Oaxacae
Hartweg Mex.

Hook. B. Mag. 1840. 3742:

Bulbis ovatis diphyllis, foliis ligulato-lanceolatis acutis enerviis glaucis,
pedunculo unifloro, perianthio carnosio erecto, sepalis oblongo-ellipticis,
petalis elliptico-obovatis, labello perianthium paulo columna plusquam
duplo superante trilobo linea media lata elevata, lobo medio ovato
acuto undulato.

Pescatorea I. t. 9.

13. EPIDENDRUM HARRISONIANUM Rehb. fil. (non *Harrisoniae*!). Huc: *Cattleya Harri-
soniana* (Batem. in litt.). — Bot. Reg. XXII. 1836. 1919.

Sonnia anguste lanceolatis, racemo 1—4 floro, sepalis petalisque
patentibus his subtrotundo ovalibus, labello subtrilobo verrucoso.

Brazil. Mr. Harrison. — Very near *C. Loddigesii*. — Bot. Reg. XXX. 1844. sub
n. 5. — I only know this plant from 2 flowers given me by Mr. Batemann. They have
much shorter and broader sepals than *C. Loddigesii*, the petals are much broader
and the proportion between the middle lobe of the lip and its lateral lobes is quite
different. Besides which certain elevated lines run all the way from the base to near
the apex of the lip. The flowers are lilac, the tip with a deep blotch within the
margin. — Parad. Vind. fasc. 7. — *Cattleya Papeyansiana* Morr. Ann. Gand. 1845.
n. 2. Tab. 5.

Obs. Nescio quae sit sequens planta; sed videtur esse *C. Loddigesii* seu praecedens.

Bot. Reg. XXIX. 1843. Misc. 423: *Cattleya Arembergii* Scheidw. Gartenz. 1843. p. 109.

Sepalis lateralibus falcatis obtusiusculis, supremo lanceolato, petalis
latioribus undulatis, labelli trilobi lobis undulato-crispis intermedio mar-
gine lilacino lamina lutea, lateralibus margine lutescentibus, spatha her-
bacea compressa obtusa, pseudobulbis cylindraceutis nitidis, foliis ovatis
carnosis, obscure viridibus.

Caulis 8" alt., fol. 4" long. 2" lata, flores inodori. — Beautiful green ovate leaves,
great lilac flowers. Brasilia. — Aremberg collect. — Bot. Reg. XXX. 1844. sub 5: It

is said to bear much resemblance to some other, but to be distinguished by its beautiful dullgreen ovate leaves, and its great lilac flowers. The stem is said to be 9 inches high, the leaves 4 inches long, and 2 inches broad. The flowers sweetscented. It may be *C. Harrisoniana* or *maritima*, but it seems to be distinct.

c. *Labellum trifidum* (circa columnam volutum).

14. EPIDENDRUM VIOLACEUM Rehb. fl. MSS. *Cymbidium violaceum* H. B. Kth. Huc: *Cattleya superba* Schombgk. B. Reg. XXV. 1839. Misc. 48.

Caulibus clavatis sulcatis, foliis ovato-oblongis obtusis coriaceis marginatis caule clavato brevioribus, sepalis oblongis acutiusculis, validis, petalis lanceolatis acutis membranaceis duplo latioribus, labelli trilobi cucullati lobis lateralibus acutis; lobo intermedio transverso plano denticulato emarginato subunguiculato basi venis elevatis rugoso; callis duobus pone basin.

Sert. Orch. t. 22. — This magnificent sweetscented *Cattleya* has been found in British Guayana by Mr. Schomburgk, who sent a live plant of it to Msr. Loddiges, and a drawing to the Linnean Soc; by permission of which a figure has been published in the Sert. Orchid. The flowers if not so large as those of *Cattl. Mossiae*, are from the richness of their colours, inferior to none in beauty. According to Mr. Schomburgk the plant appears peculiar to the 3rd. or 4th. degree of N. Lat; it is not to be met with in the Essequibo north of the mouth of the Rupunoony; from thence it is found southwards on trees, which skirt the banks of the brooks and rivers which meander through the Savannas. He discovered only a few solitary specimens in the Essequibo south of the Cayuwini, and none at the equator. The Caribees call it *Oponopodoli*, or *Ducksmouth*, the Macoosees *Masame*. It is very fragrant, the odour in the morning is said to become too powerful in a confined place; the splendid flowers last from 3—4 weeks. — Although only now brought into notice, the species was many years since discovered by Dr. v. Martius, who found it near Taruma on the banks of the Rio Negro, in woods at the Barra de Rio Negro and forests near Para. It is readily distinct from all previously described species by its three-lobed lip with acute lateral segments, the middle lobe being flat, toothletted and emarginate, and by the cluster of elevated veins at the junction of the epichil and hypochil. Flowers deep rose colour, sweetscented, with a deep crimson lip. — Bot. Reg. XXX. 1839. Misc. 47.

L. Sert. 22. 1839: *Cattl. Schomburgkii* Lodd. Lindl. Paxt. Fl. Garden. J. p. 6. — Stem narrow at the base, increases in diam. upwards, it is however seldom more than 2 inches in circumference, when young it is covered with sheathes resembling the spathe. Spathe large foliaceous. Sepals fleshy. Petals wavy.

Lond. Journ. II. 1843. p. 672: on trees along the Essequibo, north of the Rupunoony. Schomb. 699. — Van Houtte Flore de Serres IX. 926.

18. EPIDENDRON AMETHYSTOGLOSSUM Rehb. fl. *Cattleya amethystoglossa* Lind. Rehb. fl.

19. EPIDENDRUM GRANULOSUM Rehb. fl. MSS. Huc: *Cattleya granulosa* Lindl. Bot. Reg. XXVIII. 1842. 1.

Caulibus teretibus gracilibus diphyllis, foliis oblongo-lanceolatis obtusis, sepalis oblongis obtusis, petalis obovato-spathulatis undulatis obtusissimis, labello cucullato tripartito: laciniis lateralibus semiovatis intermedia sinu lato divulsa ungue aequilateri laevi lamina dilatata rotundata plicata granulosa denticulata.

Hartweg leg. in Guatamala. — Labellum extus album, medium intus flavum et purpureo granuloseum. Folia 5 perigonii viridia brunneo punctata. — Bot. Reg. XXX. 1844. sub. 5. This has a slender stem, terminated by two narrow leaves, something like those of *C. bicolor*, but shorter. Sepals two inches and a half long, oblong, olive green, mottled with rich brown spots. Petals obovate, very much rounded at the point, and narrowed to the base; wavy at the margin and of the same colour as the sepals. Strongly contrasted with the dingy colours of these parts is the lip, of a pure white at the sides and points and of a glorious orange spotted with crimson in the middle; its lateral lobes curve over the column, but are divided deeply from the middle lobe by a wide slit; the middle lobe itself has its surface broken up into numerous granulations. Something in the way of *C. guttata*. It is scarcely possible that the plant fig. in the Bot. Mag. as a variety of *C. guttata* (Russeliana) is this species. The Brazilian origin attributed to it is no doubt erroneous, like that of many plants from the Woburn collection.

20. EPIDENDRUM ELATIUS Rehb. fl. MSS. Huc: *Cattleya guttata* Lindl. Bot. Reg. 1406. Orch. n. 10. Hort. Trans. 2 ser. 2. t. 8. — *C. elatior* LÖ. n. 9. founded upon a bad tall *guttata* cf. Sert. t. 23.

Caulibus elongatis teretibus, foliis 2 oblongis concavis basi paulo angustatis, spatha brevi, floribus carnosis, sepalis lineari-oblongis acuminatis, petalis conformibus paulo latioribus undulatis, labelli trilobis lobis lateralibus ovalis: intermedio cuneato bilobo disco tuberculato.

Brazil. — Flowers greenish yellow, beautifully spotted with crimson; lip white with a lilac tip. Raceme sometimes as large as a man's head. — Bot. Reg. XXX. 1844. sub. 5. — Alias *C. elatior* Lindl. Orch. 9. *C. sphenophora* Morr. Ann. Gand. 175.

Cattleya guttata Lindl. var. *Leopoldi* Lind. et Rehb. fl. Pescatorea 43.

Cattleya Leopoldi „a mere var. of *Cattleya granulosa*“ Lindl. Paxt. fl. G. II. 129.

var. *Russeliana*.

Huc: *Cattleya granulosa* var. *Russeliana* Lindl. Bot. Reg. XXXI. 1845. 59.

Foliis ovalis, pedunculis trifloris, floribus multo majoribus, petalis magis lanceolatis; labelli ungue angustiore.

Sent to Sir W. Hook, as a Brazil Orchid. At Syon said to have been rec. from Mr. Wallich, but it is surely a fine var. of the Guatemala *C. granulosa*. — The large membranous, great erect flowers, long lip spread out at the point into a broad transverse plate are different from the same parts in the smaller resupinate flowers of *Cattleya guttata*. — B. M. 3693. (N. S. XII.)

Cattleya guttata Lindl. β . *Russelliana*. — Parad. Vind. f. 8. Van Houtte Fl. des Sères III. t. 199. — Ann. de la Soc. d'hortic. de Gand. II. 487. t. 103.

Bot. Mag. 3693.; *Cattleya guttata*.

(β) *Russelliana*; elata; floribus subtriplo majoribus sepalisque intense fusco viridibus. (Tab. nostr. 3693.)

Brought to the Woburn Collection from Brazil in the spring of 1838, by Capt. Lord Edward Russel R. N. then commanding H. M. S. Actæon. It was given to that nobleman by the Director of the Botanic Garden at Rio with the information, that it was one of two specimens that had recently been discovered in the Organ Mountains. In Aug. of the same year its lovely flowers were displayed, when the drawing here represented was made on the spot. Widely as the inflorescence differs in size and colour from Dr. Lindley's *C. guttata* above quoted, it cannot be considered otherwise, than as a beautiful and stately variety, worthy of a place in every choice collection. — Labellum roseum, lobo medio kermesino; perigonii phyllis viridibus brunneo adpersis.

Obs. Species incognitæ: *Cattleya granulata*, the Leopold var. Gardeners Chronicle 1851. 471. (pro granulosa?). *Cattleya Quindois?* G. Chronicle 1853. 247. d. Labellum longe cuneatum, antice quadrilobum, s. trilobum, a columna liberum.

21. EPIDENDRUM CAMPYLOSTALIY Rehb. fl. in v. Mohl et Schlechtendal B. Zeitg. 1852. pag. 730.

Pseudobulbo „oblongo ancipiti“, apice attenuato, folio unico oblongo acuto basi attenuato, magno, spatha apice lanceolata, dorso carinata, scariosa, tripollicari, pedunculo paniculato, folium paulo excedente, valido, ramis vaginis lanceis scariosis suffultis, bracteis lanceolatis, acutis, scariosis, ovaria prismatica pedicellata aequalibus seu superantibus, perigonii phyllis externis lanceolatis acuminatis, lateralibus internis subaequalibus, angustioribus, basi cuneatis, labello liberrimo longe cuneato, medio dilatato, trilobo, lobis lateralibus rotundatis, lobo medio obovato, producto, retusiusculo, ungue superne incrassato, tumore inter lobos laterales antice in carinulas tres excurrente, gynostemio retrorsum incurvo, androclinii limbo trilobo, lobis lateralibus triangulis retusis emarginatis, medio crasso, semitereti, retuso, tabulam proferente (!)

Blüthenstiel schwarzpurpurn; Hüllblätter aussen blass, innen tief-purpurn; Lippe weiss. Costa Rica und Chiriqui.

Huc: Lindl. l. c. n. 2:

E. pseudobulbo oblongo ancipiti, folio solitario oblongo acuto, spatha lanceolata pedunculo brevior, panicula folio subaequali vaginis bracteis lanceolatis ovarii aequalibus scariosis squamata, sepalis lanceolatis acuminatis, petalis angustioribus, labello tricarnato medio dilatato trilobo: laciniis lateralibus rotundatis intermedia obovata, columna recurva, clinandrii appendice „semiterete tabulam proferente!!“

Wild in Veragua and Costa Rica — Warczewitz. — Leaf large. Flower stem dark purple. Sepals pale, petals dark-purple, lip white. — Rehb. This is surely an *Epicladium*, on account of its pathes, and not an *Encyclium*, to which sub-genus it is referred by M. Reichenbach.

§ 2. *Encyclium*. Lindley, in Hooker's Journal of Botany, III. 81; Bot. Reg. 1842, misc. q. 28. Encyclia, Hooker, in Bot. Mag., t. 2831.

The lip in this sub-genus never has free calli, but, if marked with processes of any kind, usually presents them in the form of a pair of raised lines or ribs, which either converge towards the base of the lamina, or become completely confluent into a kind of cushion. It is this peculiarity which has led to the admission of *E. naevosum* here instead of among *Amphiglotts*.

22. EPIDENDRUM VITELLINUM. LO., p. 97; Bot. Reg. 1840, t. 35; Sert. Orch., t. 45; Bot. Mag., t. 4107. Huc Lindl. l. c. sub n. 4.:

E. pseudobulbis ovatis acuminatis diphyllis, foliis oblongo-ligulatis acutis basi vaginantibus racemo erecto multifloro brevioribus, sepalis petalisque ovato-lanceolatis acutis subaequalibus patulis, labello lineari apice angustato abrupte acuto infra medium callosum bifoveato semilibero.

Wild in Mexico; Oaxaca, on oaks at the height of 5 — 6000 feet — Galeotti, 5104; Xalapa — Coulter; Guatemala, on cloudcapped mountains, amidst continual mists, in the regions of Lichens and Jungermannias — Skinner; the Cumbre of Tetontepeque, 9000 feet above the sea — Hartweg (v. v. c. et s. sp.). — Bears flowers of a brilliant orange in many-flowered erect spikes. A magnificent species very difficult of cultivation. — Lemaire ill. hortic. tb. 4. Van Houtte Flore des Serres X. 1026.

23. EPIDENDRUM NAEVOSUM Lindl. sub n. 6.:

E. pseudobulbis fusiformibus membranis laxis vestitis, foliis ovalibus pergameneis supremo tantum persistente, scapo filiformi flexuoso squamis adpressis vaginato apice 3—5-floro, floribus membranaceis nutantibus, sepalis petalisque linearibus acuminatis secundis, labello ovali linea media aspera venisque divergentibus varicosis, callo baseos excavato, cuniculo ventricoso.

Wild in Mexico; in the province of Oaxaca, at the elevation of 4000 feet, on the Pacific side — Galeotti, 5330, (v. v. c. et s. sp. comm. cel. Galeotti.) — A small species, scarcely six inches high. The leaves are about three to a pseudobulb, but two fall off early, giving the plant the appearance of an *Encyclium*; nevertheless, it may be almost regarded as an *Amphiglott*, related to *E. antenniferum*. A plant that flowered some years since with Mrs. Lawrence had white sepals and petals, a crimson anther, and a yellow lip richly dotted with crimson.

24. EPIDENDRUM BRASAVOLAE Rehb. fl. in Mohl et v. Schlechtendl. Bot. Zeitg. 1852. p. 729. Oct. 13.

„Pseudobulbis obpyriformibus, foliis oblongis acutis, inflorescentia bipedali — tripedali“ (panicula?), pedunculo teretiusculo, valido, bracteis triangulis, acutis, valde abbreviatis, ovariis teretiusculis, pedicellatis

multo brevioribus, perigonii phyllis lineari-lanceolatis, brevibus, acuminatis, coriaceis, labello usque ad basin libero, basi unguiculato ligulato, dein in laminam obtuse rhombeam, apice acuto acuminatam dilatato, linea media a medio labello ad apicem elevata, elevatione marginibus extrorsis plicosa, depressa, in basi partis anterioris rhombeae (more Lockhartiae [Fernandeziae] parthenocomos), androclinii lobis lateralibus oblique truncatis, lobo medio spatulato, fimbriato, postice carinato, antheram longe superante.

„Blüthen gelb mit braunviolett. Lippe gelb, an Spitze purpurn.“ Sie sind denen der *Brasavola Perrinii* gleichgross. Ohne Untersuchung der Anthere könnte man meinen, eine Blüthe aus dieser Gattung vor sich zu haben. Chiriqui Vulcan. 8000'. Warszewicz. Lindl. l. c. sub n. 7.:

E. pseudobulbis obpyriformibus, foliis oblongis acutis, floribus paniculatis (?), sepalis petalisque brevibus acuminatis coriaceis, labello obtuse rhombeco acuminato: linea media elevata sinuata, clinandrii lobo medio spatulato fimbriato elongato.

Wild in Veragua, on the volcano of Chiriqui, at the height of 8000 feet — Warszewicz. — Flowers the size of *Brasavola Perrinii*, yellow and brown violet; lip yellow purple at the point. Would not be taken for an *Epidendrum* without an examination, of the anther. — Rehb.

25. *EPIDENDRUM PRISMATOCARPUM* Rehb. fil. in v. Mohl et v. Schlechtend. Bot. Zeitg. 1852. p. 729. Oct. 13.:

„Habitu praecedentis“, pedunculo elongato, inferne calamus anserinum crasso, superne multifloro, nunc apice flexuoso, bracteis triangularibus, valde abbreviatis, quam ovaria pedicellata, prismatica abbreviato-triptera multo brevioribus, perigonii phyllis ligulato-lanceolatis acutis coriaceis, labello prope libero basi unguiculato ligulato, utrinque sub fovea stigmatica obtuse auriculato, dein breviter lato-ligulato, subito cordato-acuminato, crista antice bicruri inter auriculas, disci linea lanceolata apicem usque acuminata incrassata, alis androclinii lato-rhombecis, ala media quadrata, tridentata, lateralibus subbreviore.

Aehnlich vorigem. Kleinblüthiger. „Lippe braun punctirt.“ Chiriqui. v. Warszewicz. — Lindl. l. c. sub n. 23. (*Sphaerophila*):

E. pedunculo elongato multifloro, ovario abbreviato triptero, sepalis petalisque ligulato-lanceolatis acutis, labello unguiculato cordato acuminato utrinque obtuse auriculato, crista bicruri linea interjecta lanceolata, clinandrii appendice quadrata tridentata.

Wild in Veragua, on Chiriqui — Warszewicz. — Flowers small, lip brown dotted. — Rehb.

26. *EPIDENDRUM FUSIFORME* Rehb. fil. MSS. — *Isochilus fusiforme* Lindl. MSS. Herb.

Pseudobulbis longe stipitatis fusiformibus oligophyllis, foliis lineariligulatis cum apiculo, floribus solitariis nutantibus, sepalis tepalisque ligulatis acutis, labello flabellato retusiusculo.

Ex hort. Colvill.

27. *EPIDENDRUM POLYBULBUM* Sw. — Huc: *Dinema polybulbum* Lindl.

28. *EPIDENDRUM SUBAQUILUM* Lindl. Bot. Reg. 1846. sub t. 64. Lindl. l. c. sub n. 8.:

E. pseudobulbis ovatis monophyllis caespitosis, foliis linearibus oblique emarginatis obtusis scapo glabro filiformi subpaniculato aequalibus, sepalis petalisque linearibus dorsali ascendente lateralibus parallelis, labello semilibero ovato-lanceolato indiviso lamellis 3 spongiosis ante medium convexum.

Wild in Mexico or Guatemala — Warner (v. v. c.) — A small slender plant, with leaves seven or eight inches long, and barely three lines wide. Flowers dull brown with a whitish lip.

29. EPIDENDRUM DISTANTIFLORUM Rich. et Galeotti Orch. Mex. t. 7. Lindl. l. c. sub n. 9.:

E. „pseudobulbis globosis parvulis 2—3-phyllis, foliis lanceolato-linearibus, floribus pallide luteis, panícula laxa ramosa, sepalis linearibus, labello ovali-lanceolato acutissimo.“

Wild in Mexico — Galeotti.

30. EPIDENDRUM LIGULATUM La Llave. LO, p. 98. Lindl. l. c. sub 10.:

E. pseudobulbis ovatis compressis, foliis lanceolatis subcoriaceis striatis, scapo filiformi, floribus alternis resupinatis, sepalis petalisque ligulatis reflexis, labello obcordato limbo subcrenato, capsula glabra trigona.

Wild in Mexico, on the Irapaeon mountains — La Llave. — Flowers purplish brown with a yellowish dotted lip. Possibly this obscure plant may be more nearly related to *E. glaucum*.

31. EPIDENDRUM PUNICEUM Rehb. fil. MSS. *Atamania punicea* Llave LO. 153. Benth. Pl. Hartw. 72.: Monte de Jaline Mexici. Hartweg.

32. EPIDENDRUM TRIPUNCTATUM Lindl. B. R. 1841. Misc. 143. Huc: Lindl. l. c. n. 12.:

E. pseudobulbis ovalibus diphyllis, foliis ligulatis tenuibus apice recurvis scapo bifloro pluries longioribus, sepalis patentissimis lineari-oblongis, petalis duplo angustioribus, labello semiadnato obovato rugoso utrinque ultra columnam emarginato, columna atropurpurea apice triloba et luteo tripunctata.

?? *E. Ghiesbreghtianum* Richard and Galeotti, Orch Mex. n. 31.

Wild in Mexico — Galeotti. (v. v. c.) — This has long grassy leaves, and a very short scape. The sepals are twice as broad, and much larger than the petals and a dull yellow green. The column is deep purple, with three minute lobes, each tipped with a pale orange spot. The lip is pale citron rather more than half an inch long, not warted, and distinctly emarginate near the apex of the column.

33. EPIDENDRUM AURITUM Lindl. in Bot. Reg. 1843. Misc. 4. Huc: Lindl. l. c. n. 13.:

E. pseudobulbis elongatis compressis squamis vaginatis, folio angustissimo ligulato obtuso, racemo 3—4-floro folio brevioris, bracteis cartilagineo spathaceis internodiis longioribus, sepalis lineari-lanceolatis acutis rescurvis, petalis conformibus duplo brevioribus erectis, labello linear-convexo arcuato medio carnosio foveato rugoso, columna apice tridentata, anthera utrinque auricula simplici bifida subulata aucto.

Dinema paleaceum Lindl. in Bot. Reg. 1840. Misc. 112.

Wild in Mexico; Vera Cruz, on oaks at the height of 3000 feet — Galeotti, 5144; Linden 210; Guatemala — Skinner. (v. v. c. et s. sp.) — Flowers very sweet-scented, like Heliotrope, pale green or almost white, with no spot or stain, except a violet blotch at the base of the lip. A peculiar feature is the presence of one or two fine pointed horns on each side the anther, which thus, when seen in front, presents the appearance of some insect's head.

Huc: *Epidendrum Lindenianum* Rich. et Galeotti Orch. Mex. n. 42. Lindl. l. c. sub n. 83.:

E. „pseudobulbis oblongis 1-phyllis, folio oblongo-lineari obtuso, scapo terminali, floribus luteis, racemo 4—5-floro, labello libero subspatulato obtuso.“

Wild in Mexico — Galeotti.

Huc: *Dinema paleaceum* Bot. Reg. 1840. XXVI. Misc. 112.

Pseudobulbis ovalibus compressis monophyllis, foliis ensiformibus obtusiusculis planis, spica pauciflora longioribus, bracteis lineari lanceolatis acuminatis paleaceis ovario lentiginoso brevioribus, floribus secun-

dis, sepalis petalisque lineari-lanceolatis patulis, labello petalis aequali et subconformi carnosio apice dilatato per medium sulcato.

Guatemala. Bateman. — Pale straw-coloured flower of little beauty and is only interesting as confirming the goodness of the genus *Dinema*, whose character however depends upon the number of pollen straps being 2, not 4. as in *Epidendrum*, the horn-like processes of the column are apparently only of specific value.

34. EPIDENDRUM LUTEOROSEUM Rich. et Galeotti Orch. Mex. n. 32. Huc Lindl. l. c. n. 14.:

E. „pseudobulbis ovoideo-oblongis parvulis, caule 2—3-phylo, floribus parvulis luteo-roseis paniculatis, labello albido-violaceo obovali-obtusio emarginato 5-nervio glanduloso.“

Wild in Mexico — Galeotti.

35. EPIDENDRUM FLABELLATUM Lindl. Huc: Lindl. l. c. n. 15.:

E. pseudobulbis ovatis basi subangulatis diphyllis, foliis coriaceis ligulatis carinatis acutis, scapo ramoso glabro, sepalis patentibus oblongis obtusis, petalis magnis cuneatis, labello semilibero cucullato flabellatim cuneato crispo: callo elevato pubescente obovato medio depresso apice tridentato.

Wild in Mexico — Harris (v. v. c.) — A plant with the habit of *E. asperum*, with which I once incautiously confounded it (Bot. Reg. 1838. Misc. 36). It differs in its undivided lip, and smooth, not scabrous, rachis. Flowers the size of *E. odoratissimum*, dull yellowish brown; lip yellow, with well-defined crimson veins and a white callus.

36. EPIDENDRUM SANGUINEUM Sw. Prodr. 124. *Broughtonia sanguinea* R. Br. — Bot. Mag. 3536. (X. N. S. 36).

(β) foliis longioribus, petalis angustioribus. B. sg. Hook. B. M. t. 3076.

This is the usual state of the plant, but I cannot but consider 3076 as variety. — Though introduced to Kew from Jamaica since 1793, it appears to be yet a rare plant in our gardens. Bloss. Mai, Juni. — Hook. Lond. Journ. III. 526: Jamaica Purdie.

37. EPIDENDRUM NONCHINENSE Rehb. fil. MSS. *Broughtonia Chinensis* Lindl. MSS. — Hook. Lond. Journ. 1842. p. 492.

Caule brevi carnosio diphylo? foliis lanceolatis patentibus carnosis, racemo terminali, multifloro, pedunculo elongato aphylo arcto vaginato, bracteis membranaceis lineari-lanceolatis pedicellis brevioribus, labello obovato cucullato membranaceo venoso: venis flabellatis omnibus basi cristatis (Lindley).

It is perhaps not very surprising, that an American genus should occur upon one of the most westerly points of Asia; yet it is a circumstance so striking as to demand strict investigation before it can be accepted as true. It does not, however, appear possible to doubt it in the case of this *Broughtonia*, which, although in an indifferent state of preservation, indicates all the main features of the genus to which I have referred it. It is unquestionably *Epidendreous*, as is distinctly shown by its well preserved pollenmasses. It is equally certain that no Asiatic genus of that part of the Orchidaceous order will contain it. The only doubt that I entertain respecting it, is, whether to place it in *Barkeria* or *Broughtonia*. The habit is more that of the former than of the latter; but it has the adnate spur belonging to the labellum of *Broughtonia*, and it has not, as far, as I can discover, the peculiarly deflexed dorsal sepal of *Barkeria*. Its lip too is distinctly cucullate after the manner of a *Laelia*. (Lindley in enum. of the plants collected in Hong Kong by Mr. Hinds descr. by Bentham in Hook. Lond. Journ. 1842. p. 492. — *Laeliopsis* c. Lindl. in Paxt. Fl. G. III. 105.

Obs. Mihi ipsissima planta pluries ex America centrali in manus venit, unde lapsus Hindsii, qui etiam in America centrali plantas legit, facile conjiciendus.

38. EPIDENDRUM CUBENSE Lindl. — Bot. Reg. XXX. 1844. p. 17. Misc. 24.

Pseudobolbis teretibus elongatis, foliis rigidis horizontalibus subaequilongis anguste ovalibus scapo debili paucifloro duplo brevioribus, bracteis minimis, sepalis petalisque conniventibus linearilanceolatis, labello obovato apiculato lineis 3 ramentaceis in medio, clinandrio glabro.

A Cuba plant, rare, delicate and beautiful. Imported by Mrs. Loddiges. The pseudobulbs are 2" long; the scape 6" high; the flowers white, with a lip floded up, white at the end, yellow in the middle, and purple as is the column, near the base. *Laeliopsis cubensis* Lindl. in Paxt. Fl. G. I. c.

B. SARCOCHILA Lindl.

39. EPIDENDRUM GLAUCUM Lindl. in Bot. Reg. 1840. Misc. 56. Huc Lindl. l. c. n. 16.:

E. undique glaucedine obductum, pseudobulbis ovalibus compressis monophyllis, foliis ensiformibus acutis pergameneis basi canaliculatis scapo pendulo paniculato brevioribus, sepalis petalisque ovalibus obtusis, labelli linearis apice carnosii trilobi lobis lateralibus rotundatis intermedio recurvo ovato medio calloso, columnae cardine appendice ovata obtusa recurva aucto, ovario brevi trigono.

Epidendrum brachiatum Richard and Galeotti Orch. Mex. n. 40.

Epithecia glauca Knowles Flor. Cab. II. 167. t. 87.

Prosthechea glauca lb. II. 111.

Wild in Mexico — Barker: near Oaxaca at the height of 3000 feet — Galeotti, 27 and 28; St. Pedro de Nolasco etc. — Jurgensen, 600. (v. v. c. et s. sp. comm. cel. Galeotti.) — Flowers small, scentless, green, stained with dull purple. M. Galeotti's two numbers 27 and 28 merely indicate differently sized specimens of the same plant.

40. EPIDENDRUM LIMBATUM Lindl. in Bot. Reg. 1843. Misc. 104. Huc Lindl. l. c. 17.:

E. facie E. glauci; sepalis petalisque minoribus subrotundo-ovatis, labelli lobo medio recto, lateralibus subfalcatis, columnae appendice truncata dentata.

Wild in Guatemala — Skinner (v. v. c.). — The habit of *E. glaucum*, but larger, and the flowers have roundish sepals and petals, like those of *E. squalidum*. The appendage at the back of the anther is thin, truncate and toothed, not rounded, fleshy and entire. The name alludes to a narrow yellowish border which surrounds the dull purplish brown sepals and petals. It has a slight smell, like that of cobbler's wax.

41. EPIDENDRUM OCHRACEUM Lindl. in Bot. Reg. 1838. Misc. 15. tab. 26. Huc Lindl. l. c. 18.:

E. pseudobulbis obverse pyriformibus caespitosis sursum attenuatis 1-3-phyllis, foliis linearibus acutis recurvis scapo aequalibus, spica terminali laxiflora bracteis ovario aequalibus herbaceis rigidis acutis, sepalis petalisque subaequalibus lineari-oblongis obtusis, labello postico sublibero trilobo: laciniis lateralibus inflexis truncato-rotundatis denticulatis intermedia brevi emarginata: disci callo plano apice tridentato in series tres breves verrucarum procurrente, columna apice tricorni denticulata, clinandrio intra cornua coronula multidentata cincto, ovario triptero.

Wild in Mexico; Hacienda de la Laguna — Schiede, n. 6.; Oaxaca — Loddiges; St. Pedro de Nolasco — Jurgensen 601 and 645; Guatemala — Skinner (v. v. c. et s. sp.) The whole plant not more than nine inches high, with the long narrow pseudobulbs in tufts. Flowers small, orange on the inside, green without. The fringe between the anther and the horns of the column is very remarkable. Is not *E. triste* the same as this?

42. EPIDENDRUM TRISTE Richard et Galeotti Orch. Mex. n. 38. Huc Lindl. l. c. 19.:

E. pseudobulbis oblongis attenuatis 2-phyllis, fol. lanceolato-lin

ribus acutis, flor. viridibus parvulis pendulis: labello trilobo lobis lateralibus obtusis intermedio multo minori."

Wild in Mexico — Galeotti.

C. SPHAEROCHILA.

43. EPIDENDRUM SQUALIDUM Llave. LO. p. 99. Huc Lindl. l. c. 20.:

E. pseudobulbis subancipitibus, floribus racemosis, sepalis petalisque oblongis acutis patulis, labello rotundato trilobo medio crassissimo 3-costato: laciniis lateralibus obtusis intermedia subreniformi undulata.

Wild in Mexico — Karwinski; on the mountains of Valladolid — La Llave (v. s. sp. comm. cel. Bateman.) — Flowers dull yellowish brown, purplish outside. Lip whitish, apparently not cuniculate.

44. EPIDENDRUM PTEROCARPUM Lindl. in Hooker's Journal III. 82. — Bot. Reg. 1841. Misc. 128; 1844 t. 34. Huc Lindl. l. c. 22.:

E. pseudobulbis ovalibus compressis subdiphyllis, foliis ensiformibus acutis, racemo angusto, sepalis petalisque subaequalibus linearibus acuminatis patentibus, labelli subrotundi trilobi cordati laciniis lateralibus rotundatis intermedia multo longiore acuta basi bilineata callo pubescente obscure tridentato aucta, capsula ovata tri-alata.

Epidendrum cinnamomeum Richard and Galeotti Orch. Mex. n. 36.

Wild in Mexico; Oaxaca, on oaks and rocks in the cold region at the elevation of 6—7000 feet — Galeotti 5100. (v. v. c. et s. sp. comm. b. Zuccarini.) — This has a long thin raceme of brown flowers, and a yellow heart-shaped lip streaked with crimson. It is remarkable for the seed-vessel, when ripe; being extended into three broad sharp wings.

D. HYMENOCHILA.

α. lobo intermedio acutissimo vel acuminato.

45. EPIDENDRUM DIOTUM Lindl. in Bot. Reg. 1843. Misc. 97. Huc l. c. 24.

E. pseudobulbis ovatis elongatis monophyllis, foliis coriaceis ensatis patulis racemo duplo brevioribus, floribus distantibus, sepalis petalisque obovatis unguiculatis undulatis acutis, labelli obtuse rhombi tripartiti axi elevata carnosa in medio foveata laciniis lateralibus planis erectis rotundatis intermedia rotundata undulata cuspidata parum majore convexa, columna aptera.

Wild in Guatemala — Hartweg (v. v. c.) — Leaves about a foot long, spreading, and very stiff. Raceme about two feet high. Flowers an inch and a half in diameter, of a dull cinnamon colour, with a little yellow and some chocolate veins in the lip. The flowers have a slight odour of Elder leaves. Its name alludes to the appearance of two ears produced by the rounded lateral lobes of the lip ascending and turned towards the front.

46. EPIDENDRUM PACHYANTHUM Lindl. in Bot. Reg. 1838. Misc. 42. Huc Lindl. l. c. 25:

E. pseudobulbis ovatis diphyllis, foliis lato-ligulatis subundulatis apice oblique obtusis dorso rotundatis, sepalis carnosiss herbaceis lanceolatis, petalis obovato-lanceolatis apice complicatis, labelli laevis laciniis lateralibus ascendentibus truncatis, intermedia spathulata acuta basi callosa trilineata convexa multo brevioribus, columnae auriculis obtusis.

Wild in Demerara — Schomburgk (v. v. c. et s. sp.) — A large green-flowered species. Leaves thinner and broader than usual among these Epidendra, and a little wavy at the margin. Flowers full two inches in diameter, thick and fleshy, dull green, stained with a dirty reddish brown towards the ends of the sepals and petals.

Lip pale straw-colour, streaked along the middle with violet. Differs from *E. selligerum* in the petals not being at all unguiculate. Leaves one inch and a quarter broad.

47. *EPIDENDRUM SELLIGERUM* Bateman in Bot. Reg. 1838. Misc. 66. Huc Lindl. l. c. 26:

E. pseudobulbis 2—3-pollicaribus, scapo subramoso, sepalis patentissimis obovatis concavis obtusis, petalis unguiculatis spathulatis acutis, labello semilibero laciniis lateralibus obtusis recurvis planis intermedio ovata acuta crispatula, disco elevato carnosio medio excavato, anthera biloba terminali, columna aptera.

Epidendrum violodora Galeotti in hb. Hooker.

Wild in Guatemala — Skinner; Mexico, Oaxaca, on rocks and trees, at an elevation of 3000 feet — Galeotti, 5096—7 (v. v. c. et s. sp. comm. cel. Hooker.) — Sepals and petals dull dingy purple, lip pale violet. Flowers perfumed like the Tuberose — Bateman; or like violets — Galeotti. See *E. ionosmum* n. 73.

48. *EPIDENDRUM REPLICATUM* Lindl. in Paxton's Flower Garden; gleanings 443. ic. 224. Huc Lindl. l. c. 27.:

E. floribus dense racemosis, sepalis obovato-lanceolatis acutis, petalis rotundatis unguiculatis apiculatis, labelli trilobi lobis lateralibus oblongis subtruncatis apice reflexis intermedio longiore crispo rhombico acuminato lateribus omnino replicatis sinibus apertis, columna aptera.

Wild in New Grenada? — Linden? (v. v. c.) — Racemes closely many-flowered, about 18 inches high. Sepals and petals dull yellow, stained with brown in the middle below the point, but with a yellow border all round; the former oblong-lanceolate and acute, the latter linear below, and then spread out into a circular disc, terminated abruptly by a small point. The lip, which is white streaked with pink, is remarkable for the manner in which the two sides are turned downwards, so that their backs actually touch.

49. *EPIDENDRUM AMICTUM* Linden Rehb. fl. in Bonpl. III. 219.

Aff. *E. Candollii* Lindl. labelli gynostemium involventis lobis lateralibus semiovatis abbreviatis apice reflexis, lobo medio obtuse quadrato crispulo apice apiculato, callo medio sulcato antice acuto carnosio in disco in lineas velutinas basin versus exeunte, venis radiantibus labelli omnibus elevatulo carinatis, illis loborum lateralium subevanescentibus.

Pedunculus gracilis spithamaeus apice sexflorus. Bractee squamas minutas sistentes. Ovaria pedicellata subpollicaria. Sepala spatulata acuta. Tepala basi angustiora dein latiora. Omnia virentia. Labellum purpureo striatum. Gynostemium apterum. Flores illos *E. aromatici* subaequantes. Cult. in Hort. Lindeniano.

50. *EPIDENDRUM CANDOLLEI* Lindl. in Bot. Reg. 1839. Misc. 77. De Cand. Pl. rar. Genev. 8 not. p. 15. t. 3. Huc Lindl. l. c. 28.

E. pseudobulbis sphaericis, scapo paniculato, sepalis petalisque obovato-oblongis, labelli liberi trilobi cucullati sinibus clausis lobo medio majori crispo acuminato disco elevato calloso sulcato pubescente.

Epidendrum cepiforme Hooker in Bot. Mag. t. 3765.

Wild in Mexico (v. v. c.) — Flowers dull brown, with a dull yellow lip, striped with the same colour.

51. *EPIDENDRUM ONCIDIODES* Lindl. in Bot. Reg. t. 1623. Huc Lindl. l. c. 29.

E. pseudobulbis subteretibus, foliis 2—3 ensiformibus panicula longa racemosa brevioribus, sepalis petalisque obovatis unguiculatis, labelli trilobi lobis lateralibus angustis obtusis planis intermedio subrotundo cuspidato multo brevioribus, disco tricarinato venis elevatis utrinque, columna apice obtuse auriculata.

(A) Flowers yellow blotched with brown, coriaceous with broader sepals and petals

(B) *graniticum*. Flowers smaller, green dotted with red. Lip white, rose-coloured at the base.

Epidendrum graniticum Lindl. in Hooker's Journal III. 83.

Wild A. in Surinam; savannahs — Focke 237 and 823. B. Surinam — Focke 457; Demerara on the granitic ridges of the R. Corentyn, the Cuyumi and Guayna, among boulders where a little soil has collected — Schomburgk, 195. (v. v. c. et s. sp.: A in herb. Miquel.) — Flowers extremely fragrant. Stem six feet high according to Schomburgk, three to four feet high in gardens. Leaves two feet long and one and a half inch wide. The native country, long unknown, is proved to be Surinam by M. Focke's specimens which I have examined in the herbarium of Profr. Miquel. The green, white, and pink flowers of my *E. graniticum* are so much thinner and smaller that it is difficult to suppose it to be the same with this. Beyond colour, however, and size, I find no satisfactory difference, and it is probably a mere local variety of *E. oncioides*. Hostmann's 792, of which I have seen only a single specimen, seems also to be referable here.

Huc: *Epidendrum* (Encyclidium) *spectabile* Focke in v. Mohl et v. Schldl. Bot. Z. 1853. 229.

Foliis linearibus acutis plicatis rigidis, pseudobulbis fusiformibus 2—3 phyllis, scapo paniculato terminali 2—3 pedali, sepalis oblongo obovatis, petalis paulo latioribus orbiculato-ovatis unguiculatis sepalisque patentissimis, labello libero trilobo, disco et basi loborum lateralium columnam amplectens, lobo medio suborbiculato apiculato margine crispo unguiculato, lobis lateralibus oblongis patentibus disco subcarnoso lineis 2 elevatis instructo, columna clavata bialata.

Radices crassiusculae, albae. Rhizoma repens, annulatum, pseudobulbigerum. Pseudobulbi fusiformes, elongati, ad basin incrassati, 2—3 phylli. Folia ensiformia vel linearia, plicata, carinata, acutiusecula, rigida, erecta, coriacea, bipedalia. Scapus terminalis, paniculatus, multiflorus, erectus, 2—3 pedalis, purpureus, bracteatus. Bractee minutae. Sepala oblongo-obovata seu late spatulata, apiculata, concava, supremum paulo angustius, resupinatum, 1—5 centim. longum. Petala paulo latiora, aequilonga, orbiculata, ovata, unguiculata, subincurva, apiculo recurvo. Sep. pet. et col. pallide viridia, extus (petala etiam intus) atropurpureo dense punctata. Lab. liberum, trilobum, sepalis petalisque aequilongum, disco et basi loborum lateralium columnam amplectens, album, lobo medio suborbiculato apiculato, incurvo conduplicato, margine crispo, brevi unguiculato violaceo-striato, lobis lat. oblongis obliquis patentibus apice rotundatis, disco subcarnoso, lineis 2 elevatis luteis incrassatis. Columna clavata, concava, labelli discum vix superans, apice dilatata et bialata, lobis rotundatis incurvis luteis, basi canaliculata, clinandrio bidentato, centimetro brevior. Anthera cordata, obliqua, 4 locularis, septorinis marginibus membranaceis, flavis. Poll. 4 coll., per paria caudiculis 2 linearibus replicatis (singulum processu filiformi) affixa, oblongo-falcata, compressa, flava. Capsula ovali oblonga, in pedunculum attenuata, brevi rostrata, trisulcata, inter sulcos tricostata, papillis minutis albidis muricata, atroviridis. — Distr. Para, ad pag. Jodensavane. Jul. Aug. Sept.

Huc: *Epidendrum affine* Focke in v. Mohl et v. Schlecht. Bot. Zeit. 1853. 341.

Foliis ensiformibus plicatis emarginatis striatis, pseudobulbis turbinatis 2-phyllis, scapo composito-racemoso terminali foliis triplo longiore erecto, sepalis late-lanceolatis apiculatis, petalis spatulatis acutis, labello trilobo, lobo medio sub-orbiculato apiculato revoluto crispo, lateralibus oblongis apice revolutis, disco et loborum lateralium basi columnam amplectens, columna clavata bialata.

Rhizoma repens. Pseudobulbi turbinati, rugosi, juniores vestiti, 2- (rarius 3-) phylli. Folia ensiformia v. linearia, plicata, carinata, obtusa, emarginata, stricta, vix pedalia. Scapus terminalis, paniculatus v. composito-racemosus, racemulis 3-floris,

erectus, 2-pedalis, viridis, bracteatus. Bracteae cordatae acutae, plicatae, patulae, fuscae. Perianthium patens. Sepala late-lanceolata, acuta, viridia; supremum convexum; lateralia concava, 12 mm. longa. Petala sepalis aequilonga, spatulata, acuta, parte dimidia inferiore sepalis multo angustiora, convexa, viridia. (Petala et sejala sub lente et tactu subvelutina). Labellum liberum, trilobum, paulo brevius, disco et loborum lateralium basi columnam amplectens, album; lobo medio suborbiculato, apiculato, revoluto, crispo; lateralibus oblongis, obliquis, obtusis, columnae applicatis, apice oblique revolutis, viridibus; disco lineis duabus elevatis albis medio foveolam efformantibus instructo. Columna clavata, concava, labelli discum vix superans, viridis, apice dilatata et bialata, alis rotundatis incurvis albidis, basi canaliculata. Anthera cordata, obliqua, 4-locularis, septorum marginibus membranaceis, flava. — Habitat in distr. Para Surinamensi. — Florebat Novembri et Decembri. — Differt haec species ab *E. spectabili* nob. praesertim pseudobulbis turbinatis (nec fusi-formibus), foliis brevioribus, inflorescentia minus divaricata magisve racemosa, floribus minoribus, petalis et sepalis non maculatis.

Huc: *Epidendrum* (*Encyclium*) *guatemalense* Klotzsch in Allg. Gart. 1852, p. 250 :

Caule ascendente subramoso radicante pseudobulboso, pseudobulbis ex ovato oblongis teretibus, apice attenuatis diphyllis; foliis lineari lanceolatis, longius attenuatis brevi acutis coriaceis subtortuosis subtus carinatis racemo subsimplice terminali subduplo brevioribus, perigonii foliis patentibus viridibus, extus intusque striis punctiformibus minutissimis fusco violaceis ornatis, exterioribus oblongis spatulatis levissime acutis, labelli omnino liberi trilobi candidi lobis lateralibus obovatis columnam amplectentibus, intermedio orbiculari deflexo brevissime acuto lineis violaceis angustis parallelis notato, basi anguste naviculari subcalloso; columna trigona auriculata, auriculis obtusis deflexis vitellinis; germinibus teretibus albedo punctato tectis.

Pedunculus bipedalis $1\frac{1}{2}$ ".

52. EPIDENDRUM CERATISTES Lindl. in Bot. Reg. 1844, Misc. 92. Huc Lindl. l. c. 31. :

E. pseudobulbis conicis 2—3-phyllis, foliis ensiformibus strictis scapo duplo brevioribus, panicula longa cernua racemiformi ramulis laevibus divaricatis, sepalis petalisque obovatis acutissimis subconformibus (herbaceis), labelli trilobi lobis lateralibus erectis obtusis ovatis apice recurvis, intermedio subrotundo unguiculato acuminato crispo striato, ungue medio depresso versus basin 4-costato, columna apice acute auriculata, anthera tricostata.

Wild in New Grenada; in the province of Rio Hacha; Sierra of Sa. Martha, at the height of 5000 feet — Linden, 1658; Socorro and Ocanna — Schlim, 1007 (v. v. c. et s. sp. comm. cel. Linden). — Panicle about three feet long; the leaves resemble those of *E. virgatum*, but are not so glaucous; the flowers are extremely sweet, clear green (Mr. Linden says dull yellow) with a whitish lip, streaked with red, and the column has two horn-like ears. — Rchb. fil. in Bonpl. III. 67. Ocanna Wagerer. — Rchb. fil. Bonpl. II. 19. Caracas. 4000'. Wagerer.

53. EPIDENDRUM PLICATUM Lindl. in Bot. Reg. 1847, t. 35. Huc Lindl. l. c. 32. :

E. pseudobulbis ovatis diphyllis, foliis ensiformibus acutis racemo brevioribus, sepalis petalisque lanceolatis cuspidato-acuminatis, labelli lobis lateralibus oblongo-lanceolatis undulatis basi elevatovenosis, intermedio cordato transverso plicato crenato cuspidato, callis 2 maximis carinatis acutis apice subliberis in unguem.

Wild in Cuba — Loddiges (v. v. c.) — The plaited crenelled lip, with a long cusp, is quite peculiar; it is of a rich crimson, as are the petals at the back; but the sepals and inside of the petals are green, the former just warmed and the latter richly spotted with crimson.

54. EPIDENDRUM ODORATISSIMUM Lindl. in Bot. Reg. t. 1415. LO., 10. Huc Lindl. l. c. 33.:

E. pseudobulbis ovatis corrugatis, foliis binis loratis, racemo subsimplici, bracteis membranaceis ochreatis, sepalis oblongis petalisque cuneatis patentibus, labelli trilobi lobis lateralibus linearibus obtusis, intermedio ovali rugoso multo latiore, disci callo elevato acuminato medio excavato lamina laterali s. plica utrinque adjecta prope basin, columna apice obtuse auriculata.

Epidendrum glutinosum Scheidw. in Allg. Gartenz. 1843. p. 110?

Macradenia lutescens Lodd. Bot. Cab. t. 1556. non R. Br.

Encyclia patens Hooker Bot. Mag. t. 3013.

Wild in Brazil — Capt. Sullivan, R. N.; in woods near Rio Janeiro — Harrison (v. v. c. et s. sp. in hb. Miers.) — Flowers olive-green with yellowish edges, or quite green, very sweetscented. None of the figures above quoted are good, all having been made from unhealthy garden specimens. The middle lobe of the lip is in reality wrinkled with elevated veins, and there is a distinct plait or fold on each side the main callus near the base.

55. EPIDENDRUM TAMPENSE Lindl. in Bot. Reg. 1847. sub t. 35. Huc l. c. 34.:

E. pseudobulbis monophyllis anguste ovatis acuminatis teretibus, foliis linearibus apiculatis, panicula rara racemosa duplo brevioribus, bracteis obsolete, sepalis petalisque oblongo-linearibus acutis, labelli tripartiti laciniis lateralibus linearibus obtusis intermedia oblonga acuta paulo longiore, disco bilamellato linea intermedia antrorsum interjecto, columnae auriculis minutis acutis.

Wild in Florida; Tampa Bay Torrey (v. s. sp. comm. cel. Torrey.) — Pseudobulbs small and terete, with a narrow tapering neck. Leaf from seven to eight inches long, and not more than three lines wide. The species differs from the *E. gracile* of the Bahamas in its acute lip, narrow solitary leaves, and smaller flowers.

56. EPIDENDRUM OXPETALUM Lindl. Orch. Linden. n. 46. Huc l. c. 35.

E. pseudobulbis monophyllis parvis ovatis acuminatis, foliis rigidis linearibus scapo paniculato flexuoso aequalibus, sepalis petalisque lineari-lanceolatis acutis, labelli tripartiti laciniis lateralibus elongatis obtusis pubescentibus, intermedia unguiculata ovata acuta venis scabriusculis, columna aptera.

Wild in Cuba; in the forests of Guantanamo — Linden. — Pseudobulbs oval, rounded, acute. Leaves linear-lanceolate, coriaceous. Scape a foot high. Flowers dull yellow.

57. EPIDENDRUM FUCATUM Lindl. in Bot. Reg. 1828. Misc. 17. Huc l. c. 36.:

E. pseudobulbis subrotundo-ovatis caespitosis monophyllis, foliis ligulatis coriaceis obtusis scapo brevioribus, panicula nutante multiflora, bracteis ovatis acutis squamiformibus, sepalis petalisque lineari-oblongis tessellatis aequalibus obtusis conniventibus, labelli liberi tripartiti lobis lateralibus erectis linearibus apice rotundatis, intermedio ovali multo brevioribus, disci lamellis 2 elevatis ad basin lobi intermedii.

Epidendrum polyanthum Hort. Gall.

Wild in Cuba — Captain Sutton, R. N., (v. v. c.) — Flowers small, dull yellow, tessellated, with a pink spot in the centre of a white lip.

Huc *Epidendrum Sagraeanum* A. Rich. in Ramon de Sagra etc. N. 235. tab. 75.

Pseudobulbs ovoideis oblongis, vaginis laxis vestitis, apice monophyllis; folio oblongo, angusto, 1—8 uncias longo, coriaceo, apice obtuso —, vix unam unciam lato, scapo terminali tereti bipedali; sepalis externis crassiusculis, subspathulato oblongis, vix acutiusculis; internis aequilongis, spathulatis, obtusis, luteolis, labello medietate inferiore

gynostemio parallelo, idque amplexanti, 3 lobo; lobis lateralibus oblongis angustis, obtusis, subfalcatis, intermedio obovali obtusissimo margine undulato crispo basi angustato et subungiculato paulo brevioribus.

Crescit in insulae Cubae locis sylvaticis, parasiticum in arborum cortice (Ramon de la Sagra).

Huc: *Epidendrum affine* (Tab. 78.) A. Rich. in Ramon de Sagra n. 237.

Pseudobulbis subrotundo ovatis caespitosis, monophyllis; foliis ligulatis coriaceis obtusis, scapo brevioribus; panicula nutante multiflora, bracteis ovatis acutis squamiformibus, sepalis petalisque lineari-oblongis lobellatis aequalibus obtusis conniventibus, labelli liberi tripartiti lobis lateralibus erectis linearibus apice rotundatis, intermedio acuto ovali multo brevioribus, callo sulcato, plano, elevato basi lobi intermedii.

Crescit in insula Cuba.

Obs. Conocemos sola esta especie por el caracter que reproducimos del professor Lindley. Nos parece tener relaciones con las tres especies precedentes.

Huc: *Epidendrum hircinum* A. Rich. in Ramon de Sagra N. 236. Tab. 77.

Pseudobulbis ovoideis apice attenuatis, 2½--3 pollices longis, 1 pollices latis, apice diphyllis; foliis coriaceis, oblongis, angustis, subacutis, dorso subrenatis aveniis, 5—7 lineas latis, 6—8 pollices longis; scapo terminali, foliis duplo longiori, nudo, basi simplici, apice ramoso paniculato, floribus amplitudine mediis, pedicellatis, bractea minima suffultis; sepalis patentibus intensive luteis subcinnamomeis spathulato-oblongis acutis concoloribus; labello trilobo gynostemium obtegente libero; lobis lateralibus obliquis, oblongis obtusis, lineis purpureis subsimplicibus facie interna notatis; terminali elliptico, oblongo, plano, integro, sessili in disco venis violaceis approximatis notato, in ambitu albo; gynostemium brevi clavato purpurascente.

Crescit in sylvis insulae Cubae.

Obs. p. 237. He aqui tres especies, *E. oxypetalum* Lindl., *E. affine* Nobis, y *E. Sagraeanum* Nobis, que tienen entre si una notable analogia. Todas las tres tienen flores perquen as amarillas ó perducas con un labelo blanco. El *E. oxypetalum* se distingue por sus sépalos mas estrechos y alargados, mas agudos, por el lobulo medio de su labelo oboval y agudo; por sus bulbos que llevan dor hojas estrechas coriáceas, casi de la longitud del hastil d'escapo.

2º El *E. Sagraeanum* Nobis, tiene los bulbos llevando solamente una hoja mas ancha y mas corta, los sepalos espatulados avenos agudos en el vertice; su labelo blanco, recorrido por venas violetas; el lobulo medio oboval muy obtuso y ondulado en su contorno;

3º En cuanto el *E.* que llamamos *affine* sus pseudobulbos con alargados, lisos, portadores de dos hojas estrechas y cas agudos, dos veces mas cortas que el escapo, sus petalos soc espatulados algo agudos; el lobulo medio de su labelo es oboval; agudo, plano y entero en su contorno. Difiere puer de las dos especies praecedentes por sus bulbos que llevan dos hojas del *E. Sagraeanum* por el lobulo medio de su labelo entero, plano y agudo, y del *E. oxypetalum* por sus sepalos espatulados y la forma del lobulo medio de su labelo.

58. EPIDENDRUM CHLOROLEUCUM Hooker in Bot. Mag. t. 3557. Lindl. l. c. 37.:

E. pseudobulbis oblongis ovatis diphyllis, foliis coriaceis ligulatis apice rotundatis obscure bilobis, racemo paniculato, sepalis petalisque subaequalibus lineari-lanceolatis obovatis, labelli trilobi liberi lobis lateralibus linearibus obtusis inflexis, intermedio ovato acuminato crispulo multo brevioribus, disci lamellis 3 obscuris, columnae auriculis minimis obtusis.

Epidendrum chloranthum Lindley Bot. Reg. 1838. Misc. 28.

Wild in Guayana — Schomburgk (v. v. c.). — Flowers scentless, pale green without spots, and a white lip.

b. lobo intermedio obtuso.

* Rhachi laevi.

59. EPIDENDRUM VIRGATUM Lindl. in Hooker's Journal III. 83. Lindl. l. c. 38.

E. pseudobulbis ovatis oblongisve sub-compressis rugosis, foliis binis ensiformibus ternisque convexis subundulatis acutis glaucis unciam latis, panicula virgata ramis longis gracilibus, sepalis lanceolatis petalisque duplo angustioribus patentibus discoloribus, labelli unguiculati lobis lateralibus acutis rectangulis intermedio subrotundo-obovato, callo maximo rotundato acuminato pone basin.

Wild in Mexico; on the ground among *Pteris aquilina*, on the mountains of Cohan, and the Cumbre of Choacas — Hartweg (v. v. c. et s. sp.). — In general appearance much like *E. vitellinum*, but with more glaucous leaves. Flowers small, dirty green stained with brown, arranged in a long lax graceful panicle, the branches of which are simple, and sometimes as much as a foot long, with nearly twenty flowers on each. The lip is whitish yellow. Scape sometimes seven feet high.

60. EPIDENDRUM AMABILE Linden Rehb. fl. — Rehb. fl. in Bonpl. III. 219.

Aff. *E. virgato* labelli trilobi lobis lateralibus divaricatis ligulatis obtusatis, lobo medio obovato apice obtuse bilobulo callo depresso subobsoleto in lineolas tres excurrente ante basin lobi medii.

Panicula gracilis pruinata multiflora. Flores illos *E. virgati* aequantes. Sepala ac tepala (angustiora) lanceolata acuta brunnea pruinata. Labellum aureum purpureo punctatum. Gynostemium purpureum apterum apice obtusissime trilobum; subliberum. Mexico. Ghiesbreght 37. „Les bulbes sont petits et aplatis, Fleurit en Février. On le trouve seule sur des chênes rabougris en terre chaude. Elle n'est pas odoreuse.“

61. EPIDENDRUM LINKIANUM Klotsch in Allg. Gartenz. Sept. 22. 1829. Lindl. l. c. 39.:

E. pseudobulbis fusiformibus 2—3-phyllis, foliis lineari-ensiformibus recurvis racemo paucifloro longioribus, sepalis patentissimis lineari-lanceolatis, petalis conformibus angustioribus, labelli lobis lateralibus minutis erectis acutis intermedio ovato-oblongo crispo venis elevatis sub columna pubescentibus.

Epidendrum Pastoris Link und Otto Abbild. t. 12.

Wild in Mexico — Deppe (v. v. c.). — Flowers small, dull yellow, streaked with purple. Lip nearly white.

Huc: *Epidendrum tripterum* Lindl. in Hook. Journ. III. 83. Lindl. l. c. 58.:

E. pseudobulbis ovalibus compressis diphyllis, foliis lineari-oblongis obtusis racemo paucifloro (4—6) subaequalibus, floribus erectis, sepalis petalisque lineari-lanceolatis patulis, labelli trilobi lobis lateralibus linearibus obtusis planis intermedio subrotundo basi angustato undulato venis rugosis elevatis, clinandrio obtuse 3-lobo, capsula anguste clavata triptera.

Wild in Mexico — Karwinski (v. s. sp. comm. b. Zuccarini). — The whole plant when in bloom little more than six inches high. Flowers apparently dull purple, with a pale lip, on long peduncles, and erect, not drooping. Forms a transition to the last section of *Encyclium*, being nearly allied to *E. tessellatum*.

62. EPIDENDRUM CONCOLOR La Llave. LO. 12. Lindl. l. c. 40.

E. foliis in pseudobulbos confertos lenticulares solitariis lato-lanceolatis acutis, scapo filiformi 5-floro, sepalis ligulatis, petalis linearibus,

labello tripartito laciniis integris intermedia majore, ungue columnae longitudine.

Wild in Mexico; on trees near Valladolid — La Llave. — Flowers pale yellow, whole-coloured, with a striated labellum.

63. EPIDENDRUM PASTORIS La Llave. LO. 7. Klotzsch in Allg. Gartenzeit. Sept. 22. 1838. Lindl. l. c. 41.

E. pseudobulbis oblongis 2—3-phyllis, foliis linearibus carinatis subtortuosis, floribus racemosis, sepalis lineari-subspathulatis acuminatis, petalis spathulatis acutis, labello trilobo lobis lateralibus majoribus basi semilunatis integerrimis basin columnae orbiculatim amplectentibus, medio cordato deflexo minore acuto margine basique recurvo, columna semitereti obtuse tridentata, pericarpis elongatis acuto-triquetris.

Wild in Mexico — Klotzsch; on trees in the province of Mechoacan — La Llave. — Flowers fragrant, like Vanilla, dull yellow externally, striped with purplish brown inside. Lip whitish, becoming yellow, with purple cross-bars on the lateral lobes, and minute purple dots on the middle one. Column brown, with three yellow spots at the end.

Obs. *Epidendrum pastoris* Klotzsch! Herb. Berol.! nil est nisi *Epidendrum pterocarpum*.

64. EPIDENDRUM OVULUM Lindl. in Bot. Reg. 1843. Misc. 71. Lindl. l. c. 42.

E. pseudobulbis oviformibus diphyllis, foliis linearibus canaliculatis acutis, scapo filiformi foliis paulo longiore 3-floro, sepalis linearibus 3-veniis, petalis angustioribus spathulatis, labelli trilobi lobis lateralibus nanis acutis intermedio dilatato rotundato venis radiantibus glandulosis variegato, columnae tridentatae dentibus lateralibus rotundatis denticulatis.

Wild in Mexico; near Bolanos — Loddiges (v. v. c.). — In habit resembling *E. bractescens*, or *aciculare*. The sepals and petals are olive green; the lip white, with rose-coloured side-lobes and crimson glandular radiating veins.

65. EPIDENDRUM ACICULARE Bateman in Bot. Reg. 1841. Misc. 98. Lindl. l. c. 44.:

E. pseudobulbis oblongis diphyllis, foliis linearibus canaliculatis acutis racemo simplici aequalibus, sepalis petalisque lineari-lanceolatis aequalibus acutis, labelli laciniis lateralibus nanis ascendentibus linearibus obtusis apice recurvis, intermedia ovato-oblonga subundulata apiculata.

Epidendrum esculentum Hort. Kew. in hb. Hooker.

Epidendrum linearifolium Hooker in Bot. Mag. t. 4572.

Wild in the Bahamas — Skinner; Mexico, near Oaxaca — Galeotti 39 (v. v. c. et s. sp. comm. cel. Galeotti). — A little species, with long narrow leaves, a slender erect raceme of six or seven flowers, whose sepals and petals are dull purple, and lip white, enlivened with rosy veins. — Lemaire l. c. 145.

Huc: *Epidendrum bractescens* Lindl. in Bot. Reg. 1840. Misc. 122. Lindl. l. c. 43.:

E. pseudobulbis ovatis caespitosis 3—4-phyllis, foliis linearibus, scapo debili 3—4-floro, bracteis infimis foliaceis floribus longioribus, supremis obsoletis, floribus nutantibus longe pedunculatis, sepalis petalisque lineari-lanceolatis acuminatis discoloribus labello longioribus, labelli liberi lobis lateralibus apice recurvis obtusis subdentatis, intermedio unguiculato subrotundo-ovato multo longiore secus unguem elevato sulcato pubescente.

Wild in Mexico; near Oaxaca — Hartweg (v. v. c.). — One of the prettiest of the small species. Pseudobulbs exactly ovate, closely clustered, and about as large as a pigeon's egg. Flowers scentless, with a beautifully but delicately painted white

lip, the gay effect of which is heightened by the contrast with the dingy purple of the long narrow sepals and petals.

66. EPIDENDRUM XIPHERES Rchb. *Bl. in V. Houite Flore des Serres IX. 98. Bonpl. II. 89.*

Pseudobulbis pyriformibus monophyllis, folio crassissimo lineari canaliculato acuto curvato, pedunculo capillari 3—4 floro, bracteis brevissimis, ovariis cum pedicellis hyalino papillois, sepalis oblongo-linearibus acutis, tepalis angustioribus basin versus valde attenuatis, labello libero unguiculato, medio trilobo, lobis lateralibus linearibus, lobo medio unguiculato dein cordato acuto, margine crispulo, callo in ungue lobi medii excavato tomentoso, antice in basi laminae labelli in tres venas elevatas puberulas excurrente, venulis lateralibus carinato elevatulis, gynostemio gracili, androclinio tridentato, lobis lateralibus minutis acutis, lobo postico medio subobliterato bidentatulo.

Importée du Pérou par MM. Booth et fils de Hambourg, qui nous en ont communiqué des exemplaires.

Obs. Ovaria aspera, hinc cf. etiam sectionem rhachi aut ovariis asperis.

67. EPIDENDRUM NEMATICAULON A. Rich. in Ramon de Sagra Tab. 79. n. 238.

Pseudobulbis ovoideo-oblongis, laevibus, crassitie passularum, aggregatis, apice monophyllis, vagina striata applicata erosa vestitis, folio lineari angusto crasso, coriaceo, apice acuto, superne subcanaliculato, 7 uncias longo, sesquilineam ad 2 lineas lato; scapo terminali foliis paulo longiori, simplici tenuissimo valde gracili, 4—5 floro; floribus secundis bractea lineari brevi applicata stipatis; sepalis patulis spatulato-linearibus acutis internis angustioribus, luteo bruneis, concoloribus, labello pallide luteo, unguiculato, fere usque ad basin libero, trilobo; lobis lateralibus gynostemio applicatis linearibus acutis, apice recurvis, gynostemium superantibus, intermedio cordiformi, sinuoso, in disco nervis 3 longitudinalibus cristaeformibus et nervis lateralibus apice ramosis notato; gynostemio recto, antice plano; anthera depressa, in medio biloba.

Cuba. V. V. c. in *cald. hort. bot. soc. med. Paris.*

68. EPIDENDRUM PICTUM Lindl. in *Bot. Reg. 1848. Misc. 43. Lindl. l. c. sub 45.*

E. pseudobulbosum, foliis ligulatis coriaceis obtusis dorso rotundatis, racemo erecto paniculato, sepalis petalisque obovato-linearibus subaequalibus, labelli trilobi liberi lobis lateralibus linearibus acutiusculis subfalcatis columnam amplexantibus sinibus plicatis, intermedio ovali acuto crispo multo brevioribus, disci venis elevatis.

Wild in Demerara — Loddiges (v. v. c.). — Resembles *E. odoratissimum*; with dull yellow flowers, neatly striped with crimson. Also related to *E. chloroleucum*, from which its leaves distinguish it.

69. EPIDENDRUM MICROBULBON Hooker *ic. t. 347. Lindl. l. c. sub 46. :*

E. pseudobulbis ovatis diphyllis, foliis lato-linearibus scapo brevioribus, racemo laxo paucifloro, bracteis membranaceis acutis, sepalis linearibus petalisque angustioribus patentissimis, labelli angusti lobis lateralibus nanis rectis obtusis sinibus clausis, intermedio oblongo crispo venis sabris.

Wild in Mexico: Oaxaca, on trees at the height of 7000 feet — Galeotti 5188 (v. v. c. et s. sp. in hb. Hooker). — Flowers the size of *E. bractescens*, rose-coloured; lip yellow with red dots.

70. EPIDENDRUM OBTUSUM Alph. De Candolle *Plant. rar. Genev. 8 not. p. 17. Lindl. l. c. sub 46.*

E. pseudobulbis ovatis acutis diphyllis coriaceis linearibus acuminatis scapo subpaniculato brevioribus, bracteis membranaceis caducis, labelli lobis crispis obtusis striatis aequilongis intermedio latiore, callo disci acuminato.

Wild in Mexico — Alph. De Candolle. — Leaves four inches long. Scape a foot long, drooping; flower-stalks two to three lines long. Sepals half an inch long, two lines broad, greenish brown. Lip whitish, streaked with dirty purple. Possibly this species belongs to the Sphaerorchiles.

Huc: *Epidendrum obtusum* Alph. DC. Hist. not. p. 17.

E. pseudobulbis ovoideo acutis laevibus, scapo elongato declinato multifloro sepalis petalisque oblongo-lanceolatis obtusis patentibus, labelli liberi trilobi cucullati lobis crispis obtusis striatis, medio latiore disco calloso glabro oblongo acuto.

Mexico. — Fausses bulbes ovoïdes pointues lisses, terminées par 2 feuilles opposées linéaires acuminées, planes, coriaces, longues de 4 pouces. Pedoncule d'un pied de longueur, grêle, cylindrique, lisse, décliné, multiflore. Bractées caduques, distantes, serrées en forme de gaine, ovales, obtuses, longues de deux à trois lignes seulement. Huit à dix fleurs pédicellées, et les inférieures sur des ramifications du pédoncule. Pédicelle de deux à trois lignes.

Sepales oblongs-lancéolés, obtus, d'un brun verdâtre, étalés, longs de 4—6 lignes, larges de deux lignes, les supérieurs un peu plus grands, que les autres. Pétales semblables aux sépales, mais un peu plus rétrécis à la base. Labelle d'une ligne ou deux plus court que les pétales; dans sa portée inférieure à bord roulés en dedans, de manière à former un cylindre blanchâtre, rayé de pourpre sale, entourant la colonne staminale, mais libre d'avec elle: dans sa partie supérieure, divisé en trois lobes obtus, légèrement crispes et rayés de rouge. Le lobe inférieure à peine plus long que les lobes latéraux, mais de moitié plus large et tout à fait arrondi. Une languette en tache calleuse, glabre, blanche, oblongue, pointue, sur le tube du labelle du côté inférieur, s'étendant jusque vers le milieu de sa longueur. Colonne trois fois plus courte que le labellum, glabre, convexe et rangé en dehors, plane-convexe et plus pâle en dedans. — Mexico. Paccard. — Diff. de l'*E. asperum* Lindl. par un labelle plus long, dont le lobe central qui dépasse à peine les latéraux est arrondi, obtus, en lieu d'être ovale, pointu. La couleur de la fleur est d'ailleurs la même.

71. EPIDENDRUM GRACILE Lindl. in Bot. Reg. t. 1765. Lindl. l. c. 48.

E. foliis in pseudobulbos ovatos corrugatos pluribus lorato-ensiformibus, racemo simplici longissimo, sepalis oblongis petalisque cuneatis patentibus, labelli fere liberi lobis lateralibus semiovatis intermedio oblongo crispo obtusissimo duplo minoribus disco bicostato venis elevatis.

Wild in the Bahamas — J. C. Lees (v. v. c.). — Flowers green, lip yellow, lined with purple.

72. EPIDENDRUM VIRIDIFLORUM Lindl. in Bot. Reg. 1842. Misc. p. 30. — Huc Lindl. l. c. 49.

E. pseudobulbis ovatis diphyllis, foliis lineari-lanceolatis carinatis recurvis acutis panicula brevioribus, sepalis petalisque linearibus acutis falcatis erectis, labello postico apice 3-dentato lobis lateralibus planis, intermedio ovato crispo aequalibus, disci callo duplici angusto carnoso, columna aptera.

Encyclia multiflora Hooker in Bot. Mag. t. 2831. L.O. 111.

Wild in Brazil; near Rio Janeiro — Harrison (v. s. sp. in hb. Hooker.). — Leaves shorter than the panicle, which is about a foot high, slender, and rather flexuose. Flowers membranous, green, with a purple stain at the base. The figure in the Botanical Magazine is faithful in all particulars.

73. EPIDENDRUM RUFUM Lindl. in Bot. Reg. 1845. Mis. 42. Huc Lindl. l. c. 50.:

E. pseudobulbis pyriformibus 2—3-phyllis, foliis brevibus lanceolato-ligulatis patentibus scapo paniculato brevioribus, sepalis petalisque ovalibus acutis subcarnosis, labelli laciniis lateralibus brevibus semiovatis erectis intermedia obovata convexa margine revoluta apice rotundata secus axin elevata carnosa basi in laminam duplicem (disci costam) divisa, columna membranaceo-marginata.

Epidendrum primulinum Bateman in Paxton's Flower Garden I. snb t. 30. 1850.

Wild in the Bahamas — Skinner; Brazil (?); near Rio — Lieutenant Turner R. N. (v. v. c.). — Leaves six to eight inches long. Scape a foot and more high. Flowers in a narrow slightly branched panicle, very sweet, like primroses, brownish-yellow. Mr. Bateman informs me, that Mr. Skinner certainly collected this in the Bahamas, along with *E. altissimum* and *aciculare*. In Sir C. Lemon's garden, it is said to have been sent from Rio, by Lieutenant Turner. I have seen no wild specimens.

74. EPIDENDRUM GALLOPAVINUM Rchb. fl. Bonpl. III. 219.

Affine *E. rufo* Lindl., tepalis unguiculatis ovatis, labelli lobis lateralibus trapezoideis, lobo medio unguiculato obtuse triangulo, callo depresso inter lobos basiales antice in venas varicosas 4 exeunte, papulis pluribus circumjectis in disco lobi medii, gynostemii alis cartilagineis antrorsis apice acutis, tri — quadridentatis.

Sepala oblonga cuneata. Tepala cuneato unguiculata ovata. Labellum ima basi adnatum trilobum; lobi laterales obtusanguli, trapezoidei seu quadrati, margine antico trianguli obtusi, sinus angustis interjectis inter lobum medium; gynostemium ascendens. Anthera apice retuso biloba. — Blüthen braun. Lippe gelbweiss. Adern der Seitenlappen und Schwiele purpurn. Lippenscheibe amethystfarbig gebuckelt. Eine prachtvolle Pflanze mit grosser Rispe. Bulbe und Blätter wie bei *odoratissimum*. Von Rio Janeiro durch Herrn Consul Schiller eingeführt.

75. EPIDENDRUM FLAVUM Lindl. in Hook. Journ. III. 83. Huc Lindl. l. c. 51.:

E. pseudobulbis ovatis attenuatis 3-phyllis, foliis ensiformibus paniculae pauciflorae subaequalibus, sepalis petalisque patentibus subaequalibus, lineari-oblongis obtusis, labelli laciniis lateralibus linearibus truncatis, intermedia unguiculata obovata nuda, columna sub apice obtuse auriculata.

Wild in Brazil; in the province of St. Paul's — Martius; trees, Mission of Douro — Gardner 3456 (v. s. sp.). — Leaves rather more than a foot long. Flowers pale yellow, about an inch and a half in diameter. The inflorescence is only paniced at the base, and is probably very often simple.

76. EPIDENDRUM ALTISSIMUM Bateman in Bot. Reg. 1838. Misc. 61. Huc Linpl. l. c. 52.:

E. pseudobulbis elongatis teretibus 2—3-phyllis, scapo paniculato longissimo, sepalis oblongis acutis, petalis conformibus basi angustatis, labelli lobis lateralibus dimidiatis erectis tortis obtusis, intermedio dilatato undulato laevi recurvo apiculato basi bicostato.

Wild in the Bahamas; in rocky districts — Skinner (v. v. c.). — Flowers as large as in *E. oncioides*; smelling strongly of beeswax. — Gard. Chronicle 1852. 804.

77. EPIDENDRUM ALATUM Bateman Orch. Mex. t. 18. Huc Lindl. l. c. 53.:

E. pseudobulbis ovatis, foliis binis rectis ensatis obtusis, panicula laxa multo longiore, sepalis petalisque conformibus linearibus spathulatis unguiculatis obtusis, labelli trilobi laevis lobis rotundatis lateralibus erectis, intermedio convexo multo majore emarginato undulato intra marginem scabro venis pluribus elevatis coloratis, callo disci medio excavato, columna auriculata.

Epidendrum longipetalum Lindl. in Paxt. Flower Garden I. t. 30.

Epidendrum calocheilum Hooker in Bot. Mag. t. 3898.

Wild in Guatemala — Hartweg; Honduras, near Isabal — Skinner (v. v. c.). — Very sweet-scented. Panicle long, straggling. Sepals and petals greenish at the base, purple upwards, almost an inch and a half long. Lip straw-coloured, bordered with yellow, and streaked with rose.

Until this critical revision was undertaken, I was always under the impression that the plant figured in the Bot. Reg. in Oct. 1847, was Mr. Bateman's *E. alatum*, of which *E. calocheilum* is an undoubted synonyme; and therefore, I regarded *E. longipetalum* as a new species. A very careful re-examination of evidence shows, however, that this was an error, and it is now corrected.

Huc; *Epidendrum* (Encycl.) *formosum* Kl. in Allg. Gartenz. 1854. 201.

Pseudobulbis erectis, apice attenuatis glabris laevibus, deinde longitudinaliter corrugatis, foliis oblongis acutis coriaceis rigidis erectis subtus costa acuta prominula carinatis, racemo longe pedunculato purpureo laete viridipunctato simplici 5 floro, floribus magnis flavido purpureis; perigonii foliolis spathulatis longi unguiculatis patenti reflexis atrofuscis, basi viridi; foliis interioribus basin versus angustioribus; labelli trilobi subliberi straminei rotundati lobis lateralibus apice magis dilatatis patentibus, intermedio orbiculato lanceo undulatoque marginato plano semideflexo, lineis elevatis crispatis margine purpureis radiatim dispositis, callo disci elevato oblongo excavato, ac columna brevi albidata trigona, apice utrinque auriculata.

Diff. ab *E. alato*: racemo simplici, foliis angustis longioribus, labelli lobis lateralibus marginis patentibus. — Guatemala Warszewicz. — Lemaire Jard. N. I. tab. 81. — Gard. Chronicle 1852. 390.

78. EPIDENDRUM VIRENS Lindl. in Paxt. Flower Garden I. sub t. 30. Huc Lindl. l. c. sub. 54.:

E. panicula laxa erecta angusta, sepalis lineari-ovalibus, petalis aequilongis spathulatis acutis, labelli laciniis lateralibus erectis oblongis emarginatis, intermedia convexa plicata venosa apiculata retusa, callo disci excavato utrinque juxta sinum denticulo aucto, columna auriculata.

Wild in Guatemala — Skinner (v. v. c.). — Flowers green, whole coloured, except the lip, which is white, with crimson veins in the middle lobe; the lateral lobes green, with crimson veins, but white at the point. Certainly distinct from *E. longipetalum*, which it most resembles, in the form and proportion of its sepals, lip, and callus.

Huc *Epidendrum* (Encyclium) *Wagneri* Klotzsch in Allg. Gtz. 1851. 250.

Pseudobulbis caespitosis, breviter ovatis, glabris, laevibus 2—3 foliatis, foliis linearibus, coriaceis, tortuosis, apice obtusis, submarginatis, basi conduplicatis; racemo paniculato terminali olivaceo, laete viridi punctulato, pedicellis brevissime bracteatis, basi articulatis; gemminibus teretibus, deorsum attenuatis punctato-scabris, perigonii foliolis aequalibus, spathulato erectis, patentibus, flavo viridibus, labello trilobo candido, lineis purpureis elevatis striato, basi bicalloso, lobis lateralibus brevibus, conniventibus, falcato oblongis, obtusis, lobo intermedio cordato, orbiculato-ovato, brevi, acuto; columna libera apice utrinque carinato-auriculata.

Pseudobulbi 2 pollices longi, supra basin 1½ poll in diametro. Folia 15 poll. longa 8 lin. lata. Racemi bipedales. Flores odoriferi. Perigonii foliola 9 lin. longa, 3 lin. lata. Labellum album deinde alutaceum. In hort. reg. Berol. ex cultum Julio. Venezuela. Wogener. — Rehb. fil. in Bonpl. II. 19. Caracas. 3500'. Mai. Wogener.

Huc; *Epidendrum* (Encyclium) *ochranthum* A. Rich. in Ramon de Sagra. Tab. 78. n. 237.

Pseudobulbis caespitosis ovoideo-oblongis basi in rhizomate abeun-
VI.

tibus, apice 1—3-phyllis, 3 uncias longis, sesqui unciam latis, basi lineis circularibus ad insertionem bractearum annulatis; foliis erectis coriaceis angustis, apice obtusis, dorso subcarinatis, sesquipedalibus vix unam unciam latis; scapo terminali 2—3 pedes longo ramoso; floribus paniculatis pedunculatis magnis colore luteo sulphureis; sepalis patulis oblongo-spathulatis acutiusculis in utraque facie luteis; internis (petalis) conformibus vix paulo latioribus obtusioribusque concoloribus; labello libero trilobo erecto gynostemio applicato, idque amplexanti; lobis lateralibus erectis ovali oblongis obtusis, externe macula diffusa subpurpureo notatis; intermedio ovali obtuso margine obsolete undulato, in disco incrassato subtrilineato; gynostemio clavato dorso carinato antice ad apicem ala brevi angusta obtusa notato.

Crescit in insula Cuba. — Hemos descrito esta especie con vista de surestres vivas que flore cieron en el jardin botanico de la facultad de Medicina de Paris.

79. EPIDENDRUM AROMATICUM Bateman Orch. Mex. t. 10. Lindl. l. c. sub. 55.:

E. pseudobulbis sphaeroideis diphyllis, foliis late loratis recurvis, floribus membranaceis paniculatis, sepalis linearibus patentissimis basi angustatis, petalis conformibus sed paulo latioribus, labelli lobis lateralibus triangulari-falcatis rectis inflexis acuminatis, intermedio multo majore oblongo venis scabris cristato, callo disci oblongo brevi convexo in acumen producto, columna aptera.

Epidendrum incumbens Lindl. in Bot. Reg. 1840. Misc. 84.

Wild in Guatemala — Skinner in a temperature of 60° to 75° (v. v. c. et s. sp. comm. cel. Skinner.). — Flowers very sweet; in large pale dull yellow panicles, the lower branches of which curve gracefully downwards. The texture of the flowers is much thinner than that of allied species. The plant which I formerly called *E. incumbens* with a shorter lip and a narrow panicle, is apparently an accidental form, and not even a variety.

80. EPIDENDRUM AMBIGUUM. Huc Lindl. l. c. 56.:

E. panicula laxa flexuosa, bracteis brevibus duris acutis, sepalis membranaceis lineari-lanceolatis incurvis, petalis angustioribus longe unguiculatis, labelli lobis omnibus crispato-laceris, lateralibus rotundatis, intermedio oblongo venis scabris, callo disci duplici antice in lineas 3 elevatas procurrente lamella brevi ad sinum attingente utrinque aucto, columnae auriculis acutiusculis.

Epidendrum alatum Lindl. in Bot. Reg. 1847. t. 53. nec Bateman.

Wild in Guatemala — Rucker (v. v. c.) — Flowers pale yellowish green, very sweet-scented. Lip straw-colour, spotted and streaked with rose.

This is the plant alluded to under *E. alatum*, n. 53, as having been confounded with species. It is in reality much nearer *E. aromaticum*, from which its very narrow unguiculate petals (ill represented in the Bot. Reg.), auriculate column, and totally different callus, separate it. Both sepals and petals curve inwards exactly as is shewn in the figure just referred to. This and the next require to be carefully distinguished by the characters now assigned to them.

81. EPIDENDRUM TRACHYCHILUM. Huc Lindl. l. c. 57.

E. pseudobulbis elongatis diphyllis, foliis rectis coriaceis ensiformibus scapo pluries brevioribus, panicula densa ramosissima, bracteis brevibus membranaceis acutis, sepalis coriaceis oblongis patentissimis, petalis subconformibus, labelli lobis lateralibus oblique ovatis obtusis integris scabro-venosis, intermedio subrotundo crispo venis ramentaceis varicosis scaberrimis, callo disci quadruplici antice in lineas 3 elevatas laceras procurrente, lamella minuta juxta basin utrinque aucto, columnae auriculis truncatis.

Epidendrum alatum Lindl. in Plant. Hartweg. p. 92.

Wild in Mexico; on the Cumbre of Choacas — Hartweg (v. v. c. et s. sp.). — Flowers olive-brown, very leathery; sepals about eight lines long, but in *E. ambiguum* quite an inch. Lip deep yellow, studded with red warts, white and spotted with pink on the callus, brilliant green with red warts on the lower lobes.

82. EPIDENDRUM GUTTATUM Richard and Galeotti Orch. Mex. n. 39. Huc Lindl. l. c. 59.:

E. „pseudobulbis ovoideis 2-phyllis, fol. elliptico-oblongis acutis, scapo brevi compresso 3—4-floro, floribus aurantiacis punctatis, labelli trilobi lobis lateralibus subfalcatis, intermedio orbiculari apiculato.“

Wild in Mexico, Galeotti.

* Rhachi, aut ovariis asperis.

83. EPIDENDRUM NEMORALE Lindl in Hook. Journ. III. 82. Huc Lindl. l. c. 60.:

E. pseudobulbis ovatis, foliis ensiformibus obtusis flaccidis, scapo pedicellis ovariisque verrucosis, racemo nutante, sepalis petalisque lineari-lanceolatis acuminatis, labelli trilobi lobis lateralibus subfalcatis acutis nanis intermedio ovali crenulato basi serrato bilamellato, columnae auriculis truncatis.

Epidendrum verrucosum Lindley in Bot. Reg. 1844. t. 51.; Hooker Bot. Mag. t. 4606.

Wild in Mexico — Loddiges; on trees in groves near Sultepec — Martius (v. v. c. et s. sp. in hb. Martius). — Flowers large, rich rose-colour, in a drooping raceme. Sepals full two inches long. The name *E. verrucosum* was applied by Swartz to another species. — Lemaire Jard. Fl. III. tab. 253.

84. EPIDENDRUM ASPERUM Lindl. in Hook. Journ. I. 6. Huc Lindl. l. c. 61.:

E. panicula stricta racemosa scabra, sepalis coriaceis spatulatis obtusis, petalis linearibus apice dilatatis, labelli lobis lateralibus semi-ovatis obtusis intermedio subrotundo cuneato venis tumidis striato, disci callo medio excavato apice in tres lineas elevatas flexuosas procurrente, columnae auriculis minutis obtusis.

Wild in Panama and W. Colombia — Cuming 1250; Guayaquil — Jamieson (v. v. sp.) — Much confusion has been introduced into the characters of this plant in consequence of its having been accidentally mixed with *E. flabellatum*, n. 15, in my herbarium. The sepals and petals seem to have been dark-coloured, and the lip pale.

85. EPIDENDRUM ADENOCARPUM. La Llave. LO. 16. Huc Lindl. l. c. 62.

E. foliis strictis linearibus carinatis acutis in pseudobulbos pyriformes glaucescentes ternatim insidentibus, scapo erecto simplici v. paniculato multiflora, floribus distantibus, sepalis lineari-oblongis acutis, petalis paulo angustioribus unguiculatis, labelli semiliberi laciniis lateralibus obovatis intermedia 3-ple majore obscure quadriloba versus basin callosa venis 3 tenuibus elevatis radiantibus, columna bidentata, pedunculis papillosis.

? *Epidendrum crispatum* Knowles Flor. Cab. II. p. 79.

Epidendrum papillosum Bateman in Bot. Reg. 1838 misc. 8. Hooker in Bot. Mag. t. 3631.

Wild in Guatemala — Skinner; Mexico on the Irapaeon Mountains — La Llave: Agua caliente, on the road to Salama — Hartweg (v. v. c. et s. sp.) — Flowers greenish yellow. Lip white, with three short purple streaks.

86. EPIDENDRUM STELLATUM. Huc Lindl. l. c. 63.

E. pseudobulbis cepaeformibus diphyllis, foliis ensiformibus acutis panicula scabra longioribus, sepalis petalisque angustioribus lineari-lanceolatis stellatis, labelli lobis lateralibus angustis falcatis intermedio sub-

rotundo plano venis rugulosis, disci callo medio excavato in lineas tres rugulosas procurrente, columnae auriculis minutis acutis, clinandrio denticulato.

Wild in the Caraccas — Purdie (v. s. sp. comm. cel. Hooker). — A slender grassy plant, with leaves fifteen inches long by half an inch broad. The stellate flowers and flat round lip are striking peculiarities in the dried state.

87. EPIDENDRUM ADENOCALON La Llave, LO. 15. Huc Lindl. l. c. 64.

E. foliis in pseudobulbis binis v. ternis ensiformibus coriaceis, scapo simplici glanduloso, sepalis carinatis petalisque lineari-lanceolatis subaequalibus patentissimis, labello tripartito laciniis lateralibus acutis involutibus intermedia cordata emarginata obtusa, columnae auriculis petaloideis.

Wild in Mexico; on trees near Valladolid — La Llave. — Scape two to three feet high. Flowers pale violet, with a veiny lip of the same colour. Bracts membranous. According to La Llave the lip is united to the column.

88. EPIDENDRUM GRAVIDUM Lindl. in Journ. Hort. Soc. IV. 114 (1849). Huc Lindl. l. c. 65.

E. scapo paucifloro apice flexuoso laeviusculo, floribus pendulis longipedunculatis clausis, pedicellis laevibus, ovariis fusiformibus maximis verrucosis; labelli trilobi lobis lateralibus linearibus, intermedio ovato acuto venis elevatis, columnae angulis superioribus inflexis.

Wild in Mexico; near Xapatam — Hartweg (v. v. c.) — Scape six inches high, four-flowered. Flowers green, never expanding, seated on a large fusiform deep olive-green ovary, studded with pale green warts. The ovary is one inch and a half long, the flower scarcely half an inch.

Obs. Potius monstrum, quam species mihi visum! Rehb. fil.

89. EPIDENDRUM TRACHYCARPUM Lindl. Bot. of Sulphur p. 172. Huc Lindl. l. c. 66.

E. pseudobulbis elongato-conicis 2—3-phyllis, foliis rigidis ensiformibus canaliculatis acutis, scapo subpaniculato ramulis pedunculisque scaberrimis, floribus carnosis, sepalis petalisque oblongis obtusis, labelli laciniis lateralibus nanis semiovatis acutis, intermedia rotundata emarginata laevi, capsula ovali scaberrima.

Wild in W. Mexico; Manzanilla Bay — Hinds (v. s. sp.) — Dried flowers nearly black; natural colour unknown.

c. Lobo intermedio manifeste bilobo.

90. EPIDENDRUM TESSELLATUM Bateman in Bot. Reg. 1838, misc. 9. Hooker, Bot. Mag. t. 3638. Huc Lindl. l. c. 69.

E. pseudobulbis ovalibus compressis 2-raro 3-phyllis, foliis lineari-lanceolatis scapo simplici flexuoso paucifloro longioribus, sepalis lineari-lanceolatis acutis mucronatis petalisque minoribus subspathulatis, labelli laciniis lateralibus brevibus rotundatis, intermedia majore oblonga undulata biloba v. retusa, disci callo lineari tomentoso seriebus tribus verrucarum nunc connatarum a fronte.

Epidendrum lividum Lindl. in Bot. Reg. 1838 misc. 91.

Wild in Guatemala — Skinner; Mexico near Oaxaca at the height of 3—5000 feet — Galeotti, 50 and 5320; Caraccas Sa. Martha — Purdie (v. v. c. et s. sp.) — Flowers dingy olive-brown: with a pale lip tessellated with crimson. The specimens vary in the warts of the lip; in one case now before me they form three complete lines with rugosities between; in Galeotti's n. 50, the lines are broken and incomplete; in another garden specimen seen by me in 1845, the warts were confluent into a single line lying between the downy callus and the point of the lip.

Huc: *Epidendrum lividum* Lindl. in Bot. Reg. July 1838. misc. 91. Lindl. l. c. sub. 11.

E. pseudobulbis anguste ovalibus compressis diphyllis, foliis linearilanceolatis subundulatis obtusiusculis, scapo paucifloro foliis brevioribus, ovario triquetro, sepalis erectis herbaceis linearibus mucronatis, petalis spathulatis obtusis aequilongis, labello libero lineari-oblongo obtuso crispo medio tomentoso serie triplici dentium elevatorum, intermedia majore, columna triquetra apice tricallosa.

Epidendrum articulatum Klotzsch in Allg. Gartenz. Sept. 22. 1838.

Wild in Colombia — Loddiges; La Guayra — Klotzsch (v. v. c.) — Flowers small, dull dingy purple, a little tessellated; their lip pale dirty yellow, with a few dull purple veins. — Rehb. fl. in Bonpl. II. 20. Caracas. 4000'. Aug. Wagoner.

91. EPIDENDRUM SISYRINCHIFOLIUM Richard and Galeotti, Orch. Mex. n. 35. Huc Lindl. l. c. 70.

E. „pseudobulbis ovoideis 2-phyllis, foliis lanceolatis acutis, floribus aurantiaco-viridibus subpaniculatis, labello oblongo lobis lateralibus acutis intermedio obcordato.“

Wild in Mexico — Galeotti.

92. EPIDENDRUM VARICOSUM Bateman Bot. Reg. 1838. misc. 37. Huc Lindl. l. c. 71.

E. pseudobulbis lagenaeformibus 2—3-phyllis, foliis lanceolatis utrinque acuminatis scapo gracili brevioribus, internodiis elongatis, sepalis petalisque subaequalibus cuneato-lanceolatis carnosissimis vernicosis planis, labello unguiculato: laciniis lateralibus nanis triangularibus aut rotundatis, intermedia reniformi emarginata venis tuberculatis et varicosis picta, disci callo pulvinato ovato pubescente, columnae lobo dorsali crasso cylindraceo obtuso.

Epidendrum leiobulbon Hooker Journ. III. 308. t. 10.

Epidendrum phymatoglossum H. G. Reichenb. Bot. Zeit. 1852. p. 731.

Epidendrum chiriquense Id. p. 730.

Epidendrum Lunaeum A. Richard in Hort. Par.

Epidendrum quadratum Klotzsch in Allg. Gartenz. 1850. 402.

Wild in Guatemala — Skinner; Costa Rica and Veragua — Warczewitz; Mexico on porphyry rocks near Oaxaca, at the elevation of 7—8000 feet — Galeotti 5080; Hacienda del Carmen — Hartweg (v. v. c. et s. sp.) — A small dull-brown-flowered species. The form of the lip, the flask or bottle-shaped pseudobulbs, and the acuminate leaves with wide internodes, especially distinguish it. It seems to be common from Mexico to Panama, and to present many varieties in the form and callosities of its lip. In the original Guatemala plant the lateral lobes of the lip are triangular, and the tubercles arranged in three rows in front of downy callus; in Galeotti's Mexican specimens the side-lobes are round, and the tubercles scattered without order over the lip. Other differences seem to occur among plants examined by M. Reichenbach, but I cannot think them of specific value. I learn from M. Pescatore that this is the *E. Lunaeum* of A. Richard.

Huc: *Epidendrum* (Encyclinum) *quadratum* Klotzsch Allg. Gartenz. 1850. 402.

Pseudobulbis caespitosis, ovatis, teretibus, laevibus, glabris in caulem articulatum attenuatis, foliis basi vaginatis subcoriaceis lanceolatis linearibus acuminatis, subtilius leviter carinatis, ad articulationem insertis; racemo simplici caule continuo, pedem longo, 10—12 floro, glabro, floribus erectis, bracteis ovato lanceolatis acutis striatis suffultis; perigonii foliolis viridi fuscis, maculatis, externis obovato oblongis brevi acutis, internis spathulatis, subaculis, labello unguiculato, libero, quadrilobo, sordide albido, lobis lateralibus anguste oblongis, obtusis, patentibus, minutissime rubropunctatis, lobo medio bifido deflexo, radia-

tim plicato-tuberculoso, disco pulvinateo, flavido; gynostemio striato, obtuse triangulato.

93. EPIDENDRUM CHIRIQUENSE Rehb. fl. in v. Mohl et v. Schlechtendl. Bot. Zeit. 1852. 730.

Foliis geminis lato-oblongis acutis cuneatis pergameneis (nec coriaceis!!), internodio inter utrumque conspicuo, pedunculo folia aequante seu superante, paucifloro, bracteis cuspidatis pedicellis multo brevioribus, perigonii phyllis externis oblongis acutis, lateralibus externis oblongis acutis, lateralibus internis spatulatis acutis, labello trilobo, basi cuneato, supra gynostemii basin adnato, lobis lateralibus linearibus, lobo medio producto, lato brevissimeque unguiculato obreniformi, bene bilobo, callo in ungue elongato crasso antice trilobo puberulo, seriebus 5 rectis callulosis ab illo ad medium lobum medium, venis radiantibus elevatulis, androclinii lobo postico bilobo.

Blüthenfarbe die des *E. varicosum* Bat. Ich habe diese, oder die folgende Art auf einer norddeutschen Blumenaustellung als *E. varicosum* ausgestellt gesehen. Allerdings sind diese drei Arten kritisch, aber einmal verstanden leicht zu unterscheiden. Man muss eben alle drei gleichzeitig vor sich haben. Zunächst hat *varicosum* zungenförmige, lederartige Blätter. Im Blütenbau steht es nahe, doch ist der Buckel vorn einfach, schmaler, viel stärker papillös. Die Ordnung der weniger zahlreichen Warzen eine andere. Das *E. Lunaeanum* (cui?) ist mir unbekannt, meines Wissens unbeschrieben. — Costa Rica und Chiriqui. Warscewicz.

94. EPIDENDRUM PHYMATOGLOSSUM Rehb. fl. in v. Mohl et v. Schlechtendl. Bot. Zeit. 1852. 731.

Pseudobulbis — apice attenuatis, foliis ternis oblongis acutis basi cuneatis, pergameneis, internodio inter inferiora elongato, spatha membranacea acuta abbreviata, pedunculo elongato, plurifloro, bracteis triangularibus abbreviatis (uti in *E. varicoso*), pedicellis elongatis, perigonii phyllis oblongo-obovatis acutis, lateralibus internis spatulatis, acutiusculis, nunc apice trilobis, labello basi cuneato-unguiculato, lobis lateralibus linearibus retusis abbreviatis, divaricatis, lobo medio rhombeo sessili, apice emarginato, marginibus lateralibus anterioribus hinc lobulato, callo unguem tegente depresso, apice bilobo a medio ad apicem usque sulcato, velutino, toto labello excepto margine ipso varicoso papuloso, varicibus quidem abbreviato lamellosis, androclinii lobo postico angusto ligulato, obtuso, integerrimo.

Mexico.

95. EPIDENDRUM MICHUACANUM La Llave. LO. 21. Huc Lindl. l. c. 72.

E. foliis in pseudobulbos pyriformes ternis quaternisve ensiformi-lanceolatis conduplicatis, scapo ramosissimo, sepalis petalisque angustioribus cuneato-lanceolatis, labelli tripartiti lacinia intermedia reniformi biloba.

Wild in Mexico; on the mountains of Mechoacan, and near Valladolid — La Llave. — Pseudobulbs large. Flowers small, scentless, pale yellow, with a white lip. Seems very like *E. varicosum*, but the leaves are said to be a foot long.

96. EPIDENDRUM IONOSMUM Lindl. in Bot. Reg. 1838. misc. 87. Huc Lindl. l. c. 73.

E. pseudobulbis diphyllis, scapo apice simplici racemoso brevioribus, sepalis petalisque coriaceis obovatis concavis obtusis subaequalibus, labelli trilobi liberi lobis lateralibus elongatis erectis oblongis columnnam amplexantibus apice rotundatis denticulatis intermedio subrotundo emarginato rugoso crispo, callo disci duplici elevato altero angustiore apici propiore, columna acute auriculata.

Wild in Demerara — Loddiges (v. v. c.) — The blossoms are rather large, a dull

reddish green, with the lip delicately streaked with deep lilac. The odour that of the sweetest violets. It is very near *E. selligerm* n. 26 from which its emarginate not acute lip seems to distinguish it.

97. *EPIDENDRUM PYRIFORME* Lindl. in Bot. Reg. 1847. t. 50. Huc Lindl. l. c. 74.

E. pseudobulbis obpyriformibus aggregatis diphyllis, foliis coriaceis lanceolatis acutis scapo subbifloro longioribus, sepalis petalisque lanceolatis acutis, labelli lobis lateralibus subrecurvis acutis integerrimis, intermedio subrotundo glabro retuso, callis 2 maximis parallelis apice subliberis in unguem.

Wild in Cuba — Loddiges (v. v. c.) — Leaves unusually thick and fleshy, about four inches long on little pseudobulbs, which look like inverted pears. Notwithstanding its diminutive stature, the flowers are fully two inches and a half in diameter, with reddish yellow sepals and petals, and a pale straw-coloured lip veined with crimson.

98. *EPIDENDRUM BIFIDUM* Aublet. LO. 17. Bot. Reg. t. 1879. Redouté liliac. t. 84. Huc Lindl. l. c. 75.

E. foliis in pseudobulbos subternis oblongis coriaceis, scapo ramoso foliis multo longiore, sepalis oblongis acutis petalisque lineari-spathulatis patentibus, labelli cuneati unguiculati lobis lateralibus rotundatis brevibus conduplicatis, intermedio maximo apice dilatato subreniformi sulcato, disci callo ovato lobato in lineam elevatam producto.

Helleborine fl. papilionaceo Plum. ic. 186. f. 1.

Epidendrum papilionaceum West. S. Cruz. 230.

Epidendrum auropurpureum LO. 14.

Epidendrum atropurpureum Willd sp. pl. 115.

Wild in the West Indies; Hispaniola — Plumier; St. Christopher's, St. Bartholomew's — Swartz; St. Thomas — Riedley (v. v. c.) — Sepals and petals light green, with a dull purple spot near the end. Lip rose-colour, with the lateral lobes yellow. *E. auropurpureum* does not seem to be distinguishable.

99. *EPIDENDRUM DICHROMUM* Lindl. in Bot. Reg. 1843. misc. 119. Huc Lindl. l. c. 76.

E. pseudobulbis ovato-fusiformibus diphyllis, foliis ligulatis planis apice rotundatis racemo laxo paucifloro brevioribus, sepalis lineari-lanceolatis, petalis obovato-lanceolatis latioribus, labelli lobo medio obcordato pluries costato cum mucrone, lateralibus duplo brevioribus rotundatis apice patulis, columna obtuse auriculata.

Wild in Pernambuco — Quesnel (v. v. c.) — Flowers pure white, with a rose-coloured lip, yellow and downy at the base.

100. *EPIDENDRUM JENISCHIANUM* Rchb. fl. Van Houtte Flores des Serres IX, p. 98. Bonplandia II. p. 89

Pedunculo racemoso ramoso laevi, bracteis squamaeformibus acutis minutissimis, pedicellis in ovaria inflata sensim abeuntibus, sepalis oblongo-spatulatis acutiusculis, tepalis angustius cuneatis, dein duplo latioribus ovalibus, labello libero trilobo, lobis lateralibus ligulatis apice erosulis incurvis, lobo medio cuneato oblongo bilobo cum apiculo in sinu, lineis sex carinatis a portione antebasilaris per unguem lobi medii excurrentibus, venis in lobo medio elevatulis, gynostemii angulo utroque auriculato, auriculis inflexis, superadditis setis erectis pone antheram emarginatam.

Espèce magnifique à fleurs de la grandeur de celles de l'*Epidendrum bifidum*, Aublet. Ces fleurs sont d'un blanc rosé à l'extérieur, la face intérieure est d'un beau lilas, le labelle est couvert de veines pourpres. — Introduite de Bahia, elle a d'abord été cultivée par M. Kramer, jardinier-en-chef de M. le sénateur Jenisch, l'un des amateurs d'Orchidées les plus compétents, et dont les belles cultures ont été pendant longtemps sans rivaux en Allemagne. — Nous nous sommes empressé de donner à cette belle espèce le nom célèbre de son possesseur.

101. EPIDENDRUM HANBURIi Lindl. in Bot. Reg. 1844. misc. 60. Huc Lindl. l. c. 77.

E. pseudobulbis ovatis, foliis ensiformibus coriaceis scapo racemoso multo brevioribus, sepalis petalisque spathulatis unguiculatis patentibus, labelli lobis lateralibus falcatis obtusis nanis erectis intermedio oblongo bilobo venis elevatis dichotomis sulcato, disci callo excavato in lineam rectam elevatam exeunte, columna aptera.

Wild in Mexico — Galeotti; Sierra S. Pedro Nolasco — Jurgensen 829 (v. v. c. et s. sp. comm. cel. Galeotti). — Leaves very coriaceous, shorter than the raceme, which is about two feet long. Sepals and petals deep dull purple; lip pale rose, with crimson radiating veins; lateral lobes white at the tip and curved over the column.

102. EPIDENDRUM PHOENICEUM Lindl. in Bot. Reg. 1841. misc. 120. Sert. Orch. t. 46. Huc Lindl. l. c. 78.

E. pseudobulbis subrotundo-ovatis diphyllis, foliis anguste oblongis coriaceis erectis, scapo paniculaque scabris, sepalis petalisque subaequalibus coriaceis obovato-lanceolatis, labelli laciniis lateralibus oblongis erectis obtusis apice recurvis intermedia maxima membranacea subrotunda undulata emarginata, disci callo duplici carnosio apice libero, columna acute auriculata.

(B) *vanillosum*. Lip white spotted with rose.

Epidendrum phoeniceum vanillosum V. Houthe Fl. des Serres 1848. 306 ic.

Epidendrum Grahani Hook in Bot. Mag. t. 3885.

Wild in Cuba; in the forests of Guantanamo — Linden (v. v. c. et s. sp. comm. cel. Linden; B s. c. in hb. Hooker). — Panicle from two to three feet high, flowers large, scentless. Sepals and petals leathery deep purple, a little mottled with green specks both inside and out. Lip nearly an inch and a half long, of the clear bright violet of *Cattleya labiata*, and with the same deep crimson veins and stains in the middle. The variety B is said to be deliciously perfumed with Vanilla.

Obs. Huc pertinebit, nisi E. plicatum, quod minus crediderim;

Epidendrum oblongatum (Tab. 80) A. Rich. in Ramon de Sagra n. 239.

Pseudobulbis ovoideo oblongis, apice attenuatis 1—2 phyllis, vaginis dissectis obtectis; foliis lanceolatis obtusis, coriaceis, dorso carinatis; scapo terminali bipedali, simplicis; floribus pedicellatis, acutis, basi sensim angustatis et subunguiculatis, brunneo vinosis; labello trilobo, lobis lateralibus oblongo-lanceolatis acutiusculis, gynostemio applicatis longioribusque, intermedio majori subrotundo, basi unguiculato, emarginato-bilobulato, undulato, ad basin cristis 4 longitudinalibus notato; gynostemio apice trilobato, alis parvulis obtusis.

Cuba.

103. EPIDENDRUM ATROPURPUREUM W. Sp. sub 115. fid. Rehb. fl. Huc: *Epidendrum macrochilum* Hook. in Bot. Mag. t. 3534. Bateman Orch. Mex. t. 17. Morren in Ann. Gand II. p. 365 ic. Van Houthe Flores des Serres 1848 372 ic. Lindl. l. c. 79.

E. pseudobulbis ovatis rugosis diphyllis, foliis oblongis coriaceis racemo brevioribus, rachi pedicellisque angulatis, sepalis petalisque obovato-lanceolatis patentibus apicibus incurvis, labelli lobis lateralibus ovatis acutis in columnam incumbentibus, intermedio maximo obcordato laevi, disci callo bilineato obsoleto, columna alata.

Wild in Guatemala, on the coast with *Cattleya Skinneri* — Skinner; Panama and W. Colombia — Cuming; Caracas, Sa. Martha — Purdie (v. v. et s. sp.) — A very fine plant; one variety having green sepals and a white lip, the other having purple sepals with a deep rose-coloured lip. Vulgarly „Boca del Dragon“, „Dragon's mouth“, in Guatemala. Flowers the largest in this genus.

Huc: *Epidendrum atropurpureum* W. l. *Cymbidium cordigerum* Humb. Kth. Epid. macrochilum Hook. Rehb. fl. in Bonpl. II. 19. Man hat am Namen „atropurpureum“

gemäkelt. Er ist viel besser gewählt, als *Miltonia candida*, die *candida* heisst, weil ein Bischen Lippe weiss ist, andere Beispiele zu übergehen. Dass man, um Sir W. Hook. die Priorität des *E. macrochilum* zu lassen, das *E. atropurpureum* zu *E. bifidum* zog, ist doch etwas kühn.

Epidendrum atropurpureum W. b. *roseum* Rehb. fl. in Bonpl. II. 19. Merida, 5000'. Dec. Am Grunde der Narbe erscheinen bei diesem und vorigem bisweilen 2 Schwie- len, welche anderwärts fehlen. Herr Wagener hält beide Formen für verschieden, ich kann keinen Character erspähen.

Epidendrum atropurpureum W. Rehb. fl. in Bonpl. II. 281. Santa Marta. Juli. Nr. 991. Schlim.

Epidendrum atropurpureum b. *roseum* Rehb. fl. Pescat. t. 257.

Epidendrum Duboisianum Brong. ms. in Ramon de Sagra 239.:

E. pseudobulbis —, foliis —, floribus maximis; sepalis patentibus oblongis aequilongis, acutis, apice incurvis, externe subviridibus, facie interna brunneo vinosis, petalis aequilongis spatulatis, basi magis angustatis concoloribus; labello longiore lilacino, trilobo, lobis laterali- bus oblongis, falcatis, obtusis, columnam obtegentibus, intermedio maximo, suborbiculari, apice emarginato, basi intensive purpureo in disco lineis 3 parallelis elevatis, gynostemio erecto, postice convexo, antice plano, margine dilatato; anthera planiuscula et subconcava, cor- data, lutea.

Cuba. — Esta especie nos parece una variedad con grandes flores del *E. phoeniceum* que ofrece suma diversida de formas. Hemes descrito los caracteres por con indivi- duo que florecia en casa de M. Pescatore.

§ 3. *Diacrium*. Lindley, in Hooker's Journal of Botany III. 81.

This section at first sight seems to merge in *Encyclium*; for the chief difference appears to consist in the stem being fusiform and leafy at the end, which is but a small modification of the pseudobulbous condition. In addition, the lip of *E. bicornutum* is not parallel with the column, and has two deep pits on the under side, corre- sponding with the same number of fleshy elevated triangular plates on the upper side.

104. EPIDENDRUM BIDENTATUM LO. p. 98. Huc Lindl. l. c. 81.

E. foliis obovato-lanceolatis apice recurvis supra v. sub pseudobulbo nascentibus, racemo terminali erecto paucifloro, sepalis lanceolatis petalisque angustioribus patentibus, labello semilibero rhomboideo angulis utrinque unidentato.

Wild in Mexico — herb. Pavon (v. olim s. sp.). — The only memorandum I possess regarding this species is a sketch of its flower, made many years ago from a speci- men in the Lambertian herbarium. It seems very near *E. bicornutum*, but it has petals narrower, not broader than the sepals, and the side lobes of the lip are little more than projecting teeth.

105. EPIDENDRUM BICORNUTUM Hooker Bot. Mag. t. 3332. Huc Lindl. l. c. 82.:

E. foliis lineari-oblongis obtusis coriaceis, caule corniformi, sepalis ovato-lanceolatis, petalis conformibus latoribus, labelli trilobi lobo medio elongato lanceolato aculo latoribus obtusiusculis basi lamellis 2 triangularibus aucto.

Wild in Trinidad — Hooker; Demerara — Schomburgk 429 (v. v. c. et s. sp.). — Flowers large and white, slightly tinged with rose-colour. Lip yellow at the base with some crimson specks on the tongue like middle lobe. According to Schom- burgk, the petals are also spotted with crimson, which is not the case with the cultivated plants.

106. EPIDENDRUM BILAMELLATUM Rehb. fl. MSS.: minus, labelli lobis medianis ob- VI.

tusis, lobo medio triangulo acuto, lamellis geminis infra excavatis ovatis obtusis, antrorsis, contiguis. — Caracas Wägener! Panama P. Chagres Behr!

107. EPIDENDRUM BIGIBBEROSUM Rehb. fl. MSS.: minus, labelli lobis medianis acutangulis antrorsis, lobo medio oblongo - ovali acuto, callis geminis infra excavatis triangulis, extrorsis distantibus. — E Guatemala in hort. Schill. introduct.

§ 4. *Hormidium*. Lindley in Hooker's Journal of Botany III. 81.

We here find a set of creeping species, with true pseudobulbs, sessile (or nearly sessile) flowers, and a lip adnate to the column. They differ from *Aulizeum* and *Osmophytum* in the pseudobulbs, and in the flowers not being in conspicuous racemes; from *Lanium* in their flowers not being paniced and woolly; from *Spathium*, *Amphiglotium*, and *Euepidendrum* in their stems not being leafy.

(Tota sectio superflua ad *Aulizea* pertinet!)

108. EPIDENDRUM PYGMAEUM Hooker Journal of Botany I. 49. t. 118. Bot. Mag. t. 3233. Huc Lindl. l. c. 84.:

E. foliis brevibus lanceolatis subundulatis acutis, floribus solitariis, sepalis ovato-lanceolatis acuminatis lateralibus majoribus labello subtilis adnatis, petalis angustioribus acuminatis incurvis, labelli trilobi columnae adnati laciniis lateralibus rotundatis erectis intermedia triangulari acuminata.

Epidendrum uniflorum Lindl. in Bot. Reg. 1839. Misc. 13.

Wild in Brazil — Harrison; Jamaica — Hooker; Mexico — Barker (v. v. c.). — Flowers small, yellowish green, one or two together. I have nowhere found a wild specimen of this.

109. EPIDENDRUM MISERUM Lindl. in Bot. Reg. 1841. Misc. 62. Huc Lindl. l. c. 85.:

E. caulibus ovalibus exuviatis compressis aggregatis, foliis, scapo brevissimo subbifloro, spatha bivalvi pedunculis subaequali membranacea, sepalis ovatis acutis, petalis linearibus, labelli trilobi lobis lateralibus rotundatis inconspicuis, intermedio truncato emarginato callis nullis (?).

Wild in Mexico; near Oaxaca — Loddiges (v. v. c.). — Pseudobulbs about half an inch high. Scape, peduncules, and ovaries, taken together, about the same length. Flowers a dull, dingy, greenish brown, not unlike those of *E. musciferum*.

- 110 EPIDENDRUM CAESPITOSUM Pöppig and Endl. N. G. et Sp. Pl. II. t. 101. Huc Lindl. l. c. 86.:

E. pseudobulbis subcylindricis diphyllis, foliis ovali-lanceolatis acutis, floribus in sinu folii paucis brevissime spicatis aut sessilibus, sepalis petalisque subaequalibus lanceolatis, labello integro transverso reniformi lateribus rotundato breviter apiculato nudo, capsula subrotunda triptera.

Coelogyne triptera Ad. Brongn. Voy. Duperr. t. 42. A.

Wild in Peru; on trees in dense forests between Cuchero and Pampayaco — Pöppig. — Flowers hardly a line long, green, with a white lip.

111. EPIDENDRUM SERPENS Lindl. in Benth. Pl. Hartweg. p. 149. Huc Lindl. l. c. 87.:

E. pseudobulbis oblongis 2—3-phyllis, foliis ovato-lanceolatis acutissimis, sepalis ovatis, petalis lineari-lanceolatis, labello cochleato serrulato laevi, capsula ovali triquetra.

Wild in Peru; mountains near Chiquiribamba, creeping among Lichens — Hartweg (v. s. sp.). — Flowers rather large, deep violet; the pseudobulbs so crowded together, that they must form a carpet when growing wild. It is remarkable, that no straps appear to be connected with the pollen-masses in this species, but some powdery matter is formed in its stead. The capsule is larger than the leaves.

§ 5. *Aulizeum*. Lindley in Hooker's Journal of Botany III. 81. *Aulizea* Salisbury in Hort. Soc. Trans. I. 261.

Among the species whose lip is united to the column, are those which, like *E. ciliare*, have that organ broken up into long and beautiful fringes, or at least split into three pieces; they have a long horn-like stem, leafy only at the end, and their flowers invariably grow in racemes; these form the subgenus *Aulizeum*, along with others of less conspicuous beauty, but similar in those respects. They pass into *Osmophytum* by *E. fallax* and its allies, which may be almost equally placed in one subgenus or in the other.

a. *Labellum integrum*.

112. EPIDENDRUM CORIOPHORUM (*Stenoglossum coriophorum* Humb. Kth. Rchb. fil. in Bonpl. II. 20.

Stenoglossum subulatum Lindl. Hook. Ic. I. 837. t. LI.:

Labello petalisque subulatis, sepalis ovato lanceolatis aveniis.

Lindl. MSS. — On trees near Pichitagua, on the western declivity of Pichincha. Prof. W. Jameson. — Caulis spithamaeus, inferne ramosus, compressus, vaginatus, apice uni-bifolius; foliis lineari-oblongis; obscure striatis, crassiusculis. Pedunculus solitarius, terminalis, fere spithamaeus; inferne vagina longa tectus. Spica elongata multiflora. Flores resupinati. Perianthium connivens. Sepala ovato lanceolata, acuminata, trinervia. Petala labellumque lineari-subulata. Columna urceolata, inferne cum labello connata. Anthera reniformis, 4 locularis. Pollinia 4 libera, basi solummodo glandula unita.

113. EPIDENDRUM SERIATUM Lindl. l. c. sub 183.:

E. panicula filiformi laxa, pedunculo elongato distanter vaginato, bracteis minimis, ovariis longipedunculatis, sepalis lineari-lanceolatis acutis, petalis filiformi-spathulatis, labello lineari oblongo acuto seriebus 5 verrucarum ornato, clinandrio integro,

Wild in Mexico — Bateman (v. v. c.). — A thin panicle at the end of a long slender peduncle, and dirty yellow flowers, are very peculiar features among the present section of *Amphiglottis*.

114. EPIDENDRUM SERRULATUM Rchb. fil. MSS.: *Cymbidium serrulatum* Sw.

115. Nonne potius huc *Pinelia hypolepta* Lindl., quam ad *Restrepia*? Forsan.

b. *Labellum tripartitum*.

116. EPIDENDRUM CILIARE Linn. Sp. Pl. 1349. Jacq. Amer. 224. t. 179. f. 89. Swartz Nov. Act. Ups. VI. 69. Ker in Bot. Reg. t. 784, LO. p. 100. Huc Lindl. l. c. 90.:

E. foliis oblongis obtusis, bracteis spathaceis ovario brevioribus, sepalis petalisque linearibus acuminatis, labelli tripartiti lobis lateralibus pectinatis incis, intermedio lineari acuminato.

(A) Sepals and petals narrow. Middle lobe of lip setaceous, longer than the laterals.

Auliza ciliaris Salisbury in Hort. Trans. I. c.

(B) *cuspidatum*. Middle lobe of lip linear-lanceolate, not much longer than the laterals.

Epidendrum ciliare Bot. Mag. t. 463.

Epidendrum cuspidatum Lodd. Bot. Cab. t. 10. Ker in Bot. Reg. 10. t. 783. LO. p. 101.

(C) *viscidum*. Leaf narrower, more channelled. Bracts glutinous. Middle lobe of lip setaceous, longer than the laterals. Flowers smaller.

Epidendrum viscidum Lindl. in Bot. Reg. 1844. Misc. 190.

Wild in Tropical America. A. Colombia, on rocks near Guaduas on the descent to Honda, in the province of Bogota — Hartweg, West Indies — Jacquin, Swartz, Hooker; Mariquita — Triana 126; B. Dominica — Imray in hb. Hooker; C. Mexico, on porphyry rocks near Oaxaca — Galeotti 5087 (v. v. c. et s. sp.). —

Flowers large, white, changing to straw-colour; sometimes greenish except the lip. A careful examination of numerous specimens, both wild and cultivated, satisfies me that no limits whatever exist among the above supposed species. It is evident that the plant varies much according to age, health, and other circumstances, from bearing a single flower to forming a raceme a foot and a half long, bearing 28 flowers. It sometimes appears to have sepals only half the length of the lip (Rehb.) but I have not seen it in that state. — Rehb. fl. in Bonpl. H. 20. Caracas. 3500'. October. Wagerer.

117. EPIDENDRUM OERSTEDII Rehb. fl. in v. Mohl et v. Schlechtendl. Bot. Zeitg. 1852. 937.

Foliis ovatis acutiusculis, binis, spica pauciflora, bracteis angustis ligulatis, obtusiusculis ovaria pedicellata vix dimidio aequantibus, perigonii phyllis subaequalibus, lanceolatis, acuminatis, lateralibus internis paulo brevioribus apice subulatis, labello trilobo, lobis lateralibus obtuse et oblique rhombeis, integerrimis, margine postico et externo magis curvatis, quam interno et antico, lobo medio sublongiore ligulato dein dilatato, apiculato subulato, callis duobus obtuse triangulis in labelli basi, androclinii lobo postico denticulato.

Blüthen so gross wie bei *E. ciliare*; gelb nach beigegeführter Farbenskizze. San Miguel in Costa Rica. Oersted.

118. EPIDENDRUM COSTARICENSE Rehb. fl. in v. Mohl et v. Schlechtendl. Bot. Zeitg. 1852. 937.

Pseudobulbis fusiformibus crassis abbreviatis, triarticulatis, foliis ovatis acutiusculis, solitariis seu geminis, racemo nunc flexuoso, pauci — plurifloro, bracteis angustis ligulatis acutiusculis seu obtusis ovaria pedicellata non dimidio quidem aequantibus, p. ph. lanceolatis acuminatis subaequalibus, labelli lobis lateralibus triangulis, margine postico recto, sublanceolato, lobo medio anguste ligulato, acuto apice vix dilatato, apice subulato, lobis lateralibus subduplo longiore, callis 2 in basi obtuse triangulis, androclinii lobo postico denticulato.

Blüthen so gross, wie bei *E. cuspidatum*. Hüllblätter grün, Lippe gelbweiss. Cartago, El Viego. Oersted.

119. EPIDENDRUM FALCATUM Lindl. Taylor's Annals of Natural History Feb. 1840. Huc Lindl. l. c. 91.:

E. caule ramoso carnosio membranis laxis imbricatis vaginato, foliis solitariis carnosius falcatis ovato-lanceolatis canaliculatis acutis, fasciculis florum subsessilibus, sepalis petalisque lineari-lanceolatis patentissimis, labelli tripartiti basi bituberculati laciniis lateralibus oblongis acutis dimidiatis integris, intermedia lineari-lanceolata paulo longiore.

Epidendrum latifolium Richard and Galeotti Orch. Mex. n. 57.

Epidendrum Parkinsonianum Hooker in Bot. Mag. t. 3778.

Epidendrum aloifolium Bateman Orch. Mex. and Guat. t. 25.

Wild in Mexico; near Oaxaca, on rocks and loose stones — Hartweg (v. s. sp.). — A species with fleshy branching short stems, long channelled fleshy falcate leaves, and large pale yellowish flowers, springing from within a long pale yellowish green membranous spathe. The number of flowers varies from two to four or more in each spathe.

120. EPIDENDRUM VIVIPARUM Lindl. in Bot. Reg. 1841. Misc. 27. Huc Lindl. l. c. 92.:

E. caule fusiformi diphylo, pedunculo elongato squamato pluries brevior, foliis oblongis horizontalibus obtusis, racemo paucifloro, bracteis spathaceis canaliculatis ovario cuniculato aequalibus, sepalis petalisque linearibus acuminatis patentissimis, labelli trilobi basi bicallosi laciniis

lateralibus subrotundo-rhomboides, intermedia lineari spathulata acuminata convexa triplo longiore.

Wild in Demerara — Loddiges (v. v. c.). — This has small white flowers closely arranged at the end of a flower-stem two feet long; and the latter when old produces young plants at almost every joint. The flowers have no smell, and are not half the size of the smallest state of *E. ciliare*.

121. EPIDENDRUM CLAVATUM Lindl. in Bot. Reg. t. 1870. Huc Lindl. l. c. 93.

E. caule clavato in pseudobulbum ovalem desinente diphyllum, foliis lanceolatis patulis racemo simplici subaequalibus, bracteis ovatis canaliculatis acutis ovariis infimis brevioribus, sepalis petalisque lanceolato-linearibus aequalibus, labelli tripartiti basi bicallosi laciniis acutis integris, lateralibus ovatis intermedia unguiculata ovata acuminata, clinandrio indiviso serrulato.

Wild in Cumana — Henchmann; Sa. Martha — Purdie (v. v. c. et s. sp. comm. cel. Hooker). — Flowers green, with a white lip. Spatheaceous bracts reddish.

Huc: *Epidendrum purpurascens* Focke in Tijdsch. Wis- en Natuurk. Wetensch. uitg. door de 1. Kl. v. h. K. Neederl. Deel IV. p. 64.

Foliis in pseudobulbo elongato pedunculato solitariis lineari-lanceolatis, scapo radicali vaginato, sepalis petalisque conformibus breve acuminatis margine revolutis patentibus concoloribus, labelli trilobi lobis lateralibus ovato-falcatis acutis divaricatis, intermedio unguiculato-ovato acuto recurvo, disco bicalloso.

Radices fibrosae. Rhizoma repens. Folia solitaria, lineari-lanceolata, in pseudobulbum attenuata, glabra, coriacea, apice recurva. Pseudobulbi fusiformes, ovato-oblongi vel ovati, compressi, articulato-pedunculati, juniores vestiti, adulti rugosi, purpurascens. Scapus radicalis s. e rhizomate ortus, racemosus, erectus, vaginatus, articulatus, subsecundus, 4—8-florus. Bractee inferiores amplae, vaginantes, alternae, conduplicatae, totum scapum vestientes; — florales ovatae pedunculatae fere ad dimidium usque amplexantes, pallide purpureae. Sepala lineari-spathulata, breve acuminata, margine revoluta, extus purpurascens, intus purpureo-viridescens, petalis acutis convexis latiora, patentia, 2 centim. longa. Labellum trilobum, resupinatum, album; lobis lateralibus ovato-falcatis acutis divaricatis, intermedio spathulato s. unguiculato, late obovato acuminato, recurvo; disco bicalloso, callo ovato erecto nitente in cujusque lobi lateralis basi. Columna elongata, teres, cum ovario continua, clinandrii margine postico leviter fimbriato antheram superante. Anthera subquadrata, immersa, bilocularis, loculis bipartitis. Pollinia 4, dimidiato-semiorbicularia, compressa. Caudiculae 4 breves replicatae. Capsula ovata, longe rostrata. Tota planta purpurascit. — Habitat ad truncos arborum in sylvis ad flumina Suriname et Commewyne superiora. Florebat Novembri et Decembri. — Post nuptias flores saepius marcescunt, bractea scapi suprema dilatatur et sensim in folium exrescit; articulus infra basin istius bractee tumefactus paulatim in pseudobulbum mutatur, et racemus emarcidus remanet in axilla folii novi, bracteis reliquis pseudobulbum novum vestientibus. Vidi varietatem, cujus labelli lobus intermedius longius unguiculatus erat et apice attenuatus; in caeteris similimam.

122. EPIDENDRUM KERMESINUM. Huc Lindl. l. c. 94.

E. caule ramoso ramis crassis divaricatis in pseudobulbos ovato-fusiformes mutatis, foliis 4—5 lanceolatis canaliculatis acuminatis falcatis panícula laxa brevioribus, sepalis petalisque minoribus lineari-oblongis obtusis carnosiss, labelli semiadnati lobis lateralibus nanis rotundatis, intermedio lineari obtuso sulcato.

Wild in the Caraccas; S. Miguel, Sierra Nevada de Sa. Martha — Purdie; New Grenada in the province of Rio Hacha, at the height of 6000 to 9000 feet, March —

Schlim 985 (v. s. sp. comm. cel. Linden) — Pseudobulbs like those of *E. erubescens*. Petals and sepals red, yellow at the point; lip white, spotted with crimson. — Linden.

123. *EPIDENDRUM ERUBESCENS* Lindl. in Hook. Journ. III. 87. Bateman Orch. Mex. et Guat. t. 32. Huc Lindl. l. c. 95.:

E. pseudobulbis fusiformibus diphyllis, foliis oblongis acutis scapo pluries brevioribus, panícula ampla flexuosa, petalis unguiculatis sepalsisque oblongis obtusis, labelli trilobi lacinia intermedia venis 3 elevatis subrotunda, lateralibus obovatis multo majore.

Wild in Mexico — Grisebach 14; Zuccarini; on oaks at the heights of 7500 to 8500 feet, near Oaxaca — Galeotti 5007 (v. s. sp.). — A magnificent plant, with very large panicles of delicate rose-coloured flowers as large as a shilling.

124. *EPIDENDRUM POLYSTACHYUM* H. B. K. vol. I. 352. LO. 20. Huc Lindl. l. c. 96.:

E. foliis oblongis obtusis striato-nervosis geminatim in pseudobulbum insidentibus, scapo polystachyo, sepalis reflexis suboblongis acutis, petalis lanceolato-spatulatis, labelli trilobi lobis lateralibus irregulariter obovatis crenulatis: intermedio minore profunde emarginato.

Wild in Peru; in the cool region of the Andes of Pasto, between the village of Yayanquer and the R. Guaitara; also in the milder climate of Loxa, in the Cinchona districts, at the height of 5400 to 6480 feet — Humboldt and Bonpland. — Scape about two feet high. Spathes withering. Spikes solitary, two or three together, alternate, distant, about one inch and a half long, spreading. Flowers yellow. — H. B. K.

125. *EPIDENDRUM GRAMMATOGLOSSUM* H. G. Reichenbach in Linnaea XXII. p. 837. Huc Lindl. l. c. 97.:

E. pseudobulbis teretibus folio canaliculato recurvo gramineo duplo brevioribus, scapo stricto folio longiore, spatha brevi glumacea, bracteis ovatis membranaceis acuminatis, sepalis lineari-lanceolatis petalisque angustioribus acuminatis, labello hastato lobis lateralibus recurvis obtusis intermedio triangulari acutissimo basi callo retuso concavo laevi mucronulato, clinandrii lobis lateralibus acuminatis dorsali brevioribus obtuso.

Wild in Venezuela; near Sa. Anna, in Truxillo, at the height of 5000 feet — Funk and Schlim 739 (v. s. sp. comm. cel. Linden). — A slender species, from six to nine inches from the ground to the tip of the raceme. Flowers yellow, marked on either side of the remarkable lip with from three to four deep red spots. — Rchb. in Bonpl. III, 68. Blüthe weisslich. S. Pedro. 5050'. Ocanna. Wagener.

126. *EPIDENDRUM TIPULOIDEUM*. Huc Lindl. l. c. 98.:

E. pseudobulbo gracili 2-phylo, foliis linearibus gramineis racemo erecto angulato basi spathaceo longioribus, bracteis obsolete, sepalis dorsali lineari reflexo lateralibus lanceolatis carina alata, petalis erectis incurvis filiformibus, labelli tripartiti laciniis lateralibus angustis elongatis acutis cordatis intermedia lanceolata acuto basi bicalloso, clinandrii lobis lateralibus bilobis dorsali deficiente.

Wild in Venezuela; Campanara in the province of Carabobo, at the elevation of 1000 feet — Funk and Schlim 575 (v. s. sp. comm. cel. Linden). — A small slender grassy plant, scarcely more than six inches high. „Flowers white and brown“, appearing in May, small, membranous, nine to ten in a raceme.

127. *EPIDENDRUM MORITZII* H. G. Reichenbach in Linnaea XXIV 837. Huc Lindl. l. c. 99.:

E. pseudobulbo lineari monophyllo, folio oblongo-lineari obtuso, racemo gracili multifloro nutante e spatha herbacea coarctata erumpente, sepalis lanceolatis trinerviis petalisque linearibus uninerviis membrana-

ceis acutis, labelli tripartiti basi 3-callosi laciniis lateralibus semiovatis acutis falcatis serrulatis, intermedia lineari acuta longiore, clinandrio immarginato.

Wild in Venezuela; in the province of Merida — Moritz: at the height of 5000 feet — Funck and Schlim 1053; Ocanna — Schlim 742 (v. s. sp. comm. cel. Linden) — A slender species, with very membranous flowers. Leaf three inches long. Spathe more than half as long. Raceme a foot long. Flowers yellow and white. — Rchb. fl. in Bonpl. II. 20. Merida. Wagerer.

128. EPIDENDRUM STRAMINEUM. Huc Lindl. l. c. 100.:

E. spatha magna ampla, spica multiflora nutante, bracteis minimis acutis, sepalis lanceolatis acutis, petalis angustioribus nunc obtusioribus, labelli lamina libera triloba lobis lateralibus rotundatis apice producto nunc acuto nunc obtuso margine nunc serrulato lobo medio ligulato acuto, tuberculis 4—5 in basi labelli.

Wild in tropical America; Pamplona, at the height of 8500 feet — Schlim; Ocanna — Schlim 742 (v. s. sp. comm. cel. Linden). — Leaf solitary, rather long. Flowers yellowish green; ground of the lip purple. — Rchb.

Epidendrum stramineum Lindl. Rchb. fl. in Bonpl. III. 68. Ocanna Wagerer.

— Rchb. fl. in Bonpl. II. 252. Pamplona: la Baja. Februar. 8—9000' n. 1172. Schlim.

129. EPIDENDRUM PARVILABRE Lindl. in Benth. Pl. Hartw. p. 150. Huc Lindl. l. c. 102.

E. folio oblongo suboblique emarginato caule longiore, racemo simplicis multifloro cernuo folio multo longiore e spatha erumpente 2—3-phylla, sepalis oblongis obtusis lateralibus duplo latioribus 5-nerviis, petalis sepalo dorsali angustioribus, labelli tripartiti laciniis lateralibus falcatis acutissimis intermedia angustissima apice cuneata triloba, axi elevata basi bicallosa.

Wild in Peru; near El Porotillo and El Sisme — Hartweg (v. s. sp.). — This species has a spathe like a *Spathium*, but it has pseudobulbs instead of leafy stems. Flowers small, dense, with minute acute bracts, colour unknown.

130. EPIDENDRUM PARALLELUM. Huc Lindl. l. c. 103.:

E. rhizomate crasso repente, pseudobulbis angustis teretibus folio lineari oblongo marginibus parallelis 3-plo brevioribus, racemo stricto basi vaginato folio longiore, sepalis petalisque lineari-lanceolatis, labelli tripartiti laciniis lateralibus semiovatis acutis incurvis intermedia lineari acuminata latiore ungue ecalloso apice concavo pubescente, clinandrio obtuse 3-partito.

Wild in Sa. Marta; rocks at S. Sebastian, in the Sierra Nevada — Purdie (v. s. sp. comm. cel. Hooker). — The edges of the obtuse leaves are almost exactly parallel. Flowers the size of *E. inversum*. The total absence of calli from the lip is remarkable.

131. EPIDENDRUM VENOSUM LO. p. 99. Huc Lindl. l. c. 104.:

E. pseudobulbis angustis fusiformibus, foliis ensiformibus scapi longitudine, racemo 4—5-floro, sepalis lineari-lanceolatis petalisque angustioribus patentissimis, labello semilibero tripartito: laciniis lateralibus ovatis acutis intermedia subrotunda acuta multo majore, callo baseos lineisque tribus disci subramosis elevatis.

Wild in Mexico; on rocks near Morelia — Hartweg (v. s. sp.). — Lip white, with raised violet veins.

Huc: *Epidendrum ensicaulon* Richard and Galleotti Orch. Mex. n. 34. Lindl. l. c. sub 30.

E. pseudobulbis diphyllis, foliis oblongo-lanceolatis obtusis, scapo

terminali compresso ensiformi 2—3-floro, labello luteo trilobo: lobo intermedio multo majori late cordato apice acutiusculo.“

Wild in Mexico — Galeotti.

c. Labellum trilobum (lobis saepius rotundatis).

132. EPIDENDRUM SAXATILE Lindl. in Hook. Journ. III. 84. Huc Lindl. l. c. 105.:

E. caulibus fusiformibus apice diphyllis, foliis lineari-lanceolatis racemo paucifloro brevioribus, floribus membranaceis, sepalis oblongis petalisque filiformibus labello multo minoribus, labelli subrotundi trilobi laciniis rotundatis subrepandis intermediam bilobam reniformem serratam imbricantibus.

Wild in Brazil; on rocks in the Serra de Piedade — Martius. (v. s. sp. in hb. Martius). — Whole plant less than six inches high. Flowers membranous, reddish purple with darker longitudinal streaks, as large as in *E. Schomburgkii*.

133. EPIDENDRUM PRUINOSUM Richard and Galeotti Orch. Mex. n. 41. Huc Lindl. l. c. 106.:

E. „pseudobulbis globosis 1-phyllis, foliis lanceolato acutis, floribus luteis, racemo simplici, labello adnato trilobo: lobis lateralibus angustis divaricatis, intermedio obcordato.“

Wild in Mexico — Galeotti.

134. EPIDENDRUM RHYNCHOPHORUM Rich. and Galeotti Orch. Mex. n. 37. Huc Lindl. l. c. 107.

E. pseudobulbis monophyllis, folio lorato obtuso racemo 3—5-floro aequali, sepalis linearibus elongatis obtusis, petalis angustioribus acuminatis, labelli duplo brevioris lacinia media subulata lateralibus rotundatis nanis, columnae dente dorsali obtuso.

Wild in Mexico; Vera Cruz, on the parasitical Andromeda at the height of 4000 feet — Galeotti 5077 (adest in hb. Hooker). — „Flowers yellow.“ — Galeotti; very like those of *Pleurothallis stenopetala*, but larger.

135. EPIDENDRUM RUPESTRE Lindl. in Hook. Journ. III. 84. Huc Lindl. l. c. 108.:

E. caulibus filiformibus vaginis membranaceis vestitis diphyllis, foliis lanceolatis acutis pedunculo ancipiti aequalibus, racemo cernuo, bracteis membranaceis acuminatis pedicellis brevioribus, sepalis oblongis petalisque lineari-spathulatis obtusis, labelli trilobi laciniis lateralibus acutis margine postico serratis intermedia rotundata emarginata vel integra lineis tribus elevatis rugosis.

Wild in Peru; on bare rocks at the base of Tunguragua — Hall (v. s. sp. comm. cel. Hooker). — The whole plant about six inches high. Flowers yellow.

136. EPIDENDRUM (A. Folia ad n. 108) JAJENSE Rehb. fil. in Bonpl. II. 20.

Caule secundario ebulbi pauciararticulato, vaginis 3—4 membranaceis imbricantibus ostio triangulis vestito, summis cucullatis, folio solitario erecto ligulato acuto basi attenuato, pedunculo trifloro, bracteis lanceolatis apice brevisubulatis ovaria pedicellata dimidio aequantibus, sepalis lanceolatis acutis, tepalis linearibus acutis labelli adnati lamina libera cordata triloba, lobis lateralibus latere rotundatis antice triangulis, lobo medio lanceo, carinulis 3 in basi.

Blüthen klein Blatt 2½ Zoll lang, in der Mitte ½ Zoll breit. Der Stengel 1½ Zoll lang. Jaji. Wagener.

138. EPIDENDRUM BRACHYCHILUM Lindl. Orch. Linden n. 51. Huc Lindl. l. c. 109.:

E. foliis ligulatis obtusissimis racemo basi spathaceo brevioribus, sepalis petalisque ovalibus acutissimis, labello trilobo convexo disco villosa apice glabro petalis brevioribus.

Wild in Venezuela; the thick forests of the slope of the Sierra Nevada, at the height of 7000 feet — Linden 648; New Grenada, in the province of Ocanna, at 4800 feet Schlim 1016; Funk and Schlim 1182 (v. s. sp. comm. cel. Linden). — Pseudobulbs as in *E. fragrans*. Petals yellow, spotted with brown. Lip bright yellow. Flowers very fragrant. Leaf nearly a foot long. Spathe acuminate, bracts obsolete.

Epidendrum brachychilum Lindl.: Rchb. fl. in Bonpl. II. 281. Pamplona: la Baja. Juli. 9000'. n. 1187. Schlim.

— Rchb. fl. in Bonpl. III. 68. Ocanna. Wagener.

— Rchb. fl. in Bonpl. II. 20. Caracas 6000'. Mai. Wagener.

139. EPIDENDRUM ARMINII Rchb. fl. in Bonpl. III. 67.

Affine *Epidendro brachychilo* Lindl.: monophyllum habitu *Epid. Moritzii* Rchb. fl. et *Ep. straminei* Lindl. labelli lobis lateralibus rhombeis, superiori angulo obtuso, lobo medio lineari apice calloso, disco callosulo velutino.

Planta gracilis. Pseudobulbus fusiformis tenuis monophyllus. Folium cuneato-ligulatum obtuse acutum, 4—5 pollices longum, medio duas tertias pollicis latum. Sepala triangulo lanceolata acuta extus brunnea. Tepala cuneato-ovata acuta. Labellum flaveolum, striis quibusdam longitudinalibus atropurpureis, pube velutina alba. — Epiphyt und auf Steinen. 5000'. Februar. Ocanna. Wagener.

140. EPIDENDRUM FALLAX Lindl. Orch. Linden n. 53. Hue Lindl. l. c. 110.:

E. foliis loratis obtusis emarginatisque inaequalibus basi remotis, racemo basi spathaceo duplo brevioribus, spatha papyracea, sepalis petalisque lanceolatis, labello semilibero aequaliter trilobo concavo medio tomentoso, laciniis lateralibus rotundatis, intermedia subcordata acuta.

(A) Petals reddish. Lip purple, edged with white.

Epidendrum Lindenii Lindl. in Ann. Nat. Hist. XII. 397.

(B) *flavescens*. Petals orange-yellow. Lip white, mixed with yellow.

Wild in Venezuela; on trees in the thick forests of the Sierra Nevada, at the height of 6—8000 feet — Linden, 624, 645 (v. s. sp. comm. cel. Linden). — Pseudobulbs like those of *E. fragrans*. Spathe membranous. Flowers sweet-scented. The first two varieties seem to differ in nothing but colour. They are near *E. venosum*, the middle lobe of whose lip is much larger than the side ones. — Rchb. fl. in Bonpl. II. 20. Barbacoas. März. 4000'. Wagener.

var. *flavescens* Rchb. fl. in Bonpl. II. 20. Merida. 10,000'. December. Herr Wagener hält diese Form für specifisch verschieden, sie soll viel längere Trugknollen haben und nur in dieser hohen Region anzutreffen sein.

142. EPIDENDRUM SCEPTRUM Lindl. Orch. Linden n. 50. Hue Lindl. l. c. 111.

E. foliis loratis basi remotis obtusis emarginatisque racemo basi spathaceo pluries brevioribus, spatha foliacea, sepalis lanceolatis, petalis obovatis unguiculatis acutis, labello subrotundo-hastato medio basi pulvinato pubescente, clinandrio obtuse trilobo.

Wild in Venezuela; on rotten trees near the Indian village of Jagi, at the height of 6500 feet — Linden 650; Sa. Martha, on trees near Pacho — Purdie; New Grenada, Ocanna — Schlim, 769 and 745 (v. s. sp.) — Pseudobulbs a foot long, compressed; raceme one to two feet long. Flowers very numerous, arranged in spikes. Petals golden-yellow, very brilliant, spotted with purple. Lip bright purple, white at the base. Purdie's Sa. Martha specimens, in Sir W. Hooker's herbarium entirely agree with Linden's. The plant varies much in the brilliancy of its colour.

Epidendrum sceptrum Lindl. Rchb. fl. in Bonpl. II. 281. Auf Steinen und auch epiphyt. Ocanna. 6000'. Mai. n. 769. Schlim. Diese treffliche, reich und dankbar blühende Art hat goldgelbe mit Purpur gefleckte Hüllblätter. Die Lippe ist gelbweiss mit Violett.

143. EPIDENDRUM REFRACTUM Lindl. in Ann. Nat. Hist. XII. Orch. Linden. n. 39. Huc Lindl. l. c. 112.

E. folio ovato-oblongo coriaceo obtuso, pedunculo elongato spathis plurimis falcatis obtusis distinctis vaginato, racemo brevi 4—5-floro cernuo, floribus carnosis, sepalis oblongis acutis, dorsali refracto, petalis ovalibus subconformibus, labello subrotundo cordato trilobo basi bicalloso linea elevata interjecta: lacinia intermedia abbreviata truncata.

Wild in Venezuela; the high regions of the Sierra Nevada in Merida, at the height of 10,000 to 11,000 feet — Linden 618 (v. s. sp.) — A remarkable plant, with very broad, short, oblong coriaceous leaves, six or seven herbaceous, distinct, falcate spathes on a peduncle about nine inches long. Sepals about three-quarters of an inch long. „Pseudobulbs six to eight inches long. Flowers blood-colour.“ Linden.

Epidendrum refractum Lindl. Rehb. fl. in Bonpl. II. 20. Merida. Dec. 12,000'. Wer bloss die Spitze des Blütenstiels erhält, ohne die Pflanze zu kennen, wird sie getrost als neues Spathium bestimmen. Die überhängende Traube purpurschwarzer Blüten ist sehr ausgezeichnet. Wägener.

144. EPIDENDRUM HARTWEGII Lindl. in Plant. Hartw. p. 150. Huc Lindl. l. c. 113.

E. foliis 2 basi remotis oblongis obtusis coriaceis apice obliquis spicae rigidae multiflorae basi spathaceae caulisque bulbosi teretis longitudine, floribus coriaceis, ovario triquetro clavato, sepalo supremo oblongo obtuso lateralibus acutissimis, petalis obovatis, labello subrotundo aequaliter trilobo basi callo pubescente concavo aucto, ungue et columna brevissimis.

Wild in Peru; on the Cordillera near Loxa — Hartweg (v. s. sp.) — Nearly allied to *E. fallax*, but the leaves are shorter and broader, the spike very short and stiff, the flowers much more coriaceous. Their colour is unknown.

145. EPIDENDRUM VOLUTUM Lindl. in Paxton's Flower Garden; gleanings n. 427. ic. 215. Huc Lindl. l. c. 114.

E. caule tereti membranaceo-vaginato apice 3-phylo, foliis lineari-oblongis pergameneis inaequalibus, racemo sessili stricto flexuoso, bracteis magnis glumaceis distantibus pedunculis longioribus, sepalis petalisque linearibus margine revolutis aequalibus acutis, labello subrotundo-ovato subcordato decurvo leviter trilobo cuspidato, callis 2 ad basin plicisque tribus obsoletis.

Wild in Central America — Skinner (v. v. c.) — Stem merely terete, and not swollen into a pseudobulb. Flowers greenish white, and of no beauty. Easily known by the great alternate paleaceous bracts, planted on a somewhat zigzag rachis, and reaching nearly to the middle of the foot-stalk and ovary of each flower.

146. EPIDENDRUM PULCHELLUM Richard and Galeotti, Orch. Mex. n. 45. Huc Lindl. l. c. 115.

E. „nanum, pseudobulbis ovoideis diphyllis, foliis ovali-oblongis acutis, floribus purpureis, racemo simplici terminali 3—4-floro, labello adnato trilobo concavo lobis lateralibus latis obtusis, intermedio minori emarginato“.

Wild in Mexico — Galeotti.

§ 6. *Osmophytum*. Lindley in Bot. Reg. 1839. Misc. 135. Hook. Journ. III. 81.

In the whole of this division the lip is absolutely undivided, without any apparent tendency to even rudimentary subdivision.

147. EPIDENDRUM TIGRINUM Lindl. Orch. Linden n. 52. Huc Lindl. l. c. 116.

E. foliis oblongis coriaceis racemo basi squamato duplo brevioribus,

sepalis petalisque lanceolatis, labello obovato piloso, callo magno apice transverse curvato basi biconcavo pubescente, clinandrii trilobi, lobis rugosis dorsali appendice membranacea 3-dentata anteposita.

Wild in Venezuela; on earth or trees at Jaji in Merida, at the height of 5—9000 feet; July — Linden 1468; Brazil? Minas Gerães — Weddell (v. s. sp. comm. cel. Linden) — „Pseudobulbs a foot or a foot and half long, compressed. Petals orange-yellow, spotted with red. Lip white, washed with purple“. A plant in the way of *E. variegatum*, but with flowers four times as large. I suppose that a drawing, n. 1, in the Hb. Mus. Par., made in the Minas Gerães, by Mr. Weddell, belongs to this species.

Epidendrum tigrinum Lindl. Rehb. fl. in Bonpl. II. 20. Caracas. Wagerer. Das „labellum pilosum“ existirt bloss in Büchern.

— Rehb. fl. in Bonpl. II. 281. Ocanna. 5000'. Juli. n. 38. Schlim.

148. EPIDENDRUM VARIEGATUM Hooker Bot. Mag. t. 3151. Bot. Reg. 1839. t. 11. Huc Lindl. l. c. 117:

E. pseudobulbis fusiformibus compressis diphyllis, foliis oblongis obtusis, racemo multifloro, sepalis petalisque subrotundo-obovatis coriaceis obtusis, labello subrotundo brevissimo acuto intus sub columna pubescente: callis duobus incurvis in appendicem hippocrepicam carnosam confluentibus, lobo columnae postico obtuso dente membranaceo subbifido anteposito.

(A) *virens*. Sepals and petals green spotted with purple. Lip white with a crimson horse-shoe mark.

(B) *coriaceum*. Flowers cream-coloured, with purple spots on the sepals and petals, and dirty purple streaks on the lip.

Epidendrum coriaceum Hook. Bot. Mag. t. 3595.

(C) *crassilabium*. Calli of the lip thicker and more downy. Leaves more remote at the base.

Epidendrum crassilabium Pöppig and Endl. Nov. Gen. II. p. t. 1. 102.

(D) *leopardinum*. Flowers yellow, marbled with dark red; lip white at the point. Leaves long, broad, like those of *E. tigrinum*.

Wild in tropical America. A. Brazil — Harrison, Loddiges; Rio Negro above Barcellos, common — Spruce 1948; New Grenada — Funk and Schlim 1435; B. Demerara — Parker; Jamaica — Purdie; C. Peru — Mathews 1886; trees and rocks in the primeval forests near the farm of Pampayaco — Pöppig; D. New Grenada, in the province of Ocanna, at the height of 4950 feet — Schlim 1010 (v. v. c. et s. sp.) — A variable plant, readily known by its very short lip, on the base of which is placed a large concave downy callus, which presses against the column and gives the lip the appearance of being divided horizontally into two layers. On very strong specimens there are occasionally three or four leaves on a pseudobulb. The flowers are extremely fragrant. I am persuaded that the above synonyms represent different varieties of one and the same species, the leaves of which are sometimes strictly oblong, as in Spruce's specimens, sometimes strap-shaped, and as much as a foot long. Pöppig's figure is accompanied by details, which it would be difficult to find, and he overlooks the down on the lip, which is a striking feature of the species.

Huc: *Epidendrum* (*Encyclium*) *coriaceum* Focke Bot. Zeit. 1853. 228.

Foliis binis oblongo-lanceolatis acutis recurvis, pseudobulbo elongato (juniori ovali) ancipiti insidentibus, racemo axillari multifloro foliis brevioribus, floribus coriaceis, sepalis ovatis acuminatis, petalis dimidio angustioribus spathulatis sepalisque apice et margine recurvis, labello integro rotundato apiculato, ungue brevi columnae adnato, lateribus deflexis, disco calloso.

Radices albidae. Rhiz. repens, annulatum. Pseudobulbi compressi, ancipites; adultiores elongati, rugosi, annulato pedunculati; juniores ovaes, sessiles,

Folia bina lanceolata, lineari-lanceolata lineariave, acuta, recurva, coriacea, basi equitantiâ. Scapus racemosus terminalis, teres, validus, erectus, multiflorus, foliis brevior, viridis. Bracteae minutae, deltoideae. Perianthium coriaceum, patens. Sepala patentissima, ovata, acuminata, apice recurva, marginibus revolutis. Petala dimidio angustiore spatulata, acuminata; sepala et petala viridescencia, atropurpureo-maculata, maculis oblongis hic illic confluentibus. Labellum integrum rotundatum, apiculatum, latoribus reflexis, ungui brevi cum basi columnae connatum, disco calloso in columnam incumbens, callo albo in medio excavato totam cavitatem columnae implente, album; violaceo striatum. Columna brevis, mutica, apicem versus dilatata, bialata, alis extus convexis, labello paulo brevior, alba. Anthera subglobosa, 4 locularis. Pollinia 4 ovata, caudiculis binis affixa. Ovarium triquetrum. Capsula oblongo obovata, trilata, breve pedunculata. — Para, flum. sup. Commewini. Maj. Jun. Sept.

Huc: *Epidendrum pachysepalum* Klotzsch in Otto et Dietrich Allg. Gardenztg. XXIII. 274. :

Caule repente ramoso; pseudobulbis erectis compressiusculis longiusculo-ventricosus deorsum attenuatis triphyllis; foliis elongatis brevissime acutis rigidis plus minus recurvatis, inferne subattenuato-conduplicatis, subtus leviter carinatis; racemo terminali erecto robusto decempollicari viridi; bracteis brevibus convexis crassis ovatis acutis viridibus, basi tumidis; germine oblongo flavicante tricostato deorsum in pedicellum attenuato; perigonii foliolis spatulatis patentissimis crassis, extus pallide viridi-flavidis, intus flavis dense rubro-punctulatis, interioribus angustioribus; labello parvo suborbiculari albedo carnosus, apice obtuso recurvo lilacino, infra apicem squama minutissima semi-orbiculari instructo, marginibus lateralibus rotundatis subrevolutis; gynostemio recto obtuse trigono pallide flavido; anthera biloculari; pollinibus 4 atro-fuscis.

Epidendrum pariegatum Hook. Rehb. fl. in Bonpl. II. 20. Caracas. Wagener.

149. EPIDENDRUM PAMPLONENSE H. G. Reichenbach in Linnaea XXII. p. 837. Huc Lindl. l. c. 118:

E. racemo multifloro (14), bracteis lanceolatis acutis, sepalis oblongis cuneatis obtusis, petalis subaequalibus minoribus, labello minuto ovato cuneato antice nunc obsoletissime trilobo callo magno longitudinali foliaceo apice acuto lateribus implicato, partibus lateralibus hinc centrum ipsius calli tegentibus, clinandrii lobo dorsali obtuso lacinia subulata anteposita, lateralibus emarginatis.

Wild in New Grenada; Pamplona, at the height of 6000 feet; January — Funck and Schlim 1435 (Rehb.) — Leaves in pairs, long, acute, carinate. Nearly allied in lip leaves and column to *E. tigrinum* and *variegatum*. Flowers yellow and white, flecked with purple. — Rehb.

Epidendrum pamplonense Rehb. fl. Rehb. fl. in Bonpl. II. 281. Socorro: Lajitar. 4 — 9000', Januar. n. 1190. Schlim.

150. EPIDENDRUM SPONDIADUM H. G. Reichenbach in Bot. Zeit. 1852. p. 731. Huc Lindl. l. c. 119:

E. spatha ancipiti crassa, pedunculo valido plurifloro, bracteis triangulis excavatis brevissimis, pedicellis in ovaria triptera sensim abeuntibus, sepalis oblongis acutis, petalis obovato-oblongis acuminatis, labello ovali antice subito acuto, callo depresso oblongo a basi discum versus in carinulam antrorsum excurrente, columna abbreviata crassa, clinandrii auricularis lateralibus obtusangulis nunc bilobis, media lineari apice tri-quadridentata.

Wild in costa Rica; on the Spondias — Warscewicz.

— Rehb. fl. in v. Mohl et v. Schlechtendal Bot. Zeitg. l. c.:

Spatha ancipiti crassa, pedunculo valido plurifloro, bracteis triangularibus excavatis brevissimis, pedicellis in ovaria triptera sensim abeuntibus, perigonii phyllis tribus oblongis acutis, internis obovato-oblongis acute acuminatis, labello basi adnato ovali antice subito acuto, callo depresso oblongo a basi discum versus in carinulam antrorsum excurrente; gynostemio abbreviato crasso, androclinio triauri, auriculis lateralibus obtusangulis, nunc bilobis, auricula media lineari, apice triquadridentata.

Costa Rica: auf Spondias. v. Warszewicz.

151. EPIDENDRUM WIDGRENII. Huc Lindl. l. c. 120.

E. pseudobulbis teretibus diphyllis, foliis oblongis scapo subaequalibus, spatha papyracea pedunculi angulati longitudine, racemo 6—8-floro stricto, sepalis lanceolatis acuminatis, petalis ovalibus, labello subrotundo cochleato acuminato basi bicalloso secus axin costato.

Wild in Brazil; Minas Gerães — Widgren 775 (v. s. sp.) — Resembles *E. fragrans*, from which it is immediately known by the presence of a strong rib which runs along the axis of the lip.

152. EPIDENDRUM COLLARE Lindl. in Bot. Reg. 1843, misc. 85. Huc Lindl. l. c. 121.:

E. caulibus fusiformibus elongatis apice triphyllis, foliis coriaceis canaliculatis patentibus, racemo laxo paucifloro, cuniculo ovarii elongato extus manifesto, sepalis petalisque conformibus petaloideis undulatis lanceolatis, labello ovato obtuso undulato apice recurvo basi trilamellato, lamellis lateralibus basi bilobis, clinandrii margine elevato denticulato.

Wild in Guatemala — Hartweg (v. v. c.) — Stems eighteen inches long, strong, and deeply furrowed. Flowers white, changing to yellow and brown as they go off. Anther-bed surrounded by an elevated edge, standing up like a collar. The cuniculus of the ovary as prominent and conspicuous as in a *Pelargonium*.

Obs. Me judice ad *Aulizea* pertinet. Rehb. fl.

153. EPIDENDRUM FRAGRANS Swartz Fl. Ind. Occ. III. 1847. Bot. Mag. t. 1669. Bot. Cab. t. 1039. Huc Lindl. l. c. 122:

E. pseudobulbo monophyllo angusto fusiformi, foliis lanceolatis apice recurvis, scapo folio brevior, sepalis lineari-lanceolatis petalisque ovato-lanceolatis acuminatis patentibus, labello subrotundo cuspidato lineato integerrimo, columnae lobo dorsali obtuso dente bifido anteposito.

Epidendrum aemulum Lindl. in Bot. Reg. t. 1898.

Epidendrum lineatum R. A. Salisbury stirp. 10.

(B) *megalanthum*. Flowers very large, with vivid stripes of rich crimson on the lip.

Wild in the Tropics of America; Dominica — Imray; Jamaica — Swartz; French Guiana Leprieur 123; Surinam — Hostmann 205; Focke 127; Demerara — Schomburgk 423; Guayaquil — Jamieson; Para — Loddiges. B. Guatemala — Skinner (v. v. c. et s. sp.) — Flowers extremely fragrant, pale green or cream-colour, with crimson streaks on the lip. This plant, the great range of which is indicated by the above localities, is subject to much diversity of appearance, according to its age or the place in which it grows. My *E. aemulum* is not, I believe, even a variety, but merely a diminutive state. The variety B is remarkable for its gigantic dimensions, which it retains in cultivation; the flowers are full four inches in diameter, and its pseudobulbs and leaves, taken together, are sometimes eighteen inches long.

Epidendrum fragrans Sw. Rehb. fl. in Bonpl. II. 20. 4000'. Mai. Barcelona. Wagener.

Obs. Me judice vulgaris planta *E. aemulum* Lindl. dicenda. *E. fragrans* Swartzii mihi bene differt. Qua de re alio loco.

154. EPIDENDRUM LAMBDA Lindl., Rchb. fl. Rchb. fl. in Bonpl. II. 281.

Affine Epidendro fragranti Sw. labello cordato triangulo acuto, lineis in basi tribus velutinis, columnae dente postico simplici.

Pseudobulbus apice angustus. Foliom lanceolatum curvatum acutum bene coriaceum. Spatha anceps acuta. Racemus pauciflorus. Sepala lanceo acuta. Tepala oblongo-lanceolata acuta latiora. Labelli lineae baseos exteriores subplicatae. Perigonium flaveolum, lineae violaceae radiantes in labello, multae apice furcatae litteram graecam Lambda simulant. Flores illis Epidendri fragrantis mediani aequales. — Ocanna. Wälder. 6 — 7000'. Juni. n. 744. Schlim.

155. EPIDENDRUM (O. Folia ad n. 130.) CHACAOENSE Rchb. fl. Bonpl. II. 20.

Pseudobulbis pyriformibus diphyllis, foliis oblongo-ligulatis acutis basi attenuatis, pedunculo crasso 2—3 pollicari, bivaginato quinquefloro, bracteis vaginaformibus acutis, sepalis oblongo lanceolatis acutis, tepalis cuneato obovatis acutis, labello ovato acuto cochleato, basi gynostemii adnato, callo sericeo bilobo a basi in discum, gynostemio abbreviato crasso, fovea stigmatica semilunata, androclinio trilobo, lobis lateralibus falcatis erectis, medio postico minuto cum appendiculo lineari.

Blüthen so gross, wie die des *E. radiatum*, Hülle grün, Lippe weiss mit Purpur-Längsstreifen. Caracas. 3000'. März. Wägener.

156. EPIDENDRUM GLUMACEUM Lindl. in Bot. Reg. 1840. t. 6. Huc Lindl. l. c. 123:

E. pseudobulbis ovalis apice angustatis diphyllis, foliis anguste oblongis patentibus, racemo terminali cylindraceo e spathis glumaceis erumpente, sepalis linearibus petalisque lineari-lanceolatis acuminatis-simis, labello obovato acuminato convexo integerrimo basi calloso.

Wild in Brazil; on the branches of *Vellozia candida*, on the summit of the Pedro Bonito Mountain, common — Gardner 243; Equader — Sinclair (v. v. c. et s. sp. in hb. Hooker). — This has the habit and sweet odour of *E. fragrans*, from which it differs in the colour of its flowers, which are white, tinged with pink, and striped with rose, in the long tapering figure of the flower-buds, caused by the peculiar form of the sepals and petals, and in the shape of the lip, which is convex, not concave, obovate, and acuminate.

157. EPIDENDRUM INVERSUM Lindl. in Bot. Reg. 1839. misc. 135. Huc Lindl. l. c. 124.

E. pseudobulbis diphyllis elongatis compressis, foliis oblongo-loratis, obtusis, spica terminali sub-6-flora basi spathacea, bracteis brevibus ovalis acuminatis, ovario triquetro; sepalis petalisque patentibus lineari-lanceolatis convexis subaequalibus, labello ovato acuminato basi laevi medio sulcato callis 3 obsolete, columna obtuse 3-dentata, antherae cardinis appendice oblonga denticulata.

Wild in Brazil; on the *Crescentia* — Martius; in the Minas Gerães — Widgren 776 (v. v. c. et s. sp.) — Flowers straw-coloured, with a few purple streaks on the column and at the base of the lip; a heavy not very pleasant smell, something like that of *Glechoma*, is peculiar to it. It differs from *E. glumaceum* in the colour and small size of its flowers, and I believe in the calli of the lip, but the specimens of that plant at my disposal do not enable me to describe them accurately. The species are, however, no doubt distinct. — Cf. G. Chronicle 1852. 440.

158. EPIDENDRUM CALAMARIUM Lindl. in Bot. Reg. 1838. misc. 163. Huc Lindl. l. c. 125.

E. pseudobulbis teretibus ovalibus diphyllis, foliis linearibus planis abrupte acutis, racemo simplici erecto, bracteis minutis acuminatis, sepalis patentissimis linearibus acutis apice recurvis, petalis angustioribus subspathulatis, labello postico subrotundo acuto convexo basi pubescente, callo duplici lato apice confluyente.

Wild in Brazil; Organ Mountains, on the stems and branches of trees in large clusters;

April — Gardner 624. 5869 (v. v. c. et s. sp.) — Flowers pale, whole-coloured, yellowish green, with five small violet spots at the base of the lip. Not fragrant. A small twoleaved plant, four or five inches high.

159. EPIDENDRUM TRIPUNCTATUM. Huc Lindl. l. c. 126:

E. pseudobulbis ovalibus diphyllis, foliis anguste loratis recurvis scapo longioribus, racemo paucifloro, bracteis minutis, sepalis linearibus acuminatis, petalis angustioribus, labello lanceolato plano basi pubescente, callis 2 clavatis sulcisque 3 utrinque, columnae lobis anticis acutis.

Wild in Brazil — Loddiges (v. v. c.) — Much like *E. calamarium*. Flowers yellowish, with three deep purple spots in front of the calli, and two or three smaller on each side above the furrows of the lip.

160. EPIDENDRUM ATTENUATUM. Huc Lindl. l. c. 127:

E. caule basi ramoso in pseudobulbos tenues angustos monophyllos diviso, folio lineari-lanceolato racemo tenui spicaeformi duplo brevior, bracteis subulatis, sepalis linearibus membranaceis acutis, dorsali reflexo, petalis filiformibus, labello ovato cordato basi bisquamato tuberculo interjecto, ovario lagenaeformi.

Wild in Venezuela; Truxillo, at the Aguas de Obispo, at the height of 9000 feet; August — Funck and Schlim 734 (v. s. sp. comm. cel. Linden). — The habit is that of *E. transparens*. Flowers small, membranous, with reddish petals and a yellow lip, on which are five strongly marked forked dark veins.

161. EPIDENDRUM COCHLEATUM Linn. Jacq. Ic. Rar. III. t. 605. Bot. Mag. t. 572. LO. p. 97. Huc Lindl. l. c. 128.

E. pseudobulbis ovalibus compressis diphyllis, foliis oblongis acutis subundulatis, sepalis petalisque paulo angustioribus lineari-lanceolatis reflexis, labello postico cordato cochleato subrotundo basi bicalloso, columna nana, clinandrii lobo dorsali obtuso dente lineari bifido anteposito.

(B) *pallidum*. Stains on the lip very faint.

Anacheilium cochleatum Hoffmgg. in Linnaea XVI. 229.

Wild in the West Indies, where it is common; in Mexico, near Zacuapan etc. — Galeotti 5107 (v. v. c. et s. sp.) — Leaves broad, deep green, in pairs upon an oval furrowed pseudobulb. Sepals and petals green. Lip green, bordered with purple and deeply stained with the same colour below the middle.

Epidendrum cochleatum L. Rchb. fil. in Bonpl. II. 20. Caracas. Wagerer.

162. EPIDENDRUM LANCIFOLIUM Pavon. LO. p. 98. Bot. Reg. 1842. t. 50. Huc Lindl. l. c. 129.

E. pseudobulbis ovalibus diphyllis teretibus, foliis oblongo-lanceolatis acutiusculis, racemo brevi, sepalis petalisque lanceolatis acuminatis reflexis, labello cordato oblato-ovato cochleato basi tricostato.

Wild in Mexico — Hartweg (v. v. c.) — Like *E. cochleatum*; but sepals and petals shorter and broader, and lip regularly cochleate, without a tendency to lobing at the edge. Flowers pale green; lip marked with deep crimson radiating streaks.

163. EPIDENDRUM RADIATUM Lindl. in Bot. Reg. misc. 1841. n. 123; 1844. t. 45. Huc Lindl. l. c. 130:

E. pseudobulbis ovatis compressis utrinque costatis triphyllis, foliis angustis elongatis acutis, racemo denso paucifloro, ovariis tripartitis, sepalis lanceolatis petalisque ovalibus patentissimis, labello cochleato retuso crenato crispo basi bicalloso pubescente, clinandrii laciniis lateralibus erectis carnosus, intermedia truncata apice serrata.

Epidendrum marginatum Link. Klotzsch and Otto. Ic. Pl. t. 36.

? *Epidendrum bracteolatum* Presl. Rel. Haenk. 100. LO. 5.

Wild in Mexico; rocks near the Hacienda de la Laguna; August — Schiede 11;

Oaxaca — Galeotti 5020; Vera Cruz — Id. 5161; Guatemala — Skinner (v. v. c. et s. sp.) — Allied to *E. cochleatum*; it has the same habit, but the pseudobulbs are strongly ribbed at the side, and the lip has the margin crisp and crenated. The flowers are pale pea-green, with the exception of the lip, which is striated with bright deeper purple rays.

164. *EPIDENDRUM CHONDYLOBOLBON* Rich. and Galeotti Orch. Mex. n. 43. Huc Lindl. l. c. 131:

E. „pseudobulbis oblongis compressis basi articulatis 3—4-phyllis, foliis lanceolato-linearibus obtusis, flor. luteis violaceo-lineatis, labello breviter unguiculato cordato apice longe acuminato acutissimo“.

Wild in Mexico — Galeotti.

165. *EPIDENDRUM MARMORATUM* Rich. and Galeotti Orch. Mex. n. 44. Huc Lindl. l. c. 132:

E. „pseudobulbis oblongo-fusiformibus articulatis, foliis ellipticis oblongis, scapo terminali dependente, flor. violaceis, labello adnato convexo orbiculari emarginato costato“.

Wild in Mexico — Galeotti.

166. *EPIDENDRUM AVICULA* Lindl. in Hooker's Journal III. 85. Huc Lindl. l. c. 134.

E. ramulis pseudobulbosis diphyllis, foliis ovatis planis margine laevibus panicula tomentosa multo brevioribus, sepalis lanceolatis aculis tomentosis, petalis linearibus, labello acuto subrhombico basi bicalloso.

Wild in Brazil; Organ mountains, forming dense tufts on the stems and branches of trees; April — Gardner 625 (v. s. sp.) — Leaves about an inch long. Panicle between three and four inches. Flowers small, when seen from the back not unlike a little bird in full flight.

(§ 8. Sectio Lanii inter *Epidendra foliosa* et *pseudobulbosa* divisa. Have pia anima! Erant *E. microphyllum* Lindl. n. 133. et *E. Avicula* Lindl. n. 134.)

§ 8. *Spathium*. Lindley in Hooker's Journal of Botany, III. 81. Bot. Reg. 1844. Misc. 82.

This division is distinguished by its stem being slender, leafy, and erect, its flowers placed on a long peduncle, which proceeds from a spathe consisting of one or more equitant bracts, and by its labellum being wholly attached to the corolla. It differs from *Aulizeum* in its stem being covered with leaves, and not pseudobulbous with two or three leaves at the end only. It is very near *Amphiglottium*, from which it is distinguished by the branches not being excessively lengthened and covered with close pressed scales below the flowers. In their stead there is usually a long sheathing spathe, like that of *Cattleya*, out of which the inflorescence proceeds: occasionally there are several of such spathes, as in the second section of the following enumeration, which is only known from *Amphiglottium* by the spathes being large and herbaceous instead of dry and membranous.

a. *Spatha subsimplex. Flores racemosi.*

* *Labellum indivisum.*

167. *EPIDENDRUM GRANDIFLORUM* Lindl. in Hook. Journ. III. 86. Huc Lindl. l. c. 135.:

E. foliis distichis ensiformibus obtusis, racemo denso terminali basi flexuoso e spatha duplici orto, sepalo dorsali ovali lateralibus duplo latioribus dimidiatis, petalis linearibus, labello subrotundo cordato emarginato margine postico crispo venis baseos 2 elevatis.

Wild in Peru — Mathews (v. s. sp. in hb. Hooker). — Flowers coriaceous, about twice as large as in *E. variegatum*.

168. EPIDENDRUM MANCUM Lindl. in Bot. Reg. 1844, Misc. 28. Huc Lindl. l. c. 136.:

E. foliis 3—4 oblongis obtusis carnosis, oblique emarginatis, supremo spathae longitudine, racemo stricto multifloro foliis multo longiore, floribus carnosis, sepalis subrotundo-oblongis obtusissimis, petalis spatulatis obtusissimis apice concavis, labello parvo postico carnosio concavo indiviso callo magno margine membranaceo in medio.

Wild in Peru; on the Cordillera, near Loxa, flowering in July — Hartweg; in New Grenada, in the province of Pamplona, at the height of 9000 feet — Schlim 135 (v. s. sp.). — Flowers rather small, orange and yellow — Hartweg; yellow-spotted with red — Schlim.

169. EPIDENDRUM VENTRICOSUM Lindl. in Hook. Journ. III. 86. Huc Lindl. l. c. 137.:

E. foliis lineari-lanceolatis acutis, racemis angustis multifloris e spatha lineari ortis, floribus membranaceis, sepalis subaequalibus oblongis acutis, petalis filiformibus, columna ventricosa, labello ovato cordato acutissimo basi bicalloso.

Wild in Peru — Mathews (v. s. sp. in hb. Hooker). — A slender plant, with the stem about six inches up to the commencement of the spathe. Racemes from four to five inches long, including the spathe which covers the whole peduncle. Flowers purple, small, membranous.

170. EPIDENDRUM SCHLIMII H. G. Reichenbach in Linnaea XXII. p. 838. Huc Lindl. l. c. 201.:

E. pedunculo erecto subflexuoso basi spathaceo, spatha lanceolata acuta parva internodio ad florem brevior, bracteis lanceolatis acutis, floribus minimis paucis erectis, ovariis valde cuniculatis, sepalis ovatis acutis supremo cuneato, petalis linearibus apice dilatatis acutis, labello transverso oblongo nunc emarginato basi subcordato.

Wild in Venezuela; Merida, at the height of 6500 feet; September 1846 — Funk and Schlim 1049 (Rehb.). — Stem erect. Leaves half amplexicaul. Flowers pale red. Mr. Reichenbach observes that the spathe is quite small, and suggests that it may be not a *Spathium*, but an *Amphiglottium*.

Huc: *Epidendrum tenellum* Lindl. l. c. sub 138.:

E. foliis paucis linearibus, pedunculo flexuoso, bractea lineari carinata tenui ad utrumque articulum, floribus 3—4 membranaceis, sepalis oblongis carinatis apiculatis, petalis filiformibus, labello subrotundo rotundato repando basi bicalloso.

Wild in New Grenada — Funk and Schlim 1049 (v. s. sp. comm. cel. Linden). — The smallest species I know, not more than four inches high. The thin delicate bracts shorter than the internodes.

Epidendrum Schlimii Rehb. fl. — Rehb. fl. in Bonpl. II. 20. Cf. Linnaea sub *Spathio* Lindl. Folia Orchidacea 201 sub *Amphiglottio* cit. Funk, Schlim 1049. — *Epidendrum tenellum* Lindl. Folia Orchidacea 138, cit. Funk et Schlim 1049!!! (Hierüber wird aus Vorsorge unter 234 ein zweites *E. Schlimii* aufgestellt, welches *E. socorrense* heissen mag). Jaji an stehendem Wasser. Blüthe weiss mit rosa. 6000. Wagener.

171. EPIDENDRUM ADENOGLOSSUM Lindl. in Hook. Journ. III. 86. Huc Lindl. l. c. 139.:

E. foliis carnosis lineari-oblongis obtusis, racemo elongato simplici terminali e spatha ancipiti pedunculo brevioro orto, sepalis ovatis reticulatis, petalis linearibus 3-veniis acutis, labello lineari basi callis 2 lamelliformibus minore interjecto instructo.

Wild in Peru: Pangoa — Mathews (v. s. sp. in hb. Hooker). — Flowers small, in a thin flexuose spike.

172. EPIDENDRUM (S. Folia ad 135) HETERODOXUM Rehb. fl. in Bonpl. II. 20.

„Caulē elatiori, foliis ligulatis“ spatha solitaria majuscula subscariosa, pedunculo flexuoso, bracteis squamosis triangulis brevissimis, ovario cum pedicello pollicari, sepalo summo lineariligulato acuto, basi valde attenuato, sepalis lateralibus ligulatis acutis latere inferiore curvilineis, cum tepalis lineam altius insertis ac sepalum summum, tepalis linearibus acutis, labelli lamina libera triangula hastata obtusa margine hinc lobulato crispulo denticulata; carinis elevatis duabus in basi apice abruptis in lineas elevatas transeuntibus.

Der Blüthensiel trägt einen kleinen Nebenzweig. Caracas. Wagerer.

Epidendrum heterodoxum Rehb. fl. Bonpl. III. 220. Zur Diagnose hinzuzufügen: caulē obtuse ancipiti, foliis lanceis acutis. Der Stengel von der Dicke eines Gänsekiels. Die Blätter 5—6 Zoll lang, einen Zoll breit, fein zugespitzt, unterseits purpurfleckig oder ganz purpurn. Blüten grün, wie die des *Epidendrum nutans*. Die Scheide scharf zweischneidig, sehr spitz. Der Blütenstand gablig, jeder Zweig traubig, seitwärts übergeneigt. Sehr auffallend ist, wie die seitlichen Sepalen der Lippe am Grunde angewachsen sind. Aus Venezuela von Herrn Handelsgärtner Geitner auf den Erdbränden bei Planitz eingeführt.

** Labellum trilobum.

173. EPIDENDRUM BRACHYGLOSSUM Lindl. in Bot. Reg. 1814. Misc. 82. n. 6. Huc Lindl. l. c. 140.:

E. foliis lineari-oblongis apice rotundatis obliquis, racemo elongato simplici terminali nutante e spatha ancipiti pedunculo breviorē orto, floribus carnosis, sepalis obovatis concavis, petalis linearibus 3-venis acutis, labello brevi trilobo laciniis lateralibus nanis intermedia ovata callis duobus lamellaeformibus tuberculoque interjecto.

(B) *microtum*. Leaves longer and broader. Spathe more distinctly carinate. Lip linear, with a pair of minute auricles.

Wild in Peru; on the western face of the Andes, near Nanegal — Hartweg; — B, New Grenada in the province of Ocanna, at an elevation of 5800 feet — Schlim 1029 (v. s. sp.; B comm. cel. Linden). — A slender creeping rooted plant, with small flowers, and the appearance of *E. adenoglossum*, but the leaves are narrower and the lip has a different form. The supposed variety B may be a distinct species; but it is extremely like the original, and I dare not place too much reliance upon the form of the lip, which seems as if it might be that of *adenoglossum*, emaciated.

*** Labellum tripartitum.

174. EPIDENDRUM SARCODES. Huc Lindl. l. c. 141.

E. caulibus strictis brevibus carnosis, foliis oblongis obtusis carnosis, spathis 1—2 carinatis herbaceis, racemi cylindracei erecti pedunculo spathis longiore, bracteis minutis membranaceis, floribus coriaceis, sepalis oblongis crassis obtusis, petalis membranaceis obtusis apice dilatatis, labelli brevis carnosissimi lobis lateralibus rotundatis intermedio oblongo apiculato, callis 2 maximis lineaque elevata interjecta.

Wild in New Grenada; near Papaquere — Purdie (v. sp. in hb. Hooker). — General appearance that of *E. mancum* and cylindraceum. The excessive thickness of the lip is peculiar.

175. EPIDENDRUM ACUTISSIMUM. Huc Lindl. l. c. 142.:

E. caulibus elongatis, foliis angustis oblongis obtusis, racemi pedunculo spatha duplo longiore, bracteis setaceo-acuminatis ovario vix aequalibus, floribus carnosis, sepalis ovatis acutissime carinatis, petalis filiformibus brevioribus, labelli carnosi lobo medio brevi tereti carnosio,

lateralibus cordatis repandis margine membranaceis, callis 3 subaequalibus in lamellas deorsum desinentibus.

Wild in New Grenada; Mariquita — Triana 134 (v. s. sp. comm. cl. Linden). — Much like *E. sarcodes*, but with an entirely different flower, and larger thinner leaves.

177. EPIDENDRUM CYLINDRACEUM Lindl. in Bot. Reg. 1844 Misc. 82. Huc Lindl. l. c. 143.:

E. foliis ovato-oblongis, pedunculo spathis 2—3 equitantibus elongatis herbaceis vestito, racemo erecto elongato cylindraceo, sepals obovatis acutis dorso scabris, petalis linearibus, labelli 3-partiti basi tri-callosi laciniis lateralibus angustis antrorsum falcatis postice serrulatis, intermedia lineari basi latiore apice in lobos 2 subrotundos serrulatos divisa.

Wild in Peru; in the woods of Pitayo, in the province of Popayan, at the height of 10,500 feet — Hartweg; near Pasto — Jamieson (v. s. sp.). — Flowers small, in a very dense cylindrical raceme, about six inches long; whitish according to Jamieson in herb. Hooker.

Epidendrum cylindraceum Lindl. Rehb. fl. in Bonpl. I. 281. Blüten gelb. Lippe weiss mit karminrothen Flecken. Ocanna. Paramos. 8—10,000'. Juli. n. 733. Schlim.

— *b. stenoglossum* Rehb. fl. in Bonpl. III. 68.

Labelli laciniis angustissimis.

Ocanna. Wagener.

178. EPIDENDRUM SARCOCHILUM Lindl., Rehb. fl. in Bonpl. II. 281.

Affine *Epidendro cylindraceo* Lindl., *sarcodi* Lindl. tepalis cuneatis acutis, labello cucullato brevissime libero, lobulis lateralibus erectis bilobulis seu integris gynostemio appressis, lobulo medio ligulato nunc obtuse trilobulo, callo triangulo quinquelobo in disco in duas lineas carinatas excurrente.

Planta pedalis. Vaginae arphyllaceae. Folia oblongoligulata apice obtuse bilobula superne vernixia. Spathae 2 angustae obtusae. Pedunculus erectus cylindraceus ramosus. Bracteae triangulae apice subulatae ovarii pedicellatis quater-quinquies breviores. Sepala carnosae. Sepalum summum cuneto ovatum. Sepala lateralia oblique ovalia apiculata. — Blüten braun und gelb. — Ocanna: Paramos. 9000'. Mai. n. 1155. Schlim.

179. EPIDENDRUM SINUOSUM. Huc Lindl. l. c. 144:

E. caule longo flexuoso compresso, foliis lanceolatis acutis, racemo brevi nutante, pedunculo spatha falcata breviore, bracteis minutis setaceis, sepals coriaceis dorsali lanceolato lateralibus valde obliquis, petalis lineari-spathulatis reflexis, labelli lobis lateralibus cordatis acutis basi callosis postice denticulatis intermedio oblongo acuto, callis 2 in lineas sinuosas excurrentibus lineaque recta elevata interjecta.

Wild in Colombia; in subalpine forests at the mouth of the Paramo del Tambor, at the height of 6000 feet; Nov. — . . . ? 1181 (v. s. sp.) — I am unacquainted with the name of the collector by whom this was found, and can only give his number. The leaves are seven or eight inches long. „Flowers yellowish“.

180. EPIDENDRUM BREVIVENIUM. Huc Lindl. l. c. 145:

E. caule ramoso, foliis oblongis obtusis, spatha ancipiti obtusa, pedunculo ancipiti breviore, racemo laxo erecto, bracteis setaceis ovarii longitudine, sepalo dorsali oblongo lateralibusque dimidiatis 3-veniis, petalis linearibus obtusis 1-veniis, venis omnium cis apicem desinentibus, labelli lobis lateralibus auriculatis antice digitalis intermedio lineari in lobulos duos divergentes dilatatos expanso, callis 3 minutis, clinandrio cucullato emarginato,

Wild in Peru; Pichincha at 10,000 feet of elevation — Jamieson, 817 (v. s. sp. in hb. Hooker). — Flowers the size of *E. corymbosum*, apparently pale green. The short veins which never reach the point of the parts to which they belong are very peculiar.

181. EPIDENDRUM TRINITATIS Lindl. in Bot. Reg. 1844. misc. 82. Huc Lindl. l. c. 146:

E. caulis foliosis ancipitibus, foliis elongatis lineari-lanceolatis glaucescentibus obtusis oblique emarginatis, racemo terminali nutante pedunculo basi spatha herbacea equitanti, sepalis lineari-lanceolatis, petalis piliformibus, labelli lobis lateralibus acutis concavis denticulatis intermedio lineari-lanceolato acuminato basi 3-callosa.

Wild in Trinidad — Garden report; Santa Martha, Molina Rio Hacho — Purdie (v. v. c. et s. sp.) — Flowers small, in a long raceme, pale greenish yellow, with a deep apricot-yellow lip. It appears from Purdie's specimens in Sir W. Hooker's herbarium to form particularly long thick roots.

182. EPIDENDRUM CARNEUM Lindl. Orch. Linden n. 49. Huc Lindl. l. c. 147:

E. foliis oblongis obtusis, spatha solitaria recta carinata pedunculo aequali v. breviorē, racemo nutante, bracteis membranaceis setaceis, sepalis lateralibus lanceolatis acuminatis, petalis filiformibus, labelli lobis lateralibus subrotundo-cuneatis planis intermedio carnosio lineari acuminato basi trilamellato.

Wild in Venezuela; terrestrial in the forests of Jaji, in the province of Merida, at the height of 5000 feet; August — Linden 675 (v. s. sp.) — Flowers smaller than in *E. bivalve*, yellow, with a flesh-coloured lip, arranged in a nodding raceme from three to four inches long.

— Rehb. fl. in Bonpl. III, 68.:

Affine *Epidendro parvilabio* labelli partitionibus lateralibus semiōvatis antice acutiusculis basi semicordatis, partitione medio acuminata, carinis duabus semiōvatis basi contiguīs in disco, carinula antice interjecta in partitione media evadente, partitionibus lateralibus juxta carinas medianas incrassatis.

Caulis sursum pseudobulbosus more *Epidendri clavati*. Vaginae scariosae, folia gemina lanceolata acuta. Spatha membranacea acuta. Pedunculus racemosus pluriflorus patulus seu cernuus. Bractee subulatae ovariis pedicellatis quater aut quinque breviores. Sepala carnosula lanceolata acuminata. Tepala lineari-subulata. Gynostemium utrinque apice sinuosum. Ocanna. 5000'. Wagener.

183. ? EPIDENDRUM FLAVO-VIRENS Rgl. (*E. densifloro affine* H. Petrop.) Ind. sem. hort. Petrop. 1855 et Lem. XXVII. p. 371. — Spathium, a. Spatha simplex. Flores racemosi. Labellum tripartitum. (Lindley fol. orchid.)

Caule simplici subtereti, foliis ligulato-oblongis, apicem versus attenuato-acutis; pedunculo spathis 2 acutis equitantibus paullo longiore; bracteis membranaceis, ovario quadruplo brevioribus, lanceolatis acutis; racemo cernuo (6-floro), foliis supremis breviorē; sepalis oblongo-lanceolatis, basin versus cuneatis, apice acutis, 4-veniis, lateralibus valde obliquis; petalis filiformi-spathulatis, sepalis paullo minoribus; labelli lobis lateralibus falcato-oblongis truncatis, intermedio abbreviato in lobulos duos divergentes subtriangulares obtusos expanso; callis duobus basilariibus auriculaeformibus, costisque tribus elevatis labelli axin occupantibus.

Caulis 2 — 3-pedalis, 4 lineas crassus, foliisque laete viridibus. Folia disticha, ad 9 pollices longa, 1 1/3 pollices lata. Racemus foliis brevior. Spatha inferior foliacea, anceps, ligulato-oblonga, subfalcata, acuta, pedunculum subaequans, spatha superior membranacea. Bractee parvae, vix sesquilineam longae. Flores flavo-virentes, sepalis petalisque incurvo-patentibus, sepalis 2/3 pollices longis, lineas 2

latis. Labellum columnae adnatum, sepala superans. Floret Decembri. Patria ignota. *E. brevivenio* Lindl. affine.

184. EPIDENDRUM BIVALVE. Huc Lindl. l. c. 148:

E. foliis oblongo-lanceolatis, spatha solitaria falcata carinata pedunculo aequali, sepalis lateralibus lanceolatis acuminatissimis, petalis linearibus deflexis, labelli lobis lateralibus semicuneatis planis, intermedio carnoso tereti, lamellis baseos latissimis lobis lateralibus subaequalibus tuberculo interjecto.

Wild in Venezuela; on trees in the forests of Pamplona, at the height of 9000 feet — Linden 1266 (v. s. sp.) — Flowers yellow, larger than in *E. carneum*. I believe this to be really distinct from that species, with which I confounded it in the Orch. Lind. The great bivalve calli and terete middle lobe of the lip are peculiar.

185. EPIDENDRUM FRIDERICI GUILIELMI Wzw. MSS. 1853. Rchb. fil. Bonpl. II. 110.

Juxta (cui non affine) *E. sinuosum*, foliis oblongis, pedunculo maximo, labelli laciniis lateralibus rotundatis, basi semicordatis, lacinia media ligulata acuta, callis 2 rhombeis in basi.

Frutex robustus, exaltatus, caules validi, foliosi, folia cuneato obovata obtuse acutata, spatha solitaria, late anceps, apice oblique fissa; pedunculus spatham usque valde floridus, vulgo rectus, nunc cernuus, bracteae triangulae angustae minutae ovarium pedicellatum gynostemio ter longius, sepalum summum ligulatum acutum, sepala lateralia subaequalia margine inferiori obliqua, tepala lato-linearia acuminata, labelli laciniae posticae rotundatae, dimidio inferiori postice producto semicordatae lacinia antica producta ligulata acuminata, calli 2 rhombeis pagina inferiori longitudinaliter unicarinata in basi, carina interposita a basi in discum. — Blüten purpurn, viermal kleiner, als die des gigantischen *E. longiflorum* H. B. Kth. Peru. Warscewicz.

186. EPIDENDRUM CYLINDROSTACHYS Rchb. fil. et Warsc. in Bonpl. II. 110.

Pone *E. bivalve* pedunculo floribundo spatham longe superante, tepalis apice dilatatis, labelli lobis lateralibus semilunatis, lobo medio carnoso ancipiti.

Caulis flexuosus, folia lineariligulata (7 pollices longa, 11 lata) obtusa apiculata inferne carinata, spatha anceps angusta apice oblique rotundata (— 6 - pollicaris), nunc supradedita altera, pedunculus nudus erectus, ceterum incurvato cernuus, valde floridus, bracteae lineariacutae brevissimae, flores parvi, chartacei, sepalum summum cuneatoligulatum acutum, sepala lateralia longitudinaliter semielliptica subfalcata, reversa, tepala a basi angustissime lineari dilatata obtusa, labelli lobi laterales semilunati, post gynostemii androclinium inserti (ex sicco oblique centrum versus, ascendentia), lobus medius carnosus, anceps, apposito utrinque callo parvo sub androclinio, androclinium marginatum, crenulatum. — Blüten fast so gross, wie die des *Epidendrum cylindraceum* Lindl. Neu - Granada. Warscewicz.

187. EPIDENDRUM CORNUTUM Lindl. in Hooker's Journ. III. 86. Huc Lindl. l. c. 149

E. foliis gramineis lineari-lanceolatis acutissimis, racemo elongato cylindraceo cernuo, sepalis linearibus acuminatis striatis, petalis filiformibus, labelli trilobi laciniis lateralibus nanis rotundatis intermedia tereti cornuta basi 3-callosa.

Wild in Peru — Matthews 1895; New Granada, Boca del Monte, between Bogata and the village of Tena — Hartweg 1420 (v. s. sp.) — The Peruvian plant is more slender and smaller in all its dimensions than that from New Grenada, but I think not otherwise different. The two spathaceous bracts are acuminata, as long as the peduncle. Flowers white, very fragrant.

Huc: *Epidendrum cornutum* Lindl. Rchb. fil. in Bonpl. II. 110:

Aff. *E. alpicolo*, labelli lobis lateralibus radiantcarinulatis, callo inter lobos laterales antice truncato libero, latere utroque carina jugosa definito, linea carinata per lobum medium lanceum.

Caulis calamum cygneum crassus verosimiliter anceps. Folia anguste lanceolata acuminata, 5—6 pollices longa, medio duas tertias lata. Spatha solitaria, submembracea longe acuminata. Bractee inferiores lanceolatae acuminatae subspathaceae flores prope aequantes. Ovarium apicem versus valde incrassatum; sepala lancea acuminata, tepala filiformilinearia; labelli lobi laterales angusti, elongati, basi et apice semicordati, margine externo trilobuli, minute crenulati, lobus medius lanceus acuminatus; carinae radiantes in lobis lateralibus; callus inter lobos laterales utroque margine longitudinali limbo recto carinato cinctus, apice retusus, lobulatus; carina longitudinalis per lobum medium. Leg. Hartweg! — Rehb. fl. in Bonpl. II. 20. Caracas, Wagerer.

188. EPIDENDRUM ANTHOCEROS Lindl., Rehb. fl. in Bonpl. II. 281.

Affine Epidendro cornuto Lindl. spathis duabus, racemo longo nutanti, labelli subcordati lobis lateralibus minute denticulatis artice acutis, lobo medio teretiusculo acuto, callis 2 triangulis in basi, callo anteposito.

Planta bipedalis. Folia oblonga acuta. Spathae angustae acutae Bractee setaceae. Sepala triangula acuta. Tepala a basi subulata linearia acuta. — Die verwandten Arten haben wir pag. 110 beschrieben, und verweisen wir für das *E. cornutum* (nach Hartweg's Pflanze) eben auf die dortige Diagnose, indem die Herr Lindley's nicht ganz genau sein dürfte. Blüthen gelblich. — Neu-Granada, Ocanna. 6—8000'. Mai, n. 1157. Schlim.

189. EPIDENDRUM ALPICOLUM Rehb. fl. MSS. Mus. Berol. 1848 Rehb. fl. in Bonpl. II. 110.

Aff. *E. cornuto*, labelli lobis lateralibus laevibus, lobo medio lanceo utrinque angulato, igitur rhombeo, callis 2 angulatis inter lobos laterales, carinis tribus per lineam mediam lobi medii excurrentibus.

Validum bipedale et altius. Caulis calamum cygneum crassus (ex sicco omnino videtur anceps), obscure flexuosus. Folia linearilanceolata, 5 pollices longa, medio duas tertias lata. Spatha solitaria, vel gemina, acuta, anceps, dorso bene carinata, inferior seu unica (cui tamen minor semper videtur inclusa) 4—6 pollicaris. Racemus cylindraceus, multiflorus. Bractee linearisubulatae, infimae ovarii pedicellatis duplo, reliquae multo breviores. Perigonia sicca chartacea. Sepala lanceolata acuminata basi cuneata, dorsale magis antrorsum insertum. Tepala linearia acuminata basi valde attenuata. Labelli lobi laterales oblongi angusti postice et antice semicordati, latere externo minute crenulati, lobus medius longe productus lanceorhombeus seu ligulatus, marginibus minute crenulatus; calli 2 angulati ante gynostemium in lineas tres contiguas carinatas per lobum medium excurrentes. Merida 1068. Moritz! Wagerer!

190. EPIDENDRUM GLOSSOCERAS Rehb. fl. et Warsc. in Bonpl. II. 110.

Aff. *E. cornuto* Lindl. gracillimum, spathis herbaceis, labelli lobis lateralibus quadratis laevibus, carinis 2 prostratis triangulis in carinam lobi linearis medii excurrentibus.

Bipedale, flexuosum. Folia linearilanceolata acuminata, 6 pollices longa, tertiam pollicis lata (6—7). Spathae subuncullatae apice lanceae 1—2. Racemus 3—4 pollicaris. Bractee triangulae apice setaceae ovarii pedicellatis triplo breviores. Flores illis *E. cornuti* Lindl. triplo minores. Sepala lanceolata acuminata: tepala lineariligulata subbreviora: labellum cum gynostemio descendentem angulatum, lobi laterales quadrati erecti, margine externo minutissime crenulati, lobus medius linearilanceus; carina triangula projecta utrinque inter lobos laterales antice in carinam longitudinalem lobi medii excurrentes. Peru. Warscewicz.

191. EPIDENDRUM KLOTZSCHEANUM H. G. Rehb. Linn. XXII. p. 838. Huc Lindl. l. c. 150.

E. spathis geminis acutis maculatis, racemo cernuo elongato, bracteis lanceolatis cuspidatis, sepalis oblongis acutis, petalis lanceolatis acutis, labelli trilobi lobis lateralibus rotundatis medio producto acuto lineis 3 elevatis, callis 2 magnis in basi, clinandrio subintegro.

Wild in Venezuela; cool places in the woods of the Sierra Nevada of Merida, in January — Moritz 1069. — Stems very strong. Leaves longish, acute. Flowers brown. — Rehb.

Epidendrum Klotzschianum Rehb. fil. in Bonpl. II. 20. Caracas. Wagener.

192. EPIDENDRUM PARVIFLORUM Fl. Peruv. Syst. 245. L.O. n. 68. Huc Lindl. l. c. 152.

E. caule stricto gracillimo, foliis membranaceis lineari-lanceolatis acuminatis, racemi furcati tenuis pedunculo spatha angustissima brevior, sepalis coriaceis, petalis filiformibus, labelli trilobi laciniis integris, lateralibus rotundatis, intermedia divaricatim biloba, venis 3 elevatis.

Wild in Peru; Jambrashamba — Mathews, 1900 (v. s. sp. in hb. Hooker). — The slenderest species of this group. Stems not thicker than a knitting needle, about one foot high. Spathe about two inches long, extremely narrow and fine-pointed.

193. EPIDENDRUM ARMENIACUM Lindl. in Bot. Reg. t. 1867. Huc Lindl. l. c. 153.

E. caulibus teretibus erectis, foliis lanceolatis coriaceis acutis subplicatis, racemis pedunculatis cylindraceis nutantibus, bracteis setaceo-acuminatis, sepalis patulis ovatis acutis, petalis setaceis, labelli subcucullati laciniis lateralibus rotundatis, intermedia ovata acuminata, callo magno oblongo integro acuto in discum.

Encyclia macrostachya Pöppig and Endl. N. G. et Sp. 2. t. 114.

Wild in Peru; on trees near Cuchero; flowering in December — Pöppig; in Brazil — Miers (v. v. c. et s. sp. in hb. Miers). — Flowers small, apricot-coloured, in a slender drooping spike. Leaves sometimes grassy, sometimes lanceolate.

b. Spatha subsimplex. Flores subumbellati.

194. EPIDENDRUM SCUTELLA Lindl. in Bot. Reg. 1844. misc. 82. Huc Lindl. l. c. 154.

E. foliis coriaceis ovato-lanceolatis distichis, spatha brevi lata acinaciformi pedunculo aequali, racemo umbellato paucifloro, sepalis petalisque lanceolatis, labello oblongo cordato plano obsolete bicalloso.

Wild in Peru; in the woods of Guayan, on the western slope of Pichincha, near Quito — Hartweg (v. s. sp.) — Flowers greenish yellow, very large. Lip full an inch long. Spathe very broad, about an inch and half long. Lip an inch and half long.

— Rehb. fil. in Bonpl. II. 20. Merida. Herr Wagener fand es nie mehrblüthig, wie Herr Hartweg.

195. EPIDENDRUM LAGOTIS Rehb. fil. in Bonpl. III. 68.

Aff. Scutellae tepalis cuneato-oblongis obtusiuscule acutis, labello oblongo basi cordato basi bilobulo calloso.

Caules adsunt quadri- ad quinquepollicares. Folia carnosae oblongae utrinque attenuata apice obtusae nunc retusiusculae. (7 in caule, an ramo?). Spatha basi angustata, apice acuta, utrinque extrorsum curvata. Pedunculus a spatha obtectus; biflorus. Ovaria pedicellata pollicaria (rugulosa, quod ex exsiccandi methodo videtur exortum). Sepala cuneata oblonga, acutiuscula. Tepala subaequalia apice paulo latiora. — Blüthe nur halb so gross wie die des *Epidendrum Scutella* Lindl., „grün“. „An Bäumen. März.“ Ocanna, Wagener.

196. EPIDENDRUM TENAX Rehb. fil. in Bonpl. II. 20.

Caule tripollicari gracilento valido, verruculoso, bifolio, vaginis brevibus, laminis lineari ligulatis (2 pollices longis, supra basin dilatatis, $\frac{1}{3}$ pollicem latis) apice microscopice serrulatis, spatha magna coriacea ancipiti a latere dorsali recta, latere aperto semilunata, flore solitario, brevipedunculato, prope eunciculato (albo ex sicco), sepalis lineariligulatis apice obtuse acutis, tepalis subaequalibus linearibus, labelli lamina libera cordata oblongoligulata acuta, basi antecolumnari obsoletissime

tricarínulata, gynostemii abbreviati crassi apice trilobi lobo medio ad-cendente.

Blüthe halb so gross, als die des vorigen. Wagener.

197. EPIDENDRUM GEMINIFLORUM Humb. et Kunth Nov. Gen. et Sp. Pl. I. 354. LO. p. 102. Huc Lindl. l. c. 155.

E. caule repente ramoso, foliis oblongis obtusis coriaceis, pedunculo paucifloro e spatha pollicari orto, floribus coriaceis, sepalis lanceolatis acuminatis patulis margine revolutis, petalis conformibus planis, labello ovato cordato subcucullato trilobo: lobis lateralibus rotundatis ab inter-medio sinu brevi sejunctis, callis 3 linearibus elevatis intermedio minore.

Wild in Peru; Popayan, on the trunks of trees — Hartweg; Valley of Lloa — Jamieson: in shady mountain places, at the height of 7400 feet — Humboldt and Bonpland (v. s. sp.) — Stem with dwarf, stiff, erect side branches. Flowers middle-sized, very fleshy, with extremely sharp-pointed divisions, yellowish green, according to Hum-boldt and Bonpland. Dr. Jamieson's Lloa specimens in the Hookerian Herbarium have broader leaves, and larger flowers, which are also more numerous than in those from Popayan, brought home by Hartweg.

198. EPIDENDRUM PORPAX Rehb. fil. Bonpl. III. 220.

Juxta E. viridibrunneum Rehb. fil. pusillum, foliis ligulatis obtuse acutis vix pollicaribus perpendicularibus, spatha oblique fissa ancipiti uniflora, sepalis lateralibus gynostemio labellique ungui basi adnatis triangulis, tepalis linearibus acutis, labello ovato basi ima minute bi-callosa, gynostemii androclinio cucullato elevato.

Flores illis E. piperini Lindl. paulo majores, flavi, labello rufo. Ovarium pedicella-tum spatha triplo longius. Spathae siccae rufonigrae. In monte Pantasma in Segovia. Oersted.

199. EPIDENDRUM PEPEROMIA Rehb. fil. in Bonpl. II. 20.

Habitu Centropetali distichi, caulibus bipollicaribus, foliis ligulatis acutis distichis, spathis 2 cucullatis retusis apiculatis, flore solitaria vix cuniculato, sepalis lanceolatis acutis, lateralibus dimidiatis, tepalis angustissime linearibus, labello toti gynostemio adnato, lamina libera cor-data rotunda emarginata, carinis 2 in basi abbreviatis.

Blätter $\frac{3}{4}$ Zoll lang, $\frac{1}{4}$ Zoll breit. Blüthe so gross, wie die des Epidendrum latila-bre Lindl. Die Art könnte als ein einblüthiges Amphiglottium betrachtet werden. Es reiht sich auch an Euepidendrum Folia 2456, allein der künstliche Charakter zweier Scheiden entfernt es. Caracas. 5000'. Mai. Wagener.

200. EPIDENDRUM VIRIDIBRUNNEUM Rehb. fil. MSS. Huc: *Epidendrum Centropetalum* Rehb. fil. in Bonpl. III. 68.

Juxta Epidendrum megagastrium foliis lineari-lanceolatis acutis acu-minatis, spatha ancipiti apiculata ostio aperto extrorsum acuta, margine altero recto, labello ovali minute denticulato.

Planta pusilla repens habitu Centropetali. Folia vix pollicaria valde coriacea illis Sar-canthi rostrati comparanda. Spatha submembranacea. Sepala lanceolata acuta. Te-pala linearia acuta. Labellum nunc ante gynostemium obscure bicarinulatum? Vide-tur ibi impressum. — „Blüthen grün mit braun.“ März. 5000'. Ocanna. Wagener.

201. EPIDENDRUM MEGAGASTRIUM. Huc Lindl. l. c. 156 :

E. caule repente ramoso, foliis ovato-oblongis obtusis coriaceis, pe-dunculo paucifloro e spatha duplici laxa abbreviata orto, floribus valde carnosus, sepalis petalisque lanceolatis planis, labello cordato ovato cucullato indiviso basi 2-lamellato area aspera triangulari interposita, cuni-culo maximo ventricosus.

Wild in Peru; on trees in the province of Chachapoyas — Mathews (v. s. sp.) —

Very like *E. geminiflorum*, but the flowers are larger, more fleshy, and have a long distended pouch in front of the ovary. The lip is undivided, has only two calli, and in place of the intermediate lamella there is a dull triangular space, covered with minute asperities.

202. EPIDENDRUM LACUSTRE. Huc Lindl. l. c. 157:

E. foliis latis obtusis, spatha duplici suprema acinaciformi, racemo brevi umbellaeformi, pedunculis ovariisque 4-plo longioribus, sepalis petalisque linearibus acuminatis patentissimis, labello subcordato-ovato acuminato obsolete trilobo, callis baseos acutis linea elevata interjecta.

Epidendrum leucochilum Lindl. Orch. Linden n. 47. nec Klotzsch.

Wild in Venezuela; on half-submersed rotten trees in the marshes of Laguneta, in the province of Merida, at the height of 8000 feet — Linden 684 (v. s. sp.) — This is described as being from three to four feet high, with the purest white flowers. They are two inches and a half across, and consequently among the largest in the genus.

203. EPIDENDRUM LEUCOCHILUM Klotzsch in Allg. Gartenz. 11, p. 146. Ic. Plant. rar. herol. t. 46. Paxton's Flower Garden III.; gleanings n. 622. ic. 303. Huc Lindl. l. c. 158.

E. foliis coriaceis obtusis, spatha magna solitaria pedunculo longiore, umbella brevi cernua, sepalis petalisque lineari-lanceolatis patentissimis, labelli trilobi lobis lateralibus magnis oblique orbiculatis, intermedio ovali basi bicalloso lineisque tribus elevatis, clinandrio cucullato truncato.

Epidendrum flavidum Lindl. Orch. Lind. n. 48.

Wild in New Grenada; terrestrial in the cold region near Chitaga in the province of Pamplona, at the height of 9000 feet; April — Linden 2213; Funck and Schlim 1084; province of Ocanna, near S. Pedro, at the elevation of 6000 feet — Schlim 743; Caracas — E. Otto at the height of 4500 feet (v. s. sp. comm. cel. Linden). — A very fine caulescent plant. Leaves coriaceous, oval, acute. Flowers green, with a snow-white lip. In Funck and Schlim's 1084, the calli at the base of the lip are wrinkled, and seem almost three-lobed and the spathe is not more than three-quarters of an inch long. When the Orchidaceae Lindenianae were published, I only knew this plant by the specific character and description given of it in the Allgemeine Gartenzeitung; and I then supposed it to be different from what a figure in the Icones Berlinenses now shows it to be. Under this misapprehension, when I found it among Mr. Linden's Orchids (n. 2213), I thought it new, and called it *E. flavidum*, an error which is now corrected.

Epidendrum leucochilum Klotzsch. Rehb. fl. in Bonpl. II. 20. „Paloma blanca.“ Barbacoas. März. 4000'. Wagener.

204. EPIDENDRUM LONGIFLORUM Humb. et Kunth. Nov. Gen. et Sp. Pl. I. 354. LO. n. 45. Huc Lindl. l. c. 159:

E. foliis oblongis obtusis, racemi nutantis pedunculo spatha maxima brevior, sepalis petalisque lanceolato-linearibus acuminatis margine revolutis, labelli tripartiti laciniis lateralibus ovatis oblique truncatis revolutis: intermedia lineari cuneata mucronata margine revoluta duplo longiore, callis 2 lineisque 3 elevatis.

Wild in New Grenada: on the slope of Mount Puruguay, a lofty point in the Andes near the village of Aguacillas, at the height of 8880 feet — Humboldt and Bonpland; Popayan, near the village of Sotara — Hartweg (v. s. sp.) — A most noble plant, with yellow flowers more than four inches across. Some of the leaves are about a foot long.

205. EPIDENDRUM SPECTATISSIMUM Rehb. fl. in Bonpl. III. 68.

Affine *E. longifloro* Hb. B. Kth, callis 2 in basi antrorsum rhombeis bidentatis, labelli partitione media lancea acuminata (nec apiculata uti in *Epidendro longifloro* tantum ex speciminibus Hartwegianis nobis cog-

nito), partitionibus lateralibus more Epidendri leucochili juxta gynostemium, antice retusis, extrorsum semiovatis, basi alte semicordatis, androclinio more Epidendri longiflori apice angusto bidentato.

Caulis quadripedalis. Folia oblonga apice attenuata obtuse biloba. „Spatha magna apice acuta.“ Racemus cernuus multiflorus. Bracteae lanceo cuspidatae ovariiis pedicellatis bi- ad tripollicaribus multo breviores. Sepala lanceolata acuminata. Tepala triplo angustiora basi cuneata. — Blüten so gross wie die des Epidendrum longiflorum Hb. Kth., nur sind sind die Blütenstiele nebst Fruchtknoten viel kürzer; Hülle grün, Lippe weiss. 6000'. Auf der Erde. März. Ocanna. Wagener.

c. Spatha subsimplex. Flores paniculati.

206. EPIDENDRUM TOVARENSE H. G. Rehb. Linnaea XXII. p. 838. Huc Lindl. l. c. 160.:

E. spatha brevi acuta carinata(?), panicula pauciflora, bracteis minutissimis squamaeformibus acutis, sepalis oblongis obtusis, petalis subaequilongis basi cuneatis, labello trilobo lobis lateralibus semiovatis aliquid cuneatis basi bicallosis medio cuneato rotundato antice emarginato margine hinc inde minute denticulato.

Wild in Colombia; Tovar — Moritz 851 (Rehb.) — Leaves few, rather long, sharp-pointed. Flowers white, pink on the outside. — Rehb.

— Rehb. fl. in Bonpl. II. 20. Caracas. 6000'. Wagener.

Obs. Huc forsan pertinebit „Epidendrum sinuosum Lindl.“ Regel Gartenflora II. p. 324. Tab. 69.: Caule pedali apice compresso, foliis distichis elongato-lanceolatis acutis, racemo terminali brevi erecto, spatha carinata oblonga compressa racemo paulo brevior, bracteis minutis, sepalis lineari-cuneatis petalisque lineari-cochleariformibus margine revolutis; labello trilobo, lobis lateralibus semicordatis acutis postice plicatis denticulatisque, lobo intermedio rotundato basi callis duobus in lineas excurrentibus lineaque elevata interjecta, columna labello adnata. — Flores albi, fragrantis.

207. EPIDENDRUM MESOMICRON. Huc Lindl. l. c. 161.:

E. foliis brevibus oblongis obtusis, racemo basi subpaniculato e spatha brevi obtusa, bracteis linearibus acutis patulis, floribus carnosis, sepalis oblongis petalisque linearibus acutis, labelli trilobi laciniis lateralibus rotundatis serrulatis intermedia parva carnosa ovata per medium obtuse carinata, callis baseos 2 acutis 2que minoribus exterioribus clinandrio margine tenui cincto.

Wild in Bolivia — Bridges (v. s. sp.) — Stem a foot long, Leaves five inches long by one inch and a half broad. Flowers when dried black and brittle. The five calli are remarkable; that in the middle being large, deep, and reaching to the point of the middle lobe of the lip, those next it free at the point, and the outer ones small, but very distinct.

208. EPIDENDRUM AMPLEXICAULE. Huc Lindl. l. c. 162.:

E. vaginis scabris, foliis oblongis amplexicaulibus acuminatis papyraceis, panicula laxa cernua flexuosa, spatha angusta pedunculo longiore, bracteis linearibus acuminatis herbaceis ovario aequalibus, sepalis acutis lateralibus valde obliquis, petalis linearibus acutis venosis, labelli lobis subaequalibus oblongis truncatis apice dentatis lateralibus obliquis, callis 2 elongatis, clinandrio integro.

Wild in Peru; Quito — Jamieson (v. s. sp. comm. cel. Jamieson A. D. 1849). — The habit of this is almost that of some thin-leaved Evelynia. Leaves three inches and a half long by one inch and three-quarters wide. Flowers the size of E. nutans.

209. EPIDENDRUM EXCISUM Lindl. in Bot. Reg. 1844. misc. 82. n. 14. Huc Lindl. l. c. 163.:

E. foliis latis oblongis apice rotundatis excisis, spatha brevi lata

coriacea pedunculo longiore, floribus laxè paniculatis, petalis filiformibus, labello basi bicalloso laciniis lateralibus cordatis obsolete crenulatis, intermedia lineari divergenti cuneata retusa.

(B) *grandiflorum*. Flowers with all the parts larger and broader.

Wild in Peru; on the ascent to Sotara, near the village of Tortoro in Popayan — Hartweg; B. rocky banks, Chachapoyas — Mathews 3182; Santa Martha — Purdie (v. s. sp.; B. in hb. Hooker). — This is much like *E. floribundum*, of which it has the habit, but it has a great sheathing spathe. The variety B sometimes forms great horizontal cucullate spathes, not unlike those of *E. spathaceum*; this is observable in Purdie's specimens.

210. EPIDENDRUM MODESTUM Rehb. fl. et Warscew. in Bonpl. II. 110.

Aff. *E. exciso* spathis minoribus, inflorescentia compacta, labello trilobulo, lobulis posticis semirobundis basi alte cordatis lobo medio ligulato brevi retusiusculo, linea media carinata, additis utrinque carinulis 2 in basi.

Folia coriacea oblonge attenuata obtusiuscula, spathae ancipites profunde fissae apice carinato cucullatae, 3 — pollicares, panícula pauci- et longius ramosa, rami polyanthi, bracteae lineares minutissimae, sepala ligulata acuta, lateralibus margine inferiori obliqua, tepala ab angustissima basi linearia, validissime uninervia, labellum trilobatum, lobuli postici semirobundati basi alte semicordati, margine minute denticulati, sinus inter illos ac lobum medium obtusanguli, lobus medius brevis ligulatus, retusiusculus cum apiculo, calli ancipites obtusi erecti 2 in basi, addita carinula minutissima utrinque, linea media carinata. — Vom Ansehen des *E. excisum* Lindl., welches ganz breite, stumpfe, mehr lederartige Blätter, grössere, auch mehr lederartige Scheiden, eine schlaffe Inflorescenz und eine ganz verschiedene Lippe zeigt. Peru. Warscewicz.

d. Spathae plures imbricatae.

211. EPIDENDRUM RAPHIDOPHORUM. Huc Lindl. l. c. 164.

E. foliis oblongis obtusis, racemo crasso pendulo spathis pluribus maximis foliaceis longiore, bracteis rigidis acicularibus inferioribus aequalibus, sepalis coriaceis oblongis lateralibus abrupte acuminatis, petalis linearibus reflexis, labelli lobis lateralibus acinaciformibus obsolete denticulatis intermedio oblongo truncato apiculato apice concavo, callis 2 lineaque intermedia.

Wild in the Caraccas; the Silla, at the height of 6500 feet — Funck and Schlim 182; same place, at the entrance of the Paramo de los Conisos . . . ? 1180 (v. s. sp. comm. cel. Linden). — A strong coarse plant, with the habit of *E. nutans*, but distinct in its great spathes and long stiff needle-like bracts. Flowers white, according to Funck and Schlim, flesh-coloured according to my n. 1180, procured by the same unknown collector as he, who obtained *E. sinuosum*.

212. EPIDENDRUM OCHRIODES. Huc Lindl. l. c. 165.

E. spatha foliacea pedunculo longiore, racemo denso multifloro nutante, bracteis minutis setaceis, floribus carnosis, sepalis oblongis cuspidatis, petalis linearibus, labelli trilobi laciniis subintegris, laciniis lateralibus rotundatis intermedia retusa cuneata, callis 2 conspicuis lineaque interjecta obsolete.

Wild New Grenada; at Matanzas, in Pamplona, at the elevation of 7000 feet; Nov. — Schlim 136 (v. s. sp. comm. cel. Linden). — A plant with the habit of *E. nutans*; the flowers are not panicled, but in a dense cylindrical raceme six inches long, and there is a large herbaceous spathe at its base. Flowers pale violet.

213. EPIDENDRUM SPATHACEUM Lindl. in Hooker's Journ. III. 85. Huc Lindl. l. c. 166. :

E. racemis alternis densissimis pendulis spathis foliaceis falcatis con-

duplicatis vix longioribus, sepalis rigidis striatis acutis, petalis filiformibus, labelli trilobi laciniis lateralibus obtusis postice obsolete crenulatis, intermedia ovali obtusa basi bilamellata linea elevata interjecta brevioribus.

Wild in Peru; obtained by Mr. Matthews out of the herbarium of Ruiz and Pavon, preserved at Lima; New Grenada; in the province of Pamplona, near Matanzas, at the height of 6000 feet; February — Schlim 110; Mariquita — Triana 125 (v. s. sp. in hb. Hooker et comm. cel. Linden). — The masses of inflorescence of this plant are upwards of one and a half foot long, and consist of dense racemes proceeding from the axil of falcate spathes, so as to have a great resemblance to that of some Palm. „Flowers white and pink. Leaves thick, leathery“. — Schlim.

Epidendrum spathaceum Lindl. Rehb. fil. in Bonpl. II. 282. Neu-Granada. n. 1197. Schlim.

214. EPIDENDRUM RANIFERUM LO. 64. Bot. Reg. 1842. t. 42. Huc Lindl. l. c. 167.:

E. foliis distichis lanceolatis, spathis plurimis equitantibus obtusis pedunculo aequalibus, racemis terminalibus lateralibusque divaricatis multifloris, sepalis oblongis convexis obtusis petalisque linearibus mucronulatis patentissimis, labelli sexlobi basi 2-callosi laciniis integerrimis dentatisque; posticis latioribus — intermediis linearibus — anticis linearibus obtusis retrorsum falcatis.

(A) Lobes of the lip all toothed at the point.

(B) Back lobes of the lip rounded, others linear blunt, all entire.

(C) *luteum*. Flowers bright yellow, with red spots and a whiter lip. Back lobes of the lip confluent, plaited and lacerated.

Wild A in Mexico — Pavon; B and C in Demerara — Schomburgk 424 (v. v. c. et s. sp.) — Something like *E. nutans*. Flowers greenish, marked with rich purplish brown spots. The species varies in the amount of tothing observable in its lip. In the specimen originally described the divisions were perfectly entire; in others they are all toothed.

In the variety C. which flowered with Mssrs. Loddiges, the lip is not six-lobed, but three-lobed only, with the middle lobe emarginate. The lateral divisions are rounded, lacerated, and crisp, like those of some *Amphiglott*.

215. EPIDENDRUM CNEMIDOPHORUM. Huc Lindl. l. c. 168.:

E. spathis plurimis foliaceis equitantibus obtusis, racemo brevi multifloro sessili cernuo, bracteis linearibus, sepalis oblongis obtusis, petalis linearibus, columna sigmoidea, labelli lobis carnosissimis integerrimis lobis lateralibus rotundatis intermedio cuneato bilobo rotundato, callis 2 maximis lineisque tribus elevatis quarum intermedia major.

Wild in Guatemala — Skinner (v. s. sp. comm. cel. Skinner). — Leaves long, broad, acute. Spathes ten, closely imbricated, forming a sheath nine inches long in the specimen before me, just as in *raniferum*. Flowers fleshy in a short raceme scarcely longer than broad.

216. EPIDENDRUM DISCOIDALE. Huc Lindl. l. c. 169.

E. foliis ellipticis acutissimis, racemi brevis pedunculo spathis pluribus equitantibus acutissimis brevioribus, floribus carnosissimis, bracteis minutis apice setaceis, sepalis oblongis obtusis, petalis linearibus canaliculatis, labelli transversa circularis lobulo terminali truncato callis 2 acutis lineaque intermedia elevata.

Wild in Dominica — Dr. Imray (v. s. sp. hb. Hooker). — Stem one to one and a half foot high. Leaves six inches long. Flowers erect, larger than in *E. nutans*, their stalks an inch long. In the centre of the lip is a circular dull space, which seems to be connected with some peculiarity of colour, the nature of which cannot be determined from dry specimens. Much like *E. Clowesii*, but a stouter plant, with flowers very much larger, and a widely different lip,

217. EPIDENDRUM CLOWESII Bateman in Bot. Reg. 1844. misc. p. 16. Huc Lindl. l. c. 170.:

E. foliis lanceolatis acutis racemo basi spathaceo erecto longioribus, bracteis minimis mucronatis, floribus carnosis, sepalis oblongo-linearibus, petalis filiformibus reflexis, labelli lobis subundulatis rotundatis intermedio bilobo majore, callis 2 minutis cum lineis duabus elevatis lateralibus confluentibus linea intermedia abrupte cis apicem evanida.

Wild in Guatemala — Bateman (v. v. c.) — Although in the only specimen of this plant which I have seen, the spathes of the peduncle are not in the leafy state, that is required for a Spathian Epidendrum, on which account I formerly placed it among Amphiglotts, yet it has so close an affinity to *E. discoidale*, that I am led to believe my specimen to be starved, and that the spathes which do exist are imperfect, in which case they would in a more natural condition acquire a leafy character. The stem is leafy throughout its whole length. The leaves are nearly six inches long. The raceme short with about fifteen flowers; its peduncle being enclosed in several equitant spathes. Flowers yellowish white, sepals four to five lines long, their stalk about the same length. I formerly overlooked the calli, which are small and not easily distinguished from the raised lateral lines, which proceed from them.

218. EPIDENDRUM XANTHOLEUCUM H. G. Rehb. Linn. XXII. p. 839. Huc Lindl. l. c. 171.

E. spathis numerosis fastigiatis acutis, racemo recurvo multifloro, bracteis minutis acutis, sepalis oblongis obtusis cuneatis, sepalis linearibus apice dilatatis, labelli trilobi lobis lateralibus rotundatis sinu obtuso disjunctis a lobo medio abbreviato cuneato antice bilobulato, callis 2 maximis linea longa elevata interjecta.

Wild in Venezuela; at Chachopo in the province of Merida; at the height of 9000 feet — Funck and Schlim 852 (v. s. sp. comm. cel. Linden). — Stem a foot and more high, clothed with long obtuse leaves. Spathes numerous, collected in a cluster at the foot of the raceme, which is eight inches long and almost parallel with the stem down which it hangs. Flowers yellowish with a white lip.

219. EPIDENDRUM HARRISONIAE Hook. in Bot. Mag. t. 3209. Huc Lindl. l. c. 172.

E. caule folioso tereti, foliis elongato-obtusis cum mucrone, pedunculo flexuoso elongato spathis pluribus acuminatis vestito, racemi 7—8-flori abbreviati nutantis axi pedunculo multo brevioris, bracteis squamiformibus acutis, sepalis petalisque oblongis coriaceis obtusis his paulo angustioribus, labelli carnosii tripartiti cordati basi bituberculati laciniis lateralibus oblongis truncatis intermedia cuneata apiculo reflexo.

Epidendrum acridiforme Booth in Bot. Reg. 1845. misc. n. 12.

Wild in Brazil; on rocks in the Organ Mountains; April — Gardner 5868 (v. v. c. et s. sp. in herb. Hooker). — This plant in habit and mode of growth bears some resemblance to *E. nutans*. Flowers green, sometimes touched with reddish brown.

§ 9. *Amphiglottium* Lindley in Hooker's Journal of Bot. III. 81; Bot. Reg. 1844. misc. 24. Amphiglottis, Salisbury in Hort. Trans. I. 261.

The character of Amphiglott Epidendrums consists in a long leafy stem with distichous leaves, an absence of any tendency to form pseudobulbs, a peduncle suddenly covered with close sheaths, and a lip wholly united to the column. They join the last section of Spathian Epidendrums through *E. Harrisoniae*, which section consists of Amphiglotts in all respects except that the bracts are spathaceous and herbaceous, or foliaceous.

ANALYSIS OF THE SECTIONS.

- Flores vere paniculati A. *Polycladia*.
- Flores racemosi (raro in paniculam racemosam luxuriantes.)
- Labellum indivisum B. *Holochila*.
- " lobatum.
- laciniis omnibus integris C. *Schistochila integra*.
- laciniis laceris.
- lobo medio lamellato D. *Schistochila carinata*.
- lobo medio nudo basi bicalloso E. *Schistochila tuberculata*,

† Labellum liberum seu subliberum. (*Amblostoma* Rchb. fil.)

220. EPIDENDRUM ELEGANS Rchb. fil. MSS. — *Barkeria elegans* Knw. et Westcott Floral Cabinet II. t. 49. : Sepals spreading or reflexed, somewhat connate at the base. Petals somewhat equal or a little broader. Lip free, parallel with the column, flat or compressed, furrowed, winged, resting upon the lip. Anther fleshy, 4-celled, — Perigonii foliola roseo-lilacina, gynostemium superne album apice flavum purpureo apiculatum, maculis purpureis, inferne viridi, alis albis purpureo adpersis.

— Bot. Reg. XXIV. 1838. sub T. 20.

Sepala patentia vel reflexa, basi subconnata; petala subaequalia vel paulo latiora; labellum liberum, cum columna-parallelum, limbo indiviso, disco costato; columna elongata, plana vel compressa sulcata, alata, super labellum incumbens; anthera carnosa, 4 locularis, septum marginibus membranaceis; pollinia 4, caudiculis totidem ligulatis reflexis, per paria subconnatis.

Herba epiphyta Mexicana, pseudobulbosa (?) foliis alternis, vaginantibus, subcarnosis, scapo terminali racemoso. Knw. et West. Floral Cabinet. 7.

Barkeria elegans Knw. West. The only species mentioned is *B. elegans*, a beautiful Mexic. plant, with delicate lilac flowers.

— Bot. Reg. XXVI. 1840. Misc. 57. :

Sepala et petala aequalia, libera, membranacea, patentissima; labellum planum integerrimum, nudum (cuneatum c. apiculo) columnae adpressum; columna petaloidea; anthera 4 locularis, carnosa, septorum marginibus membranaceis; pollinia 4, caudiculis totidem ligulatis reflexis, per paria connatis.

Herba epiphyta, caulibus fusiformibus carnosis. Fol. angusta, membranacea, nervosa, Pedunculi longi, graciles, squamati, terminales, apice ramosi. Flores magni, conspicui, nutantes. — An elegant little Mexic. Orch. plant, with tapering fleshy stems like those of a meagre *Cynoches*, narrow lanceolate acuminate membranous leaves and a terminal inflorescence, in the form of a raceme of a few large bright pink flowers. Well fig. in Floral Cab. and rivals the *Cattleyas* in gaiety of appearance. Diff. of cultivation, great rarity.

— Brogniart. Ann. sc. nat. XVII. 1842. p. 44. :

Sepala aequalia, libera, patentia vel reflexa; petala expansa rotundato unguiculata sepalis aequalia; labellum integrum planum membranaceum obovatum, apice emarginatum, basi incrassatum non callosum; columna labello arcto appressa, libera, late marginato-alata subpetaloidea apice utroque latere tuberculata. Clinandrium membrana sinuata marginato-auriculatum; anthera opercularis 4 locularis, loculis septis margine membranaceis distinctis; pollinia 4, caudiculis crassiusculis replicatis geminatim postice unitis; stigma parvum triangulare. Ovarium gracile trigono cylindricum sulcatum; calcar infundibuliforme e basi labelli et columnae nascens, in ovario reconditum ejusque dimidiam partem aequans.

Diff. a *Broughtonia* sepalis reflexis, lateralibus, labello et columna liberis, columna late alata elongata, calcare non ovario adnato sed immerso.

Barkeria elegans? Knw. et Westr. 49.

var. β . foliis oblongo-lanceolatis laevibus subnervibus, nervo medio tantum distincto, scapo subunifloro. (Mexico D. Ocampo.) — Caules fasciculati, ramis arborum impositi, carnosus, elongato fusiformes, 3—5 pollicares subtetraphylli, vaginis foliorum nervosis vestiti, quandoque abbreviati subbulbiformes. Folia aequae distantia laete virentia, limbo oblongo-lanceolato acuto laevi subcarnoso, nervo medio infra carinato. Scapus terminalis gracilis squamosus uniflorus (2—3 fl., florib. abortiv.).

— Bot. Mag. 4784. — Pescatorea l. 10. — Van Houtte Flore des Serres IX: 959.
— Lem. ill. hort. tab. 23.

221. EPIDENDRUM MELANOCAULON Rehb. fil. MSS. Huc: *Barkeria melanocaulon* Rich. et Gal. tab. 19.

Caule erecto, tereti, atropurpureo; foliis approximatis ellipticis acutis; flor. roseis; sepalis internis obtusis.

Mexico. — Annales des sc. nat. 1845. Janv. p. 22.

222. EPIDENDRUM LINDEYANUM Rehb. fil. MSS. Huc: *Barkeria Lindleyana* Batem.

Foliis ovalibus acutis, bracteis linearibus pedunculo multo brevioribus; labello exacte oblongo apiculato bicarinato carina altera sub apice interjecta, unguiculato plano basi columnae adnato, columna clavata alata apice tridentata immaculata.

Appearance of Epidendrum Skinneri, with which it would be conf. But it has the winged column, and the labellum with a thin membranous border down far below the head of the column. It is however to be observed, that in the original *Barkeria* the labellum was absolutely free and sessile; while in the present species it has a distinct unguis connate with the base of the column. — Flowers of a rich deep purple; sepals and petals of equal size, linear lanceolate, directed forwards in the same manner, as in the original species; the petals are rather broader than the sepals. Labellum $\frac{3}{4}$ " long, exactly oblong rich purple, except nearly white in the mid. The anther is sunk with in the 3 teeth of the column, and is depressed in the middle while it is elevated at each side; it is very fleshy, and contains 4 cells, in which are located as many pollenmasses, each having a powdery strap bent back upon it. — Costa Rica. Skinner. — Floruit plusquam 7 hebdom. ap. Batem. — Bot. Reg. XXVIII 1842. Misc. 5. — Bat. Orch. Mex. 1842. tb. 38.

223. EPIDENDRUM SPECTABILE Rehb. fil. MSS. Huc: *Barkeria spectabilis* Batem. in Litt. Bot. Reg. XXVIII. 1842. Misc. 45.

Racemo multifloro laxo, labello ovato-lanceolato tricarinato, sepalis lineari-lanceolatis, petalis ovatis acuminatis.

Under the name of *Flor de Isabel* the plant forms one of the votive offerings of the Guatemalense. It forms a tuft of cylindrical stems about 4—5 inches high, each of which bears two fleshy lanceolate acute leaves, separated from each other by intervals of about an inch. The raceme arises out of some brown dry sheaths, and in the plants that have flowered bears about six most lovely nodding blossoms: but according to a memorandum from M. Skinner now before me, it varies in length from 3 inches — a foot: and indeed I possess a wild specimen from that gentleman with as many as twelve flowers in a raceme. The expanded flowers are nearly 3 inches and a half wide, their colour is a bright lilac, the sepals are linear lanceolate, the sepals ovate-lanceolate in form and unspotted but the labellum is white at the base and in the middle, lilac at the edge and point, and richly marked with small blood red spots. Along its middle, below the column are five purple lines, which pass into three elevated colourless ridges, beyond the place where the anther touches the lip.

— Bat. Orch. 33: Caulibus brevibus foliosis 2 — phyll. — Guatemala. Skinner. Hartweg. Mexico. Karwinski.

224. EPIDENDRUM PENTADACTYLUM Rehb. fil. in Seemann Bonpl. II. 89. :

Labelli quinquepartiti callo depresso antice bidentato per discum communem.

Caulis bipedalis arcte vaginatus gracilis apice tenui ramosus; rami ascendentes — 7 foliati. Vaginae asperulae. Laminae ligulatae acutae gramineae — 3 pollices longae, $\frac{1}{2}$ " latae. Racemus capitatus basi unisquamatus, densiflorus, pluriflorus (1,5" longa perigonia!), cernuus. Bractee lanceae ovario pedicellato gracili multo breviores. Sepala ac tepala paulo latiora oblonga acuta. Labelli unguis ima basi cum gynostemio connatus, partitiones posticae ligulatae apice exciso bilobae divaricatae; anterior-

res lineares obtusatae; lobus anticus ligulatus apice retuso hinc crenulato bilobulus. Gynostemium bene ampliatum, pro genere latum. Iraru. 9000'. Oersted. — Rchb. fl. Xenia I. Tab. 48. I. 1—4.

†† Labellum adnatum.

A. *POLYCLADIA*.

a. Panicula effusa pyramidalis.

225. EPIDENDRUM NUTANS Swartz Fl. Ind. Occ. I. 1499; Hooker Exot. Bot. I. t. 50. L.O. n. 44. Huc Lindl. l. c. 173.:

E. foliis oblongis distichis undulatis obtusis, panicula divaricata nutante multiflora ramis basi spathaceis, sepalis oblongo-lanceolatis petalisque lineari-lanceolatis obtusis patentibus, labelli trilobi lobis lateralibus subrotundis, intermedio transverso truncato apiculato basi bicalloso venis tribus elevatis.

(B) *dipus*. Middle lobe of the lip divided into two linear arms. Flowers brownish green with a white lip.

Epidendrum dipus Lindl. in Bot. Reg. 1845. t. 4.

Wild in the West Indies; mountains on the west of Jamaica — Swartz; B. Brazil in rocky places — Von Martius (v. v. c. et s. sp.) — Flowers sweet-scented in the evening, quite green in general, but brown-green and white in B., which has a shorter and more compact inflorescence, and a differently shaped lip, but which I do not now regard as a species.

226. EPIDENDRUM PANICULATUM Fl. Peruv. Syst. p. 243. L.O. 61. Huc Lindl. l. c. 174.:

E. foliis oblongis acuminatis, pedunculo vaginis acuminatissimis membranaceis vestito, panicula composita divaricata, bracteis pedicello brevioribus, sepalis oblongis, petalis filiformibus, labelli quadrilobi laciniis posticis brevibus semicordatis obtusis: anticis linearibus divaricatis, callis duobus lineisque 3 brevibus elevatis contiguus.

Epidendrum laeve Lindl. in Bot. Reg. 1844. p. 17.

(B) *longicrure*. Leaves very acuminate. Front lobes of lip very long and falcate.

(C) *cuspidatum*. Leaves oblong, suddenly cuspidate.

Wild in Peru; Popayan — Hartweg: New Grenada — Funck and Schlim 1448; Schlim 68; Venezuela — Funck and Schlim 732; Caraccas — Linden 616; B. Peru — Maclean; Bolivia — Bridges; C. Peru — Matthews (v. s. sp.) — A noble species; its panicle, which is eight or nine inches long and nearly a foot broad, being crowded with flowers. It is common all over tropical South America, varying with a more or less dense inflorescence, and in the colour of the flowers, which are said to be green with a white lip (732), or lilac (68 and 1448), and very sweet-scented. The roughness, which is found on the sepals of some specimens seems to be accidental. The two most striking forms, that I have seen are the varieties B and C.

Epidendrum laeve Lindl. Rchb. fl. in Bonpl. II. 110. Wir glauben, dass das E. syringaeiflorum Wzw. in litt. in die reiche Formenreihe dieser Art gehört, von der wir doch vermuthen möchten, dass sie sich gegen die neuere Ansicht als verschieden von E. paniculatum Ruiz, Pav. ausweisen wird. E. paniculatum kennen wir nur in Exemplaren von Hartweg und Ruiz: die selbst beim Abblühen gedrängte Rispe und die Rauigkeiten an den Kielen der Perigonerven auf der Annsenseite scheinen uns constant. — Rchb. fl. in Bonpl. II. 282. Blüten lila. Sehr aromatisch. Pamplona: la Baja. 8000'. 1849. n. 1174. Schlim.

227. EPIDENDRUM FASTIGIATUM. Huc Lindl. l. c. 175.:

E. foliis anguste oblongis acutis, pedunculo vaginis acuminatis membranaceis vestito, panicula composita rigida pyramidalis, bracteis rigidis

acuminatis pedicellis contortis subaequalibus, sepalis oblongis basi angustatis, petalis filiformibus, labelli quadrilobi laciniis posticis brevibus rotundatis, anticis linearibus divaricatis, callis 2 elongatis costisque 3 crassis axin labelli occupantibus, columna apice carnosa utrinque biloba.

(A) Leaves oblong, six inches by one and a quarter.

(B) Leaves linear oblong, six inches by half an inch.

Wild in New Grenada; province of Mariquita — Triana 127 (A) 136 (B) (v. s. sp. comm. cel. Linden). — Very like *E. paniculatum*, but with a more erect panicle, with stiffer branches, longer and stiffer bracts, and much shorter flowers. Its pollinmasses are four, acuminate, and unequal, the inner of each pair not being one third the size of the others; to each pair is a single replicate strap, proceeding from the blunt end of the masses. This is very like what Mr. H. G. Reichenbach takes as the main feature of his genus *Pseudependrum*.

228. EPIDENDRUM LAXUM Pöpp. et Endl. N. G. et Sp. II. p. 2. Huc Lindl. l. c. 176.:

E. „caulibus repentibus ascendentibus ancipitibus, foliis lanceolato-oblongis acutis, panicula terminali elongata laxa multiflora, sepalis erectis subaequalibus lanceolatis acutis, labelli columna triplo longioris ovalis subcordati apice breviter trifidi nudi laciniis integerrimis intermedia majore acutiore.

Wild in Peru; on trees in woods on the eastern subandine slope, at the farm of Cuchero, in February — Pöppig. — Stems above a foot high on a long creeping rhizome. Leaves seldom more than three on each, with a spiny point. Panicle a foot long or more. Flowers small, pale green.

229. EPIDENDRUM PORPHYREUM Lindl. in Hook. Journ. III. 86. Huc Lindl. l. c. 177.:

E. foliis distichis oblongis acutissimis, squamis spathaceis dense imbricatis acuminatis pedunculo longioribus, panicula simplici multiflora, sepalis oblongis acutis lateralibus falcatis, petalis lineari-spathulatis, labelli trilobi laciniis lateralibus rotundatis intermedia quadrata bidentata: disci axi elevata apicem versus bicallosa basi bicornata.

Wild in Peru; on trees in the Andes of Popayan — Hartweg; woods on the eastern side of Pichincha, at an elevation of 7000 feet — Jamieson (v. s. sp.) — Very like *E. paniculatum*; but abundantly distinct in the customary calli being long and horned, and in the presence of two supplemental calli on each side the main rib of the lip. Flowers larger than in *E. paniculatum*, deep orange red or purple.

230. EPIDENDRUM FUNKII H. G. Reichenb. in Linn. XXII. 839. Huc Lindl. l. c. 178.:

E. panicula multiflora, bracteis brevissimis lanceolatis obtusis, sepalis oblongis acutis, petalis cuneatis apice obtuse trilobis, labelli trilobi lobis lateralibus oblongis latere externo retusis denticulatis, medio cuneato antice retuso, callo bicurvi in basi lamella erecta interposita.

Wild in Pamplona; at an elevation of 7500 feet; January 1847 — Funck and Schlim. 1436. — Leaves rather long, sharp-pointed with wide sheaths. Flowers whitish-tinged with violet. — Rehb. It does not seem clear in Mr. Reichenbach's mind whether this is an *Amphiglott* or not. I cannot find any species to which the definition applies.

Huc: *Epidendrum Funkii* Rehb. fil. 1849. — Rehb. fil. in Bonpl. III. 68. Diese Pflanze begründet noch einige Zweifel, zumal weder von *E. Blephariste* Bark., noch von *E. brachycladium* Lindl. Originale vorliegen. — Die Pflanze von Pamplona 1436 hat einen am Grunde spindelförmig trugknolligen Stamm, welcher an *Schomburgkia* erinnert und wäre so zu beschreiben: *caulis basi fusiformi pseudobulbosus, superne foliosus. Folia sicca pergamenae basi cuneata oblongo-lanceolata 8 pollicaria, prope duos pollices lata. Inflorescentia elongata. Apex Rami laterales curvuli. Bracteae triangulae acutae ovarii pedicellatis breviores. Pedicelli minute velutini. Perigonia abbreviata. Sepala oblonga acuta carinata, lateralia falcata. Tepala spatulata apice trilobula. Labellum transversum trilobum: lobi laterales ligulati extus* VI.

retusi denticulati transversi, lobus medius cuneatus apice truncatus, denticulatus, calli 2 trianguli in basi; carinula a basi in discum. — Ein Labellum quadrilobum, welches *E. Blepharistes* besitzen soll, ist nicht vorhanden. Eher passt das *E. brachycladium* Lindl. 1853. — Nun aber sendete Hr. Wagener Exemplare, welche sich auszeichnen durch völlig gleiche Verhältnisse, doch sind die Blätter viel schmaler (kaum einen Zoll). Die seitlichen Inflorescenzen finden sich in den Achseln der Scheiden angelegt, nur die endständige ist entwickelt. Die Verhältnisse der Blüthe sind fast wie bei voriger. Allein das Labellum ist trilobum: lobi postici semicirculi, lobus medius cuneatus bilobus, antice fimbriatus. Tepala rhombea acuta minute denticulata. — Gehören nun diese Formen zusammen und das ganze *E. Funkii* zu *Blepharistes* Barker? — Ocanna. Wagener.

231. EPIDENDRUM HAENKEANUM Presl. Rel. Haenk. 100. LO. n. 40. Huc Lindl. l. c. 179.:

E. foliis distichis ovato-lanceolatis nervosis acutis, spica paniculata, sepalis oblongo-lanceolatis acutiusculis in basin attenuatis, petalis spatulatis, labelli trilobi lobis lateralibus rotundatis, medio minore obcordato.

Wild in Peru — Haenke. — Scape a foot high. Sepals ten lines broad. Perhaps *E. porphyreum*.

232. EPIDENDRUM PALLIDIFLORUM Hook. in Bot. Mag. t. 2980. LO. n. 41. Huc Lindl. l. c. 180.:

E. foliis distichis oblongis linearibus obtusis pedunculo distanter vaginato brevioribus, sepalis petalisque lanceolatis obtusis patentibus, labelli trilobi lobis subaequalibus rotundatis: intermedii trisulci 2-callosi marginibus involutis.

Wild in Dominica — Inray (v. s. sp. comm. cel. Henslow). — Flowers pale yellowish white, with a purple stain on the end of column. The specimen figured in the Botanical Magazine was weak. The inflorescence is really a loose panicle. I do not find any sufficient authority for its being a native of St. Vincent's.

233. EPIDENDRUM HYMENODES. Huc Lindl. l. c. 181.:

E. foliis gramineis lanceolatis acutissimis pedunculo longioribus, panicula erecta pauciramosa, bracteis lanceolatis membranaceis floribus subaequalibus, sepalis petalisque tenuibus carnosius angustis acutis patentissimis, labelli hastati lobis ovatis intermedio acuto integerrimo, lateralibus serrulatis (?), lamellula elevata ante antheram lineolisque 2 elevatis, clinandrio subintegro.

Wild in New Grenada; on trees in the province of Sa. Martha, at the elevation of 4000 feet; in lofty forests above Minca; July — Schlim 986 (v. s. sp. comm. cel. Linden). — This remarkable plant has much the appearance of some broad-leaved Grass. The thin narrow panicle is copiously clothed by long membranous bracts, which, in the dried state, strikingly contrast with the black flowers. The latter are much decayed in my specimen, and the structure above assigned to them is not to be altogether relied upon; they seem to have been both membranous and succulent, in the dried state are about an inch long, and are described by Schlim as dirty white.

234. EPIDENDRUM MIERSII. Huc Lindl. l. c. 182.:

E. foliis ovato-oblongis acutis, panicula ampla divaricato-ramosa pauci-vaginata, bracteis minutis, sepalis lineari-oblongis acutis, petalis filiformibus, labelli lobis lateralibus oblongis integerrimis, intermedio bipartito cuneato laciniis fimbriatis, callis 3, clinandrio cucullato membranaceo indiviso.

Wild in Brazil; Organ Mountains — Miers 1838; Demerara — Schomburgk (v. s. sp. in hb. Miers). — A most distinct plant with a great branching panicle of (apparently) yellow flowers, having a similar form to those of *E. Weddellii*.

235. EPIDENDRUM MYRIANTHUM. Huc Lindl. l. c. 184.:

E. foliis lineari-lanceolatis acutis vaginis nigro-punctatis, paniculae

compositae effusae ramis divaricatis, bracteis setaceis, pedicellis ovariisque longissimis, sepalis membranaceis oblongis obtusis, petalis lineari-spathulatis, labello longiore 4-partito bicalloso laciniis truncatis linearibus aequilongis recurvis lateralibus subintegris, intermediis apice tantum laceris, clinandrio utrinque carnosio obtuso appendice dorsali membranacea cucullata bifida.

Wild in Guatemala — Klee (v. s. sp. comm. cel. invent.). — A most brilliant species, conspicuous with its narrow leaves, whose sheaths are spotted with black, and great panicles of membranous ruby-red flowers.

b. Paniculae laterales, racemosae.

236. EPIDENDRUM BLEPHARISTES Barker in Bot. Reg. 1844. misc. p. 80. Huc Lindl. l. c. 185.:

E. foliis anguste ovalibus elongatis obtusis, panicula simplici stricta racemosa, sepalis ovalibus, petalis acuminatis, labelli quadrilobi laciniis aequalibus linearibus apice multifidis linea media elevata callisque duobus semiliberis arcuatis ad basin.

Wild in La Guayra — Linden; Venezuela — Funck and Schlim 1436 (v. v. c. et s. sp. comm. cel. Linden). — The habit of this species is altogether that of polyanthum. The sepals and lip are a rich rose-colour; the column has the deepest tint of the garnet, which gives the flowers a very gay appearance.

237. EPIDENDRUM BRACHYCLADIUM. Huc Lindl. l. c. 186.:

E. foliis angustis oblongis carinatis obtusis apiculatis, panicula angusta racemosa, bracteis parvis ovatis acutis squarrosis, sepalis oblongis, lateralibus valde obliquis carinatis, petalis rhombeis, labelli longioris transversi laciniis lateralibus cuneatis intermediaque parva biloba denticulatis, callis 2 apice liberis lineaque elevata interjecta.

(A) Petals and lip but little toothed, or even entire.

(B) *crassipes*. Petals and lip much toothed or fringed. Stem fusiform at the base.

Wild A. in Peru; Huanaco — M'Lean, Mathews; Bolivia — Bridges; B. Caraccas Sa. Martha — Purdie (v. s. sp. B. in hb. Hooker). — The narrow panicle, fleshy flowers, great wedge-shaped and small two-lobed divisions of the lip, are peculiar to this species. B. has a stem like that of *E. Stamfordianum*, and has both petals and lip very considerably denticulate; but in the latter respect each variety varies much.

238. EPIDENDRUM POLYANTHUM LO. n. 50. Bateman Orch. Mex. et Guat. t. 34. Huc Lindl. l. c. 187.:

E. foliis distichis ovali-lanceolatis acutis, panicula stricta simplici racemis plurimis multifloris cernuis basi spathaceis, sepalis ovato-lanceolatis acutis striatis, petalis linearibus reflexis, labelli trilobi tricostati lobis lateralibus subcuneatis retusis: intermedio retuso, ovario scabro.

(A) Flowers rich orange-colour.

Epidendrum funiferum Morren Ann. Gand. IV. 211. t. 198.

Epidendrum bisetum Lindl. in Bot. Reg. 1841. misc. 148.

(B) *densiflorum*. Flowers greenish, with a little pink on the edges and in the middle of the lip.

Epidendrum densiflorum Hook. in Bot. Mag. t. 3791.

Epidendrum rubrocinctum Lindl. in Bot. Reg. 1843. misc. 20.

Wild in Mexico; A Talea — Hartweg; Vera Cruz — Galeotti 5125, in the hot country; B. Parkinson (v. v. c. et s. sp.) — Flowers in A. orange or salmon-colour, with a strong smell of cowslips; in B. pale green. I am unable to discover any distinction beyond colour among the plants now brought together. I do not find an authentic specimen of *E. densiflorum* in Sir W. Hooker's Herbarium. *E. funiferum* is no doubt to be referred here, the locality given by Prof. Morren, St. Catharine's, being certainly erroneous.

Huc: *Epidendrum* (*Spathium*) *colorans* Klotzsch. Allg. Gtz. 1851. 250.

Caule simplici, tereti, folioso, foliis distichis, patenti recurvis oblongis, brevi acutis, subcarinatis, pallide viridibus, racemo brevi, terminali, punctato scabro, spatha ancipiti, dorso crenulata, diphylla, floribus parvis, roseo albicanibus, brevi-pedicellatis, bractea lanceolata, pallide lilacino suffultis, perigonii foliolis albido-subroseis, spathulatis, interioribus subbrevioribus angustioribusque, labelli trilobi lobis laterali-bus brevioribus integerrimis, subobliquis, intermedio elongato, apice bilobo, lamellis 3 parallelis, angustis instructa; columna elongata, triangulari, inferne attenuata.

Caulis teres, pedalis, foliosus, crassitudine pennae cygneae. Folia $4\frac{1}{2}$ pollices longa, 14 lin. lata. Racemus terminalis, 2 pollicaris. Flores penduli, brevi pedicellati. Bractea 2 lineas longae. Perigonii foliola subspathulata, obtusa, patentissima, primum albida, deinde dilatato rosea, exteriora 5 lin. longa, $1\frac{1}{2}$ " lata, interiora angustiora, paululum breviora. Labellum trilobum columnaque triangulari candidum, anguste trilamellatum, lobis laterali-bus brevioribus, obliquis, intermedio elongato, obtuso, apice bifido. — Guatemala v. Warszewicz.

Epidendrum Lansbergii Rgl. (*Amphiglottium* A. Polycladia Lindl.) Cat. Hort. Petrop. 55.

Caulis elongatus, simplex, foliatus; foliis distichis oblongo-lanceolatis, acuminatis. Panicula simplex, nutans; pedunculo vaginis membranaceis longe acuminatis vestito; bracteis pedicellum (nec germen) aequantibus; pedicello germinaeque papilloso. Flores virides; sepalis supremo cuneato-oblongo, apiculato, sepalis laterali-bus supremo paulo latioribus; petalis filiformi-spathulatis; labelli ungue columnae adnato, lamina late obcordata quadriloba, lobis laterali-bus semicordato-angulatis, lobis anticis divaricato-oblongis apiculo interjecto, callis duobus basilaribus costisque tribus elongatis axin labelli occupantibus; columna semitereti adnata.

Caulis ad 6 pedes altus, $\frac{1}{3}$ pollices crassus. Folia ad $\frac{3}{4}$ pedem longa et $1\frac{1}{3}$ pollices lata, superiora tenuiora. Flores $\frac{3}{4}$ pollicis in diametro, labello albido. Affine *E. paniculato* et fastigiato, panicula simplici, sepalorum et loborum anticorum labelli sicut foliorum forma diversum. *E. porphyreum* differt florum colore et sepalorum labellique forma. — Venezuela. Floret Octobri. Landsberg plantam vivam misit.

239. EPIDENDRUM LIGNOSUM La Llave Orch. Mex. II. 28. L.O. n. 42 Huc Lindl. l. c. 188.:

E. caulibus ramosissimis lignosis, foliis distichis lineari-lanceolatis confertis emarginatis, sepalis petalisque patentibus, labelli 3-partiti lacinia intermedia convexa integra, florum fasciculis sparsis.

Wild in Mexico; on trees on the mountains of Valladolid — La Llave. — Flowers green; dotted. Lip with three purple streaks at the base.

240. EPIDENDRUM MARTIANUM Lindl. in Ann. Nat. Hist. IV. 382. Huc Lindl. l. c. 189.:

E. foliis distichis angustis lanceolatis, panicula stricta simplici, squamis concavis obtusiusculis vaginata, racemis corymbosis, petalis linearibus obovatis obtusis sepalis multo angustioribus, labello cordato subrepando basi bicalloso lineis 3 elevatis.

Wild in Brazil; on plains near Villa Rica, in the Minas Gerães — Martius (v. s. sp. in hb. Mart.) — Stem from one and a half to two feet high. Flowering stem stiff, erect, branched, much longer than the leaves, which are narrow and sharp-pointed.

B. HOLOCHILA.

241. EPIDENDRUM CORYMBOSUM. Huc Lindl. l. c. 190.:

E. caule ramosissimo, foliis lanceolatis acuminatis racemo corymboso

longioribus, pedunculo basi 1—2-bracteato, bracteolis setaceis pedicellis brevioribus, floribus membranaceis, sepalo supremo angusto, lateralibus latioribus semiovalibus acutis, petalis linearibus basi tenuissimis uninnerviis, labello subrotundo cordato obtuso, callis 2 lineaque brevi elevata interjecta.

Epidendrum dichotomum Lindl. in Bot. Reg. 1838. misc. n. 146; not of Presl. Wild in Brazil — Miers n. 3484; Organ Mountains, on an old tree — Gardner 631; Demerara — Loddiges; Venezuela, on trees in the forests of Merida at 5500 feet — Linden 647 (v. s. sp. et v. c.) — A small branching species with the appearance of *E. anisatum*; but the leaves are thinner, the bracts setaceous, and the lip quite membranous without lobes. Flowers green.

242. EPIDENDRUM CARINATUM. Huc Lindl. l. c. 191.:

E. caule brevi tenui erecto, foliis paucis membranaceis striatis lanceolatis acutis, racemo subrotundo cernuo, bracteis setaceis ovario subaequalibus, sepalis lanceolatis carinatis, petalis linearibus, labello undulato circulari 3-lineato callis 2 angustis, clinandrio cucullato emarginato.

Wild in Mexico; Sierra San Pedro Nolasco, Talea etc. — Jurgensen 647 (v. s. sp. in hb. Hooker). — A small thin-leaved plant with the habit of *E. fuscatum*.

243. EPIDENDRUM MISERRIMUM Rehb. fl. in Bonpl. III. 220.

Pone *E. carinatum* (L. F. 191.) tenuiculum, foliis linearibus acutis, dorso carinatis, spica pauciflora, labello triangulo humeribus posticis rotundatis involutis.

Pusillum, 2—3 pollicare. Caules tenuiculi ramosuli subflexuosi. Folia linearia acuta, dorso carinata, carinis vaginam descendentibus, abbreviata, vix pollicaria, lineam lata. Spathula anceps obtusa sicca solitaria. Spica tri—novemflora, disticha. Bractee carinatae triangulae nervosae. Flores horizontales, bracteis reversis Ovaria demum sphaerica. Sepala triangulo lanceolata. Tepala lineari subfalcata. — Planta facie Epidid. microphylli et paranthici. — Ind. occ. Duchassaing.

244. EPIDENDRUM SETIFERUM Lindl. in Ann. Nat. Hist. IV. 383. Huc Lindl. l. c. 192.:

E. foliis lanceolatis acutis, caule simplici, pedunculo squamis lineari-lanceolatis acuminatis sub floribus foliaceis vaginato, racemo cernuo pyramidalis, bracteis longis setaceis, petalis linearibus obtusis sepalis angustioribus, labello cordato integerrimo acuto reticulato basi 3-tuberculato, clinandrio integro.

Wild in Brazil — Gomez (v. s. sp.) — Has the habit of *E. fuscatum*, but shorter leaves, longer bracts and a different lip. The flower stem is about ten inches long in the specimen before me.

245. EPIDENDRUM VIEJI (Amphyglottium Holochila) Rehb. fl. in Bonpl. III. 220.

Pone *Epidendrum setiferum* caulibus membranaceo vaginatis di—triphylis, foliis coriaceis oblongis subacutis nitidis, racemo brevi basi 1—2 squamato, squamis bracteisque sessilibus lanceis scariosis, tepalis cuneato ovatis, labello cordato orbiculari apice emarginato, carina hippocrepica ante basin.

Planta egregia a cl. Oersted unico, a Pavonio pluribus speciminibus lecta, ab hoc *E. fastigiatum* de Mexico dictum. Rami novelli prodeunt ex axillis vaginarum ramorum vetustorum. Folia tres pollices longa, prope duos lata, vernixia. Flores illis Epidendri elliptici Grah. aequales, bene coriacei. Sepala triangula et tepala ex icone picta Oerstediana carnea purpureo tristriata. Labellum flavido carneum uti gynostemium. Callus purpureus. — Bractee ovariis pedicellatis plus minus breviores. In summo monte ignivomo El Viejo Nicaraguae. Oersted. — Rehb. fl. in Xenia I. tab. 48. II. 56.

246. EPIDENDRUM CUCULLATUM Lindl. in Bot. Reg. 1838. Misc. 47. Huc: Lindl. l. c. 193.:

E. caule compresso folioso, foliis lanceolatis acutis, pedunculo squamato paucifloro foliis multo brevioribus, rachi brevi flexuosa; sepalis petalisque erectis ovato-lanceolatis acutis, labello obovato acuto: linea media tuberculisque duobus basilaribus callosis, anthera longe infra apicem clinandrii cucullati dentati truncati inserta.

Epidendrum biforatum Lindl. in Bot. Reg. 1844. Misc. p. 15. n. 2.

Wild in Brazil; Para — R. Harrison (v. v. c.). — One of the most unattractive of this large genus. The flowers are small and white, at the top of a leafy stem about nine inches high; the anther is remarkable for being inserted far below the apex of the column, in which respect the species approaches the genus *Phydinga*. The *E. biforatum* was founded upon a bad specimen of this.

247. EPIDENDRUM LAMPROCAULON H. G. Reichenbach in Bot. Zeitung 1852. 735. Huc: Lindl. l. c. 194.:

E. ramosum rigidum, ramulis paucifoliatis vaginis verruculis asperis, foliis anthesi adhuc persistentibus 1—3 oblongo-linearibus acutis, racemis tenuibus paucifloris flexuosis basi unisquamatis, squamis lineari-subulatis parvulis, bracteis angusto-lanceis pedicellis non aequatibus, sepalis oblongo-linearibus acutis, petalis duplo angustioribus, labelli lamina obtuse trilobula minute denticulata callis 2 erectis in basi.

Wild in Mexico; near Oaxaca — Galeotti 5265 (Rchb.). — There exist in Sir W. Hooker's herbarium two specimens from Galeotti, numbered 5072, which agree with this in all respects except the leafsheaths, which are not verrucose. They are marked „Arborescent, on oaks near Oaxaca at 7500 feet, flowers greenish, May.“

— Rchb. fil. l. c.:

Ramosum, rigidum, ramulis paucifoliatis, vaginis verruculis asperis, foliis anthesi adhuc persistentibus 1—3, oblongo-linearibus acutis, racemis tenuibus paucifloris flexuosis basi unisquamatis, squamis lineari-subulatis, parvulis, bracteis angusto-lanceis pedicellos non aequantibus, perigonii phyllis oblongo-linearibus acutis, lateralibus internis duplo angustioribus, gynostemio semitereti clavato; androclinii limbo postice exciso, antice utrinque producto retuso repandulo, labelli lamina obtuse trilobula, minute denticulata, dentibus 2 erectis in basi.

Oaxaca. Galeotti 5265.

248. EPIDENDRUM ANTENNIFERUM Lindl. in Paxton's Flower Garden vol. I.; gleanings 234 ic. 113. Huc: Lindl. l. c. 195.:

E. foliis coriaceis oblongis acutis, pedunculo gracillimo apice subpaniculato, petalis longissimis filiformibus, labello ovato leviter dentato basi trituberculato.

Wild in Mexico; Xalapa Henchmann (v. s. c.). — In many other *Amphiglotts*, there is a similar tendency to lengthen the petals, but in no other does it occur in the same degree as here. It is to be observed that the lengthening is an after-growth, the petals being straight and short before the flowers expand.

249. EPIDENDRUM SKINNERI Bateman in Bot. Reg. t. 1881. Hooker in Bot. Mag. t. 3951. Huc: Lindl. l. c. 196.:

E. foliis distichis lanceolatis acuminatis, caule apice longe aphyllis squamoso, racemo cylindraco multifloro, bracteis membranaceis setaceis pedicellis aequalibus, floribus cernuis, sepalis lineari-lanceolatis, petalis ovalibus acutis, labello ovato acuminato integerrimo per medium trinervi basi obsolete 2-callosa.

Epidendrum Fuchsii Regel in Schweiz. Zeitschr. für Gartenb. 1854. p. 202.

Wild in Guatemala; on trees in cool climate — Skinner (v. v. c.). — One of the most beautiful of its race. Flowers large, deep rose-colour, in long racemes. It is difficult to cultivate. Mr. Skinner says that it inhabits a middling temperature, and will thrive best in a climate graduated from 56° to 70°. He directs us not to put it in earth, but to permit it to have free scope for the young roots and shoots, which it, when wild, throws out in August. *E. Fuchsii* is certainly a starved state of this common and well-known plant.

Epidendrum Fuchsii Regel. Rehb. fil. in v. Mohl et v. Schlechtel. B. Z. 1842. 672. Nach einer erhaltenen Originalabbildung nichts als *Epidendrum Skinneri* Lindl., zwar eine alte Gartenpflanze, aber kein *Euepidendrum*, sondern ein *Amphiglottium*.

250. EPIDENDRUM COSTATUM Richard and Galeotti Orch. Mex. 22. Huc: Lindl. l. c. 197.:

E. caule compresso crasso vaginis maculatis, apice folioso, foliis oblongis subundulatis acutis panicula cernua bispatacea brevioribus, bracteis spathaceis costatis pedicellis brevioribus, sepalis lanceolatis apice involutis, petalis angustioribus incurvis, labello transverso rotundato dentato emarginato basi bicalloso venis radiantibus, clinandrio integro.

Wild in Mexico — Galeotti Loddiges (v. v. c.). — Flowers rich crimson, as large as in *E. nutans*.

251. EPIDENDRUM FILICAULE LO. n. 23. Huc: Lindl. l. c. 198.:

E. caule gracili ramosissimo, foliis linearibus acutis, sepalis cuneato oblongis petalisque filiformibus patentibus, labello subrotundo cordato retuso repando, spicis terminalibus 3-floris, rachi capillari bracteis spathaceis paucis membranaceis.

Wild in Brazil — Prescott; branches of trees, Pedra Bonita Tejuca — Gardner 242 (v. s. sp.). — A branched reed-like plant. Flowers small, in little three- to four-flowered racemes, half hidden among the grassy leaves.

252. EPIDENDRUM SELLOWII H. G. Reichenbach in Linnaea XXII. p. 839. Huc: Lindl. l. c. 199.:

E. pedunculo brevi squamato, squamis vaginantibus subacutis, bracteis subaequalibus, ovariis pedicellatis longioribus, florum (3) sepalis oblongis acutis, petalis angustioribus, labello cordato acuto basi bicarinato.

Wild in Brazil — Sellow. (Rehb.). — „Stems erect, leafy. Leaves longish, rounded at the point.“

253. EPIDENDRUM GALEOTTIANUM Richard and Galeotti, Orch. Mex. p. 21. Huc: Lindl. l. c. 200.:

„*E. caule simplici, foliis ellipticis obtusis carnosis, racemo simplici terminali, floribus parvulis purpureis, labello adnato cordiformi subobtus.*

Wild in Mexico — Galeotti.

254. EPIDENDRUM HEMISCLERIA Rehb. III. Huc: *Hemiscleria* Lindl. Folia I. fasc. 4.:

Sepala erecta, coriacea, concava, aequalia. Petala conformia, membranacea. Labellum dependens, concavum, lineare, sessile, coriaceum, sepalis longius, basi c. columna continuum; lineis 3 rectis elevatis. Columna nana, semiteres, basi juxta labellum utrinque auriculatum; clinandrium membrana marginatum. Stigma fovea circularis. Pollinia 4, ovalia, aequalia; caudiculis 2 pulvereis replicatis in unam connatis; glandula 0. Anthera 4-ocularis, carnosae, loculis membranaceo-marginatis.

Herba epiphyta Americae tropicae, caulescens. Folia coriacea, disticha. Corymbus terminalis, pedunculatus. Flores coriacei, semiclausi.

A singular plant, with quite the habit of an Amphiglottian Epidendrum. From that genus it differs in its lateral sepals being shorter, than the lip and in no degree oblique; in the latter gradually passing into the column; and especially in the presence of a pair of small round auricles, standing at the base of the column, at the place where the lip joins on. I think, there can be no doubt that these processes belong to the column and not to the lip, because they hold firmly to the column, when the lip is pulled off, and have evidently a vascular connection with the former. It may be added, that the lip hangs down from the foot of the column, instead of being parallel with it, as in Epidendrum.

1. *HEMISCLERIA NUTANS*. — Wild in Peru; Chachapoyas — Mathews (v. sp. in hb. Miers). — The single specimen of this rare plant, preserved in Mr. Miers' herbarium, has no number, and consists of a hard stem about six inches long, closely covered with coriaceous distichous obtuse leaves. The peduncle is scarcely so long as the upper leaves, stands nearly horizontally, and has a pair of acute short scales at its base; below the middle there is a single joint, above which it thickens into a club-shaped rachis, closely covered with small globular coriaceous flowers, and stiff acute bracts, very much shorter, than the stiff pedicels. The sepals are roundish ovate, concave, very obtuse, and erect. The petals are thin, of the same figure, but flat and rather cordate. The lip is linear, channelled, two-lobed, very coriaceous, at the base where it joins the column, and there furnished with three stout ribs, of which the central is much the largest. The auricles of the column are nearly round, and petaloid.

C. *SCHISTOCHILA INTEGR*A.

255. *EPIDENDRUM PATENS* Swartz Fl. Ind. Occ. I. 1495. Bot. Cab. t. 1537. LO. n. 60. Bot. Mag. t. 3800. Paxton's Flower Garden; gleanings 394 ic. 198. Huc: Lindl. l. c. 235.

E. foliis oblongo-lanceolatis, racemo longo laxo pendulo, sepalis petalisque subaequalibus oblongis acutis concavis patentibus, labelli quadrilobi lobis lateralibus subrotundis anterioribus linearibus obtusis conniventibus, callis 2 minutis lineaque elevata.

Wild in Jamaica, on the mountains — Swartz; Guatemala — Skinner (v. v. c.). — Stem about a foot high, clothed with oblong coriaceous distichous leaves. The raceme is about nine inches long, and pendulous, bearing thirteen or fourteen flowers, of a pale rusty yellow colour, and about an inch and a half across. Sepals thicker in texture than the petals, keeled on the outside, and somewhat darker. Lip thin, roundish, four-lobed, with a slight central elevated line, and a pair of thin tubercles at its base; the lateral lobes rounded, somewhat hatchet-shaped, very much larger than the two in front, which are divergent.

256. *EPIDENDRUM FRUTICOSUM* LO. 22. Huc Lindl. l. c. 202.:

E. foliis distichis ovato-oblongis acutis, caule ramoso fruticoso, racemo terminali nutante, sepalis cartilagineis petalisque membranaceis ovato-lanceolatis acutis erectis, labello subrotundo cordato retuso apiculato undulato callis 5 magnis confluentibus in disco.

Wild in Mexico — Pavon (v. olim s. sp. in hb. Lamb.). — Stem branching, without a trace of sheaths, as thick as a crowquill. Bracts linear-lanceolate, about as long as the ovary.

257. *EPIDENDRUM GLADIATUM* LO. 47. Huc Lindl. l. c. 203.:

E. „foliis distichis gladiiformibus, racemis terminalibus fasciculatis corymbosis recurvis, sepalis oblongis obtusis margine reflexis petalisque spatulatis patulis, labelli trilobi lobis lateralibus subquadratis rotundatis intermedio multo minore obcordato basi bituberculato“.

Wild in Peru — Pavon (v. s. sp. olim in hb. Lambert). — „Stem a foot high, apparently

simple, naked at the base, hard, as thick a goose-quill, leafy towards the upper end, and curved. Racemes short, proceeding from several sheaths. Sepals four lines long, three lines broad". It is more than twenty-two years since I saw this plant, which I have since thought identical with a Mexican plant, now referred to *E. anisatum*. The original specimen requires to be re-examined.

258. *EPIDENDRUM ANISATUM* La Llave p. 27; LO. n. 62. Huc Lindl. l. c. 204.

E. caulis brevibus erectis, foliis ovato-lanceolatis carnosius obtusis racemis longioribus, bracteis membranaceis ovatis, sepalis oblongis petalisque lineari-cuneatis obtusis, labelli lobis lateralibus rotundatis intermedio emarginato basi bicalloso.

Epidendrum gladiatum Lindl. in Benth. Plant. Hartweg p. 72.

Wild in Mexico; on trees near Valladolid, June — La Llave; Rancho del Ojo de Agua, April — Hartweg (v. s. sp.). — This is very near *E. gladiatum*, with which I once confounded it; but it seems to be satisfactorily distinguished by its narrow fleshy leaves, short membranous blunt bracts etc. The flowers are described as being of a dingy colour, and emitting a smell of Anise at night. The lip is said to have three purple lines at the base.

259. *EPIDENDRUM ORCHIDIFLORUM* Salzmann LO. n. 29. Huc Lindl. l. c. 205.

E. foliis distichis coriaceis planis ovato-oblongis obtusis, caule apice nudo obtuse vaginato, racemo brevi terminali, floribus carnosius, sepalis supremo obovato lateralibus oblongis dimidiatis, petalis linearibus subcuneatis, labello subrotundo basi bicalloso apice tridentato: dente intermedio minore.

Wild in Brazil; Bahia, in sandy thickets — Salzmann; sandy bushy places near Macero, February — Gardner 1421; Berbice — Schomburgk (v. sp. sp.). — Leaves very fleshy and shining. Flower-stem a foot long, stout, clothed with blunt somewhat rough sheaths. Flowers green, as large as in the largest state of *E. fuscatum*.

260. *EPIDENDRUM FUSCATUM* Swartz Nov. Act. Ups. VI. 69. LO. n. 38. Bot. Reg. t. 67. Bot. Cab. t. 887. Bot. Mag. t. 2844. Huc Lindl. l. c. 206.:

E. foliis oblongis undulatis apice recurvis, scapi squamis acuminatis, sepalis oblongis, petalis linearibus, labello carnosio cordato trilobo laciniis rotundatis intermedia emarginata apice calloso basi 2-tuberculato, spica globosa recurva.

Epidendrum anceps Jacq. Amer. 224. t. 138.

Amphiglottis lurida Salisbury l. c.

(B) *virescens*. Flowers smaller and more green than usual.

Epidendrum virescens Lodd. Bot. Cab. t. 1867.

Epidendrum musciferum Lindl. in Hook. Journ. I. 6.

(C) *viridipurpureum*. Flowers much larger than usual, with a violet lip edged with yellow.

Epidendrum viridipurpureum Hook. in Bot. Mag. t. 3666.

Wild in the West Indies, and tropical America; Jamaica — Swartz; Grenada — Loddiges; Panama — Cuming 1288; St. Vincents — Guilding; Dominica — Imray; Guayana — Schomburgk; Martinique — Jacquin (v. v. c. et s. sp.) — One of the most common plants in some of the tropical parts of America, varying greatly in the size of its flowers and the length of the flower-stem. Hence have arisen spurious species, proposed by myself and others, which a better acquaintance with them cancels. In colour, the flowers vary from dull greenish purple to green and almost yellow. *E. viridipurpureum* has unusually large flowers, and a flower-stem shorter than common. There is a little difference in the degree of lobing of the lip.

— Rchb. fl. in Bonpl. III. 68. Ocapna. 3000'. April. Wagerer.

Epidendrum (Amphigl.) *amphistomum* A. Rich. in Ram. Sagra. Tb. 81.

Caule erecto simplici, folioso, compresso ancipiti, bipedali, glabro; foliis alternis vaginantibus, (vagina ancipiti persistente nervosa) ellip-
VI,

lico oblongis coriaceis obtusis, 5—7 uncias longis, 10—15 lin. latis, subtus carinatis, floribus parvulis virescentibus pedunculatis, racemos simplices unciales, saepius geminos e parte caulis superiore enatos, bracteis ovali acuminatis, lata basi insertis persistentibus; sepalis externis oblongis subspathulatis, nervosis lateralibus subobliquis, concavis; int. (petalis) oblongo-linearibus acutis, membranaceis, enerviis, basi longe unguiculatis, sepalis aequilongis, labello parvulo cum lateribus gynostemii coalito et hic inflato subsaccato, in parte libera trilobo lobis lateralibus oblongo subquadratis, truncato obtusis, terminali transverso latiore quam longo subquadrato, medio incrassato et plicato; gynostemio abrupte incurvo, antice alato, alis cum ungue labellis*) coalitis.

Cuba.

Obs. Huc forsán inserenda Lemaireana species: *Epidendrum* (Amphigl.) *calliferum* Lem. Jard. Fleur. IV. 65.

Caule elato subancipiti tripedali, foliis distichis lineari oblongis mucronulatis basi vaginantibus, coriaceis; racemo terminali pedali candelabriformi pendulo; floribus carnosissimis longe pedicellatis magnis flavescenscentibus purpureo punctatis, sepalis petalisque oblongis aequalibus, iis angustioribus; omnibus apice callo rotundo donatis; labelli partis liberae lobis basilaribus auriculiformi laceratis supra bicallosis, terminali ungue tricarinato, lobulis oblongo laceris divaricatis.

Grandes Antilles.

Obs. Forsán haec nova species est antiquum *Epidendrum* raniferum?

261. EPIDENDRUM OVALIFOLIUM LO. n. 39. Huc Lindl. l. c. 207.:

E. foliis distichis ovali-lanceolatis acutis, sepalis oblongo-lanceolatis, petalis linearibus, labelli trilobi cordati lobis lateralibus rotundatis, intermedio lineari bilobo disco 3-carinato basi bituberculato, racemo elongato.

Wild in Mexico — Pavon (v. s. sp. olim in hb. Lambert). — Very near *E. fuscatum*, from which it chiefly differs in the lateral lobes of the lip being mucronate, the intermediate linear and two-lobed, and the racemes long. It requires re-examination. What bears the name in gardens is usually a starved state of *E. paniculatum*.

262. EPIDENDRUM SMARAGDINUM Lindl. in Bot. Reg. 1838. misc. 44. Huc Lindl. l. c. 208.:

E. caule gracili ad fastigium ipsum folioso, foliis lineari-lanceolatis acuminatis subdistichis, spica terminali pauciflora rigida nutante foliis brevioribus, bracteis acuminatis squarrosis ovario ventricoso cuniculato brevioribus, sepalis lineari-oblongis acutissimis, petalis angustissimis acuminatis, labello cuneato cordato carnosissimo apice tridentato basi bicalloso: laciniis aequilongis lateralibus rotundato-truncatis intermedia acuta decurva.

Wild in Demerara — Loddiges; Brazil, Organ Mountains — Miers (v. v. c. et s. sp. in hb. Miers.) — Allied to *E. cucullatum*, with small bright green flowers, hardly distinguishable from the leaves.

263. EPIDENDRUM CAMPESTRE Lindl. in Bot. Reg. 1844. misc. p. 17. Huc Lindl. l. c. 209.:

E. foliis distichis lineari-lanceolatis canaliculatis coriaceis, caule basi pseudobulboso, pedunculi elongati squamis distantibus appressis, racemo cylindraco, sepalis lateralibus falcatis labello duplo brevioribus, petalis conformibus angustioribus, labello subrotundo obsolete 4-lobo margine integerrimo, callis 2 linearibus confluentibus linea elevata flexuosa interjecta, clinandrio 4-lobo laciniis quadratis.

Wild in Brazil; in dry upland Campos, Serro do Frio, Diamond District — Gardner 5207 (v. s. sp.) — Somewhat related to *E. orchidiflorum*. Remarkable for its short falcate lateral sepals and round lip, without any sort of fringing, and for the enlarged pseudobulbous condition of its stems at the base, in which they approach *E. brachycladium*.

264. EPIDENDRUM LIMA. Huc Lindl. l. c. 210.:

E. caule ramoso folioso, foliis ovato-lanceolatis acutis vaginis scabris, racemis subsessilibus corymbosis, bracteis linearibus acuminatis herbaceis pedicellis aequalibus, sepalis lanceolatis margine revolutis, lateralibus obliquis carinatis basi columnae manifeste adnatis, petalis lineari-spathulatis 3-venis, labelli lobis lateralibus rotundatis intermedio cuneato minoribus, callis 2 conspicuis lineaque elevata interjecta, clinandrio cucullato carnosio.

Wild in Peru; in the ravines of Pichincha — Jamieson 111 (v. s. sp. in hb. Hooker). — In habit this agrees with *E. corymbosum*, from which its scabrous sheaths, larger flowers, and widely different lip, distinguish it. The lateral sepals are an inch long, and very distinctly united to be the base of the column. The capsule is oblong, three-cornered, with broad rather thin-edged ribs at the angles.

264. EPIDENDRUM VANDIFOLIUM Lindl. in Journ. of Hort. Soc. IV. p. 269. Huc Lindl. l. c. 269.:

E. foliis longis angustis distichis recurvis basi canaliculatis, racemo brevi cernuo subsessili, labelli tripartiti lobis lateralibus semicircularibus, intermedio lineari retuso lineis tribus parallelis lucidis elevatis callisque 2 elongatis intra basim.

Wild in Mexico — Loddiges (v. v. c.). — Introduced by Mssrs. Loddiges, from whom I received it in April 1849. It is nearly related to *E. fuscum*, but its leaves are long, narrow, distichous, and recurved like those of some *Vanda*. The flowers are sweet-scented, dull purple, somewhat freckled.

265. EPIDENDRUM WEDDELI. Huc Lindl. l. c. 212.:

E. caule simplici, foliis paucis ovalibus obtusis sursum angustioribus, pedunculo elongato gracili apice paucifloro, petalis filiformibus, labelli lobis lateralibus rotundatis intermedio cuneato fisso brevioribus.

Wild in Brazil; Serra d'ouero branco, Minas Gerães, Dec. 1843 — Weddell (v. ic. pict. in hb. Mus. Par.) — I have only seen a sketch of this among Mr. Weddell's Brazilian drawings. It represents a slender plant about a foot high, with four leaves towards the root. The flowers are rose-coloured, like those of *E. elongatum*, and twice as large.

266. EPIDENDRUM WARSZEWICZII H. G. Reichenb. in Bot. Zeit. 1852. p. 736. Huc Lindl. l. c. 213.:

E. caule calamus anatinum crasso paucifolio (5—6), foliis in caule florido duobus summis tantum adhuc vigentibus lineari-ligulatis apice bilobis, pedunculo reflexo plurifloro basi bisquamato, squamis apice lanceis glumaceis vix pollicaribus pedicellis brevioribus seu aequalibus, ovario sub apice strumoso canaliculato, sepalis petalisque oblongis acutis, labello lato-cuneato antice dilatato minute denticulato trilobulo, callis 2 erectis in basi lineis tribus elevatis antrorsum procurventibus.

Wild in Costa Rica and Veragua — Warczewitz (Rchb.) — Rchb. fl. Xenia I. Fl. 26. p. 67.

267. EPIDENDRUM PARANTHICUM H. G. Reichenb. in Bot. Zeit. 1852. p. 736. Huc Lindl. l. c. 214.:

E. tenue pusillum rhizomate tenuissimo, caulibus assurgentibus terretiusculis, foliorum vaginis arphyllaceis laminis carnosulis trigono-

teretiusculis obtusis, pedunculo ancipiti paucifloro, bracteis triangulis amplexicaulibus ovaria pedicellata non aequantibus, sepalis petalisque lanceolatis acutis, columna ultra basin labelli producta, (labello?) trilobo lobis lateralibus oblongis antice et postice rotundatis medio lineari acuto (omnino *Homidii* more).

Wild in Guatemala — Warzewitz. — Flowers as small as in *Stelis parvilabris*. Leaves scarcely half an inch long. Stem as much as five inches high. — Rchb. I presume that the word *labello* is accidentally omitted by Mr. Reichenbach in his printed definition above quoted.

268. EPIDENDRUM CENTROPETALUM *) H. G. Reichenb. in Bot. Zeit. 1852, p. 736. Huc Lindl. l. c. 215.:

E. caule stricto calamum passerinum crasso densius foliato, foliorum vaginis arctissimis violaceo-verrucosis, foliis lineari-oblongis sensim acutis, pedunculo abbreviato basi unisquamato paucifloro, bracteis linearibus acutis ovaria pedicellata longe non aequantibus, sepalis cuneato-lanceolatis acutis, petalis duplo augustioribus magis cuneatis, labelli trilobi lobis lateralibus basilaribus anguste triangulis apice cuneatis medio cuneato alte bilobo lobis oblongis obtusis cum denticulo in sinu, callo bilobo cum denticulo medio corneo in basi, clinandrio cucullato longe producto integro crenulato.

Wild in Veragua; on the volcano Chiriqui Warzewitz. — Caudicles three times as long as the pollen-masses. — Rchb.

Huc: *Oerstedella* Rchb. fil. in v. Mohl et v. Schlechtld. Bot. Zeit. 1852, p. 932.

Perigonium membranaceum, phylla lanceolata acuta, lateralia interna angusta angustiora. Labelli unguis marginibus suis cum gynostemii petaloidei margine connatus, lamina triloba. Gynostemium omnino petaloideum, in cucullum membranaceum ligulatum ascendentem productum; anthera in puncto prominulo cuculli postice inserta (*Coelogynis* more), antice bicuspis; quadrilocularis; pollinia quaterna (caudiculae valde elongatae in *O. centropetala* inserta, quam in *O. centradenia* non vidi), rostellum nullum!! limbus stigmatis inferior: lineae oblique descendentes sub fovea stigmatis sub figura trianguli.

Oerstedella centropetala:

Labello trilobo, lobis lateralibus triangulis, lobo medio sessili divaricato-bilobo, sinu inter utrumque lobum oblongum obtusum triangulum; lamella unguis adnata obtusa biloba cum denticulo superposito.

Epidendrum centropetalum Rchb. fil. Bot. Zeit. 1852, p. 732.

Ein Exemplar mit 2 Blüten. Chiriqui. V. Warszewicz.

Huc: *Oerstedella centradenia*:

Labello trilobo, lobis lateralibus lineari-falcatis, lobo medio a basi ligulata subito expanso in laminam obreniformem cum apiculo in sinu antico; lamella angusta flava apice triloba lateribus suis accreta in ungue cum gynostemii marginibus connati.

Ueber Fuss hoch. Blätter zweizellig, spitzlineal, kurz; Scheiden nervig, blaugraue Höckerchen auf den Nerven. Aehre mit zwei Zweigen. Deckblätter spitzlanzettlich, viel kürzer, als die langgestielten Fruchtknoten. Blüten rosa, so gross, wie bei *Epidendrum elongatum*. Irasu in Centralamerika. 7000'. Ein Exemplar. Oersted. — Cf. *Xenia Orchid.* tab. 17. pag. 39, 40.

*) „As this sheet was going to press, the B. Z. of Dec 31, 1852, reached me, in which Mr. Reichenbach raises this to the rank of a genus, called *Oerstedella*, joining with it a second species. The genus is described as having a petaloid, though adnate column etc. Lindl.“

D. SCHISTOCHILA CARINATA.

269. EPIDENDRUM SPICATUM Hook. fil. in Linn. Trans. XX. 180. Huc Lindl. l. c. 216.:

E. caule simplici flexuoso, foliis lanceolatis acutis laxè vaginatis, spica densa ovali squamis 2 membranaceis suffulta foliis multo breviorè, bracteis lineari-oblongis carinatis ovario aequalibus, sepalis ovalibus acutissimis lateralibus sub apice alte carinatis, petalis linearibus acutissimis, labelli subrotundi lobis lateralibus cordatis rotundatis antice denticulatis sublaceris intermedio retuso majoribus, callis 2 minutis lineaque interjecta obsoleta.

Wild in the Galapagos; Chatam Island — Capt. Wood; James Island — Darwin (v. s. sp. in hb. Hooker). — This has no very obvious affinity to any other species. Its loose leaf-sheaths and simple oval spike are very peculiar.

270. EPIDENDRUM ATTENUATUM. Huc Lindl. l. c. 217.:

E. foliis carnosis ovato-oblongis obtusis, pedunculo aphylo, bracteis linearibus acuminatis pedicellis multo longioribus, sepalis petalisque linearibus acuminatis, labelli lobis lateralibus semiovatis laceris, intermedio lineari-lanceolato subdentato multo brevioribus, callis 4 linea longa elevata interjecta, clinandrio obsolete denticulato.

Wild in New Grenada — Lobb. (v. s. sp. in hb. Hooker). — A plant quite unlike all others, with flowers resembling those of *E. ciliatum* in miniature.

271. EPIDENDRUM CINNABARINUM Salzmann LO. 106. Bot. Reg. 1842. t. 25. Huc Lindl. l. c. 218.:

E. foliis oblongis apice sub-recurvis, sepalis petalisque lanceolatis subaequalibus, labello trilobo carinato basi bicalloso laciniis lateralibus inciso-laceris intermedia basi obcuneata sub apice constricta apice cuneata truncata angulis acuminatis simplicibus fissisque.

Wild in Brazil; sandy thickets near Bahia — Salzmann; Glocker 38; Pernambuco. in similar places — Gardner 1163; Venezuela, Merida — Sonder in hb. Hooker (v. v. c. et s. sp.). — Three species, each of great beauty, are very nearly related. They all have bright scarlet or crimson flowers, a pair of tubercles at the base of the labellum, and a ridged line running from between the tubercles to nearly the apex of the lip. They however differ thus: *E. radicans* has the lateral lobes of the labellum rounded and toothletted only, not lacerated, and it produces coarse pale green roots from its stems; *E. cinnabarinum* has the lateral lobes of the labellum deeply lacerated, while the central lobe is contracted in the middle, and then suddenly wedge shaped, with its angles prolonged into one or two fine teeth; *E. Schomburgkii* has the lateral lobes only toothed, with the centre lobe gradually widened to the point, and there toothletted, without being at all truncate.

272. EPIDENDRUM SCHOMBURGKII Lindl. in Bot. Reg. 1838. Misc. n. 16. t. 53. Huc Lindl. l. c. 219.:

E. foliis oblongis obtusis carnosis, caule simplici apice aphylo, sepalis petalisque lineari-lanceolatis acutis aequalibus patentissimis, labelli trilobi alte carinati basi bicallosi lobis lateralibus semiovatis latis rotundatis postice laceris intermedio cuneato apice triangulari crispo denticulato et utrinque undulato.

Epidendrum fulgens Focke Tijdschrift nederl. IV. 66.

(B) *confluens*. Lobes of the lip almost blended in one circular deeply fringed body.

Epidendrum fulgens Ad. Brongn. Voy. Duperrey t. 43.

Wild in Demerara — Schomburgk, 834, 581; Surinam, on the trees bordering the Commewyne river — Focke 57, 1057; Brazil, Pernambuco, on trees — Gardner, 1162; St. Catharine's — Lesson; Peru, Andes of Quito — Jamieson in hb. Hooker (v. v. c. et s. sp.). — Flowers rich scarlet, very handsome. Leaves sometimes bordered with

crimson. The variety B, with all the lobes of the lip nearly run together into one circular plate, a little toothed at the edge, and more so at the point, seems to be a very common state. There is no doubt that the form of the lip varies greatly.

Huc: *Epidendrum fulgens* Focke in Tidschr. Natuurk. Wetensch. IV. p. 66.:

Foliis oblongis ellipticisve apiculatis rigidis, caule folioso apice et inferne aphylo vaginato, sepalis petalisque lanceolatis acuminatis aequalibus, labelli trilobi lobis lateralibus dimidiatis laceratis patentibus, intermedio cuneato apiculato, utroque apicis margine lacerato involuto, basi bicalloso, disco cristato.

Radices fibrosae; primariae crassiusculae albae. Caulis inferne teres, aphyllus, vaginatus; superne subcompressus, foliosus, erectus, 2—3-pedalis crassitie pennae anserinae. Folia alterna, vaginata, oblonga vel elliptica, recurvo-apiculata, crassiuscula, subcarnosa v. coriacea, rigida, oblique patentia, nitida, laete viridia, 8—15 centim longa, 2—3 lata. Pedunculus terminalis apice subcorymbosus aphyllus, articulatus, vaginatus, 5—7-florus. Vaginae arctae, longiores, totum fere articulum amplectentes, purpurascētes; superiores minores angustatae acutae. Flores speciosi, coccinei. Sepala et petala aequalia lanceolata, acuminata; sepala retrorsum flexa, paulo latiora concaviuscula. Labellum cum columna connatum, limbo 3-partito, disco crista lineari lutea ultra medium lobi intermedii porrecta instructo utrinque ad basin calloso, callis luteis apice subulatis, basi rotundatis; lobis lateralibus dimidiatis laceratis patentibus, intermedio lato-lineari vel cuneato apiculato, utroque apicis dilatati margine lacerato involuto. Columna erecta cum ovario continua, marginibus luteis in labellum juxta cristam in callo decurrentibus. Anthera globosa bilocularis, loculis septo divisis. Pollinia 4 geminata, cultriformia, compressa, per paria caudiculis duabus elasticis pulvereis replicatis affixa. Ovarium et pedicellus concolor. — Epiphyta in arboribus sylvarum secus flumen Commewyne superioris. — Floreat Martio et Decembri. — Ab *E. crassifolio* Lindl. haud ita longe distare videtur, sed iconem Loddigesianam in Op. Lindl. p. 107 citatam, mihi videre non contigit.

273. EPIDENDRUM RADICANS Pavon. MSS. LO. 35. Huc Lindl. l. c. 220.:

E. foliis carnosis subcordatis ovatis obtusis, caule simplici longe aphylo vaginato, sepalis petalisque lanceolatis acutis patentibus, labelli carinati basi bicallosi lobis lateralibus rotundatis denticulatis, intermedio cuneato apice fimbriato emarginato utrinque integro.

Epidendrum rhizophorum Bateman in Bot. Reg. 1838. Misc. 10.

Wild in Guatemala — Skinner; Mexico — Hartweg 567; in grass at Tomatze, near Comaltepeque — Id. (v. v. c. et s. sp.). — One of the finest of its race, with dark orange-red flowers, as much as an inch and a half across. It always has long white roots proceeding from the sides of the stem. The plant thus named in Pavon's handwriting in the Fieldingian herbarium is *Dinema polybulbon*.

274. EPIDENDRUM CALANTHUM Rehb. fl. et Warscew. in Bonpl. II. 110.

Aff. *E. radicanti* et *decipienti*, superne arrhizum, labelli lobo medio sessili obcordato, omnino denticulato, carinula hinc flexuosa a basi in discum, disco (sicco) velutino.

Summitates tantum adsunt. Pedunculus bene lignosus. Vaginae arctae, ostio flosso acutae haud valde productae. Racemi laterales inflorescentiam terminalem haud aequantes. Bractee triangulares seu lanceae ovaris quater breviores. Sepala ac tepala membranacea oblonga acuta; labellum trilobum; lobi laterales flabellati, margine externo fimbriato denticulati, margine postico et antico integerrimi, lobe medius obcordatus, antice emarginatura triangula excisis, sinu integerrimo parvo a lobis lateralibus distinctus, marginibus fimbriato dentatis, calli 2 parvi trianguli in ima basi, linea carinata hinc flexuosa a basi in discum velutinum, androclinium vertice triangulum, utrinque folcatum. — Blüten so klein, wie die des *E. ellipticum* Grh. Peru. v. Warscewicz,

275. EPIDENDRUM DECIPIENS. Huc Lindl. l. c. 221.:

E. foliis oblongis obtusis carnosis, caule simplici apice aphylo, sepalis petalisque lanceolatis aequalibus patentissimis, labelli trilobi carinati basi bicallosi semicircularis lobis aequalibus inaequaliter dentatis intermedio cuneato lateralibus antice rectis postice rotundatis, clinandrio cucullato denticulato.

Wild in New Grenada; in the province of Ocanna — Schlim, 1032; Demerara, on the Conocon mountains — Schomburgk (v. s. sp.). — This is nearest *E. Schomburgkii*, from which it is distinguished by its equally divided lip, smaller flowers, and the inconsiderable keel of the lip. The flowers are vermilion according to Schomburgk, orange according to Schlim.

Epidendrum decipiens Lindl. Rehb. fl. Bonpl. III. 68. Wagerer.

276. EPIDENDRUM PAYTENSE (*Schistochila carinata*) Rehb. fl. in Bonpl. III. 220.

Aff. *Epidendro decipienti* Lind. sepalis lanceis, tepalis cuneato rhombis, superne denticulatis, labelli laciniis lateralibus semirotundis antice acutis serratis, lacinia media cuneata apice biloba lobis incumbentibus antice serratis.

Caulis rotundulus. Folia oblonga supra basin paulo rotundata, margine anguste cartilagineo denticulato cincta, bi — quinquepollicaria, supra basin nunc unum lata. Pedunculus teres vaginis nonnullis arctis subdistantibus vestitis. Racemi rhachis incrassata. Bractee lanceae seu triangulae erectae. Ovarium basi attenuatum plus quam semipollicare. Sepala lancea cinnabarina. Tepala spathulata, apice acuta, margine externo serrulata; lacinia media cuneata integerrima, apice biloba, lobi semiovati, superposite denticulati, calli duo angusti rotundati in basi, carina interposita a basi per discum. Flos cinabarinus illo *E. cinnabarii* duplo minor, labellum luteum punctis atropurpureis paucis in disco. Gynostemii anguli laterales utrinque angulati. La Payta de Peru v. Warscewicz. — Eingeführt von Herrn Fabrikbesitzer Nauen in Berlin, cultivirt von Herrn Gireoud. (Vgl. Allg. Gtz. 55.)

277. EPIDENDRUM IMATOPHYLLUM L.O. n. 52. Huc Lindl. l. c. 222.:

E. foliis distichis ligulatis obtusis submarginatis, caule simplici apice aphylo vaginato, sepalis lineari-lanceolatis patentibus lateralibus falcatis, petalis duplo latioribus nanis laciniatis, intermedio cuneato-rotundo subundulato basi serrato.

? *Epidendrum flexuosum* Meyer Fl. Essequib. p. 260. L.O. n. 34. Focke Tijdschrift nederl. IV. 65.

Wild in Demerara — Schomburgk 426; Parker; Surinam — Kappler 1656; Hostmann 405; Brazil, mouth Rio Negro, on trees — Spruce 1660 (v. v. c. et s. sp.) — Flowers pale rose-colour, larger than in *E. ellipticum*. Leaves very long, strap-shaped. The column is sometimes green, and the same colour occurs to a small extent in the sepals. *E. flexuosum* is referred hither in hb. Hooker — and perhaps with justice. N. 122 of the Herb. Mus. Par., collected in French Guiana by Mélinon, consists of leaves of this, and flowers of *E. Schomburgkii*.

Huc: *Epidendrum flexuosum* G. F. W. Meyer Fl. Esseq. p. 260. Lindl. l. c. p. 103. in Tijdsch. Natuurk. Wetensch. IV. 65. — Cl. Meyeri descriptioni haec sunt addenda: Spica umbellata terminalis 9 — 12-flora. Sepala recurva, lateralia falcata. Labelli discus 2 costis brevibus compressis elevatis divaricatis albis instructus. Anthera 4-locularis. Pollinia dimidiato-ovata, hinc rotundata, compressa. Clinandrium marginatum, 3-dentatum, dentibus obtusis. Capsula oblonga trisulcata. — Mense Septembri florens ad rivum Tampati, fluminis Commewyni superioris tributarium, ad arboris truncum.

E. SCHISTOCHILA TUBERCULATA.

278. EPIDENDRUM DICHOTOMUM Presl. Rel. Haenk. 101. LO. n. 58. Huc. Lindl. l. c. 223.:

E. foliis lanceolato-oblongis obtusis, caule apice aphylo squamoso ramoso, sepalis petalisque lanceolatis acutis reflexis, labelli laciniis fimbriatis lateralibus rotundatis patentissimis intermedia majore obcordata, callo altero concavo crenulato indiviso duobusque minoribus ad basin, clinandrio integerrimo.

Wild in Peru — Mathews 1024; near Huanaco — Haenke (v. s. sp.). — Very near E. ibaguense, but distinguished by its little lobed lip, and entire clinandrium. The unlobed tubercle, with a pair of smaller calli near its base, affords another mark of distinction.

279. EPIDENDRUM QUITENSIMUM Rehb. fil. MSS. Huc: *Epidendrum fastigiatum* Lindl. l. c. 224.:

E. foliis ovato-oblongis obtusis carnosis, scapo aphylo, racemo oblongo composito densissimo fastigiato, bracteis setaceis, sepalis petalisque oblongis obtusis aequalibus, labelli multifidi laciniati lobis lateralibus intermedio truncato minoribus, tuberculi 5-lobi elongati callo terminali 3-crenato lateralibus 2-crenatis, clinandrio integro.

Wild in Peru; on the Andes of Quito — Jamieson (v. s. sp. in hb. Hooker). — The large middle lobe of the lacerated lip, and its very peculiar long tubercle, render it easy to recognise this, independently of the dense fastigiate inflorescence. It is the size of E. Schomburgkii.

280. EPIDENDRUM BRACHYPHYLLUM. Huc Lindl. l. c. 225.

E. foliis ovato-oblongis carnosis, pedunculo 4-squamato racemo bis longiore, bracteis acuminatis pedicellis brevioribus, sepalis petalisque oblongis acutis subaequalibus, labelli lobis inaequalibus dentatis, lateralibus rotundatis intermedio cuneato emarginato apiculato ungue utrinque 2-dentato, tuberculi tripartiti lobis lateralibus decurrentibus intermedio ovato 5-crenato, clinandrio serrato.

Wild in Bolivia; in the province of Yungas, Dec. — Weddell, 4255 (v. s. sp. comm. hb. Mus. Par.). — A sturdy plant, about six inches high, with the habit of E. elongatum. Flowers rose-coloured.

281. EPIDENDRUM SPINESCENS. Huc Lindl. l. c. 226 :

E. caule elongato apice dense folioso, foliis lineari-lanceolatis petiolatis rigidis apice spinescentibus, pedunculo sessili bracteis inferioribus acuminatis herbaceis, sepalis oblongis subaequalibus, labelli transversis lobis dentatis lateralibus rotundatis antice incisus intermedio apiculato minore, callo ovato elevato concavo medio utrinque tumido et in labellum decurrente, clinandrio serrulato.

Wild in Brazil — Miers 3484 (v. s. sp. in hb. Miers). — Stem nine inches high, at the upper end bearing five or six stalked taper-pointed leaves, an inch and a half to two inches long. Raceme sessile, two inches long. Flowers the size of E. ellipticum.

282. EPIDENDRUM GRACILICAULE Rehb. fil. et Warscew. in Bonpl. II. 111.

Aff. E. Lindenii floribus carnosulis triplo minoribus, labelli lobo medio transverso bilobo, lobis margine externo serratis, callo depresso hippocrepico crenato a basi lobi medii ad angulos gynostemii.

Summitates tantum adsunt. Pedunculus ultra pedalis, calamum columbinum vix crassus, nunc flexuosus, multisquamatus (squamae arctae, appressae), apice racemo 2-3 pollicari terminatus, nunc superadditis racemis lateralibus, bractee triangulae, breves, ovaria bene sed haud conspicue cuniculata. flores carnosuli, sepala ac tepala subaequalia paulo angustiora oblonga acuta, labellum trilobum, lobi laterales a basi cuneata trianguli, seu ovati lacero dentati, lobus medius sinus angustis sepa-

ratus, statim dilatatus, transversus, bilobus, lobi oblongi, margine externo pauciserrati, apiculus parvulus nunc in imo sinu antico; callus hippocrepicus crenulatus limbosus a basi lobi medii angulos versus gynostemii, androclinium trilobum, non serratum. — Die kleinen Blüthen von orangegelber Farbe sind kaum halb so gross, als wie die des *E. ellipticum*. Peru. v. Warscewicz.

283. EPIDENDRUM LINDENII Lindl. in Bot. Reg. 1845. misc. 59. Huc Lindl. l. c. 227.:

E. caulibus simplicibus strictis, foliis carnosis ovalibus obtusis emarginatisve, racemo oblongo obtuso, sepalis lanceolatis petalisque aequalibus, labelli laciniis laceris lateralibus subrotundis, intermedia cuneata emarginata, callo 7-crenato crenis convexis integris inferioribus duplo majoribus, clinandrio denticulato.

Wild in Venezuela; rocks in the neighbourhood of Merida, at the height of 5000 feet — Linden 636; New Grenada, Santa Martha — Purdie; Caracas — Linden 64 (v. s. sp.) — This seems to be a common plant on the Spanish Main. Mr. Linden says there are three varieties; one with bright carmine flowers, another with rose-coloured, and a third with yellow-orange. The central tubercle is hemispherical, with seven lobes gradually diminishing in size up to the point. Mr. Linden's 636 is authority for this; what is said about the species in the Botanical Register, l. c., belongs, in part at least, to some other plant. Mr. Linden's 64 is rather smaller, the tubercles on the lip are slightly different, and the middle lobe of the lip is merely denticulate.

284. EPIDENDRUM COCHLIDIUM Lindl. in Ann. Nat. Hist. Vol. IV. 382. Huc Lindl. l. c. 228.

E. foliis ovato-oblongis obtusis emarginatisque coriaceis, sepalis petalisque lineari-lanceolatis patentibus aequalibus, labelli laciniis laceris subaequalibus intermedia cuneata truncata callo carnosio maximo excavato trilobo parum majore.

Wild in Peru — Mathews 1868; Venezuela Merida, in subalpine rocky places — Moritz 1601 (v. s. sp.) — Flowers yellow and red according to Moritz. The large tubercle, which covers the whole centre of the lip is very remarkable. It is said by Moritz to be called „Flor de San José“ in Merida.

Huc: *Epidendrum pulcherrimum* Klotzsch in Allg. Gartenz. 1854. n. 30.

Caule tereti gracili folioso; foliis oblongo lanceolatis brevissime acutis; carnosio coriaceis distichis patentibus basi vaginatis; racemo congesto terminali; pedunculo sesquipedali vaginis elongatis bracteiformibus suffulto; floribus germinibusque sordide puniceis disco plicato cristato, labelli vitellino, bracteis persistentibus linearisubulatis membranaceis, perigonii foliolis oblongo obovatis acutis patentibus, basi attenuatis, exterioribus latioribus; labello trilobo, lobis lateralibus flabelliformibus inciso laceris, intermedio basi cuneato, apice dilatato divergenti bifido oblique truncato argute dentato, inter lacinias apiculato, disco 5 plicato appendicibus marginalibus 2 majoribus instructo germine glabro deorsum attenuato.

285. EPIDENDRUM CATILLUS Rehb. fil. et Warsc. in Bonpl. II. 112.

Aff. *E. cochlidium* Lindl., labelli callo a basi ad apicem lobi medii obovati apiculati integerrimi elliptico, crenulato, duplici, basilari in anteriorem incurrente, disco carinato.

Summitates tantum adsunt. Pedunculus nitidus, quasi calamaceus: terminalis crassus, more Polystachyarum quarundam; pedunculi laterales elongati graciliores; bractee lanceae acuminatae ovariis pedicellatis inferioribus triplo - quadruplo breviores, sepala oblonga acuta, tepala subaequalia acuta, labelli lobi laterales flabellati, postice latiores, margine externo rotundato dentati, antice et postice integerrimi;

lobus medius obovatus apiculatus integerrimus, cum collo connatus, vix productus, callus oblongus, margine pluricrenulatus, antice linea media carinata, carina in apiculum excurrente, limbus crenulatus ante basin utrinque in discum incurrens: hinc quasi duo calli sibi imbricantes; androclinium serrulatum. — Blüthen etwas grösser, als bei *E. decipiens* Lindl. Neu-Granada: West - Cordilleren. v. Warszewicz.

286. EPIDENDRUM INCISUM Rchb. fil. et Warsc. in Bonpl. II. 112.

Aff. *E. cochlidio* labelli lobo medio rotundo, basi utrinque recto, callo oblongo crenulato apice in carinam acutam apicem labelli versus excurrente.

Summitates tantum adsunt. Pedunculus superne simplex seu ramosus. Flores sicci chartacei cinnabari. Sepala ac tepala oblonga apiculata. Labellum circuitu rotundum: lobi laterales semicordati rotundati extus dentati, lobus medius basi utrinque rectus, ceterum rotundatus, apice sinu triangulo bilobus, lateribus inciso dentatus. Callus depressus marginatus crenulatus a basi gynostemii in basin lobi medii, antice in carinam sinum versus anticum productus; androclinii anguli infra rostellum paucidentati. — Das harte Gefüge der Blüthe und ihre Farbe zeichnen sie sehr aus. Grösse wie die des *E. cochlidium* Lindl. Peru. v. Warszewicz.

287. EPIDENDRUM XYTRIOPHORUM Rchb. fil. et Warsc. in Bonpl. II. 112.

Aff. *E. cochlidio* Lindl. perigonio membranaceo (in sicco), sepalis tepalisque lanceolatis, labelli lobo medio transverso non cuneato, carina acuta ultra callum excurrente.

Summitas tantum adest. Racemus multiflorus, cylindraceus 3—4 pollicaris. Bractee triangulae apice subulatae ovariis pedicellatis septies et magis adhuc breviores. Perigonium in sicco membranaceum. Sepala ac tepala a cuneata basi lanceolata acuta. Labellum ambitu oblongum; lobi laterales quadrati, basi vix semicordati, latere externo paulo latiori inciso dentati; lobus medius aequilatus, sinu lineari divisus, transversus, sinu latissimo obsolete bilobus, lateribus rotundatis inciso dentatus; callus depressus oblongus lobulatus inter lobos laterales in basin lobi medii, antice medio carinatus, carina antice acuta ultra callum paulo progrediente; androclinii alae laterales denticulatae. — Blüthen wenig grösser, als die des *E. Lindenii* Lindl. Peru. v. Warszewicz.

— Rchb. fil. in Bonpl. III. 68. Ocanna. Wagerer.

288. EPIDENDRUM (*Amphiglottium Schistochila Tuberculata*) FIMBRIA Lindl. et Rchb. fil. in Bonpl. II. 282.

Nulli affine, foliis ovali lanceis acutis minutis, pedunculo longissime squamato, labelli laciniis lateralibus semiovatis profunde laceris, lobo medio cuneato apice paucidentato, lamella media ligulata apice retusa crenata assurgente, callis 2 obtusis in basi, uno obtuse papulaeformi utrinque in basi loborum laterahum, androclinio serrulato

Planta elegans ultra pedalis. Folia in basi 7 sesquipollicaria, basi tertiae pollicis aequilata. Pedunculus prope per longitudinem pedis vaginis arctis tectus apice corymbosus. Flores illos Epidendri elliptici Grah. aequantes. Sepala ovata acuta. Tepala duplo angustiora. „Flores aurantiaci, labellum rubro maculatum.“ — Ocanna. 3500'. Savannen. October. 990. Schlim. — Eine durch die kleinen Blätter und die sehr zerissene Lippe höchst ausgezeichnete Pflanze.

289 EPIDENDRUM ANSIFERUM Rchb. fil. in Bonpl. II. 111.

Aff. *E. elliptico*, foliis lato ellipticis, labelli lobo medio transverso, subrotundo, callo trilobo antice crenulato utrinque ab angulis gynostemii divergenti carinato.

Caulis tripedalis. Folia lato elliptica, valde crassa, quatuor pollices longa, medio duos lata. Pedunculus longus, calamo anserino crassior, vaginae arctae, appressae, subcontiguae, punctulatae. Sepala ac tepala subaequalia oblonga cuneata apiculata,

lateralibus dimidiatis. Labellum circuitu circulare, lobi laterales semicordati, denticulati, sinus parvis acute triangulis a lobo medio transverso aequalato antice rotundato bilobo separati, lateribus denticulato; callus depressus carnosus in basi anteriore loborum lateralium ac in radice lobi medii, antice minute crenulatus, superne hinc papulosus, carinis 2 ab angulis decurrentibus serrulatis gynostemii divaricatis inter lobos laterales et lobum medium. — Blüthen so gross, wie die des *E. elongatum*.
Caracas: Chacaos. 625. E. Oto.

290. EPIDENDRUM XANTHINUM Lindl. in Bot. Reg. 1844. misc. p. 18. Huc Lindl. l. c. 229.:

E. foliis oblongis carnosis, caule longe aphylo, sepalis petalisque patentibus ovalibus acutis aequalibus, labelli trilobi lobis lateralibus truncatis alte incisus intermedio cuneato dentato, callo plicato mucronato concavo serrato, clinandrio antice serrato.

Epidendrum ellipticum var. *flavum* Lindl. in Ann. Nat. Hist. IV. p. 382.

Wild in Brazil — Martius; Serro do frio, Minas Gerães — Gardner 5205; Caraccas — Linden 636; Loddiges (v. v. c. et s. sp.) — Flowers yellow, or vermilion, touched with orange. Stems three feet high according to Martius, but in all my specimens very much shorter. The leaves like *E. ellipticum*, but its yellow flowers are peculiar, and the central tubercle of the lip is destitute of the shoulders that run off into the side lobes in *E. ellipticum*.

291. EPIDENDRUM ELLIPTICUM Graham in Exot. Bot. t. 207. LO. n. 56. Lodd. Bot. Cab. t. 1216. Huc Lindl. l. c. 230.:

E. foliis ellipticis obtusis concavis succulentis, caule longe aphylo nunc ramoso squamoso, sepalis petalisque patentibus lineari-lanceolatis aequalibus, labelli trilobi lobis dentatis lateralibus rotundatis, intermedio emarginato basi cuneato, callo concavo plicato acuminato utrinque in lobos laterales decurrente deorsum dentato, clinandrio serrato.

Epidendrum crassifolium LO. n. 55. Bot. Mag. t. 3543.

Wild in Brazil; Organ mountains — Miers; common on rocks in exposed places — Gardner 627; three to four feet high in marshy bushy places, Chapada de N. S. d'Abadio, May — Gardner 4365 (v. v. c. et s. sp.) — Very near *E. elongatum*, from which it differs in its elliptical blunt succulent leaves, paler flowers, and especially in the form of the tubercle of the lip, which is deeply furrowed, or plaited, shouldering off to the lateral lobes, and is not furnished there with a free tubercle as in *E. elongatum*. Flowers light rose-colour.

292. EPIDENDRUM ELONGATUM Jacq. ic. rar. III. t. 604. Bot. Mag. t. 611. LO. n. 54. Huc Lindl. l. c. 231.:

E. foliis ovato-lanceolatis acutiusculis, scapo longe aphylo nunc ramoso squamoso, sepalis petalisque patentibus lineari-lanceolatis aequalibus, labelli trilobi lobis lateralibus truncatis denticulatis: intermedio duplo majore dilatato cuneato emarginato biloboque denticulato, callo carnosio concavo acuminato crenato utrinque verruca crenata aucto, clinandrio serrato.

Amphyglottis secunda Salisb. Hort. Trans. l. c.

Epidendrum secundum Linn. sp. pl. 1349. Jacq. Amer. 224. t. 137. LO. n. 57.

Wild in the West Indies; Trinidad — Schach; Dominica — Imray; Antigua — Nicholson; Martinique, on the mountains — Jacquin; Caraccas — Jacquin (v. v. c. et s. sp.) — Flowers bright rose-colour. Leaves longer and thinner, more ovate and acute than in *E. ellipticum*.

293. EPIDENDRUM LACERUM Lindl. in Bot. Reg. 1838. misc. 18. Huc Lindl. l. c. 232.:

E. foliis lineari-oblongis acuminatis obtusis, caule simplici apice aphylo laxo squamato, sepalis petalisque patentibus lineari-lanceolatis subaequalibus acutis, labelli lobis aequalibus laceris pectinatis, intermedio apice mucronato integro, callo hippocrepico mucronato in labellum utrinque per crura 2 decurrente, clinandrio serrulato.

Wild in Cuba — Capt. Sutton (v. v. c.). — A slender species with narrow grassy leaves, pale rosy flowers, and a distinct entire point to the middle lobe of the lip. It has the habit of *E. imatophyllum*, but the leaves taper to the point, and the lip is wholly different.

294. *EPIDENDRUM IBAGUENSE* Humb. et Kunth, Nov. Gen. et Sp. I. 352. LO. n. 53. Huc Lindl. l. c. 233.:

E. foliis oblongis obtusis carnosis, caule simplici apice aphylo nunc ramoso, sepalis oblongis acutis patentibus, petalis conformibus paulo minoribus, labelli laceri lobo intermedio obcordato lateralibus altius limbriatis cordatis apice rotundatis, callo concavo carnosio trilobo apiculato, clinandrio serrato.

Wild in New Grenada; between Ibague and M. Tolima, at the height of 4440 feet — Humboldt and Bonpland; Peru, on walls and rocks about Loxa — Hartweg; deep ravines near Quito — Jamieson 94 (v. s. sp.) — A very fine species, with orange-coloured flowers. The leaves are an inch and a quarter broad, and the stems as thick as a swan's quill, and apparently often branched. When old they become as smooth as bamboo.

295. *EPIDENDRUM NOVOGRANATENSE* Rehb. fl. et Warsc. in Bonpl. II. 111.

Aff. *E. ibaguensi*, callis falcatis utrinque 2 calli limbo suppositis.

Tripedale. Foliorum vaginae bene transverse rugulosae (arpophyllaceae); laminae oblongae, apice inaequales, tres pollices longae, duas tertias pollicis latae. Pedunculus ultra bipedalis, pluri (9) vaginatus, vaginae arctae, dorso bicarinulatae. Racemae ineunte anthesi subcorymbosus illum *Calanthis veratrifoliae* aemulans. Bractae inferiores triangulo setaceae, ovarii pedicellati tertiam aequantes. Sepala oblonga apiculata; tepala angustiora, apicem versus vulgo crenulata. Labelli lobi laterales tepali dimidium lati, postice alte semicordati, ceterum rotundati, antrorsum lacero serrati, postice denticulati, lobus medius subaequilatus, cuneatus, antice rotundatus cum sinu triangulo, lateribus anticis lacero serratus; callus depressus a gynostemii basi in basin lobo medii: antice trilobus, lobi laterales falcati, lobus medius quadratus apice retuso trilobulus; lateribus crenulatus; calculae 2 suppositae sinibus inter lobos anticos calli; calcula altera utrinque lateri medio calli supposita; androclinium trilobum, lobus verticis triangulus, lobi laterales decurrentes serrulati. — Blüthen getrocknet mennigroth, etwas grösser, als die des *E. Lindenii*; Blüthenstiel und Fruchtknoten über zollang. Neu-Granada. v. Warscewicz.

296. *EPIDENDRUM TRICRURE* Rehb. fl. et Warsc. in Bonpl. II. 112.

Aff. *E. ibaguensi*, labelli lobo medio quadrifido, callo depresso tricurri, cruribus lateralibus in labelli lobos laterales prostratis, crure medio lateri lobulato in medium usque discum lobi medii.

Pedunculus tantum adest pedalis quadrivaginat; apice racemosus per tres pollices. Bractae lanceae acuminatae ovarii pedicellatis quadruplo-sextuplo breviores. Ovarium bene sed non abrupte cuniculatum. Sepala subaequalia oblonga apiculata, lateralia dimidiata, tepala angustiora apice minute crenulata, labelli lobi laterales postice alte semicordati, margine rotundato externo denticulati, antrorsum laceri, lobus medius transversus, aequilatus, sinu lineari parallelo a lobis lateralibus divisus marginibus externis rotundatus, fimbriatolaceratus, medio alte bifidus, utrinque etiam bifidus; androclinii angulis decurrentibus serrulatis. — Blüthe so gross, wie die des *E. Lindenii* Lindl.: schön lilä. Die Lippe ist im Umkreise ganz rund und ziemlich häutig. Peru. v. Warscewicz.

297. *EPIDENDRUM SOCORQENSE* Rehb. fl. in Bonpl. II. 20. Huc: *Epidendrum Schlimii* Lindl. l. c. 234.

E. caule erecto ramoso, pedunculi vaginis paucis obtusis distantibus, racemo laxo, sepalis petalisque membranaceis oblongis reflexis, columnae elongatae basi tenui, labelli parvi lobis lateralibus hastatis cordatis postice

subdentatis apice trifidis intermedio lineari indiviso, callis 5 conspicuis oviformibus.

Wild in New Grenada; on trees in forests on the Volcan del Diablo, in the province of Socorro, at the height of 4—5000 feet — Schlim 75 (v. s. sp. comm. cel. Linden.) — Leaves unknown. The stem branches like some shrub. The flowers are bright red, an inch and a half in diameter, with a very slender column and small lip.

298. EPIDENDRUM PANCHRYSUM Rchb. fil. et Warsc. in Otto et Dittrich Allg. Gartenz. XXII. n. 40. p. 313.

Affine *E. gracilicauli* labelli lobis lateralibus obtriangulis angustis latere externo sinuato dentatis, lobo medio ligulato dilatato antice quinque-dentato; callo ligulato postice obtuse corniculato utrinque in basi loborum lateralium, altero alteri subparallelo, antice in callum hipposiphonatum plicatum latere antrorso rotundato et in apiculum subtus adnatum exeunte; androclinio tridentato.

Diese schöne Art hat goldgelbe Blüten, die nur halb so gross sind, wie die eines gesunden *E. ellipticum* Grah. Die Vegetationsorgane kennen wir nicht, doch genügt die obige Diagnose zur Erkennung der Art. Dass Sepalen und Tepalen wie bei den Verwandten gestaltet sind, ist aus der Weglassung derselben in der Diagnose ersichtlich. — Herr v. Warscewicz entdeckte diese Art in Peru. Wir erhielten sie aus dem Garten des Herrn Senator Jenisch durch den Obergärtner Herrn Kramer.

§ 10. *Eupidendrum*. Lindley in Hooker's Journal III. 81. Lindl. l. c.

The essential distinction of this section is the leafy, not pseudobulbous stem, the adnate labellum, and the entire want of sheaths at the base of its peduncle, as in *Amphiglottium*, or of leafy spathes, as in *Spathium*.

The Species may be subdivided thus:

Folia equitantia	A. <i>Equitantia</i> .
Folia plana, bracteis spathaceis saepius ancipitibus	B. <i>Planifolia spathacea</i> .
Folia plana, bracteis depauperatis.	
floribus umbellatis	C. <i>Planifolia umbellata</i> .
floribus racemosis	D. <i>Planifolia racemosa</i> .
floribus paniculatis	E. <i>Planifolia paniculata</i> .

In all cases the species with an entire lip form the beginning of each series, and those with it most divided the termination.

A. EQUITANTIA.

299. EPIDENDRUM VESICATUM Lindl. in Bot. Reg. 1838. misc. 89. Huc Lindl. l. c. 236.:

E. caule elongato, foliis inflatis equitantibus carinatis acutis glaucis, floribus terminalibus fasciculatis carnosis foliis vix longioribus, sepalis lineari-oblongis acutis, petalis conformibus angustioribus, labello subrotundo cordato linea media tuberculisque duobus basilaribus elevatis, collo ovarii medio vesicato.

Wild in Brazil — Loddiges (v. v. c.) — Leaves covered with a glaucous bloom, imbricated, and more like inflated carinate bracts, than true leaves. Flowers greenish white, with the neck of the ovary having an elevated semi-transparent blister near its middle. This blister is in fact the lower extremity of the cuniculus.

300. EPIDENDRUM EQUITANS Lindl. in Bot. Reg. 1838. misc. 76. Huc Lindl. l. c. 237.:

E. caule folioso ancipiti, foliis equitantibus ancipitibus lanceolatis elongatis acuminatis, flore solitario terminali pendulo, pedunculo ancipiti, spatha diphylla foliolo inferiore erecto foliaceo flore longiore, sepalis linearibus acuminatis patulis, petalis conformibus paulo brevioribus, labello ovato-lanceolato trilobo complicato cum columna basi con-

nato medio trilamellato; lobo medio carnoso semitereti recurvo lateralibus erectis membranaceis integris.

Wild in Mexico, Vera Cruz — Hartweg (v. v. c.) — In habit resembles *Fernandezia*. Flower dull chocolate brown.

B. *SARCOPHYLLA* Rehb. fil.

301. *EPIDENDRUM MICROPHYLLUM* Lindl. in Hook. Journ. III. 85. Huc Lindl. l. c. 133.:

E. ramulis foliosis, foliis distichis angustis carnosis canaliculatis acutis serrulatis racemo terminali tomentoso multo brevioribus, sepalis aristatis, petalis linearibus, labello oblongo acuto basi bilamellato venis tribus per medium obsoleteis.

Epidendrum? sarcophyllum Focke, Tijdschrift nederl. IV. 67.

Wild in Demerara — Schomburgk; Hostmann 626, in herb. Mus. Par. and Miquel (v. v. c. et s. sp.) — A small creeping species, with woolly dull purple or greenish flowers. The cultivated plant has much longer foot-stalks to the flowers than the wild one. M. Focke observes that the pollen-masses are incumbent, not collateral, a circumstance which leads him to ask whether this is really an *Epidendrum*. See his excellent description in the work above quoted.

Huc: *Epidendrum? sarcophyllum* Focke in Tijdschr. Naturk. Wetensch. IV. p. 67.

Rhizomate repente, caule fusiformi terete folioso, foliis semiteretibus mucronatis carnosis, racemo terminali paucifloro, sepalis oblongis acuminatis, lateralibus basi connatis subfalcatis, petalis multo angustioribus linearibus, labello suborbiculato acuminato concavo, columna terete clavata, clinandrio marginato bidentato.

Rhizoma repens, tortuosum, annulatum. Radices filiformes, griseae. Caules breves, fusiformes, teretes, foliosi, arrecti. Folia disticha, semiteretia, canaliculata, lineari-lanceolata, mucronata, basi vaginantia, carnosia, rigida, pollicaria. Pedunculus racemosus, terminalis, filiformis, erectus, 5—8-florus, foliis longior; purpureus, albidus lanuginosus. Flores minuti, bracteis vaginantibus acutis glabris viridibus suffulti, viridescentes. Perianthium patens. Sepala elliptico-oblonga, acuminata, convexa; lateralibus labello supposita subfalcata, basi connata, ascendente. Petala multo angustiora, lanceolata, apice attenuata. Labellum posticum, petaloideum, subrotundum, acuminatum, basi columnae adnatum ibique lamellis 2 acutis disco adpressis instructum, saccato-concavum, circa columnam connivens. Columna teres, clavata, brevis, in ovarium resupinata, purpureo-picta; clinandrio obliquo, marginato, postice bidentato. Stigma rinale, labellum versus spectans. Anthera suborbicularis, apice bifida, convexa, clinandrio immersa, bilocularis, loculis septo transverso bipartitis. Pollinia quatuor ovata, per paria sibi invicem superposita, quorum 2 superiora longiuscule unguiculata, per paria caudiculis duabus pulverulentis replicatis parallelis adnata, flava. Ovarium teres, purpureum, sparse pubescens, sub lente floccosum. Capsula globosa, apiculata, pisi magnitudine. — Herba pusilla epiphyta. Floret Junio, Julio, Novembri. — Hancce plantam ad calcem generis *Epidendri* collocaui, etsi mihi non liqueat, eam revera huc pertinere. Descriptionem e planta sedulo inspecta fidam ac fusam dare conatus sum. Videant Botanici, qui, me feliciores, librorum copia et reliquis naturae studioso necessariis adminiculis gaudent, an novum aliquod genus hic lateat. Sepala lateralibus basi coalita, pollinia incumbunt, nec collateralibus, ideoque caudicularum numerus mihi differentias satis conspicuas constituere videntur.

C. *TERETIFOLIA* Rehb. fil.

302. *EPIDENDRUM TERES* Rehb. fil. in Bonpl. III. 220.

Foliis teretibus, labelli compressi lundo basilari carinati lobis lateralibus humiliter angulatis erectis, lobo medio triangulo ancipiti.

Planta habitu Poneræ juncifoliæ. Caulis usque octopollicaris. Vaginae nervosae (ancipites?). Folia carnosâ sesquipollicaria 8—9. Caulis dein anceps in spatham foliaceam excurrentis: fasciculus bractearum ancipitium (more E. equitantis) congestus ex axi racemi valde abbreviata. Flos ex icone Oerstediana flavus, clausus, incluso ovario subpollicaris vivus — siccus multo minor. Ovarium cuniculatum fusiforme. Sepala carnosâ triangula, tepala spathulata acuta. Labellum basi gynostemii obtusi abbreviati adnatum. In summo monte El Viego 5500'. In monte Irasu 10,000' Oerst.

303. EPIDENDRUM KARWINSKII Rehb. fl. in Bonpl. 1856. 327. : Huc: *Isochilus cernuum* Lindl. Ann. Bot. Hist. t. 18p2. 184

Caulibus caespitosis filiformibus erectis, foliis teretibus obtusissimis, spatha terminali bivalvi, pedunculis elongatis, floribus cernuis, sepalis ovatis petalisque linearibus obtusis, labello concavo subtrilobo columnae adnato apice carnosâ acuto utrinque rotundato membranaceo, linea elevata in medio.

Mexico. Karwinski. — The habit of this plant is that of *Isochilus globosus*, but its stem are nearly 6" high and stout in proportion, and the flowers are ½" long.

304. EPIDENDRUM SUBULATIFOLIUM Rich. and Galeotti Orch. Mex. n. 51. Huc Lindl. l. c. 258.:

E. foliis teretibus subulatis acutis, scapo 4—5-floro, floribus intense luteis parvulis, labello suborbiculari integro sinuoso.

Wild in Mexico — Galeotti.

D. PLANIFOLIA SPATHACEA.

305. EPIDENDRUM RAMOSUM Jacq. Amer. 221. t. 132. Swartz Fl. Ind. Occ. I. 1505. LO. n. 24. Huc Lindl. l. c. 238.:

E. fruticosum, ramosum, foliis linearibus obtusis emarginatis, racemis terminalibus laxis flexuosis paucifloris, bracteis cucullatis obtusis ovario longioribus, sepalis ovato-lanceolatis petalisque linearibus acutis patentibus, labello subcordato ovato acuto concavo rigido.

Epidendrum rigidum Lodd. Bot. Cab. t. 1600.

Isochilus ramosum Spreng. Syst. III. 734.

Wild on trees in the West Indies, common; Demerara — Parker; French Guayana — Melinon 116; Mexico, rocks and trees at 5000 feet near Oaxaca, on the Pacific side — Galeotti 5034; Brazil, Organ Mountains — Miers (v. s. sp.) — Stem shrubby, somewhat dichotomous. Flowers small, greenish yellow. It varies in the size of its parts. In Sir William Hooker's herbarium is a Dominican specimen (Imray 179), with leaves two inches long by half an inch wide.

306. EPIDENDRUM STROBILIFERUM Rehb. fl. in Orch. Splitg. Huc *Isochilus ramosum* Focke in Tijdschr. Natuurk. Wetch. IV. 69.

Caule tereti ramoso folioso vaginato, foliis distichis carnosis ovato-lanceolatis apice oblique bidentatis, spica disticha terminali stricta compressa, floribus bracteis inclusis, sepalis lateralibus ovatis subfalcatis basi obliquis concavis acutis superiore oblongo plano latioribus, petalis paullo angustioribus linguaeformibus basi obliquis, labello cordato-hastato acuto concavo, ovario ventricosâ.

Radices filiformes, viridescentes. Caules teretes, ramosi, foliosi, vaginati. Folia disticha, vaginantia, ovata, oblongo-ovata vel ovato-lanceolata, apice oblique bifida vel emarginata, carnosâ, uninervia, 1—2 centim. longa, 6—8 millim. lata. Spica disticha, terminalis, stricta, 3—4-flora, bracteata, compressa. Bractee membranaceae, amplae, subtriangulares, plicato-cucullatae, amplexicaules, persistentes, floris longitudine. Perianthum clausum. Sepala aequilonga, lateralialia ovata acuta inaequilatera, basi obliqua, concava, superiore oblongo obtuso plano erecto latiora.

Petala paullo angustiora, sepalis aequilonga, linguiformia, basi obliqua. Labellum unguiculatum, unguiculo columnae basi adnatum, cordato-hastatum, acutum, concavum, cum columna parallelum, marginibus conniventibus. Columna brevis, cum ovario continua semiteres, marginata, apice bicornis. Anthera opercularis 4-locularis. Pollinia 4 subrotunda, compressa, per paria caudiculis brevibus replicatis adfixa. Ovarium sub labello ventricosum. Capsula globosa, rostello obtuso terminata. — Herba epiphyta perennis, in Crescentia Cujete non rara. — Flores albi, inconspicui. — Floret Augusto.

307. *EPIDENDRUM RIGIDUM* Jacq. Amer. 222. t. 134. Swartz Fl. Ind. Occ. III, 1507. L.O. n. 70. Hook. ic. t. 314. Huc Lindl. l. c. 239.:

E. caule subsimplici, foliis distichis ovato-oblongis obtusis, spicae flexuosae rachi ancipiti, bracteis foliaceis dolabriformibus carinatis ovarii longitudine, sepalis coriaceis ovatis obtusis patentibus, lateralibus majoribus, petalis linearibus membranaceis, labelli postici cordato-ovati obtusi disco calloso cuniculo inflato, clinandrio dentato.

Wild in the West Indies, common; Caraccas — Purdie; Mexico — Pavon; Demerara — Loddiges, Schomburgk 889; Surinam — Splitgerber; Brazil, on trees, Barro do Rio Negro — Spruce 166, Martius, Miers (v. s. sp. et v. c.) — Stem simple, a span high, two-edged. Flowers small, green, turning yellow.

— Rehb. fil. in Bonpl. II, 20. Caracas. Wagerer.

308. *EPIDENDRUM CORIIFOLIUM* Lindl. in Journ. Hort. Soc. VI, 218. c. ic. Huc Lindl. l. c. 240.:

E. foliis angustis coriaceis subdistichis carinatis concavis obtusis, spica densa terminali, bracteis coriaceis carinatis herbaceis distichis ovario longioribus, sepalis lateralibus crassis carinatis ovalibus, petalis linearibus spathulatis, labello subrotundo plano emarginato basi bicalloso, medio elevato.

Wild in Central America — Skinner (v. v. c.) — In all its parts tough, thick, leathery, and generally glazed, as it were, with a shining exudation. The narrow stiff leaves are blunt, about six inches long, concave, with a sharp midrib. Spike terminal, about four inches long, consisting of hard amplexicaul keeled bracts. Flowers greenish. Keel of lateral sepals serrated.

Lindl. Paxt. II, p. 85. n. 356.: *Epidendrum coriifolium* Lindl. — Flowers green. Central America. Tough, thick, leathery structure, generally glazed with shining exudation. The narrow stiff leaves are blunt, 6 inches long, concave, with a sharp midrib. Spike, which is terminal and about 4 inches long, consists of hard amplexicaul keeled bracts pressed close to the flowers and forming a kind of cone before they expand. The flowers are pale green, very firm and leathery, with a broad roundish convex lip having an elevated callosity along the middle. The lateral sepals, which are peculiarly thick, have a serrated keel at the back. — Nearly related to *E. rigidum*, but its leaves are much longer, and narrower, and the flowers three or four times as large, and extremely coriaceous. — Journ Hort. Soc. VI.

309. *EPIDENDRUM XYLOSTACHYUM* Lindl. in Bot. Reg. 1845. misc. p. 70. Huc Lindl. l. c. 241.:

E. caule simplici, foliis oblongis obtusis coriaceis mucronulatis, vaginis scabris, spica stricta flexuosa dura folio summo parum brevior, bracteis herbaceis cucullatis ovatis rigidis approximatis, floribus carnosis, sepalis oblongis concavis, petalis conformibus planis angustioribus, labello cordato ovato obtuso concavo margine recurvo, clinandrio integro.

Wild in New Grenada; Pennon du Pan de Azucar, on the side of Tolima, at the height of 6000 feet; February — Linden 1280 (v. s. sp.). — Resembles *E. macrostachyum*, but the bracts are larger, the spike is short, the flowers are larger, and the petals are almost as broad as the sepals, instead of being filiform. Flowers greenish white.

310. EPIDENDRUM MACROSTACHYUM Lindl. in Bot. Reg. 1845. misc. p. 70. Huc Lindl. l. c. 242.:

E. caule simplici, foliis oblongis mucronulatis vaginis scabriusculis, racemo longissimo cernuo angulato, bracteis magnis duris ovato-cordatis reflexis, floribus coriaceis, sepalis oblongis obtusis, petalis filiformibus, labello cordato obtuso laevi basi valde concavo, clinandrio integro.

Wild in New Grenada; on the rocks of the Pan Azucar, on the side of Tolima, at the height of 6000 feet; February — Linden 1279 (v. s. sp.) — A singular species, with racemes more than a foot long, covered with distant leafy bracts full half an inch long. Flowers green, fleshy. Stem from two to three feet high.

311. EPIDENDRUM IMBRICATUM LO. 71. Huc Lindl. l. c. 243.:

E. caule ramoso, foliis distichis lineari-oblongis obtusis, spicis ovato-oblongis imbricatis, bracteis carinatis obtusis, sepalis petalisque ovatis acutis subaequalibus erectis, labello ovato acuto obsolete crenulato.

Wild in Brazil; pendent from large trees in the Organ Mountains — Gardner (v. s. sp.) — Spike almost like a strobilus, two inches long, by one and a half inch broad. „Flowers white“. — Gardner.

312. EPIDENDRUM BIFARIUM Swartz Fl. Ind. Occ. III. 1509. LO. 69. Huc Lindl. l. c. 244.:

E. foliis distichis cordato-lanceolatis acuminatis horizontalibus, spica terminali flexuosa, rhachi ancipiti, bracteis spathaceis compressis falcatis acutis carinatis, sepalis ovato-lanceolatis convexis, petalis brevioribus setaceis, labelli dilatati trilobi lobis lateralibus subrotundis integris, intermedio bilobo.

Wild in Jamaica — Mac Fadyen 4; on the trunks of trees on the Blue Mountains; September — Swartz (v. s. sp. in hb. Smith et Hooker). — Stem two to four inches high. Flowers greenish white. Bracts somewhat falcate, keeled, as long as the ovary. The only specimens I have seen of this are in Mr. Smith's herbarium, from Swartz himself, and in Sir William Hooker's. Its amplexicaul fleshy somewhat falcate leaves, and long naked ancipitous zigzag spike, are very different from anything else in the genus.

E. PLANIFOLIA UMBELLATA.

313. EPIDENDRUM PIPERINUM Lindl. in Ann. Nat. Hist. XV. 256. Huc Lindl. l. c. 245.:

E. caule ramuloso, foliis distichis succulentis oblongis obliquis obtusis laxè vaginatis, pedunculis brevissimis terminalibus subbifloris, sepalo dorsali petalisque filiformibus erectis, lateralibus ovato-lanceolatis carinatis horizontalibus, labello cordato-ovato cochleato ecalloso venis radiantibus in margine confluentibus,

Wild in Peru; on the road between Quito and the village of Machachi — Hartweg 1419 (v. s. sp.) — A small succulent species, when dried beautifully netted. It looks like a Peperomia.

314. EPIDENDRUM SCULPTUM Rehb. fl. in Bonpl. II. 89.

E. sculptum, juxta E. piperinum: foliis oblongis bi—tripollicaribus, punctulatis, torsione perpendicularibus, sepalis petalisque subaequalibus, labelli trilobi lobis lateralibus angulatis, lobo medio ligulato.

Folia oblonga, apice bitubula, valde micantia utrinque minutissime punctulata, obliqua, lamina prope perpendiculari. Flores tres in apice caulis sessiles, bractee amplae, apice rotundato retusae, ovaria ecuniculata aequantes, flores subcartilaginei, sepala ac tepala subaequalia, lineari-ligulata, obtusiuscula, labellum aequilongum, carnosum, trilobum, lobi laterales rhombeo retundati, apice acutanguli, lobus medius productus, ligulatus obtuse acutus, gynostemii humilis androclinium marginatum

utrinque medio unidentatum. Von Chagres von Herrn Keferstein eingeführt, von Herrn Lehmann cultivirt.

315. EPIDENDRUM TOLIMENSE Lindl. in Bot. Reg. 1845. misc. p. 66. Orch. Lindl. n. 29. Huc Lindl. l. c. 246.:

E. caulibus ramosis scaberrimis, foliis striatis ovato-lanceolatis, floribus 2—3 terminalibus sessilibus coriaceis, sepalis lineari-lanceolatis acutis striatis, petalis setaceis, labello subcordato ovato concavo apice carnoso basi ecalloso intus pubescente avenio.

Wild in New Grenada; in the forests of Tolima at the height of 10,000 feet, January — Linden 1272 (v. s. sp.). — Flowers small, a dull yellow colour. Branches excessively rough with irregular asperities. Leaves about one and a half inch long. It is much like E. Lima in habit, although so different in structure.

316. EPIDENDRUM STENOPETALUM Hook. in Bot. Mag. t. 3410. Huc Lindl. l. c. 247.:

E. caule flexuoso, foliis loratis acuminatis obtusis emarginatis, umbella sessili terminali pauciflora, sepalis petalisque angustioribus acutissimis, labello obovato rotundato convexo basi lamellato, columna brevissima, clinandrio carnoso lobato.

Epidendrum lamellatum Bot. Reg. 1843. misc. 60.

Wild in Honduras — Sir C. Lemon; Panama — Fendler 332; Jamaica — Mac Fadyen; Venezuela, in Merida, near St. Cristoval, in forests at the height of 3000 feet, October — Linden 710 (v. s. sp. et ic. pict.). — Sir W. Hooker says, that the lip is free from the column, Mr. Booth, that it is adherent; we cannot settle the point from want of examinable specimens. The flowers are bright rose-colour. The E. stenopetalum of Knowles and Westcott (Floral Cabinet II. p. 175), now irrecoverably lost, must be very different from this.

Epidendrum stenopetalum Hook. Rehb. fil. in Bonpl. II. 20. Die Lippe ist frei von der Säule. November. 6000' Caracas. Wagener.

Huc: *Isochilus elegans* Focke Tijdschr. Naturk. Wetschr. IV. 68.

Caule radicali simplici folioso, foliis distichis lineari-lanceolatis emarginatis strictis coriaceis, floribus terminalibus nutantibus, sepalis oblongis, petalis ovatis vix brevioribus, labello orbiculato acuminato.

Radices fibrosae, confertae. Caulis foliosus, teres, erectus, profunde ac regulariter sulcatus, griseus, 2—3 decim. longus, pennae anserinae crassitie. Folia disticha, lineari-lanceolata, sensim attenuata, obtusa, inaequaliter et profunde emarginata, stricta, coriacea, amplexicaulia, superiora vaginantia, 8—10 centim. longa, 1—1,2 lata. Spicae breves, terminales, 2—3-florae, nudaе. Perianthium patens. Sepala oblonga, acuminata; lateralia inaequilatera, 1,8 centim. longa, 6 millim. lata. Petala ovato-rhomboidæa, apiculata, sepalis fere aequilonga, centim. lata. Labellum petalis subconforme, orbiculatum, breve acuminatum, unguiculatum, unguiculo cum ima basi columnæ connatum, concavum, basi minute imbricato-callosum, disco albo, 1,5—2 centim. longum, 1,2—1,5 latum. Columna brevissima, erecta, carnosa, conduplicata, concolor, apice biloba, lobis rotundatis conniventibus erectis, clinandrio lobis columnæ tecto. Stigma labello reconditum. Anthera dorsalis, bilocularis, loculis bipartitis, septis membranaceis, in clinandrio immersa, albidæ. Pollinia 4 oblonga, dimidiata, compressa, flava. Caudiculae 4 filiformes, pulveræe, replicatae. Ovarium teres, leviter sulcatum. Capsula oblonga, obsolete triquetra. — Herba epiphyta perennis, non rara. — Flores purpureo-rosei, nutantes. — Floret Junio.

317. EPIDENDRUM DIFFORME Jacq. Ann. 223. t. 136. Huc: *Epidendrum unbellatum* Swartz, Nov. Act. Ups. VI. 68. Bot. Mag. 2030. L.O. u. 28. Lindl. l. c. 248.

E. foliis oblongis subundulatis obtusis, umbella sessili, sepalis lineari-oblongis obtusis petalisque linearibus acutis patentibus, labello indiviso rotundato repando transverso basi bicalloso, clinandrio laciniato.

Epidendrum difforme Jacq. Amer. 223. t. 136.

? *Epidendrum subumbellatum* Hoffmg. in Linn. XVI. 232.

? *Epidendrum radiatum* Hoffmgg. Bot. Zeit. 1843. 832.

Wild in the West Indies; Trinidad — Sieber 379, Dominica — Imray 130, St. Vincent's — Guilding; Brazil, Minas Gerães — Widgreen 777; Guatemala; in woods near Samborondan — Hartweg (v. v. c. et s. sp.) — Flowers green, without a trace of spathe or equivalent bracts.

318. EPIDENDRUM LATILABRE Lindl. in Bot. Reg. 1841. misc. 163. Huc Lindl. l. c. 249.

E. foliis ovatis obtusis brevivaginantibus supremis suborbicularibus, umbella 2—4-flora sessili, sepalis lineari-oblongis obtusis patentibus, petalis lineari-spathulatis obtusissimis, labello repando sublobato emarginato basi bicalloso fere 4-plo latiore quam longo, clinandrio laciniato.

? *Epidendrum virens* Hoffmgg. in Linnaea XVI. 223.

Wild in the West Indies, Dominica — Imray; Peru, Myobamba, on trees — Mathews; Brazil, Rio Janeiro — Gardner 628, Organ Mountains — Miers (v. v. c. et s. sp.) — Very near *E. umbellatum*, of which it has the habit; but its lip, which is four times broader than long, and curved downwards on each side, so as to bear no little resemblance to a stiffly starched lady's apron, gives it a different appearance. The flowers, too, seldom exceed four to an umbel, the petals are very blunt, and the leaves more round than oblong: in Mathew's Peruvian specimens they are almost orbicular. Nevertheless, it is much to be doubted whether this is anything more than a gigantic variety of *E. umbellatum*.

319. EPIDENDRUM ENSATUM Rich. and Galeotti Orch. Mex. n. 54. Huc Lindl. l. c. 250.:

E. caule compresso ancipiti, foliis oblongo-lanceolatis acutis, floribus parvulis albido-brunneis, labello adnato trilobo lobis obtusis subaequalibus margine sinuosis.

Wild in Mexico — Galeotti.

320. EPIDENDRUM TETRACEROS H. G. Reichenbach in Bot. Zeit. 1852. p. 735. Huc Lindl. l. c. 251.:

E. caule elato ramuloso, foliis linearibus acuminatis, pedunculis tenuibus paucifloris (2—4), bracteis anguste triangulis acutis, sepalis cuneato-oblongis acutis, petalis duplo angustioribus, labello ab angustiori basi trapezoideo dilatato obtusangulo antice emarginato in sinu minute unidentato lineis tribus medianis elevatis, clinandrio 4-dentato dentibus mediis minutis lateralibus dolabriformibus.

Wild in Veragua; on Mount Chiriqui — Warczewitz. — Twice as large in every part as *E. filicaule*, which is nearly related to it. — Rehb.

321. EPIDENDRUM LACERTINUM Lindl. in Bot. Reg. 1841. misc. 109. Hort. Soc. Journ. II. 309. Huc Lindl. l. c. 252.:

E. foliis lanceolatis acuminatis pedunculo longioribus, racemo sessili umbellato, ovariis subsecundis longissimis pendulis bracteis setaceis multoties longioribus, sepalis lanceolatis acuminatis, petalis lineari-lanceolatis, labelli trilobi basi bilamellati laciniis lateralibus triangularibus intermedia lineari acuminata elongata, anthera cucullo integerrimo immersa.

Wild in Guatemala — Loddiges (v. v. c.) — The flowers hang down on long stalk like ovaries from one side of a short raceme; bright green, with the exception of the column, which is yellow; the lip is a little stained with purple, and has the appearance of a lizard's tail, the hind legs being outside the flower, and the head and shoulders buried within the cup.

Huc: *Epidendrum* (*Amphiglotum*) *indusiatum* Klotzsch Allg. Gtz. 1854. 177.

Caule simpliciter ramoso, ramis fusi formibus remote foliosis utrinque

attenuatis; foliis papyraceo coriaceis lanceolatis acuminatis patenti recurvis, superioribus apicem versus tortis racemo terminali superantibus; racemo compressiusculo tripollicari 6—7 floro, basi bracteis 2 oppositis pollicaribus lanceolatis acuminatis foliaceis instructa; pedicellis teretibus flavidoviridibus 2½ pollicaribus bractea semipollicaria 4 lineari lanceolata acuminata suffulta; perigonii foliolis flavo viridibus angustis setaceo-acuminatis sesquipollicaribus; columna clavata candida intus indusio plano bilobo ornata; labelli trifidi basi bifido-callosi laciniis lateralibus brevissimis falcato uncinatis reflexis; intermedia viridi lanceolata subulata 9 lineari patentissima.

Guatemala. v. Warscewicz col. Mathieu.

322. EPIDENDRUM NOCTURNUM Linn. Sp. Pl. 1349. Jacq. Amer. 225. t. 139. LO. n. 43. Bot. Reg. t. 1961. Bot. Mag. t. 3298. Huc Lindl. l. c. 254.:

E. foliis oblongis, floribus subgeminis, sepalis petalisque pedicello duplo brevioribus linearibus acuminatis patentibus, labelli trilobi lobis lateralibus ovatis integerrimis intermedio setaceo brevioribus, clinandrio dentato.

Epidendrum discolor Richard and Galeotti Orch Mex. n. 56.

Epidendrum tridens Pöppig and Endlicher N. G. et Sp. II. t. 103.

(A) Leaves oval, four to five times as long as broad.

(B) *latifolium*. Leaves very large, not more than twice as long as broad.

Wild in the West Indies; St. Vincent's — Guilding, Dominica — Imray 200, woods on the mountains of Martinique — Jacquin, Jamaica — Mac Fadyen; Surinam — Focke 126, Hostmann 36; Demerara — Parker; Peru, on rocks and stones — Pöppig (v. v. c. et s. sp.) — About a foot high. Flowers three inches long, white, with a tinge of green or crimson, extremely sweet-scented. It varies so much in the breadth of the leaves as to make it doubtful whether *E. longicolle* is really distinct.

Epidendrum nocturnum Jacq. Rchb. fl. in Bonpl. III. 68. Ocaña. Wagener.

— Rchb. fil. in Bonpl. II. 20. Caracas. 5000'. Augst. Wagener.

Huc: *Epidendrum Spruceanum* Lindl. l. c. 253.

E. foliis oblongis obtusis, floribus fasciculatis, sepalis petalisque linearibus acuminatis pedicello longioribus, labelli trilobi laciniis lateralibus semirhombeis obtusis apice dentatis intermedia setacea brevioribus, clinandrio integro.

Wild in Brazil; at the Barro do Rio Negro, on trees — Spruce 1466 (v. s. sp.) — Leaves as large as in the largest state of *E. nocturnum*. Flowers nearly six inches from tip to tip of the long attenuated sepals. „Sepals and petals greenish white; lip white“. — Spruce.

323. EPIDENDRUM LONGICOLLE Lindl. in Bot. Reg. 1828. misc. 49. Bot. Mag t. 4165. Huc Lindl. l. c. 255.:

E. foliis strictis linearibus apice angustatis obtusis, floribus subsolitariis foliis brevioribus, sepalis lineari-lanceolatis acuminatis patentibus, pedicellis ovario subaequalibus, petalis linearibus acutis supra columnam convergentibus, labelli trilobi lobis lateralibus obtusis semiovatis integerrimis intermedio setaceo brevioribus; lamellis 2 callosis ad basin, collo ovarii elongato, clinandrio dentato.

Wild in Demerara — Schomburgk (v. v. c. et s. sp.) — Near *E. nocturnum*, but much less handsome. The sepals and petals are pale yellow; the lip white, with two yellow plates at the base.

F. PLANIFOLIA RACEMOSA.

324. EPIDENDRUM JAMAICENSE. Huc Lindl. l. c. 256.:

E. foliis oblongo-lanceolatis acutissimis racemo longioribus, bracteis

herbaceis acuminatis pedicellis aequalibus, floribus membranaceis, sepalis lanceolatis petalisque linearibus acutis, labello transverso indiviso cuspidato basi bicalloso, clinandrio cucullato indiviso.

Wild in Jamaica; on trees in the woods of Dunrobin Castle — Purdie (v. s. sp. in hb. Hooker). — Not much like any other species. The two upper leaves (?) in Sir W. Hooker's herbarium being broken off, I am not quite sure of the section. The flowers are as large as in *E. verrucosum*, and apparently white or yellow.

325. EPIDENDRUM LEDIFOLIUM Richard and Galeotti Orch. Mex. n. 50. Huc Lindl. l. c. 257.:

E. caule erecto fruticoso ramoso, foliis lanceolato-linearibus obtusiusculis, racemo subsessili laxo flexuoso, bracteis membranaceis setaceis pedicellis brevioribus, sepalis acutis petalisque obtusis angustioribus linearibus, labello cordato subrotundo emarginato subintegro basi bicalloso lineis 3 elevatis interruptis.

Wild in Mexico — Galeotti (v. s. sp. comm. cel. inv.) — A branching shrub, in the specimen before me almost eighteen inches high. Flowers yellow.

326. EPIDENDRUM COCCINEUM Rchb. fl. in Bonpl. III. 68.

Affine *E. ledifolio* foliis lineari-ligulatis sursum attenuatis, retusis, racemo cernuo, floribus carnosis, labello cordato ovato obtuse acuto basi carinulis quinis obscuris carnosis.

Caulis adest quinquepollicaris. Vaginae pulcherrime arphyllaceae retusae. Laminae superiores adsunt bi- ad tripollicares; apice retusiusculae basi paulo dilatatae, bene carnosae coriaceae margine tenues. Racemus cernuus brevis pluriflorus. Bractee lanceo aristatae ovarii pedicellatis ter breviores. Perigonium valde carnosum. Sepala ovata acuta. Tepala ligulato-falcata subacuta paulo breviora. Labellum medio adnatum. Androclinium valde retusum. — Epiphyt. — Blüten „coccinroth“. 5000'. März. Ocanna. Wagener. (Liegt vor: Tunguragua, Hall.)

327. EPIDENDRUM GASTROPODIUM Rchb. fl. MSS. Huc: *Gastropodium violaceum* Lindl. Ann. Nat. Hist. XV. p. 107.

Ramosum, vaginis foliosum, foliis carnosis linearibus obtusis mucronulatis, vaginis striatis transverse rugosis; racemi laeves, sessiles, terminales, cernui. Flores parvi, membranacei, violacei. Bractee subulatae, membranaceae; sepala conniventia, ovata, libera; petala lanceolata duplo minora; labellum cum columna connatum, ventricosum, ovatum, callo tripartito ad basin. Columna brevi pyramidalis, partis liberae marginibus latis crassis truncatis; clinandrium nudum. Anthera plana membranacea, 4 locularis; pollinia 4, oblonga, collateralia, omnino sejuncta, filis totidem rectis nec replicatis, laevibus, apice connato colligata; ovarium cuniculatum, antice ventricosum.

Popayan (Hartweg). — This genus is like the true species of *Diothonea*, and like it in habits. It differs in its naked anther-bed and in the structure of the pollen-masses.

328. EPIDENDRUM PROPINQUUM Rich. and Galeotti Orch. Mex. n. 49. Huc Lindl. l. c. 259.:

E. „caule tereti foliis oblongo-lanceolatis obtusiusculis, racemis 4-floris, floribus brunneis, labello cordato margine denticulato“.

Wild in Mexico — Galeotti.

329. EPIDENDRUM PHILIPPII II: G. Rchb. in Linn. XXII. 840. Huc Lindl. l. c. 260.:

E. racemo paucifloro, bracteis lanceolatis acutis ovaria pedicellata superantibus, sepalis oblongis, petalis lanceolatis basi cuneatis multo angustioribus brevioribusque acutis, labello ovato cordato latere utroque sinuato antice emarginato margine subtiliter crenulato, callis 2 minimis.

Wild on the Cordilleras; eastern side — Philippi (Rchb.) — Stem branched, leafy. Leaves longish, with a sharp point, and broad sheaths. — Rchb.

330. EPIDENDRUM SARGOSTALIX Rchb. fil. et Warsc. in Bonpl. II. 111.

Aff. *E. Philippii* bracteis minutis, labello cordato replicato, gynostemio apice valde clavato.

Caulis validus. Vaginae valde arphyllaceae nervosae. Folia oblonga cum apiculo angustissime cartilagineo marginata, bipollicaria, medio unum pollicem lata, numerosa. Racemus reflexus, bractee triangulo setaceae ovario quater - sexies breviores, ovarii cuniculus elongatus, haud amplus, bene conspicuus. Perigonium carnosum chartaceum. Sepalum summum oblongo - obovatum acutum, lateralia subaequalia paulo latiora, tepala a basi angusta dilatata, ligulata, obtusata, medio subacuta, labellum deflexum triangulum, postice utrinque semicordatum, calli 2 parvi rotundo tumidi in ima basi, gynostemium a tenuiori basi valde clavatum, anguli 2 antici oblique rhombeii, tumidi, anthera in androclinio integro immersa. — Blüten um die Hälfte größer, als die des *E. Arbuscula* Lindl. Das *E. orgyale* hat eine gesägte Lippe und dergleichen Tepala. Peru. v. Warszewicz.

331. EPIDENDRUM ORGYALE Lindl. in Ann. Nat. Hist. XV. 256. Huc Lindl. l. c. 261.:

E. caule orgyali distiche foliato, foliis ovato-oblongis margine vaginisque scabris, racemo sessili erecto cylindraceo, bracteis membranaceis subulatis, floribus carnosis, sepalis ovalibus, petalis spathulato-linearibus serrulatis, labello cordato acuto serrulato callis duobus juxta basin unoque sulcato minore sub apice, cuniculo ventricosum.

Wild in New Grenada; Andes near Bogota — Hartweg (v. s. sp.) — Stem five feet high. Flowers apparently yellow.

332. EPIDENDRUM QUADRATUM. Huc Lindl. l. c. 262.:

E. caule alto folioso, foliis coriaceis ovato-oblongis obtusis, racemo sessili cernuo multifloro, floribus carnosis, bracteis linearibus herbaceis acuminatis, floribus carnosis, sepalis oblongis obtusis, petalis spathulato-lanceolatis minute denticulatis, labello subrotundo-quadrato serrulato undulato basi bicalloso axi crassa venisque lateralibus elevatis carnosis rugosis, clinandrio carnosum 4-dentato.

Wild in Tropical America — Linden (v. s. sp. comm. cel. Linden, sine numero aut loc. nat.) — Near *E. orgyale*, with very much larger flowers.

333. EPIDENDRUM FIMBRIATUM H. B. K. I. 351. L.O. n. 27. Huc Lindl. l. c. 263.:

E. foliis distichis oblongo-linearibus oblique retusis margine vaginisque scabris, racemo angusto terminali, floribus subsessilibus, sepalis linearibus retusis, petalis conformibus serratis, labello subrotundo-ovato serrato basi bilineato, columna nana.

Epidendrum alternans Lindl. in Hook. Journ. III. 88.

Wild in Peru; lofty mountains of Andimarcha — Mathews 1072 and 1897; ravines of Pichincha — Jamieson 67 and 95; woods of Guayan — Hartweg 1418; nearly on a level with Quito — Jamieson 9; province of Carabaya — Weddell 4668; Venezuela, terrestrial, in the Paramo del Zumbador, at the height of 11,000 feet — Linden 1473; New Grenada tufts in the open spaces of the vast forests of Quindiu, between Palmilla and El Moral, in the province of Mariquita, at the height of 8400 feet — Linden 1288, Purdie: Ocanna, on the borders of rivulets — Schlim 736 (v. s. sp.) — Slender plants about six inches high, with small racemose flowers, pale rose-coloured — Weddell; white, dotted with rose or violet — Linden. The lip varies in its degree of fimbriation.

Epidendrum fimbriatum Hb. B. Kth. Ocanna. Wegränder. 8000'. Blüten weiss. n. 736. Schlim.

Epidendrum fimbriatum Hb. B. Kth. Rchb. fil. in Bonpl. II. 20. Caracas. Wagerer.

Epidendrum fimbriatum Hb. B. Kth. Rchb. fil. in Bonpl. III. 68. Ocanna. 7000'.

Wagener.

334. EPIDENDRUM SCRIPTUM Rich. and Galeotti Orch. Mex. n. 53. Huc Lindl. l. c. 264.:

E. „caule tereti, foliis elliptico-oblongis acutis, floribus viridulis, racemo simplici terminali, labello adnato obsolete trilobo albo lineis purpureis scripto“.

Wild in Mexico — Galeotti.

335. EPIDENDRUM LONGIPETALUM Rich. and Galeotti Orch. Mex. n. 55. Huc Lindl. l. c. 265.:

E. „caule compresso diphylo, foliis approximatis lato-ellipticis subacutis, floribus pallide roseis, racemis paucifloris scapum pedalem terminantibus, sepalis internis linearibus externa duplo superantibus, labello cordato obsolete trilobo“.

Wild in Mexico — Galeotti. — Compare with *E. antenniferum*.

336. EPIDENDRUM TENUE. Lindl. in Hook. Journ. III. 88. Huc Lindl. l. c. 266.:

E. foliis distichis linearibus acuminatis oblique emarginatis, racemis acutis angustis simplicissimis (nunc casu quodam bifidis multifloris 10—20), bracteis ovatis acutis rigidis cucullatis pedicello longioribus, floribus erectis membranaceis, sepalis linearibus obtusis, petalis filiformibus, labello sesili ovato acuto concavo utrinque 1-dentato, venis baseos elevatis.

Wild in Brazil — Martius (v. s. sp. in hb. Martius). — The habit is that of *E. parviflorum*. Stems little more than six inches high.

337. EPIDENDRUM ANGUSTISSIMUM. Huc Lindl. l. c. 267.:

E. caulibus caespitosis erectis simplicibus, vaginis scabriusculis, foliis linearibus serrulatis mucronulatis, racemo tenui flexuoso foliis brevioribus, bracteis acuminatis ovario aequalibus, sepalis linearibus reflexis, petalis filiformibus, labello tripartito laciniis lateralibus cuneatis fimbriolatis, intermedia ovata.

Wild in New Grenada; province of Mariquita — Triana 128 (v. s. sp. comm. cel. Linden). — Near *E. fimbriatum* and *tenuis*. Stem six to nine inches high. Flowers extremely small. The exact structure of the lip and column cannot be determined in the only specimen I possess.

338. EPIDENDRUM CARDIOGLOSSUM H. G. Reichenbach Linn. XXII. 841. Huc Lindl. l. c. 268.:

E. racemis paucifloris cernuis, bracteis lanceolatis acutis, sepalis oblongis acutis, petalis oblongis basi cuneatis ab apice latissimis acutis, labello trilobo oblongo cordato retusiusculo medio apiculato latere utroque emarginato, callis 2 in basi lineis 3 elevatis antepositis.

Wild in the Caraccas, March — Moritz 621 (Rchb.) — Stems strong, branched. Leaves longish, acute. Vaginae in the dried specimen very rough, loose. Flowers yellowish. — Rchb. Seems to be near *E. scabrum*.

339. EPIDENDRUM VERNIXIUM Rchb. fil. et Warscew. in Bonpl. II. 110.

Aff. *E. cardioglossum* tepalis cuneato-ligulatis subdenticulatis, labelli lobis posticis rotundatis alte semicordatis, lobo medio producto retusiusculo, venis loborum rugulosis, papula utrinque in sinu.

Caulis robustus, vaginae valde arphyllaceae, folia oblongo-ligulata, apice obtusata, sesquipollicaria, dimidium pollicem lata, nunc latiora, superne pulchre vernixia, pedunculus caule multo tenuior, floribundus, tripollicaris, erectus (?), bractee linearitriangulae ovario pedicellato prope decies breviores, perigonium chartaceo-carnosum, sepala oblonga acuta, summum subcuneatum, tepala a lineari basi oblongo-ligulata, obtusa, microscopice sublobulata, subdenticulata, labelli lobi postici semirotondi, alte

semicordati, limbo interno revoluti, minutissime denticulati, lobus medius ab angustiori basi dilatatus, apice retusiusculus (trapezoideus), margines antici impliciti, denticulus in medio, venae 5 mediae ac illae in lobis lateralibus ruguloso incrassatae, papula unica utrinque ad sinum inter lobos, anguli antici gynostemii falcato producti. — Von *E. cardioglossum* durch die Gestalt der Lippe und Tepalen und blüthenreiche Inflorescenz und langen Stengel sehr gut verschieden. Der Blüthenstiel ist halb geknickt, daher können wir über seine Stellung nicht bestimmt urtheilen; er scheint aufrecht. Blüthen viermal so gross, als beim gewöhnlichen *E. scabrum* (R. P.?) Lindl. Peru. v. Warszewicz.

340. EPIDENDRUM CONOPSEUM R. Br. in H. Kew V. 219. Elliott. Carol. II. 506. Hook. in Bot Mag. t. 3457. L.O. n. 48. Huc Lindl. l. c. 269.

E. foliis paucis rigidis coriaceis acuminatis, racemo laxo multifloro, sepalis linearibus petalisque angustioribus spatulatis patentibus obtusis, labello obtuse trilobo lacinia intermedia ovata aut quadrata, callis 2 apice liberis, clinandrio cucullato integerrimo.

Epidendrum Magnoliae Mühl. Cat. 81.

Wild in the Southern States of North America; on evergreen trees sea coasts of Georgia and Carolina — Elliott; East Florida — Baldwin; Apalachicola, in West Florida — Drummond: Louisiana — hb. Hooker (v. s. sp. in hb. Hooker). — This, the most northern Epiphyte yet known, occurs, we are told by Elliot, as far to the north as „Eding's island, at the entrance of Port Royal inlet. To the south it becomes more common, and is found on several species of oak and other trees. Plant four inches high, or smaller. Flowers five to eight, green or pale yellow“. The lip of Sir W. Hooker's Louisiana plant has the middle lobe ovate, not truncate as in that which flowered at Liverpool, and is represented in the „Bot. Mag.“ Sir W. Hooker states, that at the very thime when Drummond gathered it in Apalachicola ice formed so thickly in one night's time as to bear the weight of a man. No doubt it is sheltered by the leaves and branches of the evergreen trees on which it is found, from the nocturnal radiation which produces ice in such countries as Florida.

341. EPIDENDRUM ACUMINATUM Fl. Peruv. Syst. 248. L.O. n. 31. Huc Lindl. l. c. 270.:

E. caulis erectis subramosis, foliis lanceolato-linearibus acuminatis vaginis verruculosi, racemo pyramidali foliis subaequali, bracteis brevibus membranaceis acutis, sepalis oblongis patulis lateralibus columnae alte adnatis, petalis linearibus apiculatis basi angustatis univeniis subdenticulatis, labelli lobis lateralibus semiovatis obtusis postice subdentatis intermedio truncato tridentato 3-lineato basi bicalloso, clinandrio integro cucullato.

Wild in Peru, on trunks of trees 12,500 to 13 000 feet — Jamieson (v. s. sp. comm. cel. Hooker). — A grassy plant, with erect open racemes of greenish-yellow flowers.

342. EPIDENDRUM SCABRUM Fl. Peruv. Syst. 248. L.O. n. 49. Huc Lindl. l. c. 271.:

E. caulis ascendentibus subramosis, foliis coriaceis ovato-lanceolatis obtusis, racemo denso oblongo reflexo sessili, sepalis oblongis lateralibus columnae adnatis, petalis filiformibus, labello 3-partito basi bicalloso lacinii aequalibus, lateralibus denticulatis intermedia indivisa, columna brevi crassa, clinandrio integro.

Wild in Peru; mountains of Pillao and Munna — Ruiz and Pavon; Surrucucho on the trunks of trees, Chimborazo, on rocks at 12,000 feet — Jamieson 10 and 151; valley of Bannos — Hall, Chachapoyas — Mathews 3200; Andimarcha — Fl. 1063; New Grenada, Bogota — Gudot 1; Pamplona — Purdie (v. s. sp. comm. cel. Hook.) — Very like *E. varicosum*, among the Amphigoltis, as well as *E. chioneum*. Varies much in the size of both leaves and flowers.

343. EPIDENDRUM TORQUATUM Lindl. in Benth. Pl. Hartw. p. 149. Huc Lindl. l. c. 272.:

E. caule elongato aspero, foliis oblongis coriaceis obtusis distichis,

spica sessili recurva, floribus coriaceis, sepalis ovatis acutiusculis, petalis tenuioribus basi angustatis parum angustioribus, labelli trilobi basi bicallosi lobis lateralibus subtruncatis, intermedio cuneato tridentato.

Wild in Peru; Popayan, on the ascent to the Paramo de Guanacas, at 10,500 feet — Hartweg 1424; on the ground on the Cordillera of Loxa — Id.; New Grenada, on the ground, from the Quebrada between Mouserrate and Guadalupe, in the province of Bogota, at the height of 8160 feet; March — Linden 1268 (v. s. sp.) — Near *E. scabrum*, but with much larger and more coriaceous flowers. It varies very much in the size of the flowers, which are yellowish — Linden, and very fragrant — Hartweg. It seems to be always terrestrial.

344. EPIDENDRUM CHIONEUM Lindl. in Bot. Reg. 1845. misc. p. 73. Huc Lindl. l. c. 273.:

E. caule laevi ramoso, foliis ovato-lanceolatis mucronulatis, racemo capitato cernuo, bracteis erectis herbaceis acuminatis ovario longioribus, sepalis subrotundo-ovatis apiculatis, petalis obovatis minute serrulatis, labelli laciniis integris intermedia lineari medio rugulosa basi bicallosa cuneata, lateralibus minoribus acutis, clinandrio alte marginato.

Wild in New Grenada; on the ground, Paramo, between Venta Quemada and Tunja, at the height of 12,000 feet; March — Linden 1344 (v. s. sp.) — The flowers are pure white, in small close heads, an inch or more long. It is very near *E. cernuum*, but differs in the form of its sepals and the lobes of the lip, if that species is correctly described. Leaves about two inches long by a quarter of an inch wide.

345. EPIDENDRUM CERNUUM Humb. et Kunth. Nov. Gen. et Sp. I. 353. L.O. n. 46. Huc Lindl. l. c. 274.:

E. foliis oblongis obtusis coriaceis, spica elongata cernua, sepalis lanceolatis margine revolutis cuspidatis, petalis conformibus angustioribus, labelli trilobi margine reflexi lobis lateralibus subrotundis acuminatis intermedio triplo majore concavo convexo lineari apice rhombeo axi coriacea basi bicallosa.

Wild in Peru; on trees in the Ravines of the Andes of Popayan, between the town of La Erre and the valley of Yanacatu, at the height of 5080 feet — Humboldt and Bonpland; forests on the western side of Pichincha — Jamieson (v. s. sp. in hb Hooker). — Stem three feet high, and more. Spike three inches long. Flowers sweet-scented, yellowish green.

346. EPIDENDRUM MATUTINUM H. G. Reichenb. in Linn. XXII. p. 840. Huc Lindl. l. c. 275.:

E. racemo incurvo brevi multifloro, bracteis lanceolatis acutis ovarii pedicellatis multo brevioribus, sepalis lanceolatis acutis petalis subaequalibus sub apice dilatatis, labello libero trilobo lobis lateralibus margine externo rotundatis apice acutis medio producto ligulato acuto lamellis 3 elevatis in medio, callis 2 parvis in basi.

Wild in Venezuela; Merida, Jan. — Moritz 1065 (Rchb.) — Stems strong. Leaves longish, acute, keeled beneath. Flowers yellowish. — Rchb.

347. EPIDENDRUM INSECTIFERUM. Huc Lindl. l. c. 276.:

E. foliis oblongis acutis undulatis striatis, racemo longipedunculato stricto dense multifloro, bracteis setaceis pedicellis brevioribus, sepalis petalisque linearibus acuminatis, labelli trilobi basi bicallosi linea elevata interjecta laciniis lateralibus rotundatis antice acutis intermedia ovata obtusa apiculata, clinandrio cucullato integro.

Wild in Bolivia — Bridges (v. s. sp.) — A large species. Stem nearly a foot high up to the base of the peduncle, which is perfectly naked, and, including the raceme, nearly a foot long. Leaves six inches long by more than two broad. Flowers small, membranous, on long slender stalks.

348. EPIDENDRUM ARBUSCULA Lindl. in Benth. Pl. Hartw. p. 93. Huc Lindl. l. c. 277. :

E. caule tereti fruticoso ramoso, ramulis vestitis apice 2—3-phyllis, foliis oblongis coriaceis patentibus, racemis oblongis densis terminalibus subsessilibus cernuis, bracteis lineari-lanceolatis acuminatis membranaceis patentissimis pedicellis duplo brevioribus, sepalis lanceolatis acutis carnosis, petalis tenuioribus linearibus apice paulo latioribus, labello trilobo cordato basi tricalloso, laciniis lateralibus rotundatis, intermedia emarginata undulata.

Wild in Mexico; San Juan Sacatepequez; April — Hartweg (v. s. sp.) — A plant with a large branching stem, leathery leaves, three or four inches long, and many pale stout roots. Flowers dull chocolate, relieved by a patch of yellow in the middle of the labellum, which is so folded back at the sides and front, that, although almost circular, it presents the form of an old-fashioned three-cocked hat.

349. EPIDENDRUM INCOMPTUM H. G. Rehb. in Linn. 1852. p. 735. Huc Lindl. l. c. 278. :

E. caule valido squamoso superne folioso, foliis summis anthesi persistentibus cuneato-oblongis acutis erectis, racemo plurifloro congesto, bracteis lanceolatis acuminatis ovaria infima pedicellata subaequantibus, sepalis oblongis petalisque linearibus acutis, labello transverso trilobo basi rotundato lobis lateralibus divaricatis medioque producto triangulis, clinandrio quinquelobo.

Wild in Veragua; on Mount Chiriqui — v. Warszewicz. — Next to E. Arbuscula — Rehb.

F. PLANIFOLIA PANICULATA.

350. EPIDENDRUM GRAMINEUM LO. n. 30. Huc Lindl. l. c. 279. :

E. foliis distichis lineari-lanceolatis acutis striatis, racemo terminali paniculato, sepalis oblongis acutis, petalis linearibus, labello cordato acuto medio plicato basi calloso, clinandrio integro.

Wild in Peru — Pavon (v. s. sp. olim in hb. Lambert).

351. EPIDENDRUM RECURVATUM Lindl. in Bot. Reg. 1845. misc. 77. Huc Lindl. l. c. 280. :

E. foliis ensiformibus mucronatis strictis, panicula gracili ramis longis recurvis aequalibus, bracteis apice setaceis, floribus membranaceis distantibus, sepalis ovato-oblongis, petalis lineari-spathulatis, labello alte cordato subquadrato.

Wild in Venezuela; heights of Bailadores, in the province of Merida, 6000 feet above the sea; June — Linden 1472 (v. s. sp.) — A plant with the habit of E. tridactylum, etc., but with rose-coloured flowers, which are three or four times as large.

352. EPIDENDRUM DIFFUSUM Swartz, Fl. Ind. occ. III. 1503. LO. 25. Bot. Mag. t. 3565.

Huc Lindl. l. c. 280. :

E. foliis oblongis, caule ancipiti, panicula filiformi terminali ramossissima, sepalis lineari-lanceolatis petalisque setaceis erecto-patentibus striatis, labello cordato angusto membranaceo acuminato trilineato basi calloso.

Seraphyta multiflora Fisch. Ann. Nat. Hist. VIII. 471.

Epidendrum tenuiflorum Hort.

Wild in Jamaica; on trees in the temperate parts — Swartz, Mac Fadyen (v. s. sp. et v. c.) — Flowers small, crimson.

353. EPIDENDRUM FUNCKIANUM Rich. and Galeotti, Orch. Mex. n. 52. Huc Lindl. l. c. 282. :

E. „caule articulado, foliis ovalibus obtusissimis apice bilobis, floribus parvulis brunneis paniculatis, labello adnato cordato acuto“.

Wild in Mexico — Galeotti.

354. EPIDENDRUM MICRANTHUM Lindl. in Hook. Journ. III. 88. Huc Lindl. l. c. 283.:

E. foliis distichis lanceolatis acuminatis, racemo v. panicula racemosa virgata, bracteis setaceo-acuminatis florum dissitorum longitudine, sepalis oblongis carnosis obtusis subaequalibus, petalis linearibus, labello oblongo quadrato indiviso.

Wild in Peru — Mathews 1858. (v. s. sp.) — A plant with flowers scarcely a line long, and all the habit of *E. tridactylum*.

355. EPIDENDRUM AQUATICUM Lindl. in Ann. Nat. Hist. 12.

E. caule ascendente ancipiti ramoso; foliis ovato-oblongis acutis, panicula simplici pauciflora (aut racemo) paulo brevioribus, sepalis oblongis petalisque linearibus obtusis, labello carnosio alte cordato cucullato, clinandrio carnosio utrinque bidentato.

Wild in Brazil; Goyaz, on the margin of a small stream near N. S. d'Abadia; May — Gardner 4364; Minas Gerães, Serra de Curaca; Oct. — Gardner 5206 (v. s. sp.)

— Branches four or five inches long; leaves from half an inch to two inches. Flowers yellowish.

356. EPIDENDRUM VINCENTINUM Lindl. in Hook. Journ. III. 88. Huc Lindl. l. c. 285.:

E. caule ancipiti, foliis distichis anguste lanceolatis acutissimis panicula pauciflora laxa filiformi brevioribus, sepalis lineari-lanceolatis, petalis filiformibus, labello subrotundo crispo.

Wild in St. Vincents — Guilding (v. s. sp. hb. Hooker). — A small delicate species, not more than four inches high, with minute membranous flowers, disposed in a short, loose panicle, with filiform pedicels.

357. EPIDENDRUM FRIGIDUM Lindl. in Bot. Reg. 1845. misc. p. 76. Orch. Lind n. 36. Huc Lindl. l. c. 286.:

E. caule stricto indiviso, foliis imbricatis coriaceis ovato-oblongis obtusis emarginatisque, panicula racemosa nutante, bracteis coriaceis ovatis abrupte acuminatis, floribus valde carnosis, sepalis ovatis obtusis alte costatis, petalis linearibus erectis, labello complicato transverse ovato subtus obtuse carinato basi bicostato, columna brevissima.

Wild in Venezuela; on damp rocks a short distance from eternal snow, at the height of 13,000 feet, on the Sierra Nevada of Merida — Linden 643; Peru, on the volcano of Pasto, on trees at 13,000 feet — Jamieson (v. s. sp.) — This singular plant has a stem a foot and a half high, densely covered with leaves, which are stiff, and curved back at the edge. The flowers, which are pale rose, grow in long drooping paniced racemes. Linden states, that it grows on wet rocks, at but little distance from the eternal snow, at the height of 13,000 feet above the sea. He adds that it is especially remarkable for all the plant, flowers included, being covered over with varnish. Jamieson's Pasto plant is weak and racemose, not paniced.

— Rchb. fl. in Bonpl. II. 20. Herr Prof. Lindley erwähnt nicht, dass Scheiden sowohl als Hauptblüthenstiel zweischneidig sind. Die getrockneten Blätter sah ich allemal eingerollt. Die dichte Inflorescenz mit hunderten von carmosinrothen Blüthen ist sehr ausgezeichnet. Merida. 3000'. December. Wagerer.

358. EPIDENDRUM FRUTEX Rchb. fl. Xenia I. p. 95. Tab. 97:

Aff. *Epidendro frigido* Linden! paniculae distichae (nec secundae) rhachi teretiuscula (nec ancipiti), ramulis abbreviatis, labello obtuso rhombeo.

Caulis ultra pedalis calamo gryphino crassior. Foliorum vaginae valde et rude arphyllaceae praesertim in parte sublaminari. Laminae oblongo-ligulatae apice attenuatae obtuse acutae, sex-septempollicares, pollicem latae. Pedunculi rami primarii a vaginis hyalinis nunc oblique insertis, triangulis, apiculatis fulti, octo, deflexo ramulosi. Ramuli carnosi bracteis triangulis distichis abbreviatis vestiti. Ovaria ob-

longa seu prope sphaerica, aptera, bacciformia, forsan succulenta, sed more consueto debiscentia. Perigonium carnosum. Sepalum summum triangulum. Sepala lateralialia oblique triangula nervo medio carinato. Tepala linearia. Labelli linea media carinata. Gynostemium longius, quam illud Epidendri frigidi. — Herb. Pavon. — Boissier.

359. EPIDENDRUM DURUM Lindl. in Hook. Journ. III. 87. Huc: Lindl. l. c. 287.:

E. foliis distichis ovato-lanceolatis acutis, vaginis rugosis, panicula sessili simplici pauciflora, bracteis duris ovatis cucullatis acuminatis ovarii aequalibus, sepalis oblongis acutis duris striatis, petalis angustioribus, labelli postici trilobi transverse rhombi lobis lateralibus erectis truncatis intermedio triangulari acuto.

(B) *parviflorum*. Leaves narrower. Flowers much smaller.

Wild in Guayana — Schomburgk; B. Brazil, Minas Gerães — Weddell, 1272, in hb. Mus. Par., (v. s. sp.). — Stems simple or branched, from nine to eighteen inches high, equally covered with hard distichous leaves. Flowers small, apparently yellow. The inflorescence is occasionally simple. Differs from *E. carnosum* in having smaller and less fleshy flowers, and a panicle with a shorter stalk.

360. EPIDENDRUM CARNOSUM Lindl. in Hook. Journ. III. 87. Huc Lindl. l. c. 288.:

E. foliis coriaceis distichis ovato-lanceolatis acutiusculis, vaginis rugulosis, panicula racemove rigida striata multiflora, bracteis duris ovatis cucullatis acutis ovarii longitudine, sepalis carnosis oblongis obtusis, lateralibus hinc gibbosis carinatis latioribus, petalis sepalo dorsali conformibus, labelli postici trilobi carnosi lobis lateralibus rotundatis erectis intermedio conico solido.

Wild in Brazil — Zuccarini (v. s. sp.). — A rigid plant, with the habit of *E. elongatum*. Panicle stiff, many flowered. Flowers pale yellow; when dry, hard, thick, black; evidently must be very fleshy when recent.

361. EPIDENDRUM PURUM Lindl. in Bot. Reg. 1844. Misc. 75. Huc Lindl. l. c. 289.:

E. caule fusiformi elongato, foliis ensiformibus obtusis, floribus paniculatis ramis racemosis gracilibus foliis paulo erectioribus, sepalis linearilanceolatis, petalis filiformibus, labelli tripartiti basi 3-costati laciniis indivisis acutis lateralibus cordatis repandis.

Wild in the Caraccas — Linden; New Grenáda, on trees near La Paz — Purdie, (v. v. c. et s. sp. in hb. Hooker). — Leaves not half an inch wide, six or eight inches long. Flowers in a thin paniced raceme, and of a light pale green colour. The lobes of the lip vary a little in form, the middle one especially being sometimes linear.

— Rehb. fl. in Bopl. III. 21.

Caule fusiformi crasso, foliis paucis (4) linearilanceolatis apice inaequali bilobulis, panicula pauciramosa, bracteis squamaeformibus acutis, sepalis lanceis, medio dilatatis, lateralibus dimidiatis, tepalis linearibus acutiusculis, labello cum toto gynostemio connato, trilobo, lobis lateralibus basi semicordatis antice acutis, lobo medio lanceo producto, carinis tribus in basi, media apicem labelli usque producta.

Blüthen weiss, Lippengrund gelblich. Caracas. 4000'. November. Wagener.

362. EPIDENDRUM NAUCRATES Rehb. fl. in Bonpl. II. 20.

Caule ancipiti folioso, foliis lineariligulatis apice inaequali bilobis, spica gracili multiflora, basi unisquamata, bracteis linearisetaceis ovaria pedicellata tertia parte aequantibus, sepalis oblongis acutis carnosis, tepalis filiformibus apice dilatatis, labello trilobo carnosio, lobis lateralibus obtusis erectis, lobo medio triangulo cucullato erecto, disco incrassato, margine limbo, carinis 3 confluentibus in medio, gynostemio incurvo, androclinio excavato cordiformi.

Blüthen gelbgrün, so gross wie bei *E. Schlimii*. Ansehen des *E. purum*. Cultivirt bei Herrn Consul Schiller (Januar 1853. n. 126).

363. *EPIDENDRUM SUBPURUM* Rehb. fil. in Bonpl. III. 21.:

Caule fusiformi gracili foliato, foliis lineariligulatis apice attenuatis obtusiuscule acutis, pedunculo incurvo multifloro, bracteis squamiformibus minimis, sepalis lanceolatis acutis, tepalis linearibus apicem versus paulo latioribus, labello cum gynostemio apicem usque connato, lamina libera triloba, lobis lateralibus basi semicordatis obtuse rhombicis, divaricatis, minute crenulatis, lobo medio obovato retuso bilobulato, carinulis obtusangulis 2 in ima basi abbreviatis in nervos tres elevatos excurrentibus nervis his basi antecarinulari iterum carinuligeris.

Blüthen mehr lederartig als bei *E. purum* Lindl., sonst sehr ähnlich, wie auch alle Grössenverhältnisse stimmen. Caracas. Wagerer.

364. *EPIDENDRUM LANIPES*. Huc: Lindl. l. c. 291:

E. foliis ensiformibus obtusis panicula stricta brachiata brevioribus, rachi scabriuscula, ovariis lanulosis, sepalis lineari-oblongis obtusis, petalis filiformibus, labelli lobis lateralibus semi-ovatis intermedio cuneato retuso basi bicalloso, clinandrii bilobi laciniis 2-dentatis.

Wild in Peru; Chachapoyas — Mathews 3183 (v. s. sp.). — Flowers apparently yellow in a panicle nine inches long, and as much broad. The woolly ovary is quite peculiar.

365. *EPIDENDRUM AGATHOSMICUM* H. G. Reichenb. Linnaea XXII. 841. Huc Lindl. l. c. 292.:

E. paniculae ramis squamis oblongis acutis suffultis, bracteis minimis cuspidatis, sepalis oblongis acutis basi cuneatis, petalis linearibus apice ovatis acutis, labello trilobo lobis lateralibus semiovatis basi aliquid cuneatis denticulatis callis 2 minimis in basi, lobo medio a basi cuneata dilatato transverso antice emarginato denticulato.

Wild in the Caraccas; on the top of the mountain, near the Venta — Moritz 233 (Rehb.). — Leaves longish, acute, carinate. Flowers snow-white, fragrant. — Rehb.

— Rehb. fil. in Bonpl. II. 20. Truxillo. Wagerer.

366. *EPIDENDRUM FLORIBUNDUM* Humb. et Kunth. Nov. Gen. et Sp. I. 353. t. 86. L. O. 63. Hooker in Bot. Mag. t. 3697. Huc: Lindl. l. c. 293:

E. foliis lanceolato-oblongis acuminatis submembranaceis, panicula maxima racemosa, sepalis reflexis lanceolatis, petalis filiformibus, labelli quadrilobi basi bituberculati lobis lateralibus subrotundis terminalibus linearibus divaricatis.

Epidendrum densiflorum Hook. in Bot. Mag. t. 3791.

Epidendrum ornatum Lemaire; fid. Rehb.

(B) *lilacinum* H. G. Rehb. Linn. XXII. pag. 840. Flowers purple, larger than usual, with a white lip.

(C) *convexum*. Flowers smaller, shorter, with a roundish, denticulate, obscurely four-lobed lip.

Wild in Peru — Humboldt and Bonpland; B. Venezuela — Moritz 233, Funck and Schlim 1448; C. New Grenada, in the woods of the Hacienda de Palmas, near Guaduas — Hartweg (v. v. c. et s. sp.) Not Mexican, as stated in Bot. Mag. on the authority of the Collection at Woburn. — A great branching green-flowered species, very much like *E. paniculatum* and *laxum*, differing however in the want of spathaceous bracts.

— Rehb. fil. in v. Mohl et v. Schlechtel. Bot. Zeit. 1852. 837. Huc *Epidendrum ornatum* Ch. Lem.

Epidendrum (*Amphyglottium*) *ornatum* Ch. Lemaire V. Houite Flores des Serres IV. 3346. — Fleurs verruculeuses en dehors, vertes, à segments fléchis en arrière; le gynostème et le labelle sont blancs; celui-ci orne d'une macule coccinée.

Racemo terminali racemoso longissime nutante, bracteis minimis subulatis, sepalis carnosis oblongo cochleariformibus verruculosus, petalis filiformibus ad apicem latioribus omnibus retroflexis viridibus, pedicellis flore duplo longioribus, ovario verruculoso, labelli trilobi coriacei ad discum convexum tricarinati, ad basin bi-tuberculati lobis lateralibus irregulariter rotundatis expansis; mediani lobulis oblongis obtusis divaricatis, inter eas carina disci evanescenti; pseudobulbis nullis, caulibus caespitosis gracilibus pedalibus et ultra, atroviolaceis, foliis alternatim distichis vaginantibus, inferioribus lanceolatis brevioribus, medianis oblongis angustis-acuminatis violaceis et violaceo densiore nervatis.

367. EPIDENDRUM VERRUCOSUM Swartz Fl. Ind. Occ. III. 1497. Huc Lindl. l. c. 294.:

E. foliis distichis lanceolatis oblique patentibus, vaginis verrucosis, floribus paniculatis, sepalis oblongis concavis, petalis spathulatis basi angustatis, labello multo longiore 4-lobo laciniis linearibus obtusis divaricatis anterioribus dentatis, callis 2 sulcatis alteroque minore interposito.

Wild in Jamaica; on the trunks of trees — Swartz, Purdie, Bancroft etc.; New Grenada — Purdie (v. s. sp.) — Stems simple erect, two or three feet high. Sepals and petals pale green. Lip yellow. Flowers sometimes in a large branching panicle, sometimes in a mere raceme, persist without change long after the ovary has acquired a fusiform figure of considerable dimensions. The sheaths of the leaves are quite smooth in very strong specimens.

368. EPIDENDRUM PSEUDEPIDENDRUM Rchb. fil. Xenia I. 160. Fl. 53. Huc: *Pseud-epidendrum* v. Mohl et v. Schlecht. Bot. Zeit. 1852, 733.

Perianthium et gynostemium Euepidendri. Differt egregie androclinio exciso semilunato, polliniis quaternis valde inaequalibus, ancipitibus, oblongo-falcatis, externis duplo majoribus, omnibus ima basi connatis, replicatis in caudiculam argute tridentatam, dente medio majori, polliniis externis brevioribus.

Ps. spectabile. Ich besitze einen einzigen spannenhohen Stängel. Blätter länglich, spitz, keilförmig, trocken von der Textur derer des *E. laeve* und *E. cornutum*, 5 Zoll lang, in der Mitte $1\frac{1}{2}$ Zoll breit. Der Blütenstiel 4-zöllig, 1 Zoll über dem Grunde umscheidet. Der Hauptstiel zweischneidig mit Ueberbleibseln von 3; Deckblättern. Daneben in derselben Scheide ein jüngerer, dünnerer Stiel mit 2 Deckblättern. Blüten so gross, wie die des *E. atropurpureum*, aber alle Verhältnisse anders, da bis auf die Lippenplatte alle Theile schmal sind und die Säule sehr ausgezogen ist. Die äusseren Hüllblätter länglich, stumpf, gespitzt, am Grunde keilförmig. Die inneren schmal lineal, an der Spitze allmählig ausgebreitet, länglich, spitz. Säule auffallend lang: so lang als äussere Hüllblätter. Die freie Lippenplatte bildet ein symmetrisches Parallelogramm. Die Basis beiderseits gehört, die vordere gleichlaufende ausgerandet, die Seiten (die ungleichlaufenden) gebuchtet und sägezählig; eine vorn dreilappige Platte am Lippengrund geht nach der Säule zu in 2 Leisten über, während drei erhabene Linien sich bis zur Lippenspitze ziehen. Anthere — „Hüllblätter grün, Säule grün am Grunde, dann rosa, Lippe zinnberroth.“

§ 11. *Pleuranthium.* Rchb. fil. in Linnaea XXII. p. 841.

These are long leafy stemmed species with lateral inflorescences, and an adnate lip.

369. EPIDENDRUM DENDROBII H. G. Rchb. in Linn. XXII. p. 841. Huc Lindl. l. c. 295.:

E. pedunculis nunc simplicibus, nunc ramosis, squamis ovatis nunc acutis imbricatis, sepalis oblongis lateralibus obliquis, petalis obtusis cuneatis, labello rotundo basi obtuse hastato ante basin bicalloso.

Wild in Venezuela: Merida, on mountains — Moritz 1074 (Rchb.) — Stems erect,

with many leaves, which are longish, acute, somewhat carinate. Flowers yellowish.
— Reichenbach.

370. EPIDENDRUM AGGREGATUM Lindl. in Hook. Journ. III. 84. Huc Lindl. l. c. 296 :

E. foliis distichis lanceolatis acuminatissimis, racemis oppositifoliis subsessilibus brevissimis basi squamatis, floribus corymbosis, labello subrotundo cordato basi bilamellato.

Wild in Peru — Mathews 1901 (v. s. sp.) — A very singular plant, allied to *E. cauliflorum*. The flowers are apparently as large as in *E. nutans*. The appearance of the plant is that of some *Dendrobium*.

371. EPIDENDRUM CAULIFLORUM Lindl. in Bot. Reg. 1838. misc. 82. Huc Lindl. l. c. 297. :

E. foliis ovato-oblongis planis acuminatissimis, corymbis brevibus, sepalis angustis patentissimis subaequalibus concavis, petalis linearibus apice cuneatis acutis reflexis, labello cuneato-subrotundo trilobo, lobo intermedio truncato tridentato, lateralibus rotundatis repandis, callis tribus linearibus in medio labelli, lateralibus majoribus.

Wild in Brazil; Rio Janeiro — Loddiges (v. v. c.) — Flowers about the size of those of *E. nutans*, pale straw-colour, appearing from the side of the stout cylindrical stem bursting forth from among the dry sheaths with which it is closely invested.

372. EPIDENDRUM (Pleuranthium) PILEATUM Rehb. fil. in Bonpl. III. 68.

Affine *Epidendro Dendrobii* Rehb. fil., foliis lineari-ligulatis acutis, tepalis lineari-ligulatis, labello convexo basi cordato, apice emarginato, corniculis abbreviatis geminis in basi, nervis tribus elevatis per discum.

Caulis bipedalis polyphyllus superne polystachius. Folia quinquepollicaria, apice bene attenuata. Racemi pollicares, basi vaginis cucullatis obtuse acutis vestiti. Bractea subaequales minores; ovaria pedicellata longe non aequantes. Flores illis *Epidendri Dendrobii* paulo minores. Sepala ligulata obtuse acuta. Gynostemii pars summa libera assurgens. — Epiphyt. — Grünblüthig. Februar. 5000'. Ocanna. Wagener.

§ 12. *Psilanthemum*. Klotzsch, in Link Klotzsch Otto ic. pl. 2. p. 111.

The radical inflorescence, otherwise unknown in the genus, distinctly marks this section. The lip is adnate to the column, and is similar in structure to *Amphiglottium*.

373. EPIDENDRUM STAMFORDIANUM Bateman Orch. Mex. and Guat. t. 11. Huc Lindl. l. c. 88. :

E. pseudobulbis fusiformibus, foliis oblongis obtusis coriaceis basi angustatis, racemo radicali paniculato, sepalis patentibus lanceolatis, petalis duplo angustioribus, labelli tripartiti laciniis planis aequilongis, lateralibus oblongis rotundatis intermedia transversa biloba s. emarginata fimbriata.

Epidendrum basilare Klotzsch l. c. t. 45.

Wild in Guatemala, on the coast in shady very moist soil — Skinner; Sa. Martha — Purdie (v. v. c. et s. sp. comm. cel. Hooker). — Flowers in a large branched raceme deliciously fragrant, pale yellow, with a vivid violet spot at the base of the lip.

Huc: *Epidendrum Stamfordianum* var. *pictum* Lem. — Lem. jard. fl. l. c. tab. 251. — Fl. majorib. vivide 5-coloribus, laciniis laetissime aureis purpureo-vivido-punctatis, gynostemate basi viride ap. ad sexualia kermesino-lineato, labelli lobis basilarib. niveis (aetate lutescentibus) parce kermesino-punctulatis, apicalib. luteis kermesino-punctulatis. — Patria: Mexico Vera-Cruz. — Bot. Mag. 4659. — Bonpl. II. 20. Caracas. Wagener!

Huc: *Epidendrum cynostalix* Rehb. fil. (monstrum!) in v. Mohl et v. Schlechtld. Bot. Ztg. 1852. p. 731. Lindl. l. c. n. 101. :

E. caule fusiformi, folio oblongo acutiusculo valde vernixio, spatia scariosa acuminata abbreviata, pedunculo basi uniramoso plurifloro elongato, bracteis summis tenuissimis, pedicellis subito in ovaria clavata transeuntibus, sepalis lanceolatis acutis apicibus reflexis, petalis angustolinearibus medio apicem usque dilatatis acutis, columna recurva, labello quadrilobo basi bicarinato lobis lateralibus ligulatis recurvis retusis medio angustissimo unguiculato bilobo laciniis dolabriformibus denticulatis divaricatis denticulo interposito, clinandrii 5-dentati dentibus infimis reflexis.

Wild in Veragua; Chiriqui — Warscewitz. — Flowers white and brown. — Rchb.

374. EPIDENDRUM WALKERIANUM Rchb. fil. MSS. *Cattleya Walkeriana* Gardner in Hook. Lond. Journ. II. 1843. 662

Foliis oblongo ellipticis coriaceis marginatis obtusis mucronatis caule cylindrico longioribus, sep. oblongo-lanceolatis acutiusculis callosos-apiculatis, petalis ovato-lanceolatis acutis duplo latioribus, labelli 3 lobi cucullati lobis lateralibus apice valde et oblique truncatis basi rotundatis, intermedio late rotundato emarginato edenticulato plano basi ramus elevatis rugosis.

Cattleya Walkeriana Gardn. Herb. Fl. Bras. 5200.

Hab. On the stem of a tree overhanging a small stream, which falls into the Rio San Francisco, beyond the Diamond district, Brazil. — The flowers of this very fine species measure about 4" in diam. It is nearly related to *C. superba* (Schomb. in Lindl. Sert. Orch. t. 22), but is readily distinguished by its much shorter pseudobulbs and smaller leaves, by the larger and more rotund middle lobe of the labellum, but particularly by the obliquely truncated lateral lobes, which envelope only the lower half of the broadly winged column, and not the whole of it, as in *C. superba*. — The specific name will serve to commemorate the services of Mr. Edward Walker, who accompanied me as assistant during the last two years of my travels in Brazil, and by whose activity and intelligence I was enabled to make many additions to my collections, which might otherwise have escaped my notice, of which the present plant is an example.

Huc: *Cattleya bulbosa* Lindl. Bot. Reg. 1847. t. 42.

Caulibus ovalibus brevioribus pseudobulbos referentibus, foliis solitariis ovalibus coriaceis brevioribus; pedunculis unifloris; petalis ovalibus undulatis membranaceis sepalis duplo latioribus; labelli plani calvi lobis lateralibus brevibus rotundatis, intermedio cuneato bilobo rotundato.

Brasilia. Rucker. — Accords with *C. pumila*, on its stems resembling pseudobulbs, and its colour, but the flowers are much larger, and the lip flat, not rolled up and crisp. — Differs from *C. Aclandiae* in its having much larger lat. lobes to the lip, a very differently formed middle lobe, and flowers of quite another colour. — *Pescatorea* II. 42.

ALTOGETHER DOUBTFUL SPECIES Lindl. l. c. 298—308.

Quid? Certe non Epidendrum. Gard. Chron. 1851. 142. „What is the species of Epidendrum mentioned in a former Chronicle, as figuring at the Horticultural shows in China? In fact, it is *E. chinense* „Hwni-lau-hwa“ value of hundred dollars, which is a very sweet and blossoms in winter. What is the particular green var. alluded to?“ Dodman.

1371/1. 1378. 1379. 1383. 1385. **BLETIA** Rz. Pav.

A. Corifoliae planifoliae limbo integerrimo.
(Pseudobulbosae pseudobulbis elongatis.)

1. *Lancibracteae*: bracteae ovarii pedicellati dimidium aequantes seu superantes.

* Sepala et tepala plana.

1. **BLETIA SUPERBIENS** Huc: *Laelia superbiens* Lindl. B. Reg. XXVI. 1840. Misc. 87.

Scapo longissimo multifloro, sepalis petalisque linearibus oblongis obtusis membranaceis labello longioribus, labelli lobo medio obtusissimo disco lamellis quinque maximis subserratis antice truncatis aucto, antherae crista biaurita; clinandrio denticulato.

Mr. Skinner: „Saw you ever any thing like this!!! This most magnificent of all plants I have sent several times, it is decidedly Epidendrea, but I expect it will get a new title in Europe. It flowers in Nov. and in some instances bears from 18—20 flowers on stems from 9—12' long!! Mr. Hartweg says he found this plant in great abundance in the state of Quesaltenango, near Chantle, and that he went forty leagues out of his route to find it, and now he has sent splendid masses of it to England, and at least 30 dried specimens. I have found it most rarely and evidently planted by the Indians before their doors in Acatenango from whence I brought the specimens now sent and in Sumpango, where I found it 12 months ago; also from Costa Rica Chantla. Its native habitat is very cold, in fact this plant will require only a green house warmth.

Laelia superbiens Lindl. Bot. Orch. Mex. Guat. 1843. 38: Sumpango planted by the Indians 1839. Barrancos of Sachmarachon near Comalepe twenty leagues north of Guatemala, immense quantities, finest specimens growing out of crevices of the rocks and sheltered from the north winds. 22" bulbs, flowerstems 4 yards in length and bearing upwards of the 20 flowers 27 Nvb. 184 „Coteach Kiaj of Indians of Comalepa = red flower, and Indians, who speak Spanish: La vera del Sennor San José.

2. **BLETIA ANCEPS**. Huc: *Laelia anceps* Lindl. B. Reg. XXI. 1835. 1751.

Foliis binis aut solitariis lanceolatis, scapo ancipiti bi-trifloro squamis carinatis vestito, ovario viscoso, labelli disco lineari elevato apice trilobo, pseudo-bulbis ovatis distantibus tetraquetris.

B. Mag. 1801.

b. *Barkeriana* Lindl. B. Reg. XXIII. 1837. 1947: sepalis petalisque subaequalibus, labelli lobo medio angusto acutissimo.

Mexico.

3. **BLETIA CINNAMOMEA**. *Laelia cinnamomea* Rehb. fl. Otto Gtz. 1860. p. 180.

** Tepala, nunc tepala et sepala crispa.

a. Labellum integrum.

4. **BLETIA LYONSH**. Huc: *Schomburgkia Lyonsii* Lindl. Gardeners Chronicle 1853. 615:

Sepalis petalisque ovatis obtusissimis crispis, labello indiviso conformi unguiculato concavo margine erosulo: costis 5 subaequalibus acutis, anthera bicornuta.

Prettiest *S.* Flowers pure white, with rich purple spots and speckles. The lip is of nearly the same form as the other parts, but more taper pointed, dull violet with a yellowish edge and rich crimson ribs. The anther is very remarkable for bearing in front a pair of yellow horns curved like those of an ox. Lyons Esq. of Ladiston.

B. *Labellum trilobum (cum columna basi connatum).*

5. BLETIA MARGINATA. Huc: *Schomburgkia marginata* Lindl. Sect. 1838. 13:

Pseudobulbis clavato fusiformibus, floribus racemosis, bracteis ovario subaequalibus, lavello ovali acuto basi angustato trilobo parum cucullato sepalis petalisque oblongis undulatis subaequali, lamellis crispis 5 continuis, lateralibus interruptis.

Surinam. Demerara. — Formerly in cultivation, but now lost; unless the „Spread Eagle“ plant of Jamaica should prove to be it. It differs from *S. crispa* in its flowers being distinctly purple, with only a little yellow at the edge of the sepals and petals, and in the form and appendages of the lip, which tapers to the base, is very distinctly threelobed, has an acute oval middle lobe, and is furnished with wavy plates, which are broken up at the side.

Abundant near Panamaribo in an avenue of fine trees of *Erythrina* („Coffee mamma“) from being planted among the coffee for the purpose of shade and shelter. Jan. Febr. — 4' high — Likes shade. —

Lond. Journ. II. 1843. p. 641: British Guiana Schomburgk. — Lindl. B. Reg. XXV. 1839. Misc. 12: Mr. Lance brought many plantes of to England 1834. Flowered at length much paler (owing to the dark season) with Thomas Brocklehurst Esq. of the Fence near Macclesfield, who imported it from Surinam.

6. BLETIA CRISPINA. *Schomburgkia crispa* Lindl. Sert. Orch. X. — Bot. R. XXX 1844. sub 23.:

Sepala et petala conformia, patentia, omnino libera, basi aequalia. Labellum difforme, membranaceum, trilobum, semicucullatum, basi cum margine columnae connatum, supra basin tumidum (introrsum): venis lamellatis. Columna alata. Pollinia 8. Rhizoma repens, nudum, annulatum, pseudobulbigerum. Pseudobulbi magni, elongati, 2 — 3 phylli. Folia coriacea. Scapi terminales vaginati. Bractee magnae, siccae, spathaceae. Flores speciosi, racemosi, congesti.

Nearly related to *Epidendrum*: differs by the large spathaceous bracts, membranous lip adhering to the column at only the base, and having below the middle a distinctly marked prominence, which corresponds with an impression on the under side, and by having 8 pollenmasses. In the last I trust to a drawing sent by Mr. Schomburgk.

Huc: *Schomburgkia crispa* Lindl. Sert. t. 10: Scape is terminal, erect, 3' high, hard, stiff, completely covered with pale brown, dry, closely pressed, acuminate scales, carinate at the apex, gradually passing into spathaceous, spreading bracts, which are much narrower, than the scales of the stem, brown, dry, spreading, about 2" long, but shorter than the ovary. Flowers in a dense terminal raceme, spreading, about 2 1/3" in diameter, their stalks and ovary together about two inches long. Sepals and petals bright light yellow, not spotted, linear oblong, acute, excisively crisped and undulated, of nearly the same size, texture, colour. Label pink, with a deeper coloured apex, membranous, a little wrapped round the column, and united to its edges at the base, oblong, threelobed, with a prominence below the middle and the veins crested at the junction of the middlelobe with the side ones; sidelobes nearly flat, middle lobe sessile, transverse, obtuse, very much crisped. Column obovate, much shorter, than the labellum, with a winged margin and having 3 strong veins at its back.

Lond. Journ. 1843. II. 671: *Schomburgkia crispa* Lindl. Sect. t. 10. On the Co-renthyn, and more frequently on the Berbice, Schomburgk n. 193.

7. BLETIA GLORIOSA. Huc: *Schomburgkia crispa* Lindl. Bot. Reg. XXX. 1844. 23.

S. crispa. Pseudobulbis fusiformibus, floribus racemosis, bracteis, ovario subaequalibus labello ovato-oblongo obtuso vix cucullato obsoleto trilobo, sepalis petalisque oblongis crispis subaequalibus: lamellis 5 undulatis duabusque lateralibus tenuibus rectis.

Demerara. This plant has yellowish brown flowers, with scarcely a trace of purple; and by that circumstance alone it may be distinguished. Its lip is nearly flat, very little three-lobed, and broadest at the base: other characters peculiar to itself. Also the author of the species I must plead guilty to have on one occasion (Bot. R. Misc. Febr. 1839) confounded it with *S. marginata* and thus misled Sir Wm. Hooker, whose fig. Bot. Mg. 3729 undoubtedly belongs to this spec. Probably the colours in the *Sertum*, taken from a drawing by Mr. Schomburgk, were much too yellow.

S. marginata var. Hook. B. Mag. 3729.

8. BLETIA ROSEA. Huc: Lindl. Bot. R. XXXI. 1845. sub 53: *Schomburgkia rosea* Linden Herb. 1664. Bot. Reg. XXXI. 1845. sub 53:

Sepalis petalisque oblongis undulatis labello paulo longioribus, labelli subrotundi laciniis lateralibus rotundatis intermedia subrotundata apiculata crispa multo minore, lamellis altis pone basin 4 rectiusculis membranaceis versus apicem 3 brevibus crispis.

„This magnificent species is found on rocks on the northern slope of the Sierra „Nevada de Santa Martha. Bracts, peduncles and lip, are all of a light rose colour „the petals are deep red. It was met with 5000' above the sea, between the vil- „lages of S. Antonio and S. Miguel on the territory of the Ouruhuaco Indians. Febr. 1144. Nr. 1664. Its lip is very nearly circular in its outline and its lobes are not very different in form, but those at the side are the largest; even when dry it is of the deep colours of the spot.

9. BLETIA UNDULATA. Huc: *Schomburgkia undulata* Lindl. B. Reg. XXX. 1844. Misc. 21.:

Pseudobulbis fusiformibus, floribus dense, racemosis, bracteis longissimis spathaceis, sepalis petalisque aequalibus linearibus rotundato-crispis labello longioribus, labelli cucullati lobis lateralibus rotundatis, intermedio ovali acuto v. obtuso, lamellis 5 undulatis duabusque lateralibus, rectis, tenuibus.

From *S. crispa* and *marginata* it is distinguished by its very long narrow crisp sepals and petals, the flowers are as large as those of *S. tibicinis*, but the inflorescence is quite different. There is no yellow in them, and the lip is distinctly curved up towards the column. Some fine specimens have been lately flowered by Mrs. Lawrence, one of which has brown flowers and the middle lobe of the lip wedgeshaped and obtuse, not ovate and acute; but they do not otherwise seem to differ. The very long narrower sepals and petals render this very obviously different from the two last, which it quite resemble in habit. La Guayra, Linden. acc. Rucker. Fine rich brownish purple sepals and petals, and a clear violet purple lip. From *S. crispa* it differs in having the middle lobe of the lip oval acute, and only 3 ribbed, while the side lobes are much smaller and flatter; from *S. marginata* with which it corresponds in the form of the lip it is distinguished by its very long narrow crisp petals and sepals. The flowers are as large as those of *S. tibicinis*, but the inflorescence is quite diff. unless my memory fails me, there is a representation of this plant among Plumier's fig., which I have not just now an opportunity of consulting. Bot. Reg. XXX. 1844. Misc. 21.

Lindl. Orch. Lind. 1846. p. 10. II. 56: On rocks near Pardi, the natural bridge of Icononzo. Petals dull red. New Granada in the province of Bogota, at the height of 2400'. Decb. 1842. 862.

Schomburgkia undulata Lindl. Rb. f. Bpl. III. 21. Selbst die Eingebornen von Venezuela achten die Schönheit dieser imposanten Pflanze: man findet sie auf Mauern gepflanzt, auf Ruinen u. s. w. Wagner.

Rb. f. Bpl. III: 99. Ocanna. Wagener.

II. *Squamibracteae*: bracteae ovarii pedicellati dimidium longe non aequantes.

*Labellum alte columnae adnatum. Columna apicem versus attenuata.

10. BLETIA PERRINII. Huc: Lindl. B. Reg. XXIV. 1838. Tab. 2.: *Cattleya Perrinii* Lindl.:

Foliis oblongis cauli aequalibus, sepalis oblongis linearibus obtusis, lateralibus falcatis petalis obtusis angustioribus, labello oblongo-lanceolato trilobo unguiculato nudo basi in cuciculum ventricosum producto, laciniis lateralibus erectis acutis, intermedia oblonga undulata obtusa elongata sinibus intermediis rectangularibus.

Originally sent from the garden of Richard Harrison, Esq. Since I received it from Mr. Bateman, recently from Mr. Knight of the Kings Road, Brazil. Not unlike *C. labiata*. Perigonium roseum, labellum album, purpureo pictum.

Lindl. Bot. Fig. XXVIII. 1842. sub 62.: A plant with club shaped pseudobulbs, and a large green spathe from which the scape makes its appearance; so that it has quite the habit of *Cattleya*. Flowers are pale lilac with a deep purple tip to the labellum. It would be a *Cattleya*, if it had not 8 poll.

Bot. Mag. XIII. N. S. 1840. tb. 3711. *Cattleya intermedia* (var. *angustifolia*):

(γ) Foliis angustioribus, floribus pallide roseis, labelli lobo medio usque ad marginem sanguineo (Tab. nost. 3711. *Cattleya Perrinii*? Lindl. Bot. Reg. t. 2.)

Brazil, sent to the Glasgow Bot. Gard. under the name of *C. crispa*. From *C. intermedia* fig. at t. 2851 the present will be found to differ in no essential particular and we are disposed to consider it a variety of that species, sufficiently distinguished however both from α and β. I am indeed by no means clear about the limits of the species of *C.*: I mean particularly the large purple kinds resembling the original *C. labiata*. To me the Genus appears, like so many others of the epiphyte Orchideae subject to great variation in the size and form of the flowers, and the relative length and breadth of the leaves. Perig. roseum, labello kermesino-marginato.

Bot. Reg. XXVIII. 1842. sub t. 62: *Laelia Perrinii* Lindl. — Parad. Vind. fasc. 10.

** Labellum liberum. Columna apicem versus examplicata.

I. Columna apice biauris. Auriculae lobulatae seu sublobulatae,

11. BLETIA PUMILA. Huc: *Cattleya pumila* Hook B. M. 3656 (XII N. Ser). 39:

Pseudobulbis oblongis minutis teretibus sulcatis unifoliatis unifloris, folio oblongo-lanceolato, sepalis oblongis acutis superiori recurvo, petalis ovali-oblongis obtusis undulatis angustioribus; labelli lobo intermedio brevi obtuso undulato-laciniato.

Perigonium lilacinum, labelli apice kermesino. Received from Essequibo by John Allcard Esq. flowered 38.

Cattleya pumila Bot. Reg. XXX. 1844. 5. (*C. marginata* Hort).

Caulibus brevibus ovalibus sulcatis, foliis solitariis ovato oblongis acutis, pedunculo unifloro, sepalis linearilanceolatis rectis, petalis ovalibus 3plo latioribus, labello obovato indiviso apice plicato, lineis 3 elevatis in medio.

Brazil. (Gardner 657.) — This is said to be from Essequibo, but that appears to be a mistake. It is a very distinct species, with peculiarly thick acute solitary leaves, and deep rose coloured flowers. The lip is bordered with a pale colour, which is some times almost white.

Cattleya Pinellii Hort. Bot. Reg. XXX 1844 sub 5:

Facie *C. pumilae*, sed sepalis acutis albidis, petalis ovatis roseis, labello magis crispo, columna apice dentibus 2 crenatis aucta. — Brazil. — Very near *C. pumila*, but the sepals are white, the petals almost exactly ovate, the lip more crisp and of a brighter colour. — Requires further examination.

Lindl. Paxt. Fl. G. I. p. 44. n. 66. = *Cattleya spectabilis* in Florist April (Vol. III. p. 93.) finely blown specimen.

Gardeners Chronicle 1854. 801: The accompanying cut represents a very remarkable monster of *Cattleya pumila* or *marginata*, for which we are indebted to Mr. Rucker. The reader will at once observe that the lower flower has wholly lost the lip, which is so characteristic to the genus, in place of which is a flat petal exactly like the two others. The column exhibits no peculiarity. The case in question furnishes another example of the singular tendency which Orchids have to sport from their ordinary condition sometimes assuming forms wholly aliene to their usual nature, but not less irregular; in other cases attempting, as it were, to revert to that regular types of structure to which it is the business of theorists to reduce them. A singular instance occurs in the *Dendrobium normale* of Griffith, a plant occasionally seen in cultivation, which is also a sport from one of the common yellow Indian *Deudrobia*, but in that instance the column is also metamorphosed. The loss of the lip was not the only instance of transformation in the *Cattleya* before us. The other flower had reduced a strong white tooth in the middle of its lip near the point, a circumstance which was owing to one of the three parallel ribs which naturally belong to the lip becoming free. The signification of this will be easily understood by the philosophical botanist.

Laelia pumila Rehb. fl. in Van Houtt. fl. Serres IX. 102.

12. BLETIA GLAUCA. Huc: *Brassavola glauca* Lindl. B. Reg. 1849. Misc. 67.:

Foliis coriaceis, oblongis obtusis planiusculis glaucis, spatha uniflora, sepalis petalisque lineari lanceolatis obtusis herbaceis, labello subsessili subrotundo acuto margine lobato, clinandrio dentato, dente dorsali apice glanduloso.

Mexico. Henchmann. Vera Cruz: sent by Hartweg. Its habit is so much that of a *Cattleya*, that till it flowered it was expected to belong to that genus. It however proves to be a *Brassavola*, with very large flowers. A figure is prepared for Batem. O. of Mexico and Guatemala.

B. Reg. XXVI. 1840. 44.: It is said, that this charming plant was originally found near Xalapa in Mexico by Henchman, and that it was afterwards imported more abundantly by a Frenchman of the name of Deschamps, who brought over a large quantity of Orchids and Cacti for sale.

B. Mag. 4033. — Lindl. in Pl. Hartweg. Fasc. 2. 1842. p. 93.: in loco „Chono“ dict. Hartweg. — Bateman Orch. Mex. Qual. t. 16.

13. BLETIA DIGBYANA. Huc: *Brassavola Digbyana* Lindl. Bot. Reg. 1846. t. 53.

Foliis ovalibus planis carnosis glaucis, labello sessili cucullato cordato subtrilobo, margine in crinibus longis soluto, in disco callo maximo aucto, dente postico subulato incumbente.

Honduras, Mrs. Donnell. V. Houtt. Fl. d. Gewch. III. t. 257. — B. Mag. 4474.

2. Columna apice nunc trifida auriculis tum simpliciter acutis.

* Labellum flabellatum.

14. BLETIA FLABELLATA. *Laelia xanthina* Rehb. fl. in Otto Hamb. Blzlg.

** Labellum trilobum.

a. Labellum laeve.

15. BLETIA CRISPA. Huc: Bot. Mag. 3910: *Cattleya crispa*.

Caulibus crassis oblongis, clavatis, foliis solitariis, spatha magna herbacea, sepalis lineari-obovato-lanceolatis acutis, petalis latioribus oblongo-lanceolatis, undulatis crispis, labelli indivisi limbo ovato acuminato quam maxime undulato crispato.

Cattleya crispa, Lindl. B. Reg. t. 1172. Gen. et op. Orch. p. 116. — Brazil Kew 1841. — Seems to have been first introduced to our gardens by Sir Henry Chamberlayne, Bart., 1826.

V. Houtt. IX. 162. *Laelia crispa* Rehb. fil.

Laelia crispa var. *reflexa*. Bonplandia p. II. 89. *Cattleya reflexa* Parmentier: eine sehr stätliche Abart, welche anstatt des schwefelgelben Lippengrundes schöne Orangefarbe daselbst zeigt. Catalogue des Collections délaissées par M. Parmentier p. 15. Hier wird *Cattleya reflexa* macrophylla als Art vindicirt. „Hauptcharacter“ „mais elle s'en distingue amplement par la disposition toute spéciale qu'affecte sa hampe florale: ainsi au lieu d'être dressée, elle s'infléchit fortement et avec beaucoup de grâce.“ — In der Sammlung der Herren Consul Schiller, Kammerrath Frege, Banquier Rothschild.

16. BLETIA PURPURATA. Huc: Lindl. in Paxt. Fl. G. 96. et xyl. 1843: *Laelia purpurata*:

Pseudobulbis oblongis, foliis anguste oblongis emarginatis, pedunculis bifloris e spatha erumpentibus, sepalis lineari lanceolatis, petalis oblongo lanceolatis obtusis, labello maximo circa columnam convoluto rotundato lobis lateralibus obsoletis ab intermedio parum diversis.

Island of St. Catherines in Brazil. Near *L. grandis*, that has the leaf broader at the base, than the point, nankin coloured flowers, white lip washed with rose at the base.

Huc: *Cattleya Brysiana* Ch. Lem.

Lem. jard. fl. III. tab. 275—76.

Pseudobulbis maximis et attenuatis dein ovali-oblongis tereti-compressis laevibus aetate sulcatis, folio maximo lato oblongo coriaceo crasso ap. rotundato emarginato, spatha maxima foliacea ovali oblonga complicata ap. solum oblique aperta; scapo bifloro (aut amplius?). floribus maximis odoratis, laciniis 3 exter. anguste oblongo-lanceolatis acute apiculatis; inter. 2 latissime lanceolatis margine subundulatis omnibus 5 succulentis reflexo-plicatis albis; labello (disco laevissimo) eis aequilongo, lobis lateralibus in tubum supra angustato acutum extus albidum intus luteolum purpureo-venatum, ad apicem violaceo-laetissime jucundissimeque marginatum, conniventibus; lobo terminali patulo etiam violaceo late rotundato crispulo-undulato ap. macula triangulari pallidiorē notato interiore venato; gynostemate vix medium tubi labelli attingente. —

aff. *L. crispae* Rehb. fil. et *L. purpuratae* Lindl. Sepalis tepalisque subaequalibus lanceolatis elongatis, labelli trilobi antice hinc parce undulati ac minute denticulati lobis lateralibus obtusangulis, lobo medio oblongo.

Eine Art zwischen *Laelia crispata* und *purpurata*, von etwas dickerem Blüthengewebe, grösser und namentlich gestreckter in den Organen als erstere, etwas kleiner als letztere. Die Farbe blendend weiss; am Lippengrund bis zur Mitte ein paar purpurne Nerven, die Scheibe des Mittellappens violett-purpurn, das Zwischenfeld in der Mitte weisslich-gelb. Von *Laelia crispata* und *purpurata* namentlich durch die schmälern Tepala ausgezeichnet; von *L. crispata* durch den Mangel starker Kräuselung und durch die feine Zähnelung des Mittellappens. Von Rio durch Herrn Consul Schiller eingeführt. Blühte unter Herrn Stanges Kultur kurz darauf. C. Koch Berl. Allg. Gartenztg. 1857. p. 335.

19. **BLETIA EUSPATHA.** *Laelia euspatha* Rehb. fl. in Otto Hamb. Gtz. 1860. p. 421.

20. **BLETIA GRANDIS.** *Laelia grandis* Lindl. in Paxt. Fl. G. I. p. 60. n. 91. ic. Xyl. 38.

Caule clavato monophyllo, folio coriaceo basi latiori, pedunculo bifloro basi spathaceo longiore, floribus subhorizontalibus, sepalis lanceolatis reflexis, petalis late lanceolatis denticulato crispis convexis, labello parallelis et paulo longioribus, labello membranaceo venoso nudo undulato trilobo: laciniis lateralibus circa columnam convolutis et multo latioribus.

Bahia. Near to *L. Perrinii* and *majalis*. Sepals and petals nankin colour, lip white washed with rose, with purple veins inside.

Van Houtt. Fl. Serres VII. Xyl. 238. Rehb. fil. in Otto u. Dietr. Allg. Gtz. 1855. p. 321.

aff. *Laelia Boothianae* tepalis cuneato lanceolatis acutis, minute crispulis ac grosse undulatis, quam sepala vix dimidio latioribus, labelli lobis lateralibus acutis erectis, lobo medio oblongo obtuse acuto minute crenulato ac grosse undulato, carina longitudinali per discum, gynostemii lateribus exangulatis, androclinii lobo postico dentiformi, lobis lateralibus obtuse triangulis. Flos telae illius *Laeliae crispae*.

Bei Herrn Consul Schiller blühte so eben diese erst heuer über Rio eingeführte Pflanze kultivirt von Herrn Stange (16. September). Abgesehen von zahlreichen weniger wesentlichen Merkmalen finden wir an der Säule und der erhabenen Leiste über der Lippe (beide im Originaltext, der auf eine verwelkte Blüthe begründet scheint, nicht erwähnt) solche Merkmale, dass wir unsere vormalige *Laelia grandis purpurea* abtrennen müssen. Die *Laelia grandis* steht im Blüthenschnitt keiner Art so nahe, als der *Laelia superbiens*. Man nehme breitere Tepala und eine kürzere Lippe; für Tepala und Lippe noch abgesehen von Kerbzähnen Wellenränder nach Art der *Dendrobium taurina*. Die Blüthe erinnert auf erste Ansicht sehr wenig an die der andern *Laelien* und die Färbung ist sehr eigen. Die Tepalen hell und nankinartig, die Sepalen ebenso, äusserlich rothbraun angehaucht; die Lippe weiss mit Purpuradern. Die Säule mit zahlreichen dunkeln Purpurflecken, nur ein Drittheil der Lippe erreichend.

21. **BLETIA LOBATA.** (**BLETIA BOOTHIANA**). Huc: *Cattleya lobata* Lindl. Gardn. Chronicle 1848. p. 403. c. Xyl. — Paxt. Fl. G. I. p. 6. — G. Chronicle 1852. 184.: „a great rarity.“ — *Laelia virens* Hort. — *Laelia grandis purpurea* Rehb. fil. in Bonplandia 10 April 1854:

Sepala oblongo-lanceolata acuta, basi non angustata, tepala oblonga, medio valde dilatata, apicem versus crenulata, crispula, labelli lobi laterales obtuse rectanguli, antice crispuli, lobus medius ovalis, parce

crenulatus, crispulus, gynostemium breve, medio angulato alatum, alae in dentes obliquos laterales androclinii excurrentes, dens posticus ligulatus inflexus, rostellii processus quadratus porrectus.

Habitus Laeliae crispae. Cultur der Herren J. Booth und Söhne.

Laelia Boothiana Rehb. fil. in Otto u. Dietrich Allg. Gtz. 1855. 322.

aff. *Laeliae grandi* flore tenuissime membranaceo duplo majori, tepalis cuneato oblongis minute crispis quam sepala duplo latioribus, labelli lobis lateralibus obtusatis, lobo medio oblongo obtuso retuso, omnino crispulo, disco laevi; gynostemio valido utrinque medio acutangulo; androclinii lobo postico crenulato, lobis lateralibus falcatis.

1854 blühte diese bei Herren Booth aus Brasilien eingeführte Pflanze zuerst: sie brachte einen Stiel mit drei Blüten von dem schönsten Purpur, jede so gross, wie die die einer grossen *Cattleya labiata* Lindl. Diese stolze *Laelia*, eine würdige und ebenbürtige Rivalin der *Laelia purpurata*, widmen wir als Beweis der Hochachtung und Dankbarkeit unserm Freunde, Herrn Lorenz Booth.

22. BLETIA XANTHINA. *Laelia xanthina* Lindl. in Hook B. Mag. 5144.

Obs. Huc pertinebit planta mihi penitus dubia:

Laelia virens Lindl. B. Reg. XXX. 1844. Misc.

Sepalis subereclis ovatis petalisque lanceolatis subaequalibus, labello oblongo obsolete trilobo cucullato apice ovato crispo linea obsoleta elevata versus basin, columnae cardine unidentato.

Brazilian plant, of which I have only seen a single flower. Mr. Loddiges, whose number 647 it is, informs me, that it is quite the habit of *Cattleya crispa*. The flowers are very pale yellowish green, of no beauty, and about the size of *Maxillaria alba* which they are smelling like. The number of pollen masses is certainly eight, which makes the plant a *Laelia* and not a *Cattleya*.

b. Labellum carinatum. (excl. N. 26.)

23. BLETIA PRAESTANS. *Laelia praestans* Rehb. fil. in K. Koch Berl. Allg. Gtz. 1857. p. 336.

24. BLETIA RUBESCENS. *Laelia rubescens* Lindl. B. Reg. XXVI. 1840. Misc. 25.

Pseudobulbis subrotundis compressis utrinque angulo elevato, foliis oblongis obtusis scapo tereti vaginato brevioribus, racemo multifloro, bracteis pubescentibus ovario plus duplo brevioribus, sepalis linearibus, petalis lanceolatis subundulatis, labello conformi auriculato medio pubescente: lineis duabus elevatis.

Mr. Barker purchased it some time ago from Mr. Joseph Knight, Nursery man in the Kings Road, Mexico? Is forms a patch of roundish composed, pseudobulbs looking like those of a *Maxillaria* and bearing each a single broad leaf much shorter than the slender terminal scape. The latter is about a foot long, and bears at its extremity a loose raceme of delicate whitish flowers tinged with pink, and about the size of those of *L. albida*. The two first flowers which opened with Mr. Barker exhibited a singularly monstrous structure, with only 2 sepals and 2 petals, the lip and one of the sepals being missing; all the other parts were in the usual state.

B. Reg. XXVI. 1840. tb. 41.

Pseudobulbi oblongi, compressae tetragoni, vix sesquiunciam longi. Foliolum solitarium, coriaceum, oblongum, planiusculum, quasi emarginatum, scapo gracili erecto squamato multo brevius. Racemus brevis, multiflorus. Bractee lineares, marcescentes, ovario plus duplo breviores, carinatae, pilis brevissimis minutissimis fasciculatis pubescentes. Flores L. primulina paulo minores et minus patentes. Sepala linearia, obtusa, pollicaria, basi rubrescentia, apice virescentia, recta, petala paululum longiora. Petala

lanceolata, acuta, subundulata, secus margines rubentia. Labellum ovato lanceolatum, versus basin auriculatum, apicem versus undulatum, acutum, medio luteum, et subpubescens, lineis duabus elevatis tertiaque intermedia minus conspicua, basi atropurpurea convolutum.

Most nearly related to the fragrant *L. primulina*, from which it differs in the form of its pseudobulbs, leaves and labellum, in the size of flowers and in the petals not being at all revolute. In the specific character originally given the bracts were described as pubescent. This appearance arises from the presence of minute patches of extremely delicate hairs, which soon wither up and leave nothing but a stain to indicate their having been present.

Van Houtt. Fl. des Serres VII. tab. 742. Icon optima!

Obs. Quae sit *Laelia erubescens* Gard. Chronicle 1849. p. 8. ego nescio.

25. BLETIA PEDUNCULARIS. Huc: *Laelia peduncularis*. Lindl. B. Reg. XXXVIII. 1841. Misc. 10.

Pseudobulbis subrotundis compressis linea utrinque elevata, foliis oblongis obtusis scapo tereti vaginato brevioribus, corymbo multifloro, bracteis ovatis abrupte acutis pedunculo pluries brevioribus, petalis oblongis obtusis sublaceris planis, labelli lobis lateralibus rotundatis, intermedio oblongo rotundato plano subrepando (glabro) lineis duabus (2—4) elevatis.

Mexican sp. of great beauty, with the habit of *L. rubescens*, but with rich violet flowers. Peduncle $1\frac{3}{4}$ " long, and the flowers nearly of the same length when closed. The species is very near both *L. rubescens* and *acuminata*, but the flowers are much longer in proportion, and the labellum quite round at the point and flat. The pseudobulbs are not at all tetragonous, but compressed with only a slight line in the room of the intermediate angle. Probably it is the same as a supposed var. of *L. acuminata* mentioned at t. 24. for 1841.

B. Reg. 1845. 69: Diff. a *Laelia rubescens* et ab *acuminata*: in its lip having none of the hairiness of that species, and its flowers being much more closely arranged. From the latter in neither its petals nor lip being wavy and sharp pointed, and from both in its very large whole coloured flowers, flat jagged petals, short recurved lip lobes and very long flower stalk, Mexico.

26. BLETIA VIOLACEA. *Laelia violacea* Röhb. fl. in Seemann Bonplandia II. 89:

aff. *L. rubescens*: perigonii tenuis phyllis *L. cinnabarinae*, labello *L. rubescens*, carinis tamen in disco nullis. —

Pseudobulbi compressi orbiculares ancipites apice humerati seu subtetragoni. Folium solitarium valde coriaceum a basi cuneata oblongum apice angustata bilobulum, ante apicem sulculis transversis numerosis insculptis incisum. Pedunculus multivaginatus tantum apice racemosus. Bracteae lanceolatae acutae nervosae scariosae tertiam ovarii pedicellati aequantes. Sepala ac tepala subcarnosa lineariligulata, tepala vix latiora, labellum ligulatum apice paulo angustatum, basi utrinque semirhombeo auriculatum, antice 3—4sinuato dentatum, disco laeve. Gynostemium apice tridentatum, fovea quadrata in sinum aperte triangulum media basi excurrent. — Blüten lilä, auf den seitlichen Hüllblättern auf unterer Hälfte ein dunkelvioletter Streif; eben so ist die Scheibe der Lippe gefärbt. — In Hofrath Keil's Garten zu Leipzig von Herrn Tube cultivirt.

Huc videtur pertinere: *Laelia acuminata* Hook B. M. 4905.

*** Labellum trifidum.

a. Labellum laeve.

27. BLETIA IRRORATA. *Laelia irrorata* Rehb. fl. in Otto Hamb. Garten- und Blumenzeitung 1859. XV. p. 57. N. 51.

28. BLETIA ELEGANS. Huc: *Cattleya elegans* Morr. Ann. Gand, 185. — Hook. B. Mag 4700:

Pseudobulbis teretibus, cauliformibus elongatis (clavatis), folia solitaria (v. folia gemina) lineari oblonga coriacea gerentibus, sepalis oblongis acutis, petalis lanceolatis acutis, labelli trilobi lobis lateralibus elongatis obtusis cofumnam involventibus, intermedio apice latissimo transverso subunguiculato vix emarginato undulato crispato basi laeviusculo (venis callisque deficientibus).

Lindl. in Paxt. Fl. G. I. p. 6. St. Catherines, Brazil. Flowers large, rose colour with a deep purple violet lip. Very like *Catt. superba*, except in colours, but the leaves are represented as being much narrower, and the lip is said not to have either wrinkled veins or callosities. Unknown to me except from Prof. Morren's figure made from a Belgian specimen in the possession of M. Alexander Vershaffelt.

Lindl. Gard. Chronicle 1852. Very rare. Flowered just with Mrs. Lawrence. It has long slender clavate terete stems, each bearing one very long obtuse leaf. The flowers grow in pairs or perhaps in greater number, from within a green spathe, which in B. M. is represented as long as the peduncle, but in the specimen before us, it is scarcely more than rudimentary. Sepals and petals of clear vivid uniform rose colour with expansion of about 5 inches; latter being about twice as broad as the former. Lip is cucullate, regularly 3lobed, with some elevated lines along the middle; its convolute part is almost colourless; the ends of lat. lobes, which are very much rounded and deeply separated from the middle one, have a broad rich crimson stain within the edges. The middle lobe is somewhat cordate, with a wedgeshaped base, wavy, broader than long, exactly as is the lower fig. in B. M. Blossoms, have an agreeable odour. St. Catherine. We must add, that this too is a *Laelia*, if the mere number of pollenmasses definitively separate the genera *Cattleya* and *Laelia*. Pollen-masses although 8, are of unequal size in this species, but 4 are quite small and lodged in very shallow sockets in front of anther. *Pescatorea* tab. 23. *Laelia elegans* Rehb. fl. in Otto u. Dietrich Allg. Ztg. 1855. p. 242.

29. BLETIA ACUMINATA. Huc: *Laelia acuminata* Lindl. B. Reg. 1841. XXVIII. Misc. 42:

Pseudobulbis ovatis compressis, rugosis, scapo erecto, foliis solitariis emarginatis brevioribus, floribus corymbosis, bracteis linearibus acuminatis ovario duplo brevioribus, sepalis linearibus petalisque lanceolatis undulatis acuminatis, labelli lobis lateralibus rotundatis, intermedio lanceolato undulato acuminato.

Guatemala Hartweg. Very near *L. rubescens*, from which it differs in the scape being two flowered, not racemose, in the sepals being acuminate, and the flowers at least twice as large. It is a pretty species, with pale blush flowers. What seems to be a variety, from Costarica no. 620 has produced a pair of pale violet blossoms with Mrs. Loddiges.

B. Reg. XXVII. 1841. 24. It forms a fine corymbe of 8 flowers. — Decb. in Guatemala. Hartweg. From *L. rubescens* its nearest ally it differs in its large, wrinkled pseudobulbs, larger and more corymbose flowers and the different form of the labelum. — Perigonium albido rospum, labelli lobo medio flavo striato, labelli fundo kermesino. — Lindl. in Benth. Plant. Hartweg. 2. p. 93. Retatule in *Crescentia Cujete*. Vernacule „Flor de Jesus“ dicta. Mexico. Hartweg.

b. Labellum carinatum.

§. Labelli lobi postici laterales.

∞ Unifloræ seu spicatae.

30. BLETIA AUTUMNALIS. La Llave and Lexarz a Nov. Veg. Descr. II. 19. *Laelia autumnalis* Lindl. Gen. et Sp. Orch. 115. Batem. Orch. Mexic. et Guat. t. 9. „Flor de los Santos.“ Lindl. B. Reg. 39, t. 27. Hook. B. Mag. 42. tb. 3847.

Pseudobulbis ovatis teretibus costatis apice attenuatis 2—3phyllis; foliis oblongo linearibus patentissimis, scapo multo brevioribus; scapo tereti apice subsexfloro, bracteis oblongis membranaceis acutis, sepalis lanceolatis acuminatis patentissimis, petalis oblongo lanceolatis undulatis, labelli trilobi bilamellati lobis lateralibus erectis rotundatis truncatis, intermedio oblongo-lanceolato apice reflexo, ovario glabro.

31. BLETIA FURFURACEA. *Laelia furfuracea* Lindl. B. Reg. XXV. 1839. 26.

Pseudobulbis ovatis striatis submonophyllis, foliis anguste oblongis membranaceis acutis, scapo unifloro(?) tereti, bracteis oblongis membranaceis acutis, sepalis lanceolatis acuminatis patentissimis, petalis subrhombis lanceolatis undulatis sublobatis, labelli trilobi bilamellati lobis lateralibus erectis rotundatis truncatis, intermedio oblongo revolutato, ovario glandulis nigris furfuraceo.

Mexico. Woburn Garden, received through Parkinson. Perig. roseum albidumque, labelli lobi lat. albidis, intus albidi, medium labellum flavum, lob. anterior roseus.

B. Mag. 42. 3810. Was found near Oaxaca by Count Karwinski and is probably not uncommon in coll. large quantities having been received by various persons from Mexico. A and B. are variet.

Perigonium roseum, labelli lobis lateralibus intus albis, cristulae labii flavae.

Differt ab autumnali: its pseudobulbs are ovate and slightly furrowed, instead of having a long neck and being deeply furrowed. The leaves solitary or in pairs and not in zor 3, erect and straight, not spreading and curved; flowers have little or nothing as to appear lobed, and finally the ovary is closely covered with black mealy glands.

33. BLETIA SPECIOSA. Hb. B. Kth. n. Gen. et. Sp. I. 342. Lindl. B. Reg. 1839. Misc. 42.

Laelia majalis Lindl. mss. *Cattleya Grahams* LO. 116. Flor de Mayo of the natives of San Bartolo, and the adjoining parts of Mexico, has lately been received by the Hort. Sc. of London from Mr. Hartweg, who found it on the mountains, near Leon 8000' where it sometimes freezes. I possess sp. (No. 3) given me by Prof. Schlechtendahl, gathered by Dr. Schiede in the same situations. It is one of the most beautiful of the whole order; a dried flower now before me, of a bright violet colour, measures nearly 5" from the tip of one petal to that of another, and when fresh I have no doubt the expansion of the flowers was 6". The labellum 2½" long. Many plants have been given away by the Hort. Sec., but it proves exceedingly difficult of cultivation.

B. Reg. XXX. 1844. 30.

Folio angusto scapo bifloro aequali, bracteis membranaceis ovatis, sepalis lanceolatis, petalis oblongo-lanceolatis duplo latioribus, labelli lobo medio rotundato emarginato plano, lateralibus parvis obtusis.

The labellum is dotted and veined with rich purple.

Batem. M. G. 23. B. Reg. XXVIII. 1842. sub 62.

Pseudobulbi ovati vel subrotundi macrophylli.

Bat. 33. 1840.

33. BLETIA ALBIDA. Huc: *Laelia albida* Bat. B. Reg. 1839. XXV. Misc. 4.

Pseudobulbis ovalibus diphyllis, foliis linearibus acutis spica multiflora quadruplo brevioribus, sepalis oblongo-lanceolatis acutis vel subacuminatis, petalis latioribus acutis, omnibus apicibus reflexis fortiter mucronulatis, labelli alte trilobi tricostati lobis lateralibus erectis rotundatis, intermedio duplo majore subrotundo obscure apiculato reflexo.

Bot. Mag. 1842. 3957.

Mexico out from Oaxaca by Count Karwinski. Mr. Harris purchased it of a French collector. Kew.

B. Reg. 1839. XXV. 54:

Pseudobulbi ovati, sulcati, diphylli. Folia anguste lanceolata, erecto-patula, scapo breviora. Racemus erectus, 3—5florus. Bractee ovatae, durae, obtusae, sessiles, panae. Sepala candida. apice rosea, oblonga, lanceolata, patula. Petala breviora, oblonga, obtusiora, revoluta, concolora. Labellum obovatum, trilobum, 3 lamellatum: laciniis lateralibus obtusis, intermedia obtusa apiculata undulata rubescente multo brevioribus; lamellae labelli luteae purpureo punctatae. Columna elongata glabra. Oaxaca.

B. Reg. XXVII. 1841. Misc. 21.:

Mr. Barker communicated a curious monster of this pretty plant, with the dorsal sepal united to the back of the column by means of a thin plate resembling a small knifeblade. What is very singular: every flower of the specimen was in the same state.

B. Reg. XXIX. 1843. Misc. 16.:

A beautiful variety of this with a violet lip, painted at the base with purple veins, has flowered with Lawrence at Ealing Park.

Huc: *Laelia discolor* A. Rich. u. Gal. Ann. sc. nat. 1845. Jan. p. 23:

Scapo terminali floribus sordide roseis racemosis: labello purpureo 3-lobo, lobis lateralibus oblongis, intermedio suborbiculari obtuso margine sinuoso crispo in disco lamellis luteis notato. Mexico.

∞ ∞. Vulgo paniculatae.

34. BLETIA TIBICINIS. Huc; *Epidendrum tibicinis* Batem. Mag. B. Reg. XXIV. 1838. Misc. 12.

Caulibus cylindraceis 3—4phyllis, foliis ovatis crassissimis triplo longioribus, scapo altissimo giganteo in racemum multiflorum desinente, floribus —.

Hab. in Honduras Skinner. By far the most magnificent species of the genus. Flowers of the size of *Cattleya labiata*, but I have not the means of giving their specific character. Scape 3 yards long. The hollow cylindrical stems are used as trumpets by the native children: hence the name.

B. Reg. 1844. sub 23.: *Schomburgkia tibicinis* Bat.: Its pseudobulbs between one and two feet long, are quite hollow, and as smooth inside as the outside of a Bamboo; at their base there is always a small hole, which leads to the interior, and furnishes access to colonies of ants, which are constantly found inhabiting the plant.

B. Reg. XXVII. 1841. Misc. 119.:

Schomburgkia tibicinis Batem. in litt. Pseudobulbis conicis cornuformibus annulis sulcatis 3 phyllis, (1 — 1½ — 2'), foliis oblongis coriaceis patentibus, scapo — 10' longissimo tereti distanter squamato apice paniculato, panicula pyramidalis laxiflora, sepalis petalisque undulatis crispis, labello oblongo venis per medium elevatis approximatis: laciniis lateralibus apice rotundatis, intermedia subrhombea emarginata.

The cow-horn orchis of Honduras is sent by Skinner. Lady Acland brought flowers. The flowers (exhib. at Hort. Soc.) when fully expanded are about 2½" wide, a deep pink speckled with white on their outside, rich chocolate red within. The lip is white in the middle, but deep rose colour at the side, with a short chocolate red middle lobe. Flowering stem 8—9' long!!

Bat. Orch. Mex. Guat. 1841. 130.: Flowers 2½" across. Sepals and petals dark chestnut brown inside, and dirty purple outside. Lip whole of the inside white with

the exception of the edges, which are pencilled with crimson, and five elevated yellow ridges. Column whitish brown tipped with an emerging anther. Honduras and rarer in Oaxaca and Caracas. Bat. 30. 1841.

Schomburgkia tibicinis var. *grandiflora* Lindl. B. Reg.: XXXI. 1845. 30.:

Floribus duplo majoribus, labello extus pallido intus lobo medio luteo, albo vel violaceo limbato.

Ead. Hook. B. M. 4476: Dr. Lindley considers it a variety, but it would be perhaps more correct to consider it the perfect state of the plant, such as it assumes in its native woods.

Huc: *Schomburgkia Galeottiana*. A. Rich. Galeotti in Annales des sciences naturelles 1845. Jan. p. 23.:

Sepalis externis planis, non undulatis: labello obsolete 3-lobo, lobo medio apice fisso. Mexico.

35. BLETIA HUMBOLDTI. Huc: *Epidendrum Humboldti* Rchb. fl. in Linn. XXII. p. 386. Lindl. Folia Orch. Epid. N. 80.:

„E. sepalis oblongis acutis basi aliquid cuneatis, petalis obtusis basi valde cuneatis sub apice dilatatis, labello maximo trilobo basi ima cuneato, lobis lateralibus integris obtusatis medio maximo subquadrato antice emarginato denticulato nervis 7 medianis elevatis a basi ad centrum cristatis serratis, columna postice carinata, clinandrio tridentato interjecto dente antice rostellari.

Wild in the Caracas: Porto Cabello. Humboldt u. Bonpland.

Epidendrum (Encyclium) Humboldti Rchb. fl. in Bonplandia II. 19.

Es ist kein geringes Verdienst unseres Wagener, diese von Humboldt entdeckte Art wieder aufgefunden zu haben. Ich fand im Berliner Herbar ein paar Blüten vor ohne Axe, die unter unbestimmten Arten der Untersuchung harrten. Selbst diese alten Blüten vermochten mir eine Ahnung einzuflöszen, dass diese Art werth wäre, den Namen ihres Entdeckers zu führen. Allein auf eine solche Pracht war ich nicht gefasst. Denke man sich eine unzählige Masse Blüten der *Laelia pumila*, (*Cattleya* p. Hook.), aber mit den edlern Farbentönen der *Laelia anceps* — mit der Gestalt der Blüten des *Ep. atropurpureum* — vereint diese in eine pyramidale Rispe — so hat man *Epidendrum Humboldti*. Die Anthere ist zweihörnig. — Die Pollinia sah ich nicht. Das Perigon ist weit gespreizt, die Lippe umrollt die Säule, der prächtige feingezähnelte quere, vorn ausgerandete Mittellappen derselben steht vor.

Obs. Quacnam sit sequens, nescio:

Schomburgkia violacea Paxt. Mag. XVI. 123. Scape 5, length, a large trup of dark violet flowers, sepals and petals much crisped.

§ §. Labelli lobi postici antrorsi.

35. BLETIA CINNABARINA. Huc: *Laelia cinnabarina* Bat. in Sert. Orch. t. 28.:

Pseudobulbis cylindraceo-ampullaceis elongatis, foliis binis basi discretis oblongis subrecurvis et undulatis, scapo tenui ascendente foliis multo longiore 4—5 floro, sepalis petalisque oblongo linearibus obtusis aequalibus, labelli oblongi convoluti recurvi lobis lateralibus acutis, intermedio ovali crispato, lineis 3 elevatis in axi.

Brazil. — Flowers rich orange colour.

B. Reg. XXVIII. 1842. sub. 62.

Pseudobulbs 4—5", thickest at the base, tapering upwards. Leaves about as long as the pseudobulb. Scape 1' or more, slender, green, scales; bracts very small. At the base of the labellum is a passage passing down the side the ovary and indi-

cating, that the labellum is really calcarate, but that its spur is adherent to the flower stalks as in *Pelargonium*. The mouth of its spur is shown at fig. 2.

B. Mag. t. 4302.

37. BLETIA FLAVA. *Laelia flava* Lindl. B. Reg. 1839. Misc. 143. :

*Pseudobulbis ovalibus 1—2*phyllis, foliis carnosis coriaceis planis subconvexis brevioribus, scapo erecto foliis longiore squamulis quibusdam distantibus vaginato apice paucifloro, bracteis minimis acutis, sepalis petalisque oblongo-linearibus obtusis, labelli lobo medio crispo recurvo, lateralibus obtusis undulatis multo longiore.

I believe a native of Mexico. Charles Lemon's Coll. at Carelew. Flowered 39
Flowers bright yellow.

Lindl. B. Reg. XXVIII. 1842. 62: Nearly allied to *L. cinnabarina*, but it appears to be of a smaller size, with much more coriaceous leaves; the flowers are a clear pure yellow, and not a brilliant cinnabar colour, and the lateral lobes of the lip are obtuse not acute.

Huc: *Laelia caulescens* Lindl. B. Reg. 1841. sub t. 1.

Not of Mexico!!! Serra de Piedade Prov. Minas Geraes Martius. Rocky places coll. in the Serra do Frio District Brasil.

38. BLETIA CAULESCENS. *Laelia caulescens* Lindl. B. Reg. XXVII. 1841. sub 1.

Folio coriaceo lineari-oblongo caule tereti longiore, scapo subdecemfloro, bracteis squamaeformibus erectis rigidis striatis, sepalis petalisque subaequalibus lineari-lanceolato acutis, labelli postici nudi lobo intermedio obtuso crispo, lateralibus parum longiore.

A species near *L. cinnabarina*. The flowers are apparently purple, and about the size of *L. rubescens*. The lip is perfectly destitute of all elevation or inequality. In the herbar of von Martius is a smaller plant from the same loc., with a three flowered raceme, and much shorter leaves; japp. it is a mere variety. From the Serra de Piedade in the prov. of the Minas Geraes in Brazil. (Herb. Martius).

39. BLETIA RUPESTRIS. *Laelia rupestris* Lindl. B. Reg. XXVIII. 1842. sub 62.

Pseudobulbo elongato monophyllo, folio oblongo erecto canaliculato, scapo racemoso multifloro brevioris, sepalis petalisque oblongis acutis, labelli circularis lobo intermedio obtuso margine crispo disco plano lateralibus obtusis, lineis elevatis rectis. Brazil.

Found by Prof. Gardner in elevated rocky tracts in the Diamond District. „Flowers violet“. Very near *L. flava*.

40. BLETIA WENDLANDI. *Laelia Wendlandi* Rehb. fl. in litt.:

„*Pseudobulbo Bletiae ancipitis*“, foliis cuneato oblongis obtuse acutis, panícula pluriflora, ramis abbreviatis, squamis triangulis quam ovarii pedicellata multo brevioribus, perigonio subcoriaceo illi *Laeliae cinnabarinae* aequali, sepalis petalisque ligulatis obtuse acutis, labelli trifidi laciniis lateralibus triangulis obtusatis antrorsis, lacinia media obovata crispula denticulata, lineis per discum ad apicem ternis, paulo incrassatis, media apice undulata, columna basi late alato dilatata, anthera biapiculata. — Guatemala. Wendland.

B. Corifoliae planifoliae limbo serrulato.

41. BLETIA LINDENI. Huc: *Laelia Lindenii* Lindl. in Orch. Linden.

Scapo gracili tereti apice 4—10 floro, sepalis ovalibus acutis, petalis oblongis obtusis, labello multo majore obovato, subrotundo, bilobo, venis omnibus infra medium dentatis, columna basi bidentata.

Cuba. Jun.

This charming species grows on single trees in the Savannah, between San Andres and the Saltadero. The flowers are large, pale rose colour, the pseudobulbs are small and compressed; the leaves are fleshy, lanceolate, toothed. (N. 1805).

This is probably the same as *Cattleya? domingensis*. I have not seen the leaves.

Huc: *Laelia Lindenii* Lindl. Ramon de Sagra hist. Cul. tab. 82.

42. BLETIA DOMINGENSIS. *Cattleya domingensis* LO. 11. B. Reg. XXX. 1844. sub 5.

Caule brevi oblongo annulato squamoso, folio ovali-oblongo coriaceo, scapo terminali longissimo stricto apice racemoso 7—8 floro, sepalis lineari-lanceolatis acutis, petalis oblongis obtusiusculis triplo angustioribus, labello indiviso obovato obtuso plicato crispo emarginato cucullato.

St. Domingo.

In the absence of sufficient evidence, as to the species, which is No. 231. of Jaegers coll. it may be conjectured to be a *Laelia* rather than a *Cattleya*. It is found on longwood trees in the wood near Miragoane in St. Domingo, flor. April.

Laeliopsis Lindl. in Paxt. Fl. G. III. 105. :

Omnino *Cattleya*, nisi quod flores membranacei, nec non venae labelli barbatae.

L. Domingensis: pseudobulbis 2 phyllis, foliis oblongis coriaceis obtusis, scapo gracili nudo apice sub 8floro, labelli 2 lobi laciniis denticulatis undulatis recurvis, venis centralibus barbatis.

Cattleya domingensis LO. 118. — *Broughtonia lilacina* Henfrey Gard. Mag. Bot. Vel. III. p. 201. with a fig.

Laelia? no — because it has 4 pollenmasses. *Broughtonia*? no, for through its flower is deeply cuniculate, yet it has not a long external adnate spur and decurved sepals. *Epidendrum*? — no, for it wants the unguiculate lip more or less adnate to the column. *Cattleya*? still no, although we once thought it one; for the flowers are membranous, the veins of the lip bearded, and the habit quite different. We see no means of providing a fixed station for this and a few allied plants, except by giving them a genus to themselves, the essential features of which shall consist in what has been above proposed. There is no doubt that *Cattleya*, *Epidendrum*, *Broughtonia* are so very nearly related, that on more technical grounds they might be all placed in the same genera, but their habits are very different and the mind is unable to reconcile itself to their union. As to *Broughtonia*, is, we disregard its cucullate lip and manifest external adnate spur, there is little to divide it from *Epidendrum*, the majority of whose species have a cuniculate ovary, and in the case of *E. vesicatum* even a spur partially visible; or from *Cattleya* except the tough coriaceous equality of the lip and the adhesion of the sepals of *Broughtonia* to the face of its external spur. Upon grounds of the same nature as those, which separate those general must *Laeliopsis* be sustained, when the mutual difference among the 4 genera may be tabulated thus:

Labello calcarato sepalis calcari adnatis	<i>Broughtonia</i>
calcaratum cuniculatum tantum unguiculatum	
ungue saepissime columnae adnato.	<i>Epidendrum</i>
sessile convolutum;	
coriaceum imberbe	<i>Cattleya</i>
membranaceum barbatum	<i>Laeliopsis</i>

L. will receive *L. Lindenii*, *Broughtonia chinensis*, *Epidendrum cubense*. — Mackenzie, — near Miragoane. Jaeger.

Obs. Haec omnia pulchre dicta. Sed pollinia adsunt octona. Rehb. fil.

43. BLETIA ORTGIESIANA Rehb. fil. in Otto Hamb. Gartenz. [1860. p. 420.

Sectionem C. cum E. combinandam judicavi, ob difficultatem judicandi folia „Brassavolarum“ ex nodosae affinitate ad icones Anglorum.

Ego excepta una B. venosa, quae et nobis folia fert planiuscula, saltem transsectione semilunari, semper alias reperi foliis teretiusculis sulcatis. Sed Anglorum icones recedunt. Putavi olim folia adulta fieri planiora — num recte?

D. *Vomerifoliae*: folio triquetro. Pseudobulbosae.

44. BLETIA PUMILIO. Huc: *Brassavola Pumilio* Rehb. fil. Linnaea XVIII. p. 418.

Rhizomate repente pseudobulbifero, pseudobulbis minimis, oblongis, unifoliis(?), foliis coriaceis oblongis obtuse acutis, scapis unifloris ex spathis pusillis membranaceis erumpentibus, vaginatis, bracteis vaginatis membranaceis pedicello aequalibus, sepalis petalisque aequalibus lanceolatis cuspidatis ovario aequalibus, labello oblongo-cordato acuminato, gynostemio brevi, androclinio integre alato. —

Ich kenne von dieser niedlichen Pflanze blos ein Exemplar in der Sammlung des Hrn. v. Römer. Die Trugknollen sind 2““, die Blätter 5““, der haarfeine Schaft 7““, die Kelchblätter 5—6““, die Lippe 5““, die Säule 1½““ lang. — Da die Blätter alle abgefallen sind, kann ich nicht bestimmen, ob die Trugknollen ein- oder zweiblättrig sind. Die Blüthe scheint weiss gewesen zu sein, an der Basis der Lippe zeigt sich ein dunkler Fleck. Die Anthere ist 4fächrig, die 2 hinteren Fächer sind deutlich 2fächrig, an den vorderen kann ich dieses nicht deutlich wahrnehmen. — Tropisches Mexiko. Leibold.

Nunc ipse habeo bona specimina Schaffneriana.

C. et E. *Cepulifoliae*. Folia seu teretiuscula seu teretiuscula applanata.

a a. Labellum fimbriatum.

45. BLETIA CUCULLATA. Huc: *Brassavola cucullata* Br. Kew. Ed. 2. Vol. V. 216. Lindl. Journ. Hort. Soc. V. 85. c. Xyl.

This cut represents a flower of what I believe to be *B. cucullata*, almost lost in English gardens. It is pure white and remarkable for the manner in which its long tail-like lip and other floral divisions fall to one side as soon as they are disengaged from each other in the bud. In the foliage there is nothing to distinguish the plant from several other species. If the old fig. of Bot. M. 543 is to be trusted the lip must be subject to some variation in form; but we have no plant now in cultivation, which corresponds with that figure, nor has such a plant been marked in herbaria.

Var. *cuspidata*. Huc: *Brassavola cuspidata* Hook. B. Mag. XIII. N. S. 3722.

Caule unifloro, labello trilobo, lobis lateralibus rotundatis parce fimbriato-dentatis, intermedio longissimo cuspidato subuliformi integerrimo, sepalis petalisque longe acuminatis.

John Moss. Esq. of Oughterspool Liverpool. Trinidad. sent by Robert Esq. Most nearly allied to *B. cucullata* Br. (*Epidendr. cucullat.* B. M. 543.) That species however has the middle lobe of the lip much broader at the base and deeply fimbriated for the general part of its length, having the apex alone entire. In our plant the lobe in question is subulate and almost quite entire.

Perigonium candidum flaveolo (labellum) et roseo (laciniæ perigonii) adpersum.

Huc: *Brassavola appendiculata*. Rich. et Gal. tab. 21. Ann. sc. nat. 1845. p. 23.

Caule erecto, apice 1-phyllo; fol. subtereti subulato, sulcato; floribus solitariis maximis pallide-luteolis; sepalis lineari-lanceolatis, labello subcordiformi margine denticulato apice in ligulam linearem acutam desinenti. Mexico.

46. BLETIA MARTIANA. Huc: *Brasavola Martiana* Lindl. B. Reg. XXII. 1836. sub 1914. B. Reg. XXV. 1839. 5.

Labello ovali (aut ovato) acuminato ciliato-dentato sessili; petalis sepalisque linearilanceolatis acuminatis longioribus, clinandrio cucullato inciso. B. Reg. fol. 1914. in textu.

Folia longa, teretia, supra sulcis tribus exarata, racemo subcorymboso duplo longiora. Pedunculi laeves, teretes, sepalis longiores, pone basin fusco-purpureo tincti. Sepala et petala lineari-lanceolata subaequalia, patula. Labellum ovatum aut ovale, acuminatum, fimbriatum, basi luteum; ungue brevi columnae appresso. Columna apice cucullata, inflexa, fimbriata. (Perigonii foliola viridia).

Berbice imp. Loddiges. Originally discovered by Dr. Von Martius on the barks of the Rio Negro in Brazil.

47. BLETIA AMAZONICA. Huc: *Brasavola amazonica*. Pöpp. Endl. — Lindl. B. Reg. XXV. 1839. sub 5.

Beyond the reach of ordinary travellers occupying the branches of trees surrounding lake „Egan“, one of the offsprings of the Amazons.

48. BLETIA ANGUSTATA. Huc: *Brasavola angustata* Lindl. B. Reg. 1838. XXIV. Misc. 6.

Sepalis petalisque linearibus acuminatissimis collo ovarii longioribus, labello ovato acuminato serrulato basi haud cucullato, clinandrii trilobi lobo medio incurvo integro, lateralibus cuneatis flabellatis incisiss.

A fine new species imported from Demarara, by Wilmore Esq. of Oldford near Birmingham. The flowers are large and long-stalked, of a pale yellowish green, with a narrow fringed white lip. It differs from *B. cucullata* in the lip not being at all cucullate at the base. The leaves are very long and slender.

Huc: *Brasavola surinamensis* Focke is Tijdschrift v. d. naatuurk. Wetenschappen. 4. p. 71.

Foliis teretibus subuliformibus articulato-petiolatis unisulcatis, sepalis et petalis aristato-attenuatis, labello oblongo-cordato acuminato recurvo fimbriato, clinandrii dentibus lateralibus laceratis, postico integro acuto procumbente, spica laxa pauciflora in axilla folii eoque multo breviora.

Rhizoma annulatum, repens. Radices crassae, albae. Folium pedale, carnosum, teres, subuliforme, mucronatum, articulato-petiolatum, uno latere sulcatum, vaginatum. Spica axillaris, 3—5-flora, folio multo brevior, nutans. Perianthium patens. Sepala et petala libera, aequilonga, aristato-attenuata, pallide viridia, 4 centim. longa. Sep. lateralia subfalcata approximata; superius erectum, basi convexum, apice obliquo-recurvum. Petala paullo angustiora, planiuscula, deorsum incurva. Labellum basi cucullatum, unguiculatum, ungue basi columnae adnato, oblongo-cordatum, acuminatissimum, limbi basi columnam amplectens, toto margine fimbriatum, subrepandum, apice recurvum, album, disco luteo, inde a basi callo longitudinali infra limbi medium evanescente instructo, 3 centim. longum. Columna cum ovario continua, marginata, concava, alba, clinandrio antice biaurito, postice dentibus tribus instructo, quorum 2 laterales lacerato-fimbriati, erecti, intermedio integro acuto procumbente, centim. longa. Anthera terminalis, subglobosa, emarginata, 4-ocularis, septis marginatis. Pollinia 8, quorum 4 minora ovata, 4 majora compressa, cultriformia, lutea.

Caudiculæ 4 elasticæ, parallelæ, quævis utrinque polliniorum minus atque majus gerens, luteæ; interdum tuberculis minutis, polliniis similibus, obsessæ. Ovarium decimetri fere longitudine, teres, glabrum viride, basi atro-purpurascens, bractea minutâ suffultum. Herba epiphyta, caespitosa, pendula in arboribus ad rivum Para. Floret Martio et Aprili. Flores speciosi odorem gratum caryophyllatum exhalant. Tubercula polliniis accessoria, quæ memorat cel. Lindley, quippe reddita in icone Hookeriana B. tuberculatæ, in nostrâ quoque specie occurrunt. —

Dedi Paramariboæ, 28. Juli 1850.

805. *Brassavola* sp. perhaps *B. angustata* Lindl. Lond. Journ. II. 1843. p. 672. But the spec. too imperf. to determine: British Guiana Schomburgk. n. 428.

bb. Labellum integerrimum.

α. Columnæ auriculæ anticae retusæ.

49. BLETIA TUBERCULATA. Huc: *Brassavola tuberculata* Hook. B. Mag. Vol. III. N. S. 1829. t. 878.

Antonio Musa Brassavola a Physician of Ferrara, who published many works in the 16 th. cent on the properties of plants as employed in medicine.

Caule unifloro, lamina labelli integra, pedunculo petalis exterioribus tuberculatis, labello candido medio basique flaveolo, phyllis reliquis perigonii luteis; sepalis bruneo maculatis.

Botafogo Bay found by Henry Harrisen Esq. sent to Rich. Harr. of Aigburgh near [Liverpool.

Huc: *B. tuberculata* Hook. Rehb. fil. Bpl. III. 221.

Diese Pflanze, die in Herbarien sehr häufig, in Gärten bisweilen vorkommt, haben wir nur einmal mit einigen Würzchen, gewöhnlich aber ohne alle dergleichen Rauigkeiten gesehen.

Lond. B. Journ. I. p. 188. 1842. *Brassavola tuberculata*. Common on rocky by the sea, near Rios as on the Moro do Flamingo, where it grows almost to the water edge. Jul. Aug. Gardner. Nr. 120.

50. BLETIA RETUSA. Huc: *Brassavola retusa* Lindl. B. Reg. 1847. sub 20,

Labello undulato cuneato truncato margine laevi.

Lip white with a little green near the base. Maracaybo.

51. BLETIA CEBOLETTA. Huc: *Brassavola Cebolletta* Rehb. fil. Bpl. III. 221.

aff. *Brassavolæ Perrinii* gynostemio labelli oblongi acuti basi bicarinati dimidium æquante, postice tridenticulato, utrinque obtuse alato labellum usque. — Folium teres apice subulatum 5—6pollicare superne sulcatum. Pedunculus 1—2florus. Ovarium pedicellatum 2—3pollicare. Sepala lanceolata acuta. Tepala paulo angustiora. Labellum ima cum gynostemio connatum. Blüthen so gross, wie bei *Brassavola cordata*, Hüllblätter grün. Lippe und Säule weiss, am Grunde grün. Von Herrn Consul Schiller eingesendet.

β. Columnæ auriculæ antice acutæ seu inæquali lacerae.

§. Unifloræ, raro bifloræ.

52. BLETIA ACAULIS. Huc: *Brassavola acaulis* Lindl. Paxt. Fl. G. II. 152. N. 428. c. xyl. 216.

Foliis teretibus rectis et flore subsessilibus, sepalis petalisque linearibus patulis æqualibus, labelli lamina subrotundo ovata ungue cuculato duplo longiore.

App. *Brassavola grandiflora* in the size and form of lip. Only one flower appears on a very short stalk, greenish white, with some tendency to spotting, the firm and narrow sepals, about three inches long, and curving round the lip, the flat part roundish ovate and about twice as long as the rolled up claw. The leaves are remarkably short and stiff. The only plant we know is in the garden of Hort. Soc., where it was received from Mr. Skinner, and was reported to have pink flowers. — Central-America. Fl. cream colour.

52. BLETIA LINEATA. Huc: *Brassavola lineata* Hock. B. Mag. 4734. (1853).

Folio tereti acuminato inferne attenuato antice sulcato, pedunculo radicali bifloro, floribus magnis pendentibus, sepalis petalisque linearibus lanceolatis conformibus, labelli ungue elongato integro, lamina amplo cordata acuminata, longitudinaliter plicata striata.

Dr. Lindley has referred me to *Brass. acaulis*, as allied, but different from this in its short leaves, one flowered peduncle, short unguis.

Huc: *Brassavola Mathieuana* Klotzsch Allg. Gtz. 1853. 290.

Caule ramoso; foliis teretibus acutis linea canaliculatis, flore solitario brevi pedicellato candido; perianthii foliolis lanceolato linearibus acutis patentibus, labello magno infundibuliformi acuminato integerrimo, margine acumineque subundulato reflexo, margine convoluto intus ad basin punctis paucis purpureis notato columna triplo longiore; columna nana, appendicibus duabus lanceolatis falcatis instructa.

Central-Amerika. Warssewicz. Col. Mathieu.

54. BLETIA PERRINII. Huc: *Brassavola Perrinii* Lindl. B. Reg. 1832. 1561. B. Mag. 1840. 3761.

Flore solitario, labello cordato acuminato integerrimo, petalis sepalisque linearibus obtusis glabris, dentibus lateralibus clinandrii integris postico serrato, caule ramoso, folio tereti compresso subulato linea canaliculato.

Brassavola Perrinii Lindl. B. Reg. 1561.

Perigonium viride, labellum album viridi venosum. Brazil. Glasgow.

Besides a diff. in the flowers, this specimen may be further known from *B. nodosa* and *B. cordata* by its much slenderer leaves, bracing stem, and blossoms appearing solitary.

§§. Pluriflorae.

55. BLETIA CORDATA. Huc: *Brassavola cordata* Lindl. B. Reg. XXII. 1836. t. 1914.

Labello cordato acuminato integerrimo ungue parum longiore, sepalis petalisque linearibus acuminatis, clinandrio integerrimo postice in dentem subulatum producto.

Flowers half the size of *B. nodosa*. Brazil.

Perigonii phylla viridia, labellum candidum.

Brassavola cordata B. Mag. 3782 (N. S. XIII). 1840.

Labello cordato acuminato longitudine unguis, petalis sepalisque linearibus acuminatis glabris, dentibus omnibus clinandrii integerrimis, caulibus basi nodosis.

Perigonium viride, rubro adpersum; labellum candidum.

Brazil introd. by Loddiges. Our plants received by Mr. Murray from Mr. Thomas Cowan, Overseer on the White River Estate, Jamaica; so that the species would seem to have a widely extended range. It is very closely allied to *B. nodosa* (B. Mag. X. 3229) a species from which Dr. Lindley distinguishes it by the flowers being

only half the size, with a cordate labellum, and a very diff. clinandrium, but these are probably variable characters. The *B. nodosa* fig. in B. Reg. 1465 is a specimen with unusually large flowers.

56. BLETIA NODOSA. Huc: *Brassavola nodosa* B. Reg. XVII. 1831. 1465.

Labello ovato acuminato integerrimo, petalis sepalisque linearibus acuminatis, dentibus lateralibus clinandrii integris, postico emarginato.

Rhizoma repens; caules basi clavati sursum teretes monophylli squamis fuscis revoluti. Folia semipedalia, solitaria, carnosa, subtus convexa, supra canaliculata. Spicae 3—4 fl., foliis breviores, bracteis minutis, squamiformibus. Flores die inodori, noctu suaveolentes — Labellum album, limbo ovato subrotundo, acuto integerrimo, plano, ungue dimidio brevior, arcte convoluto, margine eroso, intus sanguineo.

Columna ungue labelli duplo brevior clinandrii dente postico emarginato, anticis integerrimis.

W. I. Island of Barn, off the coast of Carthagea, filling the woods at night with its fragrance. Jacquin. Jamaica Sloane. Mexico. Lubbock.

Huc: *Brassavola nodosa* Lindl. B. Mag. 3229 (N. S. VII. 33).

Labello cordato-acuminato basi angusto involuto, sepalis petalisque labelli longitudine linearibus acuminatis, columnae dentibus lateralibus integris intermedio bi—tridentato

Perigonium f. 5 viridibus, labello albido virente.

From the stove of Chartess Horsfall Esq. Mayor of Liverp. who received it from Will. Parker, Esq. of Kingston, Jan. Flowers fragrant at night, obs. by the gardener Harry Evans.—Hook. B. J. 13. 1834. Lindl. on Peruv. Orch.: Near Cuença Colonel Hall.

Var. grandiflora: *Brassavola grandiflora* Lindl. B. Reg. XXV. 1839. Misc. 14:

Folio (plano?) anguste lanceolato rigido, labello maximo subrotundo quadrato acuminato ungue longiore, sepalis petalisque linearibus acuminatissimis.

Flowers of this, the finest of the genus, were received from Honduras by the Hon. W. F. Strangways. The limb of the labellum, which is white is considerably larger than a half crown, and the sepals and petals are nearly 3" long. It resembles a gigantic specimen of *Brassavola grodosa*.

Rehb. fl. in Bpl. II. 282. Santa Marta 3000'. Juni Nr. 1169. Schlim.

Rehb. fl. Bpl. II. 21. Carabobo 100'. October. Wagener.

57. BLETIA RHOPALORRHACHIS. Huc: *Brasavola rhopalorrhachis* Rehb. fl. in Mohls und Schlechtend. B. Ztg. 1852. 833.

Rhizomate repente, caulibus secundariis laxè vaginatis, foliis teretibus acutis abbreviatis, pedunculo validissimo, brevi, pauciramoso (!), bracteis triangulis acutis abbreviatis, perigonii phyllis linearibus acuminatis, lateralibus internis subaequalibus, angustioribus, labelli ungue ligulato, basi humerato, margine dense denticulato, subito in laminam ovatam antice acuto apiculatam, aequilongam dilatato, androclinio denticulato breviori, capsula brevissime rostrata.

Eine einzelne Blüthe könnte man leicht für die einer *B. venosa* halten, obschon die Längenverhältnisse ganz verschieden sind. Spannenhoch, der Brüthenstiel sehr kurz, 2 Zoll lang. Blüthen so gross, wie bei *B. venosa* des B. M. 4021. — Guatemala: Minogalpa 1046. Friedrichsthal (Wiener Museum).

58. BLETIA VENOSA. Huc: *Brassavola venosa* Lindl. B. Reg. XXVI. 1840. Misc. 24.

Folio lanceolato semicylindraco supra canaliculato, sepalis petalisque linearibus, labelli ungue longe complicato lamina subrotundo-ovata subtriloba acuminata basi serrata: venis elevatis.

Resembles *Br. nodosa* in habit, but with much larger flowers, the sepals being more than 2' long. The lip is white, other parts greenish. It is at once distinguished from *B. nodosa* and all allied species by the firmness of the lip, which is more or less evidently lobed at the sides and has the veins distinctly elevated. Flowers deliciously sweet at night. Mss. Loddiges imported it from Honduras.

B. Reg. XXVI. 1840. Tab. 39.

Folium semipedale, carnosum, lineari oblongum, acutum, atroviride, canaliculatum, marginibus rotundatis, nec uti in speciebus pluribus in cylindrum convolutum. Scapus folio brevior, spatha nulla conspicua, sed squamis paucis vaginatus, 3 florus, bracteis parvis rigidis acutissimis. Sepala et petala linearia, acuminata, virentia, 2 pollicaria, inter se aequalia. Labelli lamina candida, venis elevatis corrugata, subrotundo-ovata, acuminata, subcarnosa, integra v. obsolete triloba, basi serrata; unguis lamina parum brevior, convoluta, margine serrata, basi integerima et maculis quibusdam sanguineis notata.

The leaf is intermediate between that of *Br. glauca* and the common terete species; and shows that in the latter the leaf owes its peculiar appearance in part to a general thickening of its parenchyma, and in part to the edges turning inwards and growing together. And this is no doubt also the origin of the terete leaves found in *Vanda*, *Lousia*, and *Dendrobium*.

Huc: *Brassavola venosa* Lindl. B. Mag. 4021.

Folio lineari lanceolato coriaceo-carnoso superne canaliculato, sepalis petalisque lineari lanceolatis, labelli ungue elongato serrato, lamina cordata acuminata venosa basi subserrata.

Brassavola venosa Lindl. B. Reg. 40. Misc. 24. t. 39.

In the form and serratures of the lip, we fear the species of *Brassavola*, as is the case with so many other Orchideae, are very liable to vary. That this plant is identical with the *B. venosa* of Dr. Lindley, there is probably little doubt, but the lab. is not so serrated and the lamina less disposed to be three-lobed. It was drawn in July from a plant that flowered in the Royal B. G. of Kew. — Much as it resembles *B. nodosa* (B. M. t. 3299) as Dr. Lindley observes, it seems to us still more closely allied to *B. cordata* (B. Mag. t. 3782.) differing chiefly in the size of the flowers and breadth of the leaf, to which Dr. Lindley adds „in the firmness of the lip, which is more or less evidently lobed at the side“ a variable character) „and has the veins distinctly elevated.“

Perigonium viride, labello albo, purpureo extus picto.

68. BLETIA GRACILIS Lodd. Bot. Cab. 1681. B. Reg. XX. 1835. t. 1671.

Sepalis petalisque subaequalibus lanceolatis acuminatis, labelli trilobi lobis lateralibus rotundatis intermedio transverso emarginato undulato: lamella solitaria in medio, foliis plicatis oblongo-lanceolatis acutis, subtus discoloribus.

Pseudobulbi ovati, aggregati, purpurei. Folia plicata, membranacea, latitudine variabilia, saepius unico tantum perfecto cuique pseudobulbo. Scapus terminalis gracilis, purpuratus, $1\frac{1}{2}$ pedes longus, erectus, calami corvini crassitudine, parvissime squamatus, apice racemum 3—4 florum gerens. Flores subringentes, sepalis petalisque sordide luteis, roseo versus apices suffusis, labello basi roseo venis picto apice luteo. Mexico. (Prov. Mexici Temascaltepec. Dr. Schiede in herb. de Roemer.)

69. BLETIA PARKINSONI Hook. Mag. LXVI. 3736:

Scapo simplici longissimo, sepalis petalisque lanceolato, linearibus erectis, labello oblongo trilobo lobis lateralibus brevibus, incurvis, intermedio ovali crispato, disco lineis elevatis 5 undulatis.

Mexico, sent by Mr. Parkinson.

Bulb terrestrial, subglobose, but gibbous. Scape two feet and more long, slender, jointed, with brownish, sheathing bractees at the joints. Raceme seven to ten-flowered. Flowers rather more than an inch long, spreading. Sepals, petals, and lip erect or closed, the two former equal, linear-lanceolate, rather acute than acuminate, deep rose colour. Lip rather longer than the sepals, and almost enclosed by

them, oblong, yellow, threelobed, the two side lobes short, obtuse, incurved, purplish, the middle one oval, reflexed, crisped, blotched, at the margin with deep purple. The whole disk mark with five elevated, wavy lines. Column enclosed by the lip, grooved in front. Anthercase purple. Pollenmasses eight, yellow.

cc. Labelli laciniae posticae rotundatae.

70. BLETIA FULGENS Rehb. fl. Bpl. III. 221.

aff. *B. coccinea* Lexarz. perigonio laevi, labelli trifidi laciniis lateralibus triangulis obtusatis, lacinia media cuneiformi, apice porrecta dilatata obtuse biloba cum apiculo in sinu, lamellis tribus a basi apicem usque humilibus, in basi lobi medii et in ipso apice iterum elevatis abrupte triangulis.

Certe erit planta, ad quam alluditur L. O. p. 123 sub *B. coccinea* „Llave“. Sed planta Lexarzae excellit: perigonio pollicari (dum *B. campanulata* nostra adhuc minor sesquipollicare gerit), dilute coccinea, velutino, labello apice profunde emarginato. Caulis tripedalis. Vaginae infimae elongatae violaceae viridi-punctulatae. Folia bina linearilancea, bene nervosa, elongata. Pedunculus sub racemo laxo pauciflorus, longe subnudus (bivaginatus). Bractee triangulae aristatae abbreviatae. Sepala lanceolata acuta. Tepala paulo latiora. Omnia bene cuneata. Labelli lacinia media angusta. Flos illi *B. campanulatae* major. Gynostemium gracile anguste alatum. „Cette belle Orchidée terrestre est très rare Les fleurs sont d'un rouge orange, la labelle est rayé de carmin. Elle croit près de Cuernavaca dans des terrains argileux et au bord des barrances. Jamais je ne l'ai rencontré dans d'autres localités. Juin, Juillet.“ Ghiesbreght.

Mexico.

Obs. Mihi incognita!

80. BLETIA VERECUNDA (RBr. Hort. Kew. V. 206?) Lindl. (Orch. 121) et herb.!

Bletia pulchella Hort. G. Chr. 1850. 168.

Huc: *Bletia Shepherdii* Hook. B. M. 3319 (N. S. VIII) 34.

Perianthio erecto-patenti, sepalis oblongis acutis, petalis obtusissimis undulatis, labelli disco lamellis 5—7 rectis undulatis lobo intermedio reflexo lato cuneato bilobo valde crispato, foliis lato-lanceolatis longe acuminatis. Lamellae flavae, perigonium lilacinum.

Jamaica received by Mr. Sphepherd at Liverpool Gard.-Wentworth,

Its nearest aff. is with *Bletia verecunda* (Limod. altum B. Mag. 930 not of Jacq. Rar. 60.) But there the flowers are much smaller, greatly shorter in proportion to the size, very gibbous or almost spurred at the base, the sepals much more patent, and very pale on the outside, and the lip has a white margin: the leaves too are much narrower. —

Our plant has been cultivated by Mssr. Sphepherd under the name of „*Limodorum tuberosum*“ from an idea perhaps, that it was the „*L. altum s. tuberosum* of Jacq.“ But that plant I have endeavoured to prove is the same with our *Bletia acutipetala* (Tab. 3217), and the name *tuberosa* being equally applicable to other species of the genus.

Huc: *Bletia Shepherdii* B. Reg. XXIV. 1838. Misc. 73.:

Flowered lately in the garden of the Hort. Society and I find it is only a dark flowered variety of *Bletia verecunda*, it does not appear to be distinguishable by any character of importance.

81. BLETIA HAVANENSIS Lindl. B. Reg. 1838. XXIV. Misc. 35:

Scapo simplici foliorum longitudine, sepalis patulis obovatis acutis elamellatis, petalis supra columnam conniventibus ovatis obtusiusculis undulatis, labello subtrotundo-ovato cucullato trilobo: laciniiis lateralibus obtusis intermediam retusam crispam longiorem basi imbricantibus, cristis tribus lamellatis, versus apicem interruptis, basi evanescentibus, venis duabus utrinque arcuatis varicosis.

Diff. from *B. verecunda* in the colour of its flowers, which are much paler and its unbranched scape, and in the form of its lip, whose crested plates are interrupted about the base of the middle lobe and bounded on each side by a pair of curved varicose veins. Introd. by Capt. Sutton is 35, added to Sir Charles Lemons coll. at Carclew, where it flowered March 1837.

Bletia acutipetala Hook. B. M. 3217. (N. S. V. VII.) 33.

Sepalis quorum duobus medio lamellatis petalisque conniventibus ovatis valde acutis aequalibus, labelli disco lamellis 5 rectis subundulatis, lobis lateralibus ovalis, intermedio apice dilatato crispato, scapo radicali alato ramoso, foliis ensiformibus plicatis.

Limodorum altum Jacq. Ic. Rar. v. 3. t. 602. vix L.

Perigonii foliola 5 rosea, sepalis inferioribus albido striatis; labelli lobo medio flavo, albo cristato, labelli apice obscure violaceo.

B. florida and *verecunda*, its nearest allies, are natives of the West Indies; this of South Carolina, whence it was directly received at the Liverp. B. G. It may possibly be the *Bl. verecunda* (Cymb.) of North American authors: and it is, I think, certainly, the *Limod. altum* of Jacquin: there the petals are acute, and the elevated line or lamina is distinctly represented in the fig.

Obs. Hic locorum inserenda videtur:

Bletia verecunda RBr. Kew. V. 206. DC. l. c.:

Sepalis ovalibus cuspidato acutis subpatentibus, petalis oblongis obtusis supra columnam fornicatis, labelli lobo medio latiore, quam longo undulato, disco costis 5 simplicibus, scapo radicali ramoso, foliis ensiformibus, bracteis ovato lanceolatis, majusculis.

1. HARTWEGIA PURPUREA Lindl. B. Reg. XXIII. 1837. sub 1971.

Folium solitarium, coriaceum, ovato-lanceolatum, lentiginosum, cauli tereti aequales pedunculo capillari multoties brevius. Flores parvi, purpurei. Sepala acuta, petalis paulo majora. Labelli limbus basi albus callosus.

var. *angustifolia* B. Reg. XXIX 1843. Misc. 58. Guatemala. George Ure Skinner Esq. added to Sir Charles Lemon's coll. at Carlew Aug. 1841. Distinct from the original form of the species in its leaves and flowers, yet the general habit and appearance of the 2 plants are so very similar, that the present one can only be regarded as a well defined variety of the other. Its leaves are from 3—4" long, and from ½"—1" in breadth, oblong lanceolato-acute, very thick and fleshy, hollowed, along the middle and tapering to both ends; of a brownish green colour, singularly marked with numerous deep brown irregularly formed spots.

The scape erect, 1' long, round and wiry, with many joints, each of which is surrounded by a pale brown-coloured bract, which closely embraces the stem, and covers it half way between joints. Flowers are terminal, of the same bright pinkish colour as those of the old variety, from which however they differ in the form and size of the sepals, which are not obliquely cordate, but ovate oblong, and rather smaller than in the other. The labellum is also very different being much larger in every respect and having a notch at the point; where as in the original species it is small, roundish cordate and forms a kind of spur where it joins the column. In this variety there is no appearance of a spur but it is narrowed round the column and has a singular indentation just opposite its point. — The column is curved and about the same length as the sepals and petals. It is also a deeper pink, and is rounded on the upper side; beneath it is 2 edged from being slightly hollowed out along the middle. The anther case is somewhat reniform, brownish pink, much darker than any other part of the flower." — Wm. B. Booth.

1373 **DIOTHONAEA** Lindl.

Hook. B. J. 1 p. 12. 13. — 1834.: Lindl. on Peruv. Orchideae.

Sepala conniventia, distincta; lateralibus paulo longioribus. Petala sepalo supremo concavo conformia et subaequalia. Labellum cum cyatho e lateribus dilatatis membranaceis columnae formato articulatum, obsolete lobatum, basi bilamellatum, sepalis lateralibus multo longius, dependens. Columna erecta, clinandrio cucullato antheram obsolete 4 locularem semitegente. Pollinia 4, solida, pyriformia, apice materie pulverea cohaerentia. Herba epiphyta, racemosa, ebulbis. Racemi axillares, multiflori, foliorum longitudine. Flores majusculi.

This distinct genus is remarkable for a wide, compressed cup, formed by the dilated cuneate margins of the column, with which the labellum is articulated. Its principal affinity is with *Epidendrum*, from which it is farther distinguished by its 4 pyriform pollen-masses and hooded clinandrium. The exact nature of the powdery matter, that terminates the pollen-masses, I have not ascertained: it most probably indicates the presence of the replicate straps that characterize *Epidendreae*. From *ὄσωνη* a sail, in allusion to the 2 membranes stretched from the column to the lip, like jibs from the formast to the bowsprit of a ship.

Nov. Veg. descr. 2. 19.

1. *ARPOPHYLLUM SPICATUM* Llav. et Lex. l. c. L. O. 151: Lindl. Ann. herb. Hist. 1840. IV. p. 384:

Folio carinato arcuato, pedunculo spatha brevior. Mexico. Hartweg. Flowers deep purple, arranged in a spike about 3' long.

Lindl. B. Reg. XXV. 1839. Misc. 16.:

Reached England in a living state. The stem is slender and 1' or 1½' high, with the sheaths as rough as shagreen leather. It is terminated by one long curved leaf, from the axil of which there curves in an opposite direction a dense spike of pink or pale purple flowers. It is a species of great rarity even in Mexico, where it has hitherto been only seen at Sultepec and near Aricubaro, growing upon trees. It belongs to Epidendreae near Ponera, and not to Vandaeae. Bentham pl. Hartweg. 72 (Lindl.) 1839: Hacienda del Carmen. Mexic. Hartweg.

2. *ARPOPHYLLUM ALPINUM* Lindl. in Pl. Hartweg. p. 93. 1842.

Folio oblongo plano mucronato, pedunculo spatha brevior s. ei subaequali, racemo denso cernuo. Lindl.

In montibus Tonicapan, alt. 10,000', in Alnum mexicanam, supra Quercuum regionem; nec non juxta Clatepeque, et rupibus horridis loco „Canada de todos Santos" dicto. Mexico. Hartweg.

3. *ARPOPHYLLUM CARDINALIS* Lind. Rehb. fil. in Bpl. II. 282.

aff. *Arpophyllo* giganteo folio bipedali superne vernixio, spatha bene rugulosa sexpollicari, racemo cylindraceo elongato, perigonio florido ovarium dimidium aequante, perula modica, tepalis ligulatis acutis, serulatis, labello prope recto, sacco antico et basilari subaequalibus, gynostemii dorso valde carinato, androclinio postice valde tridentato, rostello rotundato medio acuto.

Internodium infra foliaceum spithamaeum vagina una ancipiti acuta utrinque rugulosa vestitum. Pedunculus, ovaria muriculata. Mentum obtusum. Perula effecta ex labelli impressione in sepala lateralia haud conspicua transversa. Gynostemii fovea elliptica, limbus inferior prope rectus, medio tamen basin versus angulatus, anguli prominuli in marginibus lateralibus desunt, protuberantia basilaris conspicua. — Blüthen rosa. Lippe 5 — 6000'. Ocanna. December. — Nr. 1186. Schlim. — Pescatorea t. 45.

4. *ARPOPHYLLUM GIGANTEUM*. Lindl. Ann. nat. hist. IV. 1840. p. 384.

Folio ensiformi, plano, pedunculo spatha multo longiore.

Must be at least 3' high; its flowers are pale lilac, and disposed in a spike from 6—7" long.

Lindl. in Pl. Hartw. p. 32.: inter Tanetze et Talea Mexici. Hartweg!

1376¹. **TETRAGAMESTUS** *Rchb. fil.*

in Bonpl. II. 21.

Genus Poneram inter et Epidendrum: ovarium fusiforme ecuniculatum, sepala ac tepala oblonga acuta, sepala lateralibus basi angulato producta mentum mentientia. Labellum cuneatum cum gynostemio articulatione subimmobili coalitum, disco callosum, medio refractum. Gynostemium clavatum ab angustiori basi utrinque angulato dilatatum, fovea stigmatica majuscula. Anthera Epidendri. Recedit a Poneram: gynostemio apodo; labello refracto, — ab Epidendro: sepalorum lateralium mento; labello refracto.

1. **TETRAGAMESTUS MODESTUS** *Rchb. fil. Bonpl. II. 26:*

Caule articulato, articulis fusiformibus vaginatis apice diphyllis, foliis lineariligulatis utrinque attenuatis, 5—6 pollices longis, medio $\frac{2}{3}$ pollices latis, articulo insequenti axillari ex praecedente, floribus carnosissimis inversis, gynostemio ac perigonio cum ovario angulato, ovario basi bivaginato, sepalis lateralibus in mentum conspicuum productis, omnibus oblongis acutis, tepalis subaequalibus paulo angustioribus, brevioribus, labello ligulato medio trilobo lobis lateralibus triangularibus parvis, lobo medio producto triangulo, refracto, callo obtuse bilobo in disco, fovea nectarifera in basi, gynostemio semitereti angusto superne utrinque obtusangulo dilatato, fovea stigmatica transversa magna, fovea nectariferam in basi.

Blüthen so gross, wie bei *Maxillaria uncata*, blaugrün, mit violetten Punkten, Lippe weiss, Säule am Gipfel und vorn auf Mitte violett. In den Gärten der Herren Seidel in Dresden, Josst in Tetschen, Consul Schiller in Hamburg. *Rchb. fil. Xenia I. p. 42. Tab. 19. I. II. III. 1—6.*

2 **TETRAGAMESTUS AUREUS** *Rchb. fil. Bpl. II. 22.*

(*Scaphyglottis ruberrima* Lindl.? β *aurea* *Rchb. fil. Linnaea*): Caule teretiusculo multo quam in *Poneram leucantha* validiori, ex icone nunc ultra pedali, basi attenuato, ramoso, longi articulo, eodem certe ut in priori modo producto, nunc trichotomo, foliis 2—3 in articulum apicibus, foliis lineariligulatis, basi attenuatis, apice retuso bilobulis, ad 3 pollices longis, $\frac{1}{4}$ poll. latis, floribus in articulum apicibus fasciculatis, illos *Maxillariae* variabilis aequantibus, bractea hyalina falcata: ovario pedicellato septies brevior, sepalis petalisque subaequalibus ovatis acutis, labello a basi linearicuneato in laminam ovatam refractam acutam seu obtusam producto, utrinque uniplicato pandurato, callo medio emarginato carnosissimo inter plicas, gynostemio gracili apice utrinque angulato, fovea stigmatica transversa triangula, anthera depressa, medio impressa.

Obs. Forsan huc pertinet:

HEXADESMIA BICORNIS Lindl. B. Reg. XXX. 1544. Misc. 44.

Caulibus fusiformibus elongatis, foliis linearibus oblique bidentatis, floribus subsolitariis cernuis, labello ovato retuso, subserrato, columna utrinque bicorni.

An addition to the insignificant genus *Hexadesmia*, sent to Mr. Loddiges from Columbia by Linden. It is very like *H. fasciculata*, but differs in the leaves and column.

1377. **PONERA** Lindl.

Orch. 113.

Lindl. B. Reg. XXVIII. 1842. Misc. 17:

Sepala erecta, carnosae, lateralia majora, basi producta cum pede elongato columnae connata; dorsale planum. Petala ovalia, basi angustata, libera. Labellum cuneatum, bilobum, ascendens, arcuatum, cum basi columnae articulatum, omnino nudum. Columna brevis, teres. Anthera membranacea, depressa, 4-locularis. Pollinia per paria adhaerentia; caudiculis binis pulvereis incumbentibus. Stigma subrotundum, excavatum, subbilabiatum.

Herbae terrestres, gramineae, simplices. Folia linearia, disticha, vaginis verrucosis. Flores fasciculati, terminales (?) in caule folioso, v. axillares in caule defoliato. Ovarium breve, conicum, rectum, sessile.

Represents among Epidendreae the tribe of Malaxeeae and Vandeeae of which *Dendrobium* and *Maxillaria* are respectively the types,

a. *Ebulbes distichifoliae*.1. *PONERA JUNCIFOLIA* LO 113. Lindl. B. Reg. XXVIII, 1842. Misc. 17.

Foliis subulatis canaliculatis secundis, spica subbiflora terminali in caule folioso, labello retuso, clinandrio mutico.

Mexico.

A simple specimen of this rare plant exists in Mr. Lamberts herbar. It has a stem about a span high, and extremely narrow leaves, which in the dried state at least, are all directed towards one side. The flowers are separated from each other by an interval of nearly half an inch.

2. *PONERA GRAMINIFOLIA* Lindl. B. Reg. XXV. 1839. Misc. 15.

Nemaconia graminifolia Knowles and Westcott Flor. cab. II. 1838. p. 127! Foliis linearis lanceolatis emarginatis, spica subbiflora, terminali, caule folioso, labello oblongo acuto apice recurvo, crenulato, clinandrio mutico.

I presume the trifling differences, which exist between this species and the description in the above work (LO 113) are owing to imperfect observations in the latter case. They have however led Mr. Knowles and Westcott to suppose, that this plant forms a new genus, an error, which I hasten to correct. Having received flowers of it from Mr. Barker I find that it agrees in every essential particular with the structure of *Ponera juncifolia*, so nearly indeed that, if the leaves of the two were not different, some doubt might be entertained of their being specifically different. *P. graminifolia* is a plant of no beauty and is chiefly remarkable for having the scabrous stems, which are so conspicuous in the elegant *Arpophyllum spicatum* from the same country.

B. Reg. XXVIII. 1842. Misc. 17: Mexico. — A grassy plant of no beauty resembling *Ponera striata* in the form of its leaves, but diff. in the structure of the flowers.

Floral. Cab. II. 1838. 127. — This is a very singular part, for while in the structure of the sepals, petals and labellum it very nearly approaches the genus *Maxillaria*, it has pollen and caudiculae of the tribe of *Epidendreae*. The stems have a very remarkable appearance in not having a solitary leaf, but covered with dusky papillose sheaths. Xalappa. George Barker Esq.

3. *PONERA STRIATA* Lindl. B. Reg. XXVIII. 1842 sub Misc. 17.

Foliis linearis lanceolatis oblique emarginatis, spica subbiflora axillari in caule defoliato, labello bilobo integro, clinandrii dente dorsali in antheram incurvo.

Guatemala.

This differs from the preceding in the lip being two-lobed, not acute and recurved, in its margins being entire, and not crenulated, in the anther bed having a dorsal tooth, which curves over the anther, and 2 much smaller blunt teeth on each side of the stigma; it has also the property of flowering on the old leafless stems instead of the young leafy ones. The flowers are pale buff, striped with brownish orange.

Roots of *Neottia*, a slender stem 3—4' high, unbranched, and covered with narrow grassy leaves, from 4—six inches long, the points of which are obliquely emarginated and the sheaths rough, like those of *Arpophyllum* with little green or purple tubercles. When old the stems become leafless, are closely covered with rugged sheaths and produce here and there from their axils clusters of 2—3 sessile flowers of a pale buff colour, and less than half an inch long. In form they are exactly like a *Maxillaria* or a *Dendrobium*; both sepals and petals being striped with bright reddish brown. The column is short, taper, with a pair of small auricles on each side of the anther bed, and a dorsal tooth curved over the anther, which is membranous, 4 celled, and contains 4 pollenmasses, adhering in pairs by means of single straps of powdery matter. The labellum is wedgeshaped, slightly downy downwards in the middle and twolobed at the apex.

Pact. Fl. G. II. p. 29. Xyl. 149. Flowers pale green. Guatemala. Grassy leaves upon stems about 2 feet high; and when old throws out its flowers chiefly from the old leafless branches. The flowers are pale watery green, not unlike those of some *Maxillaria* especially in the extended column base, with which the lip is jointed; but the pollenmasses have the pulverulent caudicles of an *Epidendrum*. The lip is truncate as it were, and two lobed, the one lobe overlapping the other.

4. *PONERA MACROGLOSSA* Rehb. fil. in v. Schldl. B. Z. 1852. 639:

Floribus fasciculatis, perigonii phyllo summo oblongo, lateralibus triangulis, mentum prope rectangulum efficientibus, phyllis lateralibus internis unguiculatis, utrinque obtusangulis, obtusis, labello phyllis reliquis longiore basi unguiculato utrinque obtusangulo, apicem versus valde attenuato, bilobulo, lobulo altero alteri imposito.

Nächst *P. striata* Lindl., aber durch Gestalt der Lippe hinlänglich unterschieden.

Guatemala. Von Hrn. Van Houte gezogen. Rehb. fil. Xenia I. p. 44:

Habitus *Poneræ striatæ*. Flores fasciculati solitarii in caulibus post folia disticha dejecta; illos *Maxillariæ variabilis* Bat. subaequant. Sepalum summum oblongum acutum: sepala lateralia triangula mentum prope rectangulum efficiunt. Tepala rhombico cuneata obtusiuscula. Labellum sepalis longius, rhombeoligulatum, apice exciso bilobum; lobulo altero nunc alteri imposito. Gynostemium crassum breve truncatum; androclinium postice retuso abbreviatoque ligulatum. Fovea semicircularis. Anthera et pollinia exacte *Epidendri*. l. c. tab. 19. p. 11—16.

5. *PONERA PUNCTULATA* (floribus terminalibus racemosis). Rehb. fil. Bonpl. III. 220.

Labello cuneato dilatato apice retuso, ante basin obscure trilobo, callo depresso foveato in medio antrorsum in lineas gyrosas exeunte. Caulis pedalis calamus anatinum crassus.

Folia lineariligulata apice bidentata, tri—quadripollicaria, tres quatuorve lineas lata. Racemus uniflorus basi vaginis ancipitibus duabus vestitus. Ovarium fusiforme in pedicello elongato. Perigonium illi *Poneræ striatæ* subaequale, albovidulum punctulis multis atroviolaceis; callis gyrisque labelli flavis. Sepala triangula acuta. Tepala oblonga apiculata. Gynostemium clavatum antice pone stigma utrinque obtuse auriculatum. Aus Venezuela von Hrn. Handelsgärtner Geitner auf den Planitzer Erdbränden eingeführt.

An hujus sectionis? Specimina incompleta:

6. *PONERA PLEUROSTACHYS* Lind. Rehb. fil. B. II. 282.:

Pedunculo vaginis acutis albis vestito, ramulis flavidis vaginas more *E. Blepharistidis* perforantibus, ramulis abbreviatis nunc ramulosis, crassis pro pedicellis recipiendis scalari productis, bracteis parvis ovatis acutis, sepalis ovatis acutis, tepalis cuneato-oblongis acutis, duplo angustioribus, labello flabellato apice rotundato bilobulo cum apiculo interposito, gynostemio latissime alato, alis descendentibus.

Adest ramus subpedalis. Inflorescentia terminalis lateralibus longior, sed simplex: pedunculi excisi rhacheos *Hordeinae* instar. Flos flavus illo *Bletiae floridae* paulo minor, cui extus subsimilis, flavus. — Neu-Granada: Ocanna, Teorama. August 4—5000'. Nr. 1196. Schlim.

b. Pseudobulbosae.

Scaphyglottis Pöpp. et Endl. Nov. Gen. et Sp. Plant. 158. Lindl. B. Reg. XXII. 1836. 1901.

Sepala conniventia, lateralia basi paulo producta cum pede columnae connata, labello supposita, supremum lineare convexum. Petala conformia sed paulo breviora. Labellum oblongum canaliculatum cum pede paululum producto columnae continuum eique parallelum, margine leviter repandum. Columna marginata. Pollinia 4 teretia in glandulam cuneatam sessilia. Herbae epiphytae caulescentes, nunc pseudobulbosae in axillis. Folia coriacea, angusta. Flores parvi axillares, pedunculis dense vaginatis.

7. PONERA BEHRII Rehb. fl. Bonpl. III. 220. :

aff. *P. roseae*: mento obtuso minuto, labello basi cuneato, dein quadrato ante medium utrinque plicula elevata transversa medium versus arato, sepalis petalisque obtuse acutis.

Das vorliegende Exemplar bietet zunächst eine aus 6 Gliedern bestehende spindelförmige 5 Zoll lange Axe, deren oberste und unterste Theile sehr verkürzt. Terminal eine corymböse Traube von 6 weissen Blüten mit deutlich gestieltem spindelförmigen Fruchtknoten, oblongen spitzen Sepalen mit gekielter Mittelrippe, linealen, spitzen Tepalen, oben beschriebener Lippe. Säule völlig nach Art der Gattung. Eigenthümlich ist die ausgerandete Narbendecke. Bei einer unbekanntenen Form ohne Anthere würde man aus derselben leicht auf eine vorhanden gewesene Glandula schliessen. Das Kinn sehr klein, wie bei *P. violacea*. Chagres: Dr. med. Behr. Eingeführt durch Hrn. Keferstein.

8. PONERA DUBIA Rehb. fl. Huc:

Isochilus dubius? Rich. et Gal. Annales des sc. naturall. 1845. Jan. p. 23.

Pseudobulbis elongatis apice diphyllis; foliis linearibus crassis obtuse bilobis; floribus 2—3 pedunculatis ex apice pseudobulbi enatis: labello libero ovali subcordato, unguiculato.

Mexico.

Obs. Huc inserenda videtur planta obscura, quae in herbario Ill. Lindley non adest. Nil reperitur nisi icon floris.

ISOCILUS LIVIDUM Lindl. B. Reg. 1839. XXV. Misc. 45.:

Pseudobulbis fusiformibus attenuatis squamis pallidis membranaceis arcte vestitis, foliis solitariis linearibus apice obscure 2—3dentatis, racemo capillari secundo nutante subtrifloro folio multo breviora, sepalis petalisque ovatis concavis patulis, labello cordato revoluta apice foveato basi mellifluo.

A small dingy flowered plant imported from Mexico by George Barker, Esq. of Birmingham. Its livid semitransparent flowers, and slender pedicels, are accompanied by spindleshaped pseudobulbs tightly covered with sheaths, resembling in colour the external skin of the onion which gardeners call: „the silverskinned.“

9. PONERA VIOLACEA Rehb. fil. Bpl. II. 22. :

Caule crasso fusiformi, articulato, articulis diphyllis, foliis lineariligulatis angustis apice valde attenuatis, ramulis fusiformibus, fasciculis florum basi a squamis vestitorum terminalibus in articulis, sepalis oblongoligulatis, tepalis angustioribus, labello ligulato, supra basin utrinque plicato constricto, hinc quasi pandurato, apicem versus nunc angustiore, hinc quasi trilobo, apice bilobulo, gynostemio semitereti gracili apice oblique deciso, fovea stigmatica semilunari. Certissime Epidendrea. In horto bot. Berolinensi. Praeter pollinia bene quadrat cum *Sc. violacea* Hook. B. Mag. nec cum icone in B. Reg. 1901.

Huc ? *Scaphyglottis violacea* Lindl. Lindl. B. Reg. 1836. XXII. 1901.

Pseudobulbis nullis, foliis linearibus apice emarginatis, floribus subgeminis, labello lineari apiculato leviter repando. Cladobium violaceum. Lindl. Nat. syst. of Bat. 4.

Caules teretes, striati, articulati, verosimiliter penduli, ad nodos [pro]liferi. Folia 2—3 pollices longa; linearia v. lineari-lanceolata, emarginata, forte in pseudobulbos insidentia, dum planta vegetior pullulat. Flores minuti violacei, pedunculi dense vaginati, brevissimi, geminati. Sepala lateralia basi producta et obliqua, supremo lineari duplo latiora. Petala suprema conformia, sed paulo breviora et minus colorata. Labellum album, cum basi leviter producta columnae continuum, carnosum, canaliculatum, lineare, apiculatum, apice purpurascens, margine leviter repandum ideoque subtrilobum. Columna semiteres, alba, apice utrinque unidentata. Pollinia 4, distincta, in glandula triangulari sessilia. — Demerara Lodd. imp.

10. PONERA ROSEA Rehb. fil. in Bonpl. II. 22. Huc : *Scaphyglottis rosea* Hook. Ic. Plant. IV. (1841). tb. 313.

Pseudobulbis elongato-cylindraceutis sulcatis proliferis, foliis linearibus obtusis, floribus geminatis, labello obovato, spatulato, apice recurvo trilobo lobo medio acuminato. Hab. Demerara C. S. Parker Esq.

Near *S. violacea* Lindl. but as we examined this in a living state we pronounce it distinct. The flowers of this are of a much paler hue, the sepals and petals of an uniform rose colour: but the chief characteristic lies in the labellum, which is here attenuated below into a long narrow claw, while the upper half is curved down, the apex 3lobed, the middle coming to a rather sharp point. The habit of this genus is peculiar in its proliferous pseudobulbs: but the structure of the flowers seem to me scarcely differing from that of *Maxillaria*.

11. PONERA LEUCANTHA (*Scaphyglottis leucantha* Rehb. fil.): Rehb. fil. Bpl. II. 22.

Caulibus flaccidis teretiusculis, longiarticulatis, basi 1—2 vaginatis, vaginis membranaceis elongatis, apicibus articularum diphyllis, foliis ligulatis apice acutiusculo bilobis, basi cuneatis, fasciculo florum terminali(?), articulo insequenti ex axilla alterius folii, seu ubi duae gemmae adsunt, dichotomia effecta, articulis duobus, flosculis minutis, mento valido, sepalis lanceolatis acutis, tepalis linearibus acutis, labello a basi cuneata flabellato, apice obsolete trilobulo, gynostemio gracili clavato medio sulcato, angulo utroque ex sulco longitudinali quadrialato.

Ornithidium sp. Merida : Jaji, 7000'. Funck und Schlim. 1185. Rehb. fil. Xenia I. p. 43. Tab. 19. IV. 7—10.

Scaphyglottis leucantha Rehb. fil. Var. *uniflora* Rgl. (*S. violacea* H. Petrop.) Ind. sem. hort. Petr. 1855. :

Caulis compresso-cylindricus, articulatus, vaginatus; vaginis membranaceis, striato-nervosis, junioribus acutis. Folia in apice articularum sessilia, lineari-lanceolata, apice emarginato biloba. Flores axillares, solitarii, nutantes, albi, rubro punctulati; sepalis ovato-oblongis, acutis, erecto-patentibus, lineas 2 longis; petalis paulo minoribus, oblongo-

lanceolatis. Labellum lineam longum, basi unguiculo canaliculato instructum, apice in laminam rotundato-triangularem obscure trilobam dilatata.

Forma genuina ab planta nostra foliis oblongis et floribus aggregatis differre videtur..

12. PONERA STELLATA Rchb. fil. Mss. Huc: *Scaphyglottis stellata* Lodd, in litt. B. Reg. XXV. 1839. Misc. 60.

Pseudobulbis fusiformibus, foliis linearibus canaliculatis obtusis emarginatis, fasciculis sessilibus terminalibus, sepalis linearibus secundis patentibus, petalis conformibus angustioribus, labello cuneato trilobo, lobis lateralibus rotundatis, intermedio acutiusculo.

This species nearly resembles *S. violacea*, (B. R. t. 1901) from which it differs in having larger flowers with spreading segments, and the lateral lobes of the lip as large as the middle lobe. A native of Demerara, whence it was obtained by Mrs. Loddiges.

13. PONERA PROLIFERA Rchb. fil. in Seemann Bonpl. II. 22. *Isochilus proliferum* RBr.

14. PONERA CONFERTA Rchb. fil. l. c. *Scaphyglottis conferta* Endl. Pöpp.

Obs. Rchb. fil. Bpl. II. 22. Höchst wahrscheinlich gehören auch hierher: *Scaphyglottis affinis* Endl. Pöpp., *Sc. graminifolia* Endl. Pöpp.

Obs. Planta, quam non vidi in herbario ill. Lindley, mihi satis superque obscura: *Scaphyglottis reflexa* Lindl. B. Reg. XXV. 1839. Misc. 21.

Foliis semiteretibus supra glabris sulcatis apice integerrimis, sepalis lateralibus ovato-triangularibus reflexis, petalis linearibus obtusis, labello oblongo emarginato obtusissimo undulato medio refracto.

A branching, straggling plant with slender leaves, and solitary, pale, dull yellow flowers, with a crimson stain along the middle of the lip. Like the rest of the genus it is a species quite destitute of beauty. It was obtained by Mrs. Loddiges from Demerara.

Species exclusae

SCAPHYGLOTHIS RUBERRIMA Lindl. = *Ornithidium ruberrimum*.

SCAPHYGLOTHIS? FASCICULATA Hook. cf. *Hexademias*.

1382. LEPTOTES Lindl.

B. Reg. XIX. 1625

Sepala et petala linearia, subaequalia, patentia; labellum posticum, trilobum, cum columna parallelum, laciniis lateralibus nanis circa columnam convolutis, intermedia oblonga marginibus reflexis; columna brevis, crassa, semiteres; anthera hemisphaerica, bifida; pollinia 6, incumbentia, quorum 2 superiora pyriformia obliqua compressa, 4 inferiora inaequalia tenuiora, anterioribus duplo minoribus. Caules breves, teretes, squamis vaginati. Folia teretia

1. LEPTOTES BICOLOR Lindl. l. c. B. Reg. XXVI 1840. p. 14. in Misc.:

Fruit aromatic! Professor Morren has ascertained, that the fruit is aromatic, when ripe. He fertilized twice artificially the flower and obtained its fruit, which he describes as resembling in smell the well-known Tonka or Tonquin bean of the perfumers, or the sweet vernal grass (*Anthoxanthum odoratum*), which aromatises hay, only stronger and more penetrating than the last. It has been found, that this fruit infused in cream or milk gives them, when iced, a mild agreeable flavour, sweeter, than Vanilla, but less penetrating. „L'homme“, adds the author“ est avide des „variétés dans sa nourriture; l'art culinaire trouve ici un moyen de plus de con-

„tenter ses goûts capricieux et l'art du glacier, de diminuer chez ses produits cet „ennui, qui dit on, naquit de l'uniformité“.

Obs. Me judice huc pertinet:

LEPTOTES SERRULATA Lindl. Sect. II. (1838).

Caule subdiphylo, foliis glaucis, maculosis, labelli lobo medio oblongo lanceolato acuminato, lateralibus rotundatis serrulatis.

Epidendrum ficoide Desc. drawings, plate 28. p. 63.

Glaucous. Flowers 3—4 times as large as of bicolor, labellum merely streaked with rays of purple.

Descourtilz: Lilac, sweet. Decb. on the trunks of Cedrela trees in the ancient Rocas of Brazil, where it survives the conflagrations, that destroy so many other plants. I also found it in plenty in the district of Upper Macahe and in that of Ilha Grande, where it is rare. Stems cylindrical, creeping, covered with a dry, silvery, smooth membrane. Leaves cylindrical, thick, succulent, fusiform, deeply channelled on the upper side, glaucous green or bluish, dotted with violet purple, especially underneath. There is a var. with the leaves twice as long and falcate. The scapes are cylindrical, both terminal and axillary, bright purple, covered with acute, alternating bracts. Ovary very long, united into a drooping raceme. The flowerbuds are of a yellowish rose, protuberant at their base. Flowers very large, stellate. Sepals ribbon-shaped, rather broad, and white as the purest enamel; petals narrower and thinner. The lip has at its base two short rounded auricles; otherwise it is strap-shaped at the base with a white centre, whence there radiate numerous lines of the most brilliant lilac and is afterwards dilatated into an ovate pointed or lanceolate limb of a beautiful white.

1384. SPATHOGLOTTIS Blume.

Bijdr. 400.

1. SPATHOGLOTTIS PLICATA Blume Bijdr. p. 401. t. 76. B. Reg. XXX. 1344. Misc. 58. Mr. Loddiges received it from Penang. It has light purple flowers and has quite the appearance of Paxtonia.

2. SPATHOGLOTTIS LOBBII Rehb. fl. Mss.:

Sepalis oblongis obtuse acutis, tepalibus latioribus obtuse acutis, labelli segmentis posticis semiovatis, ungue brevi apice in laminam obcordatam expanso segmentis posticis prope aequilato, lamellis didymis planis ovatis extus villosis, auriculis antepositis triangulis villosis, columna partitionibus labelli posticis aequilonga. Ind. or. Lobb. (Klassiya?)

3. SPATHOGLOTTIS TOMENTOSA Lindl. B. Reg. XXXI. 1845. sub 19.:

Foliis binis latolanceolatis scapo tomentoso longioribus, racemo tomentoso multifloro, bracteis obtusissimis concavis rigidis, velutinis pedicellis multo brevioribus, sepalis petalisque obtusissimis his latioribus, labelli laciniis lateralibus erectis lineari-oblongis truncatis intermedia apice reniformi ungue elongato lineari angustissimo basi hastato, lamellis ad basin lanceolatis semiconnatis erectis, columna angusta elongata.

Mindanao in the province of Miscamis Manillae. 20 fl. in the raceme and the stems and bracts coated with a close fur.

4. SPATHOGLOTTIS AUREA Lindl. in Paxt. Fl. Gard. I. p. 16.:

Flowers yellow. Rather handsome, with narrow leaves like those of a Phajus and a scape 2' high, bearing at the very end about half a dozen of large golden-yellow flowers with a few dull sanguine spots on the lip. Lobb found it on Mount Ophir near Nepenthes sanguinea. According Mr. Griffith it inhabits rocks on M. Ophir at places called Goonory, Toondock, Laydang. J. H. S. V. p. 34.

5. SPATHOGLOTTIS AFFINIS De Vriese Illustr. t. 15:

Tuberibus crassis, compressis, validis, laevibus; foliis ensiformibus, lineari-lanceolatis, plicatis, acuminatis, multinerviis, pedalis et ultra, petiolatis, petiolo vagina oblongo-lanceolata, plicata instructo; scapo in singuli tuberis extremitate laterali et attenuato, sesquipedali; bracteato; racemis erectis, multifloris, pedunculis fere pollicaribus, erectis, bracteolatis; bracteolis linearibus; flore flavo; sepalis ovatis, obtusis, late patentibus; petalis lateralibus haec subaequantibus; labello trilobo, lobo medio majore, elongato, fere obcordato, apice valde emarginato, basi contracto, lobis lateralibus fere triangularibus, ad basin peculiari gibbositate instructis; ovario pedunculo multo minore, glabro.

Species exclusae.

SPATHOGLOTTIS FORTUNEI Lindl. = *Pachystoma Fortunei*.

SPATHOGLOTTIS PARVIFOLIA Lindl. = *Pachystoma parvifolium*.

SPATHOGLOTTIS PUBESCENS Lindl. = *Pachystoma*.

Huc? PAXTONIA Lindl. B. Reg. 1838. XXIV. Misc. 113. Tab. 61.

Perianthium 6 phyllum, petaloideum, patens, aequale. Columna libera clavata semiteres. Pollinia 8, angusta, clavata, cohaerentia. Stigma verticale rimo transverso sub rostello. — Herba caespitosa, pseudobulbosafoliis plicatis, racemo multifloro, radicali, foliorum longitudine.

The leaves are long, narrow, and slightly plaited, and proceed from an oblong pseudobulb, which is marked with circular scars indicating whence they fall. The flowers are a purplish-lilac, rather larger than a shilling, and grow upon a stem about a foot high, in a somewhat corymbose raceme. They look like those of a *Thelymitra*, but the structure of their column is entirely different.

PAXTONIA ROSEA Lindl. B. Reg. XXIV. 1838. 60.

Pseudobulbi dense aggregati, oblongi, cicatricibus foliorum annulatis, 3 phylli. Folia lanceolata, plicata, basi angustata, subpedalia, basi squamis ovatis concavis acutis fuscis vaginata. Scapus erectus, radicalis, foliorum longitudine calami scriptorii crassitudine, squamis 2—3 ovatis distantibus vaginatus. Bracteae ovatae, acutae, patulae, pedicellorum longitudine. Flores rosei, fere sesquinciunciam lati; pedicellis gracilibus ovarii longitudine. Sepala et petala conformia, aequalia, oblonga, acuta, 3—4'' lata; labello antico. Columna erecta, teres, antice paulo complanata, apice suclavata, rosea, petalis brevior; clinandrii margines crassi sublobati. Manilla. Mr. Hugh Cuming.

Planta disparuit, quae forsitan extra Manillam nullibi nisi in herbario Lindleyano et meo reperienda. Ipse vivam cultam ante sedecim annos Lipsiae vidi florentem. III. Lindley nuper suspicatus est, *Spathoglottidis* esse peloriam, quod ex quo quando confirmatum erit nec ne, acerrimum seu phantasticissimum.

1387. **ARUNDINA Bl.**

Bij. Nr. 401.

1. ARUNDINA Densa Lindl. B. Reg. XXVIII. 1842. Misc. 26:

Labello obovato-subrotundo quadrilobo apiculato laciniis rotundatis, lamellis 3 subaequalibus crispatis rectis, petalis oblongis foliis subaequalibus.

Singapore. Cuming.

Flowers as large as these of *A. bambusifolia*, rosy violet, with crimson-bordered lip, sweetscented and very handsome, forming a close head and not a long loose raceme.

It differs from *A. bambusifolia* in its leaves being nearly equal, and not gradually diminishing into small sheaths as they approach the flowers; and in the flowers being very closely, but loosely, arranged; and in the small size of the middle lobe of the lip, which is almost blended with the large lateral lobes. There is a difference too in the crested veins of the lip, which are all three crisped in *A. densa*, while the middle one is straight and even in *A. bambusifolia*. B. Reg. XXVIII. 1842. 38.

2. *ARUNDINA CHINENSIS* (Bl. Bijdr. 402?) Lindl. Herb. — Hook et Arnott Beechey's Voy. p. 247 (1844.) China. Canton Vaccell 182. — Lindl. in Hook. Journ. VII. 34: „Common in Hongkong Champion.“

*Perigonii phyllis lanceolatis acutis, subaequalibus, labello a cuneata
basi dilatato, apicem versus trilobo, lobis lateralibus obtuse triangulis,
medio lobo a cuneata basi dilatato, bilobo, cum reliquis margine cris-
pulo crenulato, lamellis duabus basilaribus erectis, crenulatis, versus
medium labellum omnino evanescentibus, gynostemii validioris cucullo
androclinii tridentato, dente medio obtuso.*

Cymbidium Meyenii; Schauer Act. Leop. Suppl. XIX. 433. 1844.

Caule stricto, foliis vaginis continuis gramineis lineari acuminatis
distichis, spica terminali pauciflora bracteis brevibus cucullatis, sepalis
petalisque patulis subaequalibus elongato-lanceolatis acuminatis, labello
amplo, concavo superne trilobo, lobo terminali bilobo cum dente inter-
posito: lamellis disci duabus parallelis linearibus.

China: Macao. September.

Adest specimen unicum floribus 2 polline destitutis. Foliorum lamina nervoso lineata
apicemque versus acute carinata 6 pollices circiter longitudine metitus. Flores con-
spicui, purpurei; ovarium pollicare, perigonio haud multum brevius. Labellum ex-
plicatum semipollicem latum, sepala tantillo superans. Columna versus apicem
marginata.

5. *ARUNDINA PULCHELLA* Tijsm. and Binnendyk. Naturk. Tijdk. Nederl. Ind. V. 1853.

Foliis lanceolatis acuminatis plicatis 8-9 nerviis, scapis 3 floris,
phyllis perigonii lanceolatis, labelli trilobi lobo medio undulato emargi-
nato, lateralibus undulatis acutis.

6. *ARUNDINA BAMBUSAEFOLIA* Lindl. O. 125: B. Reg. XXVII. 1841. Misc. 5.:

Fol. habit of Bamboo, flowers of Cattleya. A native of the hotter parts of India
especially of the Assam and the Burmese territories. Roxburgh speaks of the blos-
soms as numerous, large, rosy, with the lip of a lively red purple and very beautiful.
He also says, that the stems are, when in flower, 3, 4-5' high. Flowered with
IV.

Loddiges. Its natural station is said to be well shaded places, on the face of moist rocks.

Wight Icon. V. 1185. *Arundina bambusifolia* Lindl.

Lip furnished within with 2 fleshy undulated crested plates, and a shorter straight intermediate one: lateral lobes short, entire subobsolete, middle one twolobed, segments divaricating, crisp: petals lanceolate, leaves acuminate.

Ceylon. — Malabar. Nepauls.

1388. PHAJUS Lour.

Fl. Cochinch. II. 329.

1. PHAJUS BICOLOR Lindl. O. 128. Sert. 25.:

Dry postures on the sides of high hills near Peradenia. Ceylon. Novbr. Macrae. Walker (possid. Hook. icon. Walk.)

Rhizome fleshy, knobby, like that of an Iris. Leaves 1½', not taper in a petiol but rolled each round other. Flower stem 2' high. naked at the lower part, but at the upper end covered by large, yellow and crimson flowers 4' diam. Bracts large, oblong, concave, thrown off as the flowers expand. Sepals and petals linear-lanceolate. Lip much broader, oblong, rolled round the column, much undulated at the edges, curved downwards at the upper end with a pink limb and a yellow tube; at its base lengthened into a curved horn, which is emarginate at the point, about ½ the length of itself. Flowers do not appear to be fragrant. An other variety with every part yellow except the lip exists according a drawing.

B. Reg. XXV. 1839. Misc. 91.

Loddiges flowered it, imported from Ceylon. Sepals and petals are in that island a very bright deep red, and the lip is yellow; but owing the unhealthiness or some other cause the colours of Mrs. Lodd. plant were by no means of their native brilliancy: for it is certain that they are fully as bright and rich as in the fig. of Sert Orchid.

Wight Ic. V. 1659. 1660.

Ceylon. Walk. 2 col! one alike Lindley's, the other has the sepals and petals purplish above, brownish pale white beneath, the lip externally pale brownish yellow within rose.

2. PHAJUS TETRAGONUS Rehb. fl. Bonpl. III. 221. = *Pesomeria tetragona* Lindl.

B. Reg. XXIV. 1838. Misc. 6.

Sepala subaequalia, libera, sponte decidua. Petala conformia, basi columnae adnata, persistentia. Labellum posticum, cum columna conatum, basi gibbosum, limbo indiviso convoluto. Columna clavata, semiteres clinandrio dentato. Poll. 4, cuneata.

Herba terrestris, caule tetragono; foliis membranaceis plicatis; racemo laterali simplici, bracteis sponte secedentibus; radicibus crassis, simplicibus, fibrosis.

Ph. tetragona l. c.

Epidendrum tetragonum Thomas Orch. Afr.

Sepala carnosae, patula, oblonga, carinato-acuminata, luteo viridia, intus fusca, lineis intensioribus, omino libera, aequalia, sponte decidua! fere pollicem longa, 3''' lata. Petala aliquoties breviora et angustiora, obovata, acutissima intus luteo fusca, cum columna parallela ejusque basi utrinque adnata, haud decidua. Labellum posticum, convolutum, carnosum, cum columna semiconnatum, ima basi gibbosum, cuniculo intus pubescente; lamina obscura lutea, venis divergentibus fusco-purpureis, latior quam longa, apice cuspidata et crispa, intus sparse villosa, linea media elevata late carnosae sursum sulcata. Columna clavata semiteres, clinandrio dentata. Stigma lunatum, rostellum plicato? Anthera obtuse conica, pilis albis erectis villosa, apice membranacea

bidentata, tuberosa, obsolete 8-locellaris. Pollinia 4, cereacea, materia pulverulenta elastica cohaerentia (ulterius indaganda).

B. Mag. 4442.

3. PHAJUS WALLICHII Lindl. in Wall. pl. as rar. t. 158. B. Reg. XXV. 1839. Misc. 58.: Chatsworth coll. introd. by Mr. Gibson. The specimen sent me was a good deal damaged, but it appears to be as stately and beautiful a plant as the common *P. grandifolius*. Lindl. in Hook. Journ. Bot. VII. 34.

4. PHAJUS GRANDIFOLIUS Lour. Rehb. fl. Bonpl. 250. Hongkong. Hance! Lindl. Hook. Journ. VII. 34.

„Hongkong. This magnificent Orchid is common by the sides of the streams. Flowering in April. Var. *superbus* Van Houtte: flore des Serres VII. 738.

5. PHAJUS AUSTRALIS F. Müller Fragm. Physog. 1858. p. 42.:

Lindl. gen. Sp. p. 126.

Bletia flava Wall. in Bibl. Anglic. Ind. Ic. 1147. (fide Lindl.)

Bletia Woodfordi Hook. B. Mag. t. 2719.

(β) minor: foliis totis viridibus.

Tab. 2719 is represented from a drawing by Mr. Aiton, but not well. I was led into the error of considering it a native of Trinidad and communicated by Sir Ralph Woodford to the Royal Gardens at Kew. It is of Indian origin and our present drawing was made from one of the many fine plants sent to Kew by Dr. Wallich and which flowers more or less copiously all winter through. It would be included in *Bletia* of Brown and other authors; but it differs from the true *Bletia* in having a spur to the lip, and that lip connate with the base of the column, not articulated upon it.

Like some yellow flowered plants (the Primulaceae for example) the bracteas and flowers become of a deep verdigreen in decey. Any part of the plant introduced in the mouth produce after some minutes a pungent and sensible heat like the acrid leaves of some Aroideae.

Perianthium flavum, labellum margine aurantiacum.

Species exclusae.

1. PREPTANTHE VESTITA Rehb. fl. l. c. *Calanthe vestita* Lindl. Lem. Jard. Fl. 333. B. Mag. 4671. Lindl. Paxt. Fl. G. III. 38. xyl. Van Houtt. Fl. d. Serres VIII. 816. Wight Ic. VI. t. 1751. 52:

Cytheris Griffithii RW.

Scape erect hairy, many flowered, leaves bracts, ovato lanceolate, acute, externally hairy, spur slender annularly involute, lip spreading, 3lobed, lateral lobes obtuse, smaller than the dilated orbicordate middle one. Pseudobulb ovate; scape from 1½ to 2 feet high, furnished towards the base with a few sheathing scales: flowers large, pedicels slender, longer than the bracts. There are no leaves attached to the specimens. Mergui Griffith. Very distinguished from *Cytheris cordifolia* Lindl.

1389/1. **ACANTHEPHIPIUM** Blume.

Bijdr. 353.

1. ACANTHEPHIPIUM JAVANICUM Bl. B. Mag. 4492.
2. ACANTHEPHIPIUM STRIATUM Lindl. B. Reg. 1838. XXIV. Misc. 68:

Petalis oblongis acutis sepalisque apice revolutis, labelli lobis lateralibus rotundatis, intermedio acuto carnosio utrinque plicato, disci callo solitario elevato longitudinali.

Mr. Bateman received it as a Nepal plant from Her Majesty's Bot. Gard. at Kew. Very inferior in appearance to *Acanth. bicolor*, having pale „french white“ flowers with dull longitudinal stripes and not a single stain of brilliant colour. Flowers are smaller than in the species just mentioned and their lower sepals are so much contracted into a pouch at the bend of the column foot, as almost to form a spur; the labellum has long rounded side lobes, a small contracted, tawny, spotted, acute middle lobe, and a single elevated callosity running down its middle. Mr. Bateman adds, that it has larger, narrower, and more attenuated pseudobulbs, a three flowered scape and leaves like those of *A. bicolor*. I take this opportunity of stating, that the genus of *Ac.* does not belong to Vandeeae, as I formerly supposed, from the examination of imperfect specimens, but in reality should be stationed in Epidendreeae, where it represent, the *Maxillaria* of Vandeeae, and the *Dendrobium* of Malaxeeae an interesting fact with reference to systematical purposes. It should be placed near *Bletia* and *Phajus*.

3. ACANTHEPHIPIUM BICOLOR Lindl. B. Reg. XX. 1835. 1730:

Petalis oblongo-lanceolatis acutiusculis, labelli lobis lateralibus rotundatis, perianthio ovato. — Planta terrestris, pseudobulbis oblongo-ovatis, corrugatis, atro viridibus, reliquiis foliorum vestitis, paulo in collum angustatis. Folia 2—3, oblongo lanceolata, utrinque acuta, plicata, erecta, basi angustata, sed petiolo nullo. Pedunculus radicalis; squamis ovatis, concavis, brunneis, magnis, vaginatis, 2—4florus. Perianthium carnosum, sepala obtusa, lateralia basi obliqua, basi longe productae columnae inserta. Petala aequilonga, apice minus maculata, lineari-oblonga acuta. Labellum cum pede longo columnae unguem efficiente articulatum, inflexum complicatum, trilobum, lobis lateralibus rotundatis, intermedio magis luteo et carnosio, asperiusculo; lamellis disci tantum concavis, linea elevata sejunctis. Columna semiteres, acuta; stigmatate marginato, clinandrio immarginato proclivi. Pollinia 8, geminata in glandulam antice emarginatam sessilia.

Ceylon, found by Watson, the Superintendent of the Government Garden of Peradenia.

Labellum trifidum. Laciniae laterales triangulae. Lacinia media oblonga retusa cum apiculo. Columna valde clavata. Flores albi, illis praecedentis paulo majores. Labelli striae purpureae, discus viridis.

bb. Labelli lobus medius obtusus retususve.

8. PACHYSTOMA PUBESCENS Bl. l. c. Tab. XXIX. Rehb. fl. l. c.:

Labelli lobo medio cuneato retuso emarginato.

Folium ensiforme tripedale nervosum angustum acutum, Pedunculus et inflorescentia exacte praecedentis. Perigonium subbrevis. Labellum flabellatum, antice trilobum, lobi laterales extus semicircundi, intus rectilinei, apice acuti. Papulae quinqueseriatae per labelli discum.

In Java insula.

9. PACHYSTOMA MONTANUM Rehb. fl. l. c.:

Labelli lobo medio ovato concavo ciliato.

Apaturia montana Lindl. O. 131.

Sepala semiincurva longa, lateralia duplo latiora. Tepala linearia univenia. Labelli lobi laterales acuti; lineae disci quinque cristatae undulatae.

Zeylona: in monte Nuera Ellia; Macrae.

10. PACHYSTOMA SENILE Rehb. fl. l. c.:

Labelli lobo medio ovato undulato.

Apaturia senilis Lindl. O. 130.

Pedunculus pedalis. Bracteae lanceolatae. Sepala ovata oblonga obtusa 5 lineas longa. Tepala lineari oblonga trivenia. Labelli lobi laterales subfalcati, lineae tres

glandulosae quarum laterales majores elevatae ad apicem labelli secus marginem excurrunt. Sylhet Wallich Uligapus at Kalegung Hamilton.

c. Tepala ovata.

11. PACHYSTOMA FORTUNI. Huc: *Spathoglottis Fortuni* Lindl. B. Reg. XXI. 1845. 19

Foliis binis lanceolato-linearibus scapo pubescente brevioribus, racemo secundo pubescente, bracteis acuminatis ovario duplo brevioribus, sepalis ovatis obtusis, petalis oblongis subsessilibus latioribus, labelli laciniis lateralibus oblongis erectis, intermedia cuneata emarginata, ungue utrinque dente aucto, lamellis 3 basi villosis carnosis, subdentatis lateralibus truncatis intermedia ad apicem fere procurrente, columna oblonga apice denticulata, polliniis inaequalibus omnibus acutis. Perigonium flavum. Labelli lobi laterales intus et extus purpureo adpersi.

Rehb. fl. Bonpl. III. 250. Folia terna, quaterna, cuneata lanceolata acuminata nervosa plicata. Pedunculus teretiusculus laxè vaginatus superne racemosus, minute puberulus. Bractee lanceae acuminatae pedicellis breviores seu aequales. Ovaria cum pedicellis duas pollicis tertias longa, velutina. Sepala oblonga obtuse acutiuscula extus velutina. Tepala latiora; firmiora, basi cuneata. Labellum tripartitum, partitiones laterales ligulatae obtusae antrorsum curvulae; partitio media linearis basi utrinque unidentata, apice dilatata rhombea medio exciso biloba: lamellae obtusangulae super unguem in nervos incrassatos baseos exeuntes. Gynostemium curvum clavatum utrinque anguste alatum. Hongkong. Seemann! Hance!

12. PACHYSTOMA JOSEPHI:

Labelli partitione antica lineari, apice anguste flabellata biloba (nunc cochleata), carinis rhombeis a basi usque versus apicem, limbo superiore non cucullatis, carina media abrupta.

Spathoglottis Fortunei Lindl. in plant. Hookerianis. — Haec facile distinguitur carinis lateralibus abbreviatis limbo superiori cucullatis, lacinia antica flabellata dilatata latissima.

13. PACHYSTOMA WIGHTII. Huc: *Spathoglottis pubescens* LO. 120. B. Reg. XXXI. 1845. sub 19:

Foliis 2 linearilanceolatis basi angustatis, scapo pubescente longioribus, racemo secundo pubescente, bracteis minutis acutis, sepalis ovatis acutis, petalis oblongis obtusis, labelli laciniis lateralibus oblongis erectis, intermedia cuneata, emarginata, lamellis 3 basi villosis carnosis lateralibus truncatis intermedia parum elevata, cis apicem evanescente, columna oblonga apice denticulata(?), polliniis obtusis inaequalibus 4 cuneatis. Flores flavi.

Sylhet mountains, Promes and Tong mountain in Ava.

Huc: *Sp. pubescens* Wight. Ic. V. 1739:

Leaves binate linear, lanceolate, narrow at the base, striated, shorter than the erect scape, raceme second, bracteate, bracts minute, acute; petals oblong, lip acute at their base, the lateral lobes oblong, erect, middle one with 3 keel-like appendages, two tubercles at the bases cuneate, and a little larger; peduncles, sepals and ovary pubescent.

Khassya Hills. Griffith.

1396. **PLOCOGLOTTIS** Bl.

Bijdr. 380. Tab. 48.

1. PLOCOGLOTTIS FIMBRIATA Tijssm. Binnend. Naturk. Tijdsk. Ned. Ind. V. 1853. 22

Foliis elliptico-oblongis plicatis glabris 7—9 costatis, scapis erectis puberulis, phyllis perigonii externis oblongis falcatis reflexis subulatis

supremo oblongo acuto, internis linearilanceolatis, labello obovato obtuso apiculato elastice articulado marginibus reflexis; capsulis oblongis sulcatis puberulis.

Salak.

1397. **SOPHRONITIS** Lindl.

B. Reg. not. ad 1129.

Lindl. Paxt. III. p. 10. 471.:

Perianthium explanatum subaequale. Sepala et petala imbricata libera. Labellum integrum cucullatum, linguiforme, basi cum columna connatum, saepius crista simplici transversa in medio lamellisque 2 axialibus. Columna libera, apice utrinque alata, alis integris conniventibus super cristam labelli. Stigma concavum, rostello obtuso. Anthera terminalis, opercularis, 8 locularis, cardine crasso inarticulato. Poll. 8 antice et postice parallela, caudicula duplici, pulverea. Herbae epiphytae (Brasilienses) monophyllae pseudobulbosae, racemis axillaribus effusis paucifloris. Flores coccinei.

1. **SOPHRONITIS COCCINEA** Rehb. fil. Huc: *Cattleya coccinea* Lindl. B. Reg. XXII. 1836. 1919.

Foliis solitariis oblongis acutis, caulibus ovalibus teretibus longioribus, floribus solitariis, spatha nulla, sepalis lineari-oblongis obtusis rectis, petalis triplo latioribus, labello ovato basi cucullato indiviso apice plano sepalis brevior.

Brazil. Descourtilz in bibl. Deless. 10. Stems 2—3 inches high. Flowers bright scarlet, 3" across.

Lindl. Paxt. III. 10. Gl. n. 473. *Sophronitis grandiflora* Lindl.

Folio oblongo acuto pseudobulbo ovali tereti longiore, floribus solitariis, spatha nulla, sepalis lineari-oblongis obtusis rectis, petalis triplo latioribus, labello ovato, basi cucullato indiviso apice plano petalis brevior.

Descourtilz found it upon the mountains that separate the province of Bananal from that of Ilha Grande. Gardner Rio 659. 5878. Lip yellow.

Lindl. Sert. 5 f. 2. *Soph. grandiflora*. Peduncle simple, cylindrical, twisted, bright green, having at its upper end 2 smaller opposite bracts, which form a bifurcation, from their axil springs a filiform violet ovary, terminated by a broad flatly expanded flower.

Flower with all other parts of a bright vermilion, red, or orange, the sepals narrow, ovate, the pet. much broader, forming lateral wings; all streaked with deep red longitudinal lines, and having a satiny violet crest externally. Lip something like the standard of a leguminous plant inverted, clear yellow, with a broad nasturtium colour border and diverging veins of the same colour, cucullate at the base, slightly 3 lobed, with the middle division ovate, obtuse and much shorter than the sepals, passing from yellow orange to the deepest cinnabar red, but in all of them the exterior of the flower is a dead cinnabar red, with no visible streaks or veins. Column short, triangular, having two lateral white dilatations or wings bordered by bright crimson. Anther convex, greenish, divided internally into 4 membr. cells, which are thickest at their upper half, and cover eight clear-yellow pollen masses, of a triangul. form and arranged into two rows.

2. **SOPHRONITIS MILITARIS**. Huc: *Sophronitis grandiflora* „Lindl.“ B. M. 3709 (XII N. S.)

Pseudobulbis oblongo cylindraceis, junioribus spathaceis apice monophyllis, folio elliptico, petalis elliptico-rotundatis, sepalis oblongo-lanceolatis subduplo minoribus, labello (parvo) trilobo, lobis lateralibus incurvis, obtusis intermedio acuminato planiusculo.

S. grandiflora Lindl. Sert. Orchid. t. 5 f. 2.

Cattleya coccinea Lindl. B. Reg. 1919 in text.

Epidendrum ponceau „Descoutilz's Drawings, pl. 10 p. 27.“

Figured by Dr. L. from a drawing executed, as it would appear, in the native country of the species by Mr. Descoutilz and he has I think rightly followed the suggestion of making it a *Sophronitis*. The credit of introducing the plant alive to this country is due to Mr. Gardner, who found it in the Organ Mountains of Brazil, and sent it home in 37. The station given by Mr. Descoutilz is upon the high mountains that separate the district of Bananal from that of Ilha Grande.

3. SOPHRONITIS PTEROCARPA Lindl. Paxt. Fl. G. Gl. 475 p. 41. 1853:

Folio coriaceo subrotundo oblongo, racemis brevibus corymbosis, ovario hexaptero longe rostrato, labello ovato cristato. Fig. 239.

This very rare plant in gardens has rosy purple flowers.

Gardner: Organ Mountains 665. Martius: on rotting trees near Mainerde in prov. Minas Geraës.

4. SOPHRONITIS CERNUA Lindl. B. Reg. 1129. 1147. B. Mag. 3677.

Sophronitis cernua Lindl. Paxt. Fl. G. III. Gl. 472.

Sophronitis isopetala Hoffg. B. Ztg. 1834.

Sophronitis Hoffmannseggii Rehb. fl. Linn. Litt. Ber. XVI. 236.

Sophronitis nutans Id. Ibid.

Folio ovato oblongo, racemo corymboso paucifloro, sepalis petalisque ovatis acutis, labello repando acuto, columnae alis brevibus obtusissimis, ovario sexcostato. Fig. 236. 8. 9. 10.

Brilliant scarlet flowers with a yellow lip. Sepals and petals same size. There does not seem to be any essential difference in the plants now referred here.

Lindl. l. c. 656:

Mr. H. G. Reichenbach has pointed out to us the false name of *Sophronitis nutans* ascribed to him by an accidental transposition of type at Nr. 472, is really chargeable upon Hoffmannsegg, and that the name of *S. Hoffmannseggi*, another false name, should be placed to his father's account. — Cf. Rehb. fl. in v. Schidl. und v. Mohl B. Z. 1852. 639.

Rehb. fl. l. c. p. 837:

Ich kannte diese Pflanze früher nur in solchen kleinen Exemplaren, wie sie im Bot. Reg. und Bot. Mag. abgebildet wurde. Jetzt fällt mir eine grosse Pflanze in (Hofrath Keil's Garten) auf, welche, in allen Theilen 2—3mal grösser, sich durch mehr längliche Blätter auszeichnet. Die Blüthen sind erst roth (wie *Epidendrum cinnabarinum*), endlich werden sie lila. Einen specifischen Unterschied kann ich nicht entdecken. Ueppige Form in Folge guter Cultur? Gardner's wildgewachsene Exemplare sind viel kleiner.

5. SOPHRONITIS VIOLACEA Lindl. B. Reg. XXVI. 1840. Misc. 18.

Pseudobulbo ovali, folio solitario lineari, scapo terminali basi multibracteato, 1 floro longiore, labello obovato acuto nudo basi gibboso, columnae alis maximis carnosissimis obtusis falcatis.

Pretty little epiphyte with solitary violet flowers, for which I am indebted to Mrs. Cannon of Stratford Green. Febr.

Paxt, Fl. G. III. p. 1. Gl. 474. F. 238:

Common in Brazil on Organ Mountains.

Rehb. fl. in v. Schlechtend. Linnæa XXV. p. 245:

Rhizomate repente funiformi, pseudobulbis cylindraceis seu pyriformibus, basi 2 squamis vestitis, unifoliis, foliis linearibus acutis pergamenis (—3" 4" long., 2" latis), pedunculo in axilla folii, squamis 3 lanceolatis acutis vaginantibus tecto, unifloro (c. flore 1" 8"), ovario subcylindraceo, post anthesin valde elongato, perigonii

phyllis externis lanceolatis acutis (—11" long., 1,5" lat.), lateralibus internis paulo brevioribus, angustioribus, labello nunc obtuse rhomtheo, nunc lanceolato acuto, nunc obovato acuto basi calloso, callo triangulari postice bilobo, ante calcaris ostium, calcare cum ovario et sepalis inferis connato, gynostemii brachiis productis oblongis nunc apice retusis.

1397¹. **PHYSINGA** Lindl.

B. Reg. 1838, XXIV, Misc. 45.

Sepala membranacea, aequalia, basi connata. Petala minora, basi sepalis oblique adnata. Labellum carnosum, tuberculatum, indivisum, cum basi columnae connatum, sacco vesiciformi basi auctum. Columna carnosae, nana, biloba, basi ima antherifera. Pollinia 4, filis duobus geminatis pulvereis adnata. Stigma: area minuta, madida, bidentata, supra faucem vesicae.

1. **PHYSINGA PROSTRATA** Lindl. l. c.:

Caulis prostratus, brevis, anceps, dense et distiche foliosus. Folia crassissima, ovato-lanceolata, acuta, amplexicaulia, dilute purpurascens striata. Scapus terminalis, filiformis, prostratus, ramosus, 8—9 pollices longus, vaginis angustis, fusco purpureis, acutis, carinatis, striatis arcte vestitus. Flores pauci, parvi, apice ramorum, herbacei, dilute purpureo suffusi. Calycis lacinae acuminatae, patentes. Petala anguste lanceolata, acutissima. Labellum albidum, obovatum, acutum, apice recurvum, basi auriculis carnosae inflexis auctum; linea media callosa tuberculisque duobus antice procurrentibus: vesica sphaeroidea, viridescens. Columna alba, auriculis imis labelli brevior, basi ipsa tantum labello adnata.

Orchid of no beauty, but one of the most curious, that I am acquainted with. It has much the habit of an Epidendrum and is not at all unlike orchidiflorum in its manner of growth, but it belongs to no genus hitherto described. The sepals are united at the base into a cup as in Masdevallia; the labellum has a little bladder like pouch at its base, in room of a spur; and the column, which is very small, is more like that of a Cypripedium, than any thing else. Mr. Loddiges obtained it from Demerara.

1397². **DRYMODA** Lindl.

Lindl. Sert. Orchid. (1838) 8.

Perigonium valde inaequale et irregulare. Sepalum supremum erectum, liberum, lateralia postice cum pede longissimo columnae connata, sub-rhomboidea, acuminata, sessilia, supremo pluries majora. Petala nana, libera. Labellum cum pede columnae articulatum, trilobum, convexum, lobo medio deflexo. Columna nana, semiteres, auricula longa petaloidea utrinque porrecta, basi in pedem longissimum linearem canaliculatum elongata. Anthera terminalis opercularis cristata, bilocularis.

Pollinia 4, accumbentia, glandulae globosae, grumosae, separabili accrescentia. Herba minuta, epiphyta, pseudobulbosa, aphylla, scapis radicalibus vaginatis unifloris.

DRYMODA PICTA Lindl. l. c.:

The only knowledge I have is from a sketch made by Mr. Griffith from specimens discovered by him in Febr. 1835 at Mergui in the Burmese empire. It is so entirely different from any other O. with which I am acquainted that I am unable even to name a genus with which it may be compared. In the structure of the stigmatic gland in particular it is so peculiar that Mr. Griffith considers the plant situated on the confiny of Epidendreae et Vandaeae.

C. whole plant: I presume, the plant has nothing, but little lenticular angular pseudobulbs, it will be seen, that the flower is inverted, that is the labellum uppermost.

C. 1. pink and white lat. sepals (in icone flavi et purpurei!) between which hangs down the deep red fleshy, hairy labellum.

C. 2. Large yellow stigmatal gland standing in front of the anther.

C. 4. 4 pollenmasses, together with the gland. This gland is opaque, clavate, rounded, always separating with the pollen masses, which, especially the inner, adhere to it very firmly; it is composed of soft grumous matter and is easily broken away.

C. 5. Profile of same parts.

C. 6. External view of an outer pollenmass.

C. 7. Interior view of the same. Sert. Orchid. 8. C. 1838.

1397/3. **HEXADESMIA** A. Brogn.

Ann. sc. nat. 1842. XVII. 44.

Sepala subconniventia, supremo oblongo-lanceolato, lateralibus triangularibus infra cum basi columnae in pseudocalcare unitis. Petala sepalis subaequalia oblonga. Labellum cum basi producta columnae articulatum, subintegrum, plicatum. Columna petalis brevior, semiteres, apice clavata, clinandrio auriculis lateralibus et dente postico uncinato marginato basi foveola nectarifera excavata. Anthera operculaeformis, denti marginis clinandrii affixa, carnosa, sexocularis. Pollinia 6, aequalia, 4 posticis caudiculis longioribus replicatis, 2 anterioribus caudiculis brevissimis, tria ad utrumque lobum antherae pertinentia et inter se caudiculis unita, facillime glutine apicis caudicularum in fasciculo unico connexis.

Herba mexicana ab indefesso viatore Linden Musaeo Parisiensi allata, habitu Dendrobia quaedam asiatica et forma floris Apora praesertim referens, sed polliniorum structura cum Epidendreis quadrans eorumque numero ab aliis hujusce familiae generibus, excepta Hexameria RBr. e tribu Malaxidearum distincta.

1. **HEXADESMIA FASCICULATA**. 1842. Ad. Brogn. in Ann. des Sc. XVII. p. 45. B. Reg. XXIX. 1843. p. 16. Misc. 21:

Flowered in the garden of the horticultural society, where it has been saved out of a collection formed by Mr. Hartweg at Quezaltenango in Guatemala. It has small green flowers of no beauty, and the habit of Epidendrum clavatum.

B. Reg. XXVIII. 1842. Misc. 44. Caules e rhizomate nascentes, erecti, basi graciles squamis vestiti, superius incrassato-subspathulati bulbosi, pseudobulbis stipitatis compressis, elliptico-lanceolatis apice diphyllis. Folia oblonga, 5—6 pollicaria, pollicem lata, coriacea, plana, apice emarginata. Flores terminales 2—4 fasciculati subsessiles, e spatha communi brevi exeuntes, pedicellis ovariisque gracilibus incurvis, squamis obtectis. — Huc:

Hexadesmia Lindeniana. Rich. et Gal. tab. 23. Ann. sc. nat. 1845. Jan. p. 23:

Pseudobulbis stipitatis fusiformibus compressis, apice 1—2 phyllis; foliis oblongo-ellipticis obtusis; floribus fasciculatis: labello unguiculato, ovali, obtuso.

Mexico.

2. **HEXADESMIA CRUCIGERA** Lindl. B. Reg. XXX, 1844. Misc. 4: *Hexopia crucigera* Batem. Mss.

Caule fusiformi, foliis exacte linearibus, racemis flexuosis paucifloris, bracteis ovatis membranaceis, mento valde producto, labello obovato alte bilobo.

A smallflowered inconspicuous Epiphyte of no beauty, introduced from Guatemala to Mr. Bateman, with whom it flowered some years since, where it received the name of *Hexopia*. Its flowers are not half the size of *H. fasciculata*.

3. *HEXADESMIA STENOTEPALA* Rehb. fl. Bonpl. III. 221:

affinis *H. crurigeræ* Bat. foliis paulo latioribus, nunc longissimis, racemis a bracteis paucis brevibus imbricantibus tectis brevissimis, tepalis linearibus medio paulo dilatatis, labello rhombeo retuso. — Flores minores, quam in *H. crurigeræ*.

Ad Tortuga. Am. cent. Oersted!

4. *HEXADESMIA MICRANTHA* Lindl. B. Reg. 1844. XXX. Misc. 5:

Racemo multifloro, bracteis linearibus acuminatis membranaceis, sepalis acuminatis, labelli trilobi laciniis lateralibus rotundatis, intermedia apiculata.

The flowers of this are very much smaller than even these of *H. crurigeræ*, and white with a very little green. It is from Guatemala and is the no. 389. Lodd.

Obs. Forsan huc pertinet:

Scaphyglottis? fasciculata Hook. Ic. IV. 1841. tab. 317.

Pseudobulbis fasciculatis lanceolatis sulcatis monophyllis, folio lineari retuso costato avenato, pedunculo solitario brevi unifloro ad basin folii bracteato, bracteis numerosis imbricatis, perianthio patente, sepalis ovatis concavis, petalis angustioribus oblongis, columna brevi, labello oblongo obsolete trilobo recurvo.

Hab. Demerara. C. S. Parker Esq.

Of the Genus of this plant I am extremely doubtful. It was received in a living state, but the anther had fallen away, and no pollenmasses were to be found.

Species exclusa ad *Tetragamestum* collocata:

Hexadesmia bicornis Lindl.

1397/4. **HEXISEA** Lindl.

Hook. B. Journ. I, p. 7. 8. „On Cumings Orchideae“.

Perianthium clausum. Sepala et petala subaequalia, angusta; illorum lateralibus invicem discretis sed basi columnae adnatis. Labellum posticum, cum columna connatum, refractum, inappendiculatum, integerrimum, sepalis subconnatis. Columna erecta, basi nullo modo producta, apice biaurita. Anthera dorso convexa, carnosa 4-ocularis, valvulis membranaceis longitudinaliter dehiscentibus. Pollinia 4, collateralia (00 00), materie parca granulosa stigmati annexa. Herba epiphyta caulibus teretibus ascendentibus, articulatis. Folia linearia, coriacea, apice emarginata. Racemi terminales, pauciflori, bracteis vaginis membranaceis ex squamis cartilagineis imbricatis erumpentes.

This genus is in some respects related to *Isochilus* and *Dinema*, from which however it differs entirely in the structure of its pollenmasses. Its nearest affinity is certainly with *Coelogyne* and particularly with the section *Panisea*, from which it is chiefly distinguished by its posterior labellum connate with the column, like that of an *Epidendrum*. I am uncertain if this genus is not the same as *Elleanthus* of Presl.

Huc: *Euothonea* Rehb. fl. in v. Schlechtl. und Mohl B. Z. 1852 p. 772.

Nov. Gen. Alamanniae floris structura simile labelli insertionem ac androclinio tridentato ac vegetatione a *Diothonea* recedens. cf. *Gartenorchid.* IV.

1. *HEXISEA BIDENTATA* Lindl. on Cumings Orch. in Hook B. J. 1. p. 8.

Hab. in Panama et Columbia occid. Cuming. (hab. s. sp.) N. 1297.

Caules teretes, 6—8" longi. Folia 8" longa, 2½" lata. Flores glaberrimi, Ornithidi coccinei fere magnitudine. S. et P. linearilanceolata, acuta. Labellum subconforme, sed apicem versus paulo dilatatum. Auriculæ columnæ bidentatæ.

In this plant the petals are often deformed, so as to be either abbreviated, or truncated or falcate, or toothed. Their natural form is, no doubt, such as I have described.

2. *HEXISEA IMBRICATA*. Huc: *Diothonaea imbricata* Lindl. Sert. Orchidac. 40. n. 1.

Caulis articulati internodiis fusiformibus sulcatis basi squamis imbricatis, foliis linearibus apice retusis aut emarginatis, denticulo interjecto, pedunculis terminalibus 2—3 floris pariter imbricatis, labello ovato acuminato sepalis petalisque conformi.

High mountain chain between the 65 and 66 merid. and the 40 parall. of lat. 6—7000 above the sea between *Cladonia rangiferina* and *reticulata* common. D. differs from *Isochilus* only in having the lip united to the column by an intervening membrane, and it bears the same relation to that genus as is born to *Epid.* by *Encycl.* Either a dist. genus, or a mere form of *Isochilus*. The original species collected by Hall in the valley of Leon has a lip very different in form from the other divisions of the perianth and both have a strong double callosity at the base of the fore part of the lip; in the true species of *Isochilus* on contrary the lip has either one tubercle only at that part or none at all. Perigonium minutum.

Lond. Journ. 1843. II. p. 671. Lindl. Sert. t. 40. n. 1. Mountains of the Roraima chain at the height of 5000—6000 feet. Schomburgk.

Obs. Monet ill. Lindley nil nisi ipsissimum *A. gracile* Wall.

1397/7. **CHYSIS** Lindl.

B. Reg. XXIII (1837) 1937.

Sepala paulo connata, patula: lateralium pedi producto columnae adnata et calcar simulantia. Petala sepalis conformia. Labellum trilobum, patulum, venis basi callosis. Columna marginata, canaliculata, mutica. Anthera subrotunda, opercularis glabra. Pollinia 8, in laminam luteam semifusa, 4 exterioribus tenuibus quatuor interiora crassiora abscondentibus. Rostellum laminatum, convexum. Herbae epiphytae, occid., ab arboribus pendulae; caulibus Cyrtopodii depauperatis, foliis nervosis basi vaginantibus, racemis lateralibus multifloris.

1. CHYSIS AUREA Lindl. B. Reg. I. c.:

Caulis penduli, subclavati, articulati, squamis fuscis, membranaceis vestiti. Folia ovato-lanceolata, basi vaginantia, nervosa, undulata. Racemi pedunculati, ex axilla folii inferioris erumpentes, penduli, multiflori. Sepala ovata, obtusa, subundulata, basi alba, caeterum crocea; lateralium margine anteriore infracto. Petala ovato-oblonga, obtusa, magnitudine et colore sepalis similia. Labellum concavum, venis sanguineis, trilobum; lobo medio oblongo, obtuso, crispo, apice subsaccato; venis 5 mediis tumidis, callosis, tribus lateralibus utrinque pubescentibus obovatis. Pollinia sunt hujusmodi: lamina adest tenuis, lutea, pulverulenta, bipartita, utrinque biloba, in clinandrium prona, marginibus suis incrassatis et incurvis (= polliniis basi in laminis duabus geminatim cohaerentibus). — Praeterea adsunt 4 alia minora et prioribus supertecta, quorum duo ab angulis posterioribus et duo ab anterioribus lamellae supradictae fissae oriuntur (= [poll. 4 alia minora]). Horum corporum vera indoles latet; sed verosimiliter pollinia 8 adsunt quorum 4 exteriora in laminam fissam margine bilobam deliquescunt.

Discov. by Henchman is the valley of Cumancoa in Venezuela. Mr. H. describes it as growing suspended by long fibrous roots from the lateral trunks of trees, so that its pseudobulbs which in their growing state are uncommonly brittle hang downwards and wave in the wind, which would otherwise be sufficient to break them. Clapton Nursery.

B. Mag. XI. N. S. 3617. — Rehb. fil. Bonpl. II. 22: Caracas. 5000'. April. In Caracas eine grosse Seltenheit, in Neu-Granada häufiger, ich besitze sie auch aus Panama. Wagener.

var. *maculata* Hook: sepalorum petalorumque parte superiore aureo-fusco tincta, labelli medio purpureo maculato.

2. CHYSIS BRACTESCENS Lindl. B. Reg. XXVI. 1840. Misc. 131:

Bracteis cucullatis venosis foliaceis ovario longioribus, sepalis petalisque ovatis obtusis, intermedio carnosio bilobo plicato lamellis 5 carnosis aequalibus, parallelis basi pubescentibus, columna latissima carnosia cymbiformi antice pubescente.

B. Reg. XXVI. 1840. sub Misc. 130:

The other (species) has white flowers with a deep yellow fleshy lip, which is divided into two lobes, each folded twice so as to give the whole the appearance of being four lobed.

B. Reg. XXVII. (1841). 23:

Caules fusiformes carnosi, palmares. Folia ovato-lanceolata, basi cucullata, imbricantia, undulata, acuminata, supplicata. Racemus lateralis, horizontalis, folio brevior, 4—5 florus. Bracteae magnae, foliaceae, reticulatae, obtusae, concavae, cucullatae, laxae, ovario longiores. Flores magni, cerei, candidi, coriacei. Sepala lateralia dorsali latiora, obtusa, margine incurva. Petala oblonga, erecta, obtusa, basi angustata.

Van Houtt. Fl. des Serres. VII. 675.

3. CHYSIS LAEVIS Lindl. B. Reg. 1840. XXVI. Misc. 130:

Bracteis brevibus ovatis pedicelli longitudine, sepalo dorsali lineariblongo, lateralibus acuminatis, petalis falcatis apice rotundatis supra columnam convergentibus, intermedio membranaceo crispo subrotundo emarginato, lamellis 5 carnosis glaberrimis parallelis, lateralibus minoribus, columna basi alte excavata.

Barker. Very large yellow flower, whose lip is spotted with dull brown, and more membranous than in the others; and it is remarkable for its column becoming hard and very tumid after fertilization has occurred, and eventually acquiring a green colour.

Batem. Orch. Mex. Guat. tab. 31.

Obs. Species me iudice optima. *Chysis Limminghei* Lind. Rehb. fil. ipsa luce deficiente, noctu. facillime non nisi tactu a *C. aurea* distingui potest. Hujus label- lum apice crispolobatum, illius apice planum.

Reliq. Haenk. 97.

Perianthium ringens pentasepalum, sepalis tribus exterioribus ovato-lanceolatis, duobus interioribus linearibus apice et in basi incrassatis brevioribus. Labellum paulo longius, lanceolatum. Gynostemium erectum, antice sulco exaratum. Anthera sessilis decidua, operculo horizontali curvato tecta, loculis approximatis. Pollinis massae quatuor? cereaceae.

Herbae parasiticae. Radices intricatae. Scapi foliosi simplices. Folia elevato-ner- vosa. Spica terminalis pauciflora disticha, rhachi flexuosa. Bracteae magnae, flores involucentes et illis longiores. Ovarium subobliquum.

EVELYNA Pöpp. Endl. Nov. Gen. I. p. 32:

Sepala subaequalia, erecta, libera. Labellum obcordatum, subrotundum, circum columnam convolutum, disco nudum, sessile, liberum, basi saccata bicallosum. Columna semiteres, nuda, clavata, medio antice processu brevi aucta. Anthera bilocularis. Pollinis farinosi massae octonae, quaternatim collaterales, caudiculis totidem brevissimis operculo glandulae stigmatis triangulari, plano affixae.

Gen. *Octomeriae* RBr. proximum.

Genus dicatum memoriae, Johannis Evelyn, Angli (nati Woltoonii MDCXX, denati MDCCVI) peregrinationibus, quibus majorem Europae partem perlustravit nec non calami sui fertilitate celebris, de Botanice inprimis libro suo Sylva et Pomona (Londini 1664, edd. recentior. 1776, 1780, 1814) de re agraria commentariis (Terra optime Lond. 1675. ed. nov. 1778) optime meriti.

Rehb. fl. in v. Mohl und' v. Schlechtndl. B. Z. 1852. 707 :

Die zarten, meist leidlich grossen Blüten treten massenhaft auf zwischen den grossen Deckblättern. Blütenstände denen der *Phrynica*, *Myrosmata* u. dergl. ähnelnd. Dazu das wunderliche Schauspiel, dass schneeweisse Blüten in gelb und lila übergehen — die leibhaftigen Chamaeleone unter den Orchideen. Der Verbreitungsbezirk dieser Pflanzen scheint ein sehr grosser. Herr Leibold brachte Spuren einer fruchttragenden Art von Zacuapan in Mexico — eine Verwandte der *E. capitata*. — v. Warscewicz nahm nebenbei zwei Arten — die eine beschreibe ich unten. Die andere ist sehr interessant. Sie steht nächst *E. ensata* in Bezug auf Blätter. Allein die Deckblätter sind breitlineal, spitz, anscheinend dünnhäutig. Die Blütenaxe sehr dick; gewöhnlich herabgeschlagen. „Blüthen violett.“ Chiriqui. — Ich erhielt keine Blüten, mache daher nur auf sie aufmerksam. — Ich kenne auch zwei aus Brasilien, — Eigenthümlichen Abänderungen ist die Säule unterworfen. Unter der Narbe tritt bei manchen Arten (besonders den *Cephalelynae* und *Chloidelyna*) ein Kinn, ein Fortsatz hervor, unter dem dann eine Höhle sich bildet. Dieser Fortsatz entwickelt sich ganz spät, er ist in fast reifen Kuospen nur schwach angedeutet. Die leicht abfälligen Schwielen sind reiche Behälter einer überaus feinkörnigen Stärke deren jüngste Bläschen sich (wie ich es auch bei anderen, höchst ausgezeichneten Stärkearten sah) mit Jod bräunen. — Diese Buckel sind bei den Euevelynen sehr leicht abfällig, vielleicht sogar im Leben? Ich komme auf diesen Gedanken, weil ich bei jeder Art einen Apparat finde, um diese Buckel zu halten, sobald sie gross sind. Die *Cephalelynen* bilden durch das übergreifende Kinn eine Höhle, das Kinn hält und stützt jene Organe. Die *Stachydeleyen* haben entweder eine Einschnürung, oder aber eine Querplatte, auch beides. Sobald die Körperchen zart sind (wie bei *Chloidelyna*) findet sich eben nur eine Andeutung, um dem einmal befolgten Plane treu zu bleiben. Das zarte, schmale Kinn dieser Pflanze könnte grosse Buckel nicht halten. Alle neuerlich untersuchten Buckel konnten mir über die Art des Grundgewebes keinen sicheren Aufschluss geben, daher ich vor der Hand vorziehe, nichts zu sagen. Ich habe die Merzhahl der mir vorliegenden Evelynen bei Bestimmung der Art des Hrn. v. W. mit untersucht und will das Resultat dieser Arbeit um so weniger zurückhalten, als man bisher noch keinen Versuch gemacht hat, diese ursprünglich auf 5 Arten begründete Gattung einzutheilen.

A. Catelyna: Rehb. fl. in v. Schldl. B. Z. 186, 708 :

Lamina depressa in labelli basi.

1. ELLEANTHUS MYROSMATIS. *Evelyna Myrosmatidis* Rehb. fl. in v. Schldl. B. Z. 1852. 708 :

Valida, caule calamus aquilinum crasso, vaginis verrucosis arpo-phyllaceis, foliis oblongis acuminatis, cuneatis, medio sat latis, pergamineis, spathis 2 triangulo navicularibus, scariosis, sub spica compacta, bracteis oblongo lanceolatis acutis scariosis, ovariis parce muriculatis, perigonii phyllis externis oblongis acutis extus parce muriculatis, late-

ralibus internis linearibus acutis(?), labello oblongo lanceolato acuto, apice hinc inde verrucoso (? — anthera adhuc clausa, nolite putare pollinia pro verrucis habita!), apicem versus hinc inde denticulato, lamina baseos depressa, antice acuta, gynostemio utrinque angulato alato, processu rostellari ac androclinii limbo retusis.

Gracilentia, humilis, paucifolia, subramosa, vaginis asperulis, foliis lanceolatis, basi et apice attenuatis, marginibus membranaceis valde crispulis, ceterum pergameneis, folio florali lanceolato, carinato, margine crispulo, spica pauciflora, grandiflora, bracteis oblongo-lanceolatis, scarioso herbaceis, flores excedentibus, ovarii papillis filiformibus paucis validissimis papulosis, perigonii phyllis oblongis acutis vernixiis, lateralibus internis spatulatis, labello pandurato basin versus excavato, apice acuto, antrorsum ciliato, callis ante basin (nec in basi!!!); gynostemio gracili, rostello tridentato, androclinii limbo retuso.

Neu Granada, Linden. 1272.

14. ELLEANTHUS KERMESINUS. *Evelyna kermesina* Lindl. Orchid. Linden 1846. N. 61. p. 11:

Ramosus, vaginis sublaevibus, foliis linearilanceolatis, subtrinerviis mucronatis, margine scabris, racemis flexuosis, bracteis navicularibus, labello crenato subpubescente, callis 2 parvis ovalibus in fundo et lamina transversa.

„An epiphyte from the forests of Tolima in the prov. of Mariquita, at the height of 9000'. Jan. Flowers bright carmine.“ (N. 1276.) The petals are obovate and emarginate, the leaves very narrow and hard; sheaths nearly smooth. Flowers quite distinct from each other, on account of the bends of the rhachis.

Rehb. fl. Bonpl. II. 21. Caracas. Wagner.

- var. AURANTIACUS SIMPLEX. *Evelyna kermesina* Lindl., var. aurantiaca simplex Rehb. fl. Bonpl. II. 282:

Caubibus tenuibus simplicibus, reliquis tamen Evelynae kermesinae, bracteis tamen solito brevioribus et floribus aurantiacis.

Radices bene pilosae. Caules fasciculati graciles spithamaei calamus Sylviae crassi. Vaginae arctae punctulis elevatis asperae. Folia oblongoligulata acuminata apice retiuscula pergamenea superne nitida 2—3 pollices longa, supra basin duas tertias pollicis lata. Racemus flexuosus, laxo conicus, sesquipollicaris. Bractee ovatae scariosae, cucullatae, medianae ovaria aequantes. Ovaria laevia. Sepala triangulo acuta. Tepala linearicuneata obtusiuscula. Labellum pagina externa apice et basi saecatum, antice denticulatum, medio ab inferiori latere intruso constrictum; portio antica ubi vi expansa nunc trilobula. Calli 2 parvi oblongi in pariete postico sacci postici rotundi descendentes. Gynostemium medio utrinque angulatum. Rostellum cordatum apiculo interjecto, apposito utrinque anguli supremi apiculo. „Flores aurantiaci.“ Ocanna. September. 5000'. Nr. 99. Schlim.

15. ELLEANTHUS ARPOPHYLOSTACHYS. *Evelyna arpophylostachys* Rehb. fl. Bpl.

II. 21:

Caule validiori, vaginis acutis nervosis punctulatis, foliis oblongo-lanceolatis longe attenuatis, spathis 3—4 ovatis acutis, racemo oblongo-cylindraco 2½ pollicari, bracteis scariosis rigidis margine tenuioribus oblongis acutis flores aequantibus, ovariis laevibus, sepalis oblongis acutis, tepalis linearibus acutis, labello circulari basi cuneato, margine plicato crispo, callis 2 rotundis approximatis, gynostemio exangulato, mentulo appresso retuso, processu rostellari obtuso bilobo denticulo interjecto. Caracas. Wagener.

16. ELLEANTHUS AMETHYSTINUS. *Evelyna amethystina* Rehb. fl. Wrwz. Bpl. II. 113:

aff *E. arpophylostachydi* rigidior, brevifolia, bracteis acuminatis, labello basi angusto subito reniformi, callis semilunatis obtusis maximis, gynostemio utrinque angulato, mentulo nullo, ovario densissime muriculato. Caulis rigidus, quasi ferreus. Vaginae nervosae verniciae. Folia lanceolata acuta margine microscopice crispula prope coriacea (chartacea in *arpophylostachyde*), acuta seu mucronata, superiora (quae tantum adsunt) 2" longa, ⅓" lata medio. Spatha infima foliacea, 2 superiores scariosae bracteaeformes. Pedunculus nutans paulisper flexuosus densissime muriculatus. Bracteae oblongae acuminatae scariosae flores aequantes. Ovaria muriculata. Perigonium pulcherrime amethystinum, majus illo *E. kermesinae*. Sepalum impar oblongum apiculatum, sepala lateraliter subaequalia; tepala ligulata acuta; labellum basi late ligulatum utrinque extrorsum curvatum ante medium (a basi) subito hastato dilatatum, semiovatum, crenulatum; calli baseos reniformes maximi; gynostemium gracile, utrinque angulatum, medio antice carinatum; mentulum nullum; rostellum bidentatum; fovea ovata. Peru. v. Warszewcz.

17. ELLEANTHUS LANCIFOLIUS Presl. Haenk. p. 97:

E. foliis lanceolatis acuminatis plicato-nervosis serrulatis, apice tridentatis, spica horizontali.

Radices praecedentis, longiores tamen et crassiores ac minus intricatae. Scapus pedalis, anceps, inferne vaginatus, superne triphyllus. Folia erecto-patentia, firma, 4 pollices longa, vix 5 lineas lata, lanceolata, in acumen attenuata, apice tridentata, dente medio longiore, plicato-nervosa, margine serrulata. Vaginae tuberculato-scarbrae. Spica terminalis horizontaliter reflexa, compressa, disticha, ovata, rhachi angulata et angulis acutis flexuosa. Bracteae ovato-lanceolatae, longe acuminatae membranaceae, flores plus quam duplo superantes, infima fere sesquipollicaris, superiores decrescentes. Perianthium flavescens.

Hab. in Guayaquil. 2.

18. ELLEANTHUS FLAVESCENS. *Evelyna flavescens* Lindl. Orch. Lind. N. 60. 1846. p. 11:

Ramulosa, vaginis scabriusculis, foliis lanceolatis 5—7 nerviis acuminatis obtusis, strobilis oblongis basi laxis, bracteis inferioribus apice herbaceis, labello integerrimo, emarginato, callis duobus parvis ovatis in fundo.

„Terrestrial between Humucarabeja and the Agua de Obispo, in the province of Truxillo, at the height of 7000'. May. Flw. yellowish." N. 625. Leaves smaller than in the last (*bractescens*) and bracts far narrower.

19. ELLEANTHUS BRACTESCENS. *Evelyna bractescens* Lindl. Orchid. Lind. 1846. N. 59. p. 10:

Ramulosa, vaginis subsetosis scabris, foliis lanceolatis subseptem-nerviis acuminatis emarginatis, strobilis ovalibus, bractea infima apice

herbacea, labello fimbriato emarginato, callis duobus magnis ovatis in fundo et lamina transversa.

20. ELLEANTHUS HYMENOPHORUS. *Evelyna hymenophora* Rehb. in v. Schldl. B. Z. 1852. 711:

Caule simplici, vaginis (in sicco saltem) profunde sulcatis, foliorum laminis oblongis, acutis, membranaceo-pergameneis brevioribus, spatha pandurata, naviculari, hinc muriculata, spica recurva (in sicco!), abbreviata, bracteis oblongis acutis navicularibus, scariosis, hinc muriculatis flores aequantibus, ovariis gibberosis(!), muriculato papillosis, perigonii phyllo summo oblongo acuto, basi cuneato, lateralibus oblongis acutis, lateralibus internis ligulatis, obtusiusculis, nunc valde cuneatis, labello orbiculari, fimbriato, basi versus marginibus implicatis contracto, fovea clausa ope membranae semilunaris retrorsae post anthesin lacerae, callis baseos 2 triangulis.

Blätter wie bei *E. oligantha*, aber spitz, nicht zugespitzt. „Blüthen schwefelgelb.“ Chiriqui Cordilleren. 6—7000'. Decbr. v. Warszewicz.

21. ELLEANTHUS FURFURACEUS. *Evelyna furfuracea* Lindl. Orch. Lind. p. 12. N. 65. 1846:

Simplicicaulis, tenuis, vaginis purpureis, foliis ovali lanceolatis acuminatissimis multinerviis, bractea infima foliacea supremis subrotundo ovatis acutis, labello oblongo rotundato crenato emarginato, lamellis 2 in fundo concavo et linea elevata transversa.

„An epiphyte. Forests of Merida, at the height of 5500'. June. Flw. scarlet. (N. 619.) Also from Agua de Obispo, at the height of 9000'. May. Flw. fleshy, bright red.“ (N. 627). A slender thin leaved species with from 4—7 flowers in a head. June. 6—7000'. Nr. 741. Schlim. Ocanna. Rehb. fil. Bpl. II. 282. Blüthen rosa.

Rehb. fil. Bpl. II. 21. 4000'. Juli. Caracas. Wagener.

Hue: *Evelyna oeconomica* Rehb. fil. Warszew. Bpl. II. 113:

aff. *furfuraceae* (similis *casapensi*) foliis oblongis acuminatis latioribus, brevioribus, spathis florigeris!, bracteis latissimis ellipticis apiculatis punctatis, tepalis a ligulata basi ovatis acutis serrulatis, rostello erecto trimucronato.

Planta gracilis, 1,5pedalis superne flexuosa, bene foliata (folio spathaceo infimo florifero incluso 8). Vaginae tenuissime nervosae, punctatae; laminae oblongae acuminatae, basi paulo cuneatae, 5 pollices longae, 1,2" latae; folium summum vagina cucullata spathaceum, florem ex ostio vaginae propullulans (hinc nomen)! Spica reliqua pauciflora, flexuosa, brevis. Bractee bene scariosae, nervosae, punctulatae, ellipticae, longius, brevius apiculatae, flores aequantes s. superantes, infimae nunc subpollicares. Sepala oblonga acuta. Tepala a ligulata basi ovata serrulata. Labelium basi coarctatum, dein rotundum, serrulatum, basi bicarinosum, callis oblongis. Gynostemium mentulo nullo, angulis apicularibus utrinque porrectis parvis, limbo androclinii postico tridenticulato, rostello erecto, trimucronato. Neu-Granada. v. Warszewicz.

22. ELLEANTHUS DISCOLOR. *Evelyna discolor* Rehb. fil. Warszew. Bpl. II. 113:

aff. *E. hymenophorae* foliis discoloribus, spica erecta, bracteis angustioribus, sepalis lateralibus alte carinatis, carinis denticulatis (nec integris), labello latiori magis denticulato, rostello erecto triangulo acuto (nec retuso emarginato). — Caules bipedales, validi. Vaginae firmas quasi lignosae, sulcatae. Folia a cuneata basi oblonga, acuminata, 8 pollices

longa, 3—4 lata, inferne pulcherrime violacea!! Spathae 2 cucullatae acutae nervosae breves (inferior vulgo pollicaris). Spica plurimiflora, primum strobilum mentiens (expl. Wczw.). Bractee lanceotriangulae acutiusculae bene nervosae 2—3 lineas longae, 1,5'' latae. Ovaria bene muriculata. Sepalum summum oblongum acutum; sepala lateralia concava, apiculata, inaequalia, dorso medio alato carinata, carinis minutissime denticulatis. Labellum basi brevi cuneata utrinque implicatum ceterum ovale denticulatum; calli 2 magni sub plica transversa absconditi. Gynostemium breve: rostellus dens medius angustus corneus (siccus adhuc croceus!), androclinii dentes laterales parvi; mentulum nullum. — Herrliche Blattpflanze mit wundersehön violetter Unterseite der Blätter. Peru. Warszewicz.

23. ELLEANTHUS RUIZII Rehb. fil. in Linnaea. XXII. 842. — in Bpl. II, 113:

aff. discolori: labello sessili, tepalis apice dilatatis denticulatis, gynostemio gracili elongato sub stigmatē tota planitie antica angulato. Bipedalis et altior. Vaginae punctulatae sulcatae validae. Laminae cuneato oblongae acuminatae (— pedales medio 4 pollices latae). Spatha herbacea concava oblonga acuta solitaria subpollinaria. Spica elongata densissima. Pedunculus parce muriculatus. Bractee scarioso coriaceae, nervosae, oblongo-lanceolatae (4—2' longae). Ovaria (deflorata) cylindracea bracteis duplo — triplo longiora (adhuc) parce muriculata. Sepala ovata acuta, lateralia inaequalia, nervo medio carinata; tepala ligulata acuta apicem versus denticulata. Labellum sessile circulare denticulatum, callis ovatis in basi sub plica absconditis!! Gynostemium gracile, androclinium rotundatum apiculatum, fovea oblonga transversa; regio infrastigmatica angulata producta. Diess nach besseren Exemplaren. Peru. Ruiz, Pavon.)

cc. *Oliganthae* Rehb. fil. l. c. 711.

24. ELLEANTHUS OLIGANTHUS. *Evelyna oligantha* Pöpp. Endl. I. t. 57. p. 33:

E. spica terminali simplici, elongata; floribus distantibus; bracteis subulatis; foliis oblongis, acuminatis.

Crescit in sylvis montosis Peruviae versus Pampayaco ad terram locis siccioribus. Floret Februario.

Caules terrestres, erecti, apice interdum paullo laxi, inferne teretes, superne subcompressi vel obtuse et inaequaliter angulati ibique inter angulos sulcati, per totam longitudinem vaginati atque foliosi, bipedales, penna anserina tenuiores. Vaginae cylindricae, paullo inflatae, profunde nervoso sulcatae, glabrae secundum fissuram dorsalem brevem margine membranaceo, scarioso, undulato cinctae, caeterum integerrimae, seniores in griseum vergentes, circiter sesquipollicares vel paullo longiores. Folia cum vagina articulata, alterna, oblonga, superiora angustiora, inferiora latiora quandoque subrotundo oblonga, superiora angustiora, omnia in acumen longum attenuata, plana, nervis primariis septem ad novem percursa. Spica terminalis leviter flexuosa, elongata, simplicissima, haud imbricata, rhachide tenui, obscure angulosa, bracteata, digitum longa. Flores aurantio purpurei, invicem remoti, alterni distichi, patentes, sub anthesi bracteas aequantes rectas, subulatas, acutissimas, supra concavas, nervosas, rigidissimas, pungentes, pallidas, unifloras. Ovarium curvatum, cylindricum, glabrum, ipso flore paullisper longius. Sepala labello breviora, inaequalia; exteriora oblongo lanceolata, apice parum latiore ac rotundato in mucronem setiformem excurrente: interiora angustiora, mutica; infima labello supposita cum reliquis erecta, membranacea, glabra, nervosa. Labellum subrotundo obovatum uti in congeneribus circum columnam convolutum, ventricosum, margine paullisper reflexo lacinulato dentatum, caeterum glabrum. Columna inclusa, semiteres, medio pro stigmatē profunde excavata, processus supra labelli glandulas fornicati vix vestigia exhibens, nec basi pro iisdem recipiendis insignis cava. Antherae et pollinis fabrica uti in speciebus supra descriptis.

25. ELLEANTHUS GRACILIS *Evelyna gracilis* Rehb. fil. Linnaea. XXII. 1813.

26. ELLEANTHUS MACULATUS. *Evelyna maculata* Lindl. Pl. Hartwg. p. 149. 1844. Dec.

Caule simplici, foliis lanceolatis, sulcatis, racemo laxo aperto, bracteis longissimis canaliculatis acuminatis furfuraceis. — *E. oliganthæ* affinis.

In Cordillera prope Loxa.

27. ELLEANTHUS AURANTIACUS. *Evelyna aurantiaca* Lindl. p. Pl. Hartwg. 149. 1844. Dc. Nr. 843:

Caule ramosissimo, foliis lanceolatis acuminatis strictis, racemo laxo, bracteis ovatis acutis concavis pedicellis aequalibus. — Flores aurantiaci. *E. oliganthæ* magnitudine.

In montibus Paccha.

dd. *Ensatae* Rehb. fil. l. c. 711.

— Occurrunt simplices ac ramosae. —

28. ELLEANTHUS RHODOLEPIS. *Evelyna rhodolepis* Rehb. fil. in v. Schldl. B. Z. 1852. 711:

Simplex(?), caule gracili, rigido, vaginis longis arpophyllaceis, foliis lineari-lanceolatis, acuminatis, rigido-coriaceis, nervosissimis, folii floralis vagina ampla, lamina lancea, spica nutante (semper?), rhachi densissime papillis muriculatis obsita, bracteis oblongis attenuatis acutiusculis, coriaceo-scariosis, parce papilliferis, flores excedentibus, roseis (in sicca adhuc!), ovariis densissime papillosis, perigonio externo extus parce papillifero, phyllo summo ovali acuto, lateralibus externis lanceolatis acutis excavatis, lateralibus internis ligulatis apice hinc denticulatis, lunatis (!), labello orbiculari, lateribus integris baseos involutis, apice fimbriato dentato, callis baseos maximis, gynostemio utrinque apicem versus angulato-alato, androclinii limbo retuso, integerrimo seu medio minute unidentato, processu rostellari transverse retuso, nunc medio dentato. Peru.

29. ELLEANTHUS HALLII. *Evelyna Hallii* Rehb. fil. in v. Schldl. B. Z. 1852. 711:

Ramosa, vaginis arpophyllaceis, foliis lanceolatis acuminatis, apice retusiusculus, coriaceo-pergameneis, nervosis, folii floralis vagina excavata, apice foliacea, spica abbreviata, bracteis oblongis, acuto-acuminatis, concavis, laevibus, scariosis, flores superantibus, ovariis papillis muriculatis oblectis, perigonii phyllis externis lanceolatis argute acuto-acuminatis, lateralibus internis ligulatis, obtusis, labello phylla reliqua excedente, rhombeo, dimidio anteriori majori, ciliato-dentato, callis baseos compressis oblongis erectis.

Hat Aehnlichkeit mit der einfachstenglichen *E. ensata*, deren Deckblätter langespitzt, mit Papillen bedeckt sind, anderer Momente nicht zu gedenken. Berge um Tunguragua. 1300—1600'. Hall.

30. ELLEANTHUS ENSATUS. *Evelyna ensata* Lindl. Orch. Lind. 1846. p. 12. Nr. 64:

Simplicicaulis, vaginis apice verrucosis, foliis linearilanceolatis rigidis acutis multinerviis, racemo oblongo multifloro, folio florali ventricosum, bracteis ovatis setaceo-acuminatis floribus longioribus, labello medio constricto apice rotundato apiculato, callis 2 angustis acuminatis in fundo concavo.

„Terrestrial Sierra Nevada, at the height of 8000'. Aug. Flowers in spikes bright carmine (Nr. 664.) Leaves 6' long and scarcely more than half an inch broad. Raceme 2½ inches long, nodding.

Rehb. fil. Bpl. III. 69. Dunkelrosa Blumen. Drei und einen halben Fuss hoch. 5000'. Ocaña. Wagner.

ee. *Columnares* Rchb. fil. l. c. 711.

31. ELLEANTHUS BONPLANDI. *Evelyna Bonplandi* Rchb. fil. in v. Schld. B. Z. 1852. 711 :

Simplex, validissima, caule calamo aquilino crassiore, vaginis nervosis, ceterum laevibus, foliis oblongo-lanceolatis acutiusculis valde nervosis, coriaceis, spica 5-pollicari, cylindracea, plurimiflora, densissima, spathis oblongis acutis excavatis scariosis, ochraceis, apice atropurpureis, flores excedentibus, ovariis glabris, perigonii phyllis externis triangulis acutis, lateralibus internis linearibus, acutis, labello obtuse rhombeo-orbiculari, antice minute crispulo, ante basin constricto, callis basilaribus minutis.

Von *E. strobilifera* Pöpp. Endl. durch Gestalt der Lippe und mehrere Spathae gut unterschieden. Dagegen hat *E. lupulina* Lindl. papillöse Fruchtknoten, schmalere Deckblätter, grosse Lippenbuckel u. s. w. Aus Hrn. Bonpland's Sammlung. (Berl. Museum.)

32. ELLEANTHUS LUPULINUS. *Evelyna lupulina* Lindl. Orchid. Lind. 1846. p. 11. N. 63 :

Simplicicaulis, vaginis brevibus scabridis, foliis multinerviis acutis, racemo oblongo obtuso multifloro, foliis floralibus basi ventricosis, bracteis linearilanceolatis apice dilatatis floribus duplo longioribus, labello medio constricto apice rotundato callo magno didymo in fundo concavo.

„A terrestrial plant from the vicinity of the Paramo of the Sierra Nevada at the height of 10,000'. Aug. Plant 4—5' high. Flowers rose coloured in spikes. (N. 642). Raceme very compact, 4" long. Bracts very long and narrow.

33. ELLEANTHUS COLUMNARIS. *Evelyna columnaris* Lindl. Orch. Linden. 1846. p. 11 : N. 62 :

Simplicicaulis, vaginis laevibus, foliis lanceolatis, multinerviis acuminatis abrupte acutis, racemis oblongis elongatis compactis obtusis multifloris, bracteis membranaceis obtusis, labello apice ovato integerrimo basi bifoveato calloso.

„A large terrestrial species 3—4' high. Agua de Obispo and Sierra Nevada at the height of 9000'. May to August. Flowers white and purple in spikes.“ (N. 620).

Leaves one foot long, and nearly two inches broad. Racemes between 4—5 inches long, with the lowest bract leafy. Near *E. strobilifera*.

Rchb. fl. Bpl. II. 282: foliis oblongis acuminatis nervosis, spathis sub spica scariosis 2, labello rhombeo acuto antice denticulato, callis in basi geminis, ditone inter et ante callos incrassata, gynostemio utrinque acutangulo, mentulo sub fovea. — Planta bipedalis. Caulis calamum aquilinum crassus. Folia evoluta quatuor. Vaginae subtiliter nervosulae. Laminae oblongae acuminatae nitidae, bene nervosae 6—7 pollices longae, supra basin 2,5 pollices latae. Folia subspathacea 2 parva sub inflorescentia conico-cylindracea, tri—quadripollicaria. Bracteae oblongae acutae flores aequantes. Ovaria laevia. Sepala triangulo ovata apiculata. Tepala linearia apice acutiusculo lobulata. Labellum cucullatum, flabellatum, antice ovotriangulum serrulatum. Ditio antecallina incrassata. Calli 2 depresso pyriformes approximati. Gynostemium gracile utrinque pone foveam angulatum, mentulum minutum. — Blüten rosa. — Pamplona: la Baja. 8000'. Januar. 1173. Schlim.

34. ELLEANTHUS STROBILIFER. *Evelyna strobilifera* Pöpp. Endl. Nov. Gen. et Sp. p. 32

E. spica terminali cylindrica, densa; bracteis ovalibus arcte imbricatis; labello denticulato, margine ciliato, foliis ovato oblongis acuminatis, planis. — Crescit in rupibus aridioribus dumeta formans una cum Sobraliis versus Cuchero, Cassapillo etc. Floret Januario.

Caules terrestres, stricti, simplicissimi, inferne teretiusculi, compressi, obtuse ancipites, superne tetragoni, sulcati, glabri, rigidi, vaginati, valde foliosi, quinque ad septem pedes alti, calami anserini crassitie, basi crassiores. Vaginae cylindricae vel compresso subteretes, apice ventricoso latiores, uno latere ad tertiam longitudinis suae partem fissae, ore obliquo truncatae et margine membranaceo, ex sicco, undulato terminatae, elevato striatae, sulcatae, glabrae, pollices duos longae. Folia cum margine vaginae transversim articulata, alterna, latissime ovalia, in acumen sensim producta, basi concava subsemiauriculata, plana, integerrima, nervis percurta parallelis, primariis novem vel undecim utrinque prominentibus, subtus valde carinatis atque stramineis, secundariis numerosissimis, caeterum glabra, nitida, rigida, chartacea, obscure viridia, pollices septem ad octo longa, duos et dimidium lata. Spica in caulis extimo apice utplurimum bis vel ter geniculato sessilis, strobilum refert nec non Amomis nonnullis peruvianis simillima, erecta cylindrica, bracteata, vagina ultima caulis admodum ventricosa suffulta, digitum ad spithamam longa, pollicis diametro transversali. Bractee arcte imbricatae, erectae, adpressae, acutae, membranaceae, purpurascenti virides, glabrae, inaequales, inferiores latiores ovato oblongae, convexae, superiores oblongae, dorso magis planae, unaquaevis florem fovens. Ovarium curvatum, cylindricum, vix apice paulo incrassatum, glabrum. Flores majores ac in specie praecedente, caeterum simillimi, bracteam longitudine haud excedentes, versicolores, primum nivei, deinde flavi, tandem purpurei in eadem spica occurrunt variis hisce coloribus secundum aetatem tincti. Sepala libera, erecta, lanceolata, acuta, labello breviora, subaequalia, interiora parumper angustiora. Labelli circum columnam in tubum infundibuliformem postice fissum convoluti lanina dum vi explicatur late obovato spatulata, leviter obcordata, denticulato ciliata. Glandulae duae magnae, albae, globosae, dorso basi saccatae labelli intus adnatae. Columnae erectae, inclusae apice nuda processu anticus intermedium paulo minus prominens ac in *E. capitata*, unde fovea ab eodem fornicata, glandulis labelli recipiendis apta multo minor evadit. Antherae fabrica omni modo ut in specie priore.

35. ELLEANTHUS AUREUS. *Evelyna aurea* Pöpp. (Endl. l. c. tab. 57. p. 33.)

E. spica terminali subovali, densa; bracteis oblongis, laxè imbricatis; labello denticulato, margine glabro; foliis distichis, oblongo lanceolatis, acuminatis, rigidissimis, plicatis. — Crescit in Peruviae montibus aridioribus herbidis et in rupibus calcareis versus praedium Cassapi. Floret sub finem mensis Februarii.

Herba terrestris, perennis, erecta, omnibus praeter flores partibus rigidissima, fragilis. Radices paucae, simplices. Caules compresso teretes, superne fere cylindrici, glabri, vaginati, basi ad medium usque foliis destituti, rigidi, sesquipedales. Vaginae cylindricae, dorso paulo carinatae, antice ad medium fissae, ore rotundatae, profunde sulcatae, glabrae, pollices unum et dimidium longae. Folia alterna disticha, erecto patentia, cum vagina articulata, oblongo lanceolata, acuminata, integerrima, complicata, plicato nervosa, inter nervos primarios septem vel octo subtus valde prominentes, profunde sulcata, rigidissima, viridia, exsucca, pollicibus quatuor rariter longiora, pollice paulo angustiora. Spica terminalis solitaria, circuitu anguste ovalis, bipollicaris, bracteis laxè imbricata apicem versus minoribus, intimis ex vaginis terminalibus ortis foliaceis, late ovalibus, superioribus oblongis, omnibus obtuse acutis, margine membranaceo, undulato cinctis, glabris, tenuiter striatis, rigidis, dorso parum convexis, intus florem solitarium foventibus, albis. Flores magnitudine et reliquis notis ut in *E. strobilifera*, excepto labello cujus margo lacinulis inaequalibus denticulatus intus haud villosus nec pube ciliata praeditus observatur ut in altera specie habitu simili; colore quoque diversi sepala dilute purpurea et labellum aureum, intus rubro croceo monstrant. Labelli basis minus saccata, glandulas congenerum fovet. Columna medio quidem admodum tumida ac basin versus excavata processu magno *E. capitatae* orbata observatur. Anthera et pollinis massae ab supra descriptis nullo modo recedunt.

36. *ELLEANTHUS HAEMATOXANTHUS*. *Evelyna haematoxantha* Rehb. fil. Bpl. II. 238: aff. *E. aureae*: foliis pergameneocharlaceis nec subcoriaceis duplo latioribus, gynostemio utrinque sub apice acutangulo nec medio, plica per labellum, bracteis latioribus.

(Obs. *E. lupulina* Lindl. bracteas habet apice dilatas floribus duplo longiores.) — Caulis calamum aquilinum crassus, subbipedalis. Folia 4. Vaginae nervosae cicatricibus rotundis hinc illinc depressis. Folium quintum parvum vaginans. Racemus strobilinus conicus densus. Vaginae 2 scariosae ovatae acutae in basi. Bracteae oblongae acutae nervosae flores aequantes. Ovaria minutissime muriculata. Sepala triangula apiculata, lateralia extus carinata. Tepala linearia nunc subfalcata; apice obtusiuscula. Labellum late flabellatum, apice semiovato productum, fimbriato denticulatum, nunc trilobum. Plica transversa per discum. Calli gemini in basi. Gynostemium crassum labello paulo brevius; angulus acutangulus utrinque in latere; rostellum cordatum apiculo in medio interjecto; mentulum gyrosum sub fovea. Blüthen roth mit gelber Lippe. Ocanna. Juli. 4000'. Nr. 25. Schlim.

1398. b. *AMBLOSTOMA* Scheidw.

Otto und Dietrich Allg. Gartenz. 1838. 383.

Perianthium subconnivens. Sepala aequalia, basi connata, concava, apice inflexa. Petala angustiora, reflexa. Labellum cuneiforme, intus bicristatum, cum columna truncata in urceolum connatum; pars libera ascendens digitatotrifida. Anthera applanata late cordata, obtusa, quadrilocellaris; pollinia 4, sphaerice per paria cohaerentia.

AMBLOSTOMA TRIDACTYLUM Rehb. fil. Huc: *Epidendrum tridactylum* Lindl. in B. R. XXIV. Misc. 81:

Caulis fusiformi gracili apice distiche folioso, foliis anguste oblongis apice paulo angustatis obtusis cum mucronulo, spica terminali tripartita multiflora foliis longiore, sepalis subrotundo-ovatis patentibus incurvis lateralibus majoribus, petalis spathulatis linearibus apice incurvis, labello ascendente tripartito basi bicalloso: laciniis linearibus carnosulis lateralibus margine involutis intermedia breviora plana, columna brevi crassa cuneata labello omnino adnata.

A curious Brazilian Orchid with smaller flowers, than any other species of the genus yet in the gardens. I am obliged for it to Stephen Cannon, Esq. of Stratford Green. The flowers are a pale brownish yellow, except the column, which is green, short, thick, and wedge shaped. Flowered in the stove in May, for the first time.

Lindl. Folia *Epidendrum* Nr. 290: Wild in Brazil, in dense tufts on large trees in the Organ Mountains. Gardner 626. The reputed country of this, viz. Mexico, is no doubt a Garden error.

Huc: *Amblostoma cernua* Scheidw. l. c.:

Caulis herbaceus, erectus, simplex, foliosus, articulatus, basi vaginatus. Folia lanceolata, sessilia, subcoriacea, obtusa, subcarinata, mucronata. Flores in apice caulis, racemosi, parvi, alterni, pedicellati, bracteati. Racemi simplices vel subramosi, cernui. Sepala concava, coniventia, intus purpureo punctata. Labellum et petala flavescientia.

Aus dem kriechenden Rhizom treiben mehrere einfache gegliederte Stängel von 1' Länge. Ueber der Wurzel sind dieselben so dick wie Rabenfedern; gegen die Mitte nimmt die Dicke zu und ganz oben nimmt sie wieder ab. Fünf bis sechs Blätter stehen wechselsweise an den obern Gliedern. Die untern sind von trockenem

weisslichen Scheiden umgeben. Nach dem Verblühen oder mit dem Alter sterben die Blätter selbst des obern Theils der Stängel ab und hinterlassen den untern Theil in Gestalt eines länglichen, etwas gebogenen Pseudobulbus zurück, welcher theils nackt ist, theils mit den Ueberresten der Scheiden umgeben bleibt. — Die Blätter sind lineal-lanzettlich, 3—4 Linien breit, 4—5 Zoll lang, oben stumpf mit Stachelspitzchen, hellgrün und auf dem Rücken mit etwas vorstehender Mittelrippe. Blumen stehen abwechselnd in überhängenden, einfachen oder ästigen Aehren. Blumenstiele kurz, an der Basis mit kleinem schuppenartigen Nebenblatt. Blume hat $1\frac{1}{2}$ Linie im Durchmesser. Aeusserer Blumenblätter gegen einander geneigt, hohl, inwendig fein rothbraun punkirt, äusserlich schmutzig gelb, innere schmal, zurückgebogen, mit Spitze wie ein Haken einwärts gebogen, gelb. Labellum keilförmig, unten glatt, inwendig mit zwei kammförmigen, erhabenen Linien. Aeusserer Band ist fingerförmig, in drei Theile getheilt, einwärts gekrümmt. Gynostemium kurz, vorn gestutzt, mit Labellum zu becherförmigem Körper verwachsen. Anthere vierfächerig, platt, stumpf, herzförmig. Pollenmassen vier, je zwei mit Fäden verbunden. — Aus Mexico eingeführt. Blühte bei Herrn van der Maelen.

Huc etiam: *Sarcadenia gracilis* H. Paris.

1400. **ORNITHIDIUM** Salisb.

Hort. Trans. I. 293.

I. Rhizomate repente pseudobulbifero.

1. ORNITHIDIUM SOPHRONITIS Rehb. fl. Bonpl. II. 18:

Rhizomate repente ramoso squamis oblongis acutis nervosis carinatis vestito, squama sexta pseudobulbifera, pseudobulbo oblongo pyriformi foliis quaternis suffulto, folio infimo squamaeformi arpophyllaceo, insequente apice parvilaminato, summis laminis oblongis apice inaequali acutiusculis praeditis, folio apicilari cuneato ligulato apice bilobulo, pedunculis solitariis nunc geminis axillaribus in foliis fultientibus univaginatibus, sepalis ovatis acutis, tepalis rhombeis obtusis plusquam duplo minoribus, labello unguiculato trilobo erecto, lobis lateralibus quadratis seu triangulis obtusangulis, lobo mediano triangulo seu subcordato acutiusculo refracto, callo magno in disco inter lobos laterales, gynostemio gracili apice utrinque angulato, cum labello synarthrosi juncto, rostello trilobo.

Ein liebliches Pflänzchen, welches im Hochgebirge prächtige Rasen bildet. Die Blüten, grösser als die einer grossblüthigen Sophronitis pterocarpa, sind brennend roth („as red as a soldiers jacket“), die Lippe gelb, der Mittellappen mit einer rothen Linie rings vor dem Saume. Tovar. Juli. Moritz. 863, Guareima. Juli 1844. 4000'. Wagerer.

II. Rhizomate erecto seu ascendente.

a. Labellum bene unguiculatum.

— Ebulbes visae. —

2. ORNITHIDIUM AGGREGATUM Rehb. fl. Bonpl. II. 18, (*Dendrobium aggregatum* Kunth. Hb. Epl. I. 358. *Maxillaria*? aggregata Lindl. O. 151):

Caulescens, caulibus validis radicanibus ramosis, ramulis vaginis valde arpophyllaceis tectis, foliis summis adhuc laminiferis, vaginis dilatatis arpophyllaceis, laminis oblongis utrinque attenuatis, apice subinaequalibus, valde coriaceis, floribus ex vaginarum axillis fasciculatis, illis O. miniati paulo minoribus, bracteis scariosis, lanceis ovariiis pedicellatis quintuplo brevioribus, perigonio carnoso, sepalis ovatis acutis,

tepals ligulatis acutis, labello erecto primum lineariligulato canaliculato, dein in laminam cordatam plica in unguem transeuntem dilatato, gynostemii androclinio tricorni, tabula prominula in gynostemii basi.

3. *ORNITHIDIUM DISTICHUM* Lindl. sp. Benth. Pl. Hartwg. p. 153:

Rhizomate sarmentoso lignoso, foliis distichis carnosis lineari-oblongis, obsolete serrulatis, sepalis glabris, labello unguiculato, ovato recurvo apice undulato per axin carnosum. Folia sesquipollicaria. Radices longae durae simplices.

In arboribus prope Loxa.

4. *ORNITHIDIUM GIGANTEUM* Lindl. sp. in Benth. Pl. Hartwg. p. 153. Aug. 1845:

Caule erecto crasso folioso, foliis distichis ensiformibus equitantibus, labello unguiculato laevi ovato cucullato sub apice cavo mucronato et calloso, petalis obovatis obtusis sub apice carnosis.

4—6 pedes altum, in terram, in praeruptis humidis Cordillerae juxta Loxa.

5. *ORNITHIDIUM SERRULATUM* Lindl. sp. in Benth. Pl. Hartwg. 153. Aug. 1845:

Caule erecto ramoso, foliis lineari-oblongis apiculatis serrulatis, sepalis basi connatis, labello sigmoideo apice carinato concavo per axin carnosum, margine inmembranaceo. Ovarium triquetrum subrostratum.

Cordillera: Loxa.

6. *ORNITHIDIUM AUREUM* Pöpp. Endl. N. Gen. et Sp. I. p. 57. Tab. XCVI:

O. foliis imbricato vaginantibus, ensiformibus, acutissimis; pedunculis axillaribus fasciculatis, nutantibus; sepalis obtusissimis; labello apice incrassato. Crescit in Peruviae transandinae sylvis montosis ad praedium Pampayaco. Floret Februario.

Caules ex eadem radice simplices, parasitica arborum excelsiorum plures, tres ad quinque pedes longi digitum rassi, decumbentes, extremo apice ascendentes, simplices, interdum radicales repentes subter exserentes lignosi, vaginis emortuis vestiti, inferne nudi, teretes, apice modo foliosi ac floridi, compressi, bulbis uti videtur expertes. Vaginae terminales distichae, arcte imbricatae, approximatae, compressae ancipites, basi amplexicaules, vix patentes, apice oblique truncatae, angulo anteriore superiore in acumen excurrentes, planae, nervis obtuse elevatis percursae, coriaceae, rigidae, laevissimae, nitidae, virides. Folia cum apice vaginarum truncato articulata, caduca, ima basi vaginantia, compressa, ancipitia, superne plana, inferiora patentia, superiora erecta, terminalia stricta, omnia ensiformia, acutissima, apice integerrima, nervis percursa decem ad duodecim, utrinque prominentibus, primario reliquis paulo crassiore, subcoriacea, glabra, laevia, nitidissima, pulchre viridia, pedem longa vel parum breviora, pollice uno paulo angustiora. Pedunculi sex ad decem ex imis vaginarum axillis nati, fasciculati, inaequales, sub anthesi nutantes, teretes, tenues, articulati, recti nec flexuosi, uniflori, vaginati, bracteati, duos ad quatuor pollices longi. Squamae ad fasciculorum basin ovatae vel oblongae, acutae, erectae, magnae, membranaceo emarcescentes, pellucidae, tenues, nervosae, badiacae. Vaginae in inferiore pedunculi parte natae cylindricae, integrae, acuminatae, mucronatae, adpressae, tenues, membranaceae, ad medium pedunculum usque prolongatae. Bracteola minuta sub ovario, semiamplexicaulis, subrotunda, acuta, concava, margine membranacea. Ovarium teres, basi incrassatum, glabrum, exsiccatione atrum. Perianthium rectum haud resupinatum, aureum, junius flavum, globoso campanulatum, nucleum cerasi magnitudine circiter aequans. Sepala erecta, dorso convexa, apice conniventia, ovata, vel ovato oblonga, lata, obtusa, sessilia, invicem libera: exteriora subaequalia, interioribus paulo breviora. Labellum ante columnae basin accretum, medio geniculatum, inferne angustatum et utrinque auriculatum, superne dilatatum, subrotundum, lobulo terminali ovato appendiculatum, auriculis lobisque columnam amplectens, concavum integerrimum, glabrum, membranaceum. Columna labello bre-

vior, reclinata, semiteres, subcylindrica, apice parumper incrassata, sessilis, haud in processum basilem protensa, fovea terminali antherae destinata paullo obliqua ac postice spectante, marginata, caeterum nuda. Stigma subterminale, antice obliquum margine baseos prominente, utrinque ala trigona, acuta, membranacea patente. Anthera depresso plana, ad medium dorsum usque carinata. Pollinis massae bigeninae, aequales haud cavae nec vaginantes, parallelo laterales.

— Pseudobulbiferae. —

7. ORNITHIDIUM DENSUM Rehb. fil. Bonpl. III. 217. *Maxillaria densa* Lindl.:

Perigonii sepala lanceolata acuminata, lateralia labello supposita. Tepala lanceolata duplo minora. Labellum arrectum ab ungue immobili ac gynostemio producto, trilobum; lobi laterales trianguli postici, erecti, lobus medius ligulatus (hinc poteris labellum dicere obtuse sagittatum) carina obtusa semilunata transversa inter lobos laterales foveam mucosam antice cingens quae unguem usque producitur. Gynostemium semiteres. Androclinium immersum apice fissum supra foveam obtuse triangulam utrinque brachiato productum. Anguli gynostemii laterales pone rostellum paulo retrorsi. Anthera obtuse conica cum apiculo. Pollinia sphaeroidea aequalia flava. Caudicula linearis cum glandula molli.

Huc: *Maxillaria densa* Lind. B. Reg. 1836. XXI. 1804:

Pseudobulbis oblongis compressis axillaribus monophyllis, foliis oblongo-lanceolatis obtusis emarginatis, racemis axillaribus densissime aggregatis, bracteis cucullatis, perianthiis bilabiatis, sepalis carinatis lineari lanceolatis acuminatis, petalis paulo minoribus, labello oblongo indiviso apice recurvo et canaliculato, medio linea transversa elevata.

Mexico.

8. ORNITHIDIUM TAFALLAE Rehb. fil. Bonpl. II. 18. (*Scaphyglottis Tafallae* Rehb. fil. Linnaea XXII. 855):

Eine Nectargrube am Grunde der kolbigen Säule. Meine Beschreibung ist ganz richtig, allein zu einer Zeit niedergeschrieben, wo mir die gespenstische Endlicher-Pöppigsche Gattung *Scaphyglottis* etwas zu sein schien, während sie mir jetzt nichts ist, als ein Gemengsel von *Ponera* und *Ornithidium*, sowie *Isochilus* R. Br. eine *Farrago* von *Isochilus* und *Ponera*. Jedenfalls gehört hierher auch die *Scaphyglottis pendula* Endl. Pöpp. Legt man Exemplare von Ruiz und Pavon und Pöppig neben einander, so bezeichne man sie ja vorher: es ist ganz unmöglich, sie zu unterscheiden. Wo der letztgenannte Sammler seine Details schöpfte, die von den meinen bei *Sc. Tafallae* so himmelweit verschieden sind, weiss ich nicht. In der Kapsel, die bei den Originalen Pöppigs liegt, finden sich auf einem Stück Visitenkarte 2 halb reife spindelförmige Fruchtknoten mit Säule und zerstörtem Perigon, dazu die Notiz „Dinema“).

b. Labellum sessile seu subsessile.

— Ebulbes visae. —

9. ORNITHIDIUM NUBIGENUM:

Caule crasso, vaginis membranaceo praecinctis ceterum coriaceis lanceis acuminatis, sepalis oblongis acutis, tepalis angustioribus, labello cuneato obovato apice in ligulam cochlearem apice involuto emarginatam expanso, tumore altero in basi, altero in disco, columna crassa.

Pamplona les Vejas 1848. Funck und Schlim. (Herb. Lindl. Rehb. fil.)

10. ORNITHIDIUM SEMISCABRUM Lindl. in Benth. Pl. Hartweg. pg. 153. Aug. 1845 :

Rhizomate sarmentoso lignoso, foliis ensiformibus in bulbum solitariis serrulatis apice obliquis, sepalis apice scabris, labello oblongo obtuso sub apice undulato calloso. — Folia recta, 4—5 pollices longa, radices longae durae simplices.

In montibus Paccha.

11. ORNITHIDIUM BICOLOR Lindl. sp. in Benth. Pl. Hartweg. p. 153. Aug. 1845 :

Foliis lanceolatis scapo simplici paucifloro flexuoso subaequalibus, sepalis petalisque ovatis acutis subundulatis aequalibus, labello unguiculato obovato apiculato basi obtuso, denticulis quibusdam (6) in unguem, columnae brevis alis decurvis serratis. — Flores violacei labello magno luteo.

Prope Limam. (Non ab Hartweg lectum).

12. ORNITHIDIUM NIVEUM Lindl. Orch. Lind. 1846. p. 20 :

Foliis oblongis obtusis margine scabris, sepalis acuminatis, petalis acutis membranaceis, labello apice oblongo apiculato piloso, columnae facie pubescente.

„Terrestrial from the forests of Jaji in Merida, at the height of 6000—7000'. July. Pseudobulbs roundish, oval, compressed. Flowers small, entirely white.“ Nr. 1476.

13. ORNITHIDIUM SANGUIOLENTUM Lindl. Orchid. Lind. 1846. Nr. 117. p. 22 :

Foliis oblongis obtusis margine scabris, sepalis acuminatis, petalis acutis membranaceis, labello apice ovato acuminato undulato pubescente, columnae facie pubescente.]

„In habit like *O. coccineum*. Flowers bright yellow, with a bloodred spot on the lip. Damp forests in the neighbourhood of Merida at the height of 5500. Jun. Juli. (N. 640.) Perhaps a variety of the last (*Ornithidium niveum*).

ORNITHIDIUM SANGUIOLENTUM Lindl. (*O. serrulatum* Lindl.? (sic!) β . acuminatum: perigonii phyllis externis acuminatis, labello ia disco bicornuto“ Rehb. fl. in Linnaea). Rehb. fl. in Bonpl. II. 18:

Ich bin durch einen Glückszufall, endlich [zur richtigen Bestimmung gelangt: Herrn Wageners Exemplar ist so schnell getrocknet, dass der rothe Fleck auf der Lippe erhalten ist. („Flowers bright yellow, with a bloodred spot on the lip“). Dazu liegt mir Herrn Lindens citirte Nr. 640 vor. Es heisst Orchid. Lind 22: labello apice ovato acuminato undulato pubescente. Ich sehe weder Wellenrand noch Behaarung, aber zwei grosse Hörnerschwielen auf der Mitte, zwischen ihnen zwei kleinere: das wäre zu erwähnen gewesen!! (Hierher Moritz 1072, 1077). Merida. 6000'. Wagener.

— Pseudobulbiferae. —

14. ORNITHIDIUM RUBERRIMUM Rehb. fl. Huc: *Scaphyglottis ruberrima* Lindl. Pl. Lindl. 1846. p. 22. N. 113 :

Foliis lineari oblongis obtusis oblique emarginatis, pedunculis unifloris bractea longioribus, sepalis ovatis acuminatis, petalis acutis, labello ovato recurvo obtuso undulato medio obsolete bilamellato.

An epiphyte with bright red flowers, from the forests near Merida, at the height of 5000'. July. (N. 667.)

Obs. Labellum non bilamellatum, sed callo ligulato instructum, cujus apex obtusus altius per labellum transgreditur. Illius margines tantum cl. Lindley vidit. Credo labello undulato ab insequenti diversum, licet valde affine.

15. ORNITHIDIUM JENISCHIANUM Rehb. fl. Bonpl. II. 18:

Caulescens, ramosum, caulibus basi gracilioribus apice clavatis, seu totis clavatis, seu internodio penultimo incrassato pseudobulbosis, pseudobulbo pyriformi (rotundato?) vaginato, vaginis membranaceis minutissime rugulosis ostio fissis triangulis, foliorum vaginis rudibus nervosis transverse rugulosis limbo membranaceo, laminis ligulatis apice subaequali obtuso seu bilobulo obtusis coriaceis, basi a radicibus adventitiis simplicibus ramosisve perforatis, pedunculis solitariis seu geminis ex axillis foliorum exsertis, vagina inferiori membranacea infundibulari retusa, dorso falcato apiculata, superiori lancea, sepalis tepalisque ovatis acutis, labello erecto, trilobulo, lobis lateralibus obtusangulis, lobo medio retuso subemarginato refracto, callo antice acuto seu obtuse bilobo in hujus basi, gynostemio erecto, synarthrosi cum labello juncto, apice trilobo, lobis lateralibus porrectis, rostello inermi exciso semilunato, fovea stigmatica triangula, polliniorum caudicula ligulata cornea.

Eine prächtige Pflanze mit schönem, bis 2 Zoll langen Laube, das mit dem indischer Formen verglichen werden kann. Die Blüten wenig kleiner als die des *O. Sophronitis*, brennend roth, innerlich heller, die Lippe violett. Als *Ornithidium* ist die Pflanze unbeschrieben. Es existirt jedoch eine gewisse *Scaphyglottis ruberrima* Lindl., deren eben so dürftige, als weit umfassende Definition einer Masse Arten angepasst werden könnte, ohne alle Garantie richtiger Bestimmung. Es ist aber höchst unwahrscheinlich, dass diese gemeint wurde. Herrn Senator Jenisch gewidmet. Die *Ornithidien* sind lange noch nicht genügend von unsern Sammlern berücksichtigt; sie enthalten Gestalten von indischem Typus, so ist das *O. giganteum*, eine Entdeckung Humboldt's, ein Gewächs, dessen Laub es an Schönheit mit dem jeder *Vanda* aufnimmt. Truxillo. 7000'. Januar. Wagener.

16. ORNITHIDIUM MULTICAULE Rehb. fl. Bonpl. II. 18:

So ist in Zukunft der *Siagonanthus multicaulis* Endl. Pöpp. zu bezeichnen. Die Hakenleiste unterseits der Lippe existirt nicht.

SIAGONANTHUS MULTICAULIS Endl. Pöpp. N. G. et Sp. Pl.:

sepala superiora erecta, inferiora patula, cum processu columnae connata. Labellum adscendens, infractum, basi aequale. Columna basi breviter producta cum labelli ungue articulata. Anthera terminalis opercularis. Pollinis cereacei massae quatuor per paria connatae, caudicula brevi glandulae stigmatidis deltoideae adfixae. — Crescit cum praecedentibus (prope Pampayaco). Floret Februario.

Caulis sex ad decem basi juncti, radicibus numerosis repentibus arborum ramis affixi, penduli et parte inferiore adscendentes, vel in ramis prostrati, apice assurgente, strictissimo, simplices vel etiam divisi, teretes, vaginis vetustis, remotis vestiti, radiculam unam alteramve exerentes, cortice lacero, fibroso, emarcido, cinnamomeo, intus lignosi atque flavi, inferne digitum crassi, superne diametro pennam cygneam aequantes, apicem versus bulbos foliaque ferentes et vaginarum recentiorum et emortuarum mole capitato incrassati. Vaginae alternae, imbricatae, distichae, compressae, ancipites, apice truncato cum foliis articulatae ac angustiores, inferne latiores ac semiamplexicaules, adpressae, coriaceae, rigidissimae, striato nervosae, glaberrimae, laevigatae, pallidius virides, emortuae tandem badiae. Folia cum apice vaginarum articulata, incrassata, superne in laminam dilatata lineari oblongam, apice paulisper angustatam, obtusam mucronatam, vel leviter bifidam, laciniis interdum inaequalibus, obtusis, planam, multinervem, nervis supra prominulis, pallidis, subtus excepto intermedio haud conspicuis, laete viridem, rigidam, haud carnosam. Bulbus, dum adest, in apice caulis terminalis, ovatus, compressus nec anceps, angulis multis obtuse prominentibus ac totidem sulcis exaratus, extus coriaceus, laevis, intus carne viscida, viridi, insapida, inodora, apice vel nudus, vel folium solitarium reliquis con-

forme gerens, basi foliis caulinis vicinis vaginatus. Pedunculi axillares numerosi, fasciculati, uniflori, divaricati quandoque nutantes, inferne bracteis alternis, cylindricis vestiti, superne nudi, teretes, haud flexuosi, uniarticulati, pollice parum longiores. Ovarium cylindricum, tenue. Flores recti nec resupinati, mediocres, sordide albidii, labello roseo, sepalis infimis patulo deflexis, primo visu diversum genus indicare videntur. Sepala omnia plus minusve laxa, invicem haud contigua, acutiuscula: superiora tria erecta, supremum lineare lanceolatum, paullo convexum, interioribus convergentibus, inferne attenuatis, obliquis longius: infima cum processu columnae brevi subtus connata, basi truncata ovataque, apicem versus attenuata, obliqua, laxa, deflexa, inde sacci congenerum vix vestigia praebentia. Labellum cum columnae processu articulatum, ad mediam laminam ascendens, concavum, superne laxum, deflexum, lateribus revolutum, sepalis longius, obovato oblongum, integrum, obtusum, antice emarginatum, denticulatum, tenuissime ciliatum supra nudum, subtus carina ancipite, apicem versus in mucronem uncinatum, membranaceum excurrente armatum. Columna basi breviter producta, caeterum tenuis, curvata, apice incrassata, nuda, labelli parte ascendente longior, sepalis brevior, alba. Anthera galeam refereus, conica, obtuse apiculata, subdidyma, valde carnosa, intus bilocularis. Pollinis massae bigeminae, inaequales, majori minore, inferne subconnatae vaginante. Operculum glandulae stigmatis deltoidium, denticulatum.

17. ORNITHIDIUM MINIATUM Lind. Bot. Reg. XXXI. 1845. Misc. 65:

Caulescens, pseudobulbiferum, foliis oblongo-loratis patentibus apice oblique rotundatis mox margine serrulatis, floribus axillaribus laxe exsertis, pedunculis unifloris, sepalis petalisque ovatis acutis glabris, labello basi concavo nectarifero apice trilobo, laciniis lateralibus brevibus obtusis ascendentibus intermedia late ovata vel retusa subundulata.

Habit of *Ornithidium coccineum*, but it is much handsomer, having rich crimson flowers. Lip quite differently lobed and partially turned downwards: it is of yellow colour but edged and blotched with crimson. Columbia.

Ornithidium miniatum Lindl. Rehb. fil. in Bpl. II. 18. Caracas. Wagoner.

18. ORNITHIDIUM VESTITUM Rehb. III. *Cymbidium vestitum* Sw. *Camaridium vestitum* Lindl. Huc: *Ornithidium parviflorum* (*Scaphyglottis parviflora* Endl. Pöpp.) Rehb. fil. in Bonpl. II. 19:

Caulescens: caule repente, densissime paleaceo vaginato, hinc pseudobulbifero, radicibus ramosis tenuissimis, pseudobulbis oblongoligulatis compressis nunc diphyllis, foliis ligulatis utrinque attenuatis, apice acutiusculo retusis, vaginis stipantibus carinatis lanceis pseudobulbo ipsi subaequalibus, florum minorum fasciculis ex axillis vaginarum stipantium, pedunculis squamatis, bractea falcata flosculum subaequante, mento magno, sepalis oblongis acutis, tepalis angustioribus, labello a cuneata basi dilatato, medio trilobo, lobis lateralibus obtusangulis abbreviatis, lobo medio ligulato obtuso longe producto, carina transversa medio antice emarginata inter utrumque lobum lateralem, fovea in basi, gynostemio crasso, androclinio utroque angulo antice breviter brachiato, stigmatibus labio inferiore prominulo.

Blüthen weiss. Caracas. Wagoner. Auch in unsern Gärten nicht selten, z. B. als *Maxillaria ignea* (!) u. s. w.

MAXILLARIA EXIGUA Rgl. (*Sophronis ochroleuca* H. Petrop.) Ind. Hort. Petrop.:

Caulescens, caule radicante pseudo-bulbifero, vaginis membranaceis acutis vestito. Pseudobulbi ovati vel oblongi, compressi, ancipites, deinde sulcati, usque pollicem longi et ad $\frac{1}{2}$ pollicis lati, basi vaginis distichis convexis fulti, apice folium unicum ferentes. Folia lineari-lanceolata, acuta, coriacea, carinata, usque 3 pollices longa et $\frac{1}{2}$ pollicem lata. Racemi axillares 2—4-flori; pedunculo brevi, bracteis distichis imbricatis concavis acuminatis munito; floribus minimis, ochroleucis, immaculatis; pe-

dicellis bracteatis, bracteis lineari-lanceolatis membranaceis florem superantibus. Sepala ovata, vix acuta, patentia, lineam longa, lateralia columnae basi breviter conata, supremum lateralibus angustius. Petala ovato-lanceolata sepalis paullo breviora, erecto-patentia. Labellum e basi cuneata hastato-trilobum, petala aequans, lobis lateralibus incurvis, lobo intermedio sublinguaeformi obtuso, callo transverso basilari. Columna semiteres, aptera, brevis. Pollinia 2, bipartibilia. Maxillariae densae affinis et fortasse *M. prolifera* Fl. Peruv.

Huc: *Maxillaria surinamensis* Focke Mss.

19. ORNITHIDIUM COCCINEUM Salisb. l. c.

1401. **ACRIOPSIS** Reinw.

Bot. Zeit. 1825. v. 2. p. 4.

1. ACRIOPSIS JAVANICA Reinw. l. c. Huc: *Acriopsis picta* Lindl. B. Reg. XXIX. Misc. 105:

Pseudobulbis ovatis, foliis solitariis linearibus canaliculatis patulis, emarginatis, scapo paniculato, labello laciniis lateralibus triangularibus, intermedia elongata lineari disco bilamellato, columnae brachiis 2 glandulosis.

Small flowered, with the habit of *Sarcanthus pallidus*. — Flowers white and green with a dull purple stain at the point of the 4 segments of the perianth, and the same colour on the disk of the lip, leaving a white border all round.

Bantam, in the virgin forests of Datarbjaay and Bodjomanik on the river Tjileman obtained by Mr. Adolph Papeleu, one of the partners in Mr. Van Houttes Nursery.

2. ACRIOPSIS INDICA R. Wight Ic. V. t. 1851. 1748. 1:

Lip ovate, cordate, somewhat undulated, entire, without a crest.

Habitat? Two lateral sepals united. Antherbed covered by a vaulted membrana or veil.

3. ACRIOPSIS DENSIFLORA Lindl. B. Reg. 1847. sub 20:

Pseudobulbis ovalibus, racemis multifloris cylindraceutis pedicelli internodiis longioribus, labello pubescente panduriformi lacinia media rotundata subemarginata, lateralibus acutis; dente elevato fisso in medio, clinandrii cucullo integerrimo rotundato.

Flowers compactly in racemes 2" long. Small delicately marked with brown upon yellowish green, lip rose colour bordered with white.

Borneo. Lowe.

4. ACRIOPSIS GRIFFITHII Rehb. fl. Bonpl. II. p. 92:

aff. *A. densiflorae*: racemo rarifloro, labelli lobis lateralibus lobato triangularibus, lobi medii ligulati acuti in basi lamellis 2 subquadratis, androclinii cucullo retuso.

Acriopsis Griff. CCCXVIII. Affinis etiam *A. pictae*, quae recedit pseudobulbo monophyllo, panicula virgata, gynostemio gracili, labello altius inserto, lamellis brevioribus, labelli lobis lateralibus rotundatis.

1403. **ORNITHOCEPHALUS** Hook.

Exot. Flora t. 127.

a. Labellum abbreviatum duplo latius quam longum.

1. ORNITHOCEPHALUS BICORNIS: Lindl. in Belch. Voy. of the Sulphur 172. Cf. Walp. l. c. l. 781.

b. Labellum extensum latitudine sua bene longius.

† Apice acutum.

2. ORNITHOCEPHALUS GLADIATUS Hook. l. c.

3. ORNITHOCEPHALUS INFLEXUS Lind. Ann. Nat. Hist. IV. 1840. 384:

Sepalis acutissimis erectis carnosis, petalis rotundatis serrulatis, labello oblongo acuto concavo apice inflexo, margine baseos utrinque calloso.

Mexico. Hartweg.

Lindl. in Benth. pl. Hartwg. 72: Jochiapam inter Oaxaca et Veram Crucem Mexici. Hartweg. l. c. 93: in praeruptis prope Santa Rosa Mexici Hartweg.

Huc: ORNITHOCEPHALUS MEXICANUS Rich. et Gal. Ann. sc. nat. 1845. Jan. p. 24:

Foliis equitantibus gladiatis, spicis radicalibus folio brevioribus, labello ovali oblongo subacuto, lamina crassa concava aucto. Mexico.

4. ORNITHOCEPHALUS MYRTICOLA Lindl. Ann. nat. hist. IV. 1840. p. 383:

Racemo pendulo hispido, sepalis lateralibus petalisque rotundatis integerrimis reflexis ciliatis, labello cordato-lanceolato acuminato canaliculato, callis baseos marginantibus distinctis integerrimis.

Citri odorem spirat In Myrtaceis Brasiliae prope Bom Jesus de Bananal, Majo, Descourtilz.

A very curious plant with short pendulous racemes of small white flowers. Habit of *Oncidium iridifolium*.

5. ORNITHOCEPHALUS ELEPHAS Rehb. fl. Mss. 1854:

Foliis equitantibus ensiformibus acutis, rectis seu obliquis, pedunculos nunc aequantibus, pedunculis ancipitibus, tenuibus parcissime integri alatis, bracteis triangulis cordatis (nunc basi cuneatis!) minute denticulatis, abbreviatis, sepalo summo naviculari cucullato acutiusculo, sepalis lateralibus externis latosemilunatis apiculatis, tepalis late cuneato reniformibus denticulatis, labello basi bilamellato, lamellis erectis obtuse triangulis, lamina angusto lanceolata, acuto naviculari, ante lamellas erecta, lamellis multo longiori, columna curvula, androclinio immarginato, processu rostellari introrsum curvato. Guatemala am Fluss Torre 1332. Friedrichsthal (Wiener Museum!)

6. ORNITHOCEPHALUS IBIS Rehb. fl. Mss.:

Foliis equitantibus gladiatis cuneato oblongis obtuse acutis, radicibus hispidis, pedunculo paucifloro, bracteis cordato ovatis acutis limbo dorsoque calvis, ovariis pedicellatis ovato reniformibus limbo calvis, labelli auriculis triangulis angustis, lamina oblonga acuta, callo transverse ovato antice et postice emarginato, apiculo utrinque ad angulos laterales posticos. — Arima Trinit. Crueger.

7. ORNITHOCEPHALUS APICULATUS Lind. Ann. of nat. hist. IV. 1840. p. 383.:

Foliis racemo erecto denso multifloro multo brevioribus, petalis oblongis dentatis, labello ovato concavo basi sagittato integerrimo apiculo membranaceo acuto.

Peruvia. Pavon.

Very small, 2—3" high, with flowers apparently deep yellow.

8. ORNITHOCEPHALUS CHLOROLEUCUS Rehb. fl. Bonpl. III. 226:

aff. *myrticolae* Lindl.: labelli hypochilo ovato transverso carnosio in basi gynostemii utrinque semicordato medio paulo dentato; dente inflexo a medio antice in discum; epichilio membranaceo ligulato trinervi.

Folia genuina. Pedunculus gracilis hispidus. Bracteae naviculares carinatae acutae ovarii pedicellatis breviores, margine et carinae hispidae. Sepala oblongoligulata. — Perigonium album nervis viridibus.

Aus Brasilien eingeführt von Herrn Consul Schiller, cultivirt von Hrn. Stange.

9. ORNITHOCEPHALUS IRIDIFOLIUS Rehb. fil. Mss. 1854:

Foliis ensiformibus falcatis acutis medio dilatatis, pedunculos duplo superantibus, vaginis utrinque lato membranaceo alatis, alis apice acutiusculo assurgente denticulatis, pedunculis ancipitibus flexuosis alatis, alis hinc illinc denticulatis ex dorso bractearum carinatarum descendentibus, sepalis cuneato-ovatis acutis, concavis, tepalis duplo majoribus a basi late cuneata flabelliformibus, margine externo rotundato denticulatis, labelli abbreviati lato triangularis callis baseos rhombeis, extrorsum hinc dentatis, hinc inde papulosis lamina duplo brevioribus, at quovis callo labelli plusquam aequilato, columnae humilis processu rostellari lato, crasso, inferne carinato, stigmathe suprabasilaris, caudicula bis flexa: ante laminam basilem et ante apiculum glanduliferum; androclinio immarginato.

Die Blätter etwa 5 zöllig, in der Mitte $\frac{1}{3}$ Zoll breit. Die Blüten so gross, wie die der *Stelis grandiflora*.

Zacapan in Mexico. Leibold! Ein Exemplar in Alkohol.

10. ORNITHOCEPHALUS BONPLANDI Rehb. fil. Mss.:

Foliis ensiformibus subfalcatis acutis pedunculo brevioribus, pedunculis ancipitibus recurvis alatis, alis angustis denticulatis, bracteis triangulis, cordatis, subintegerrimis, sepalis oblongis apiculatis, tepalis a basi late cuneata flabellatis integerrimis, labelli callis obliquis obtuse triangulis retrorsis, erectis, lamina oblonga acuta, naviculari curvata.

Ex herb. Bonplandi.

†† Apice dilatatum.

11. ORNITHOCEPHALUS FALCATUS Focke Tidsch. Wis. Nat. Nat. Wetsch. I. 1848. 211:

Foliis distichis basi equitantibus cum basi articulatis dimidiato falcatis acutis glaucescentibus, sepalis orbiculatis mucronatis concavis retroflexis, supremo fornicato, petalis majoribus, spatulatis incurvis apiculatis, labello basi cordata solida medio constricto lamina oblonga apice rotundata conica incurva margine reflexa.

Herba parvula, epiphyta, acaulis. Radices pubescentes, teretes, albae. Folia disticha, basi equitanti, cum pede articulata, carnosa, dimidiato falcata acuta, subglauca, latere inferiore leviter canaliculata. Racemi axillares erecti, demum nantes, foliis longiores, bracteati, 4—9 flori. Bracteae persistentes alternae, amplexicaules, fere perfoliatae, patentes oblongo cordatae, acutae, marginibus et apice reflexae. Flores albi. Perianthium patens. Sepala orbiculata, mucronata, concava, retroflexa, supremum fornicatum, lateralia labello supposita, extus viridescencia, intus alba. Petala spatulata, sepalis majora, incurva, apiculata, alba. Labellum basi cordata solida laete viridi, medio constrictum, lamina oblonga obtusa concava incurva margine reflexa, alba. Columna erecta, brevis, longe rostrata. Rostellum subulatum cum labello parallelum. Anthera opercularis, sub 4 locularis rostello conformis. Pollinia 4, globosa, cruciatim caudiculae affixa. Caudicula longitudine rostellis lineari angusta apice cuneato dilatata, in rostello explanata. Glandula ovali-rotundata, in apice rostellis. Capsula ovata, triquetra, trilobata inter alas tricostatae in pedunculum brevem attenuata.

In Crescentia Cujote. Honoribo. Distr. Para. Oct.

12. ORNITHOCEPHALUS CILIATUS Lindl. Ann. nat. hist. IV. 1840. p. 384:

Sepalis petalisque latioribus membranaceis rotundatis reflexis ciliato-fimbriatis, labello carnosio cordato canaliculato acuminato apice dilatato obtuso membranaceo, rhachi hispida.

Demerara. Loddiges.

Nearly related to *Myrticola*, from which it diff. in its fringed pet. and in the dilated rounded membranous apex of its fleshy lip.

Hook. Lond. J. II. 1843. p. 672. British Guiana. Schomburgk!

13. ORNITHOCEPHALUS GRANDIFLORUS Lindl. Ann. sc. nat. hist. IV. 1840. p. 383:

Racemo erecto stricto glabro, bracteis oblongis obtusis herbaceis, petalis labelloque cymbiformi saccato denticulatis, basi cristata biloba transversa carnosae erosa aucto, clinandrio marginato denticulato.

Brasil, mont. Organ. Gardner 633.

Large yellow flowers. Fine sp. The leaves are oblong, obtuse, obscurely veined and apparently much thinner than is usual in this genus.

14. ORNITHOCEPHALUS KRUEGERI Rehb. fil. Mss.:

Foliis ensiformibus ligulatis apiculatis, radicibus calvis, pedunculo hispido sursum racemoso, bracteis triangulo navicularibus arctis supra nervum medium et limbo hispido papillois, ovariis pedicellatis hispido-papillois, sepalis tepalisque cuneato ovatis, serrulatis, sepalis extus papillois, labello trilobo, lobis posticis semiovatis angustissimis, lobo antico flabellato apice recluso serrulato dente medio maximo, callo cochleato intus tomentoso in basi labelli antice medio in dentem planum apice serrulatum excurrente.

Trinitatis Insula. Krüger.

15. ORNITHOCEPHALUS AVICULA Rehb. fil. Wulschlg. Mss.:

Foliis ensiformibus cuneato oblongis acutoacuminatis, radicibus parce papilloso muriculatis, pedunculo hispido sursum racemoso, bracteis ovato triangulis dorso ac limbo hispidulis, ovariis pedicellatis hispidopapillois, sepalis tepalisque bene majoribus cuneato ovatis, sepalis limbo parce serrulatis, dorso hinc papillois, tepalis limbo serrulatis, labello trilobo ligulato, lobis posticis prope oblitteratis, lamina antice ligulato flabellata antice emarginata cum apiculo.

Surinam. Wulschlaegel.

1404. **CIRRHAEA** Lindl.

Bot. Reg. 930. obiter sub *Rodriguezia secunda* H. B. Kth.

a. Labelli pars antica saccata.

1. CIRRHAEA SACCATA Lindl. Bot. Reg. XXV. Misc. 121. (1839.)

Pseudobulbis ovatis obtuse tetrapteris inter angulos costatis, foliis oblongis plicatis sub-septem-costatis in pseudobulbo, omnino sessilibus, scapo pendulo trigono; racemo multifloro, sepalis oblongis obtusis lateralibus margine revolutis, petalis lineari-lanceolatis obtusis basi teretibus compressis, labelli lobo medio galeato saccato.

Flowered in Woburn Abbey, Bedford. The middle lobe of labellum has very much the form of many *Satyræ*. General appearance of the other species, but its raceme is nearly a foot long, and the dull yellow green flowers are twice as large as those of any before discovered.

„Huc: *Cirrhæa fuscolutea*, Bot. Mag. which is a different plant.“

- Huc: *Cirrhaea fusco-lutea* Hook. Bot. Mag. 1840. 66. 373 b.:

Foliis lato-lanceolatis, petalis lineari lanceolatis, labelli lobo medio ovato concavo, lateralibus-oblongis reflexis hirsutis.

Huc: *Scleropteris* Scheidw. Allg. Gartenz. 1839. 407:

Perianthium patens Sepala libera, aequalia, membranacea. Petala multo angustiora, spatulata, cum columna parallela, carnosia. Labellum unguiculatum cum basi columnae continuum, saccatum, utrinque cornutum. Columna semiteres, arcuata compressa, apice truncata, anthera incumbens membranacea subbilocularis, dissepimentis incompletis, pollinia duo, elongata, compressa, caudicula elongata, obspathulata, glandula ovalis, rostellum longissimum gynizus appianatus exsuccus.

Scleropteris flava Scheidw. l. c.:

Pseudobulbis tetragonis monophyllis, foliis ovato-oblongis acuminatis, glabris, coriaceis, quinquenerviis, racemis radicalibus squamosis filiformibus pendulis, multifloris atropurpureis. Flores flavi, carnosi, labellum saccatum, apice purpureum.

Planta epiphyta Brasiliensis.

Aeuseres der *Acropera Loddigesii*. Pseudobulbus etwas zusammengedrückt. Blumentrauben wurzelständig, beschuppt, fadig, vielblumig, vollständig hängend, von schwarzbrauner Farbe. Aeussere Hüllblätter ausgebreitet, obere etwas breiter als seitenständige, innere spatelförmig, dick fleischig, etwas gebogen, dieselbe Richtung mit Säule. Das Labellum an der Basis verschmälert, an der Spitze sackförmig, und hat an jeder Seite ein nach der Basis zurückgekrümmtes Horn. Hauptsäule ist halbrund, zusammengedrückt, gebogen, mit Labellum innig verwachsen, an der Spitze abgestutzt, Anthere ist länglich, liegt auf Rücken der Säule, ist fast zweifächrig mit unvollkommenen Scheidewänden. Pollenmassen 2, mit einer umgekehrten spatelförmigen Verlängerung, Anheftungsdrüse rundlich, etwas ausgehöhlt; Schnäbelchen sehr lang und vorstehend, Narbe ganz flach und trocken. Wachsgelbe Blüten, Spitze des Labellum purpurfarbig. Stempelsäule an der Spitze unter den vorgezogenen Schnäbelchen senkrecht abgestutzt. Diess ist die Stelle, wo die Narbe sich befindet. Anstatt dass dieselbe, wie bei den meisten Orchideen etwas vertieft und mit schleimiger Masse überzogen ist, ist sie hier ganz flach, und wie es scheint mit Epidermis überzogen.

b. Labelli pars antica plana.

2. CIRRHAEA DEPENDENS Rehb. fil. Mss. Huc: *Cymbidium dependens* Lodd. Bot. Tom. X. 916. *Gongora viridipurpurea* Hook. Bot. 2978. *Cirrhaea viridipurpurea* Lindl. Bot. Reg. 1538.

CIRRHAEA TRISTIS Lindl. Bot. Reg. XXII, (1830). 1889:

Foliis oblongo lanceolatis basi parum angustatis, petalis lineari-spathulatis, labelli sagittali lobo intermedio lineari abrupto acuto lateralibus acuminatis parallelis brevioribus.

Flores odoratissimi triste purpurei, sanguineo suffusi, apicibus herbaceis. Sepala linearia patentissima obtusa, postremo sigmoideo, reflexo. Petala linearia spathulata sepalis paulo breviora et duplo angustiora. Labellum atropurpureum ungue arcum continuum cum columna resupinata efficiente; limbo sagittato, laciniis lateralibus acuminatis subaequalibus carnosis intermedia fere duplo longioribus. Columna arcuata, clavata, truncata, anthera postica, stigmatibus obliquo, verticali, cirrhifero, ut in genere.

Rehb. fil. in Schlechtl. B. Z. 1852. 839:

Cirrhaea tristis Lindl. und *viridipurpurea* Lindl. Nachdem ich ganze Massen dieser Pflanzen studirt, kann ich sie nicht mehr unterscheiden. *C. Hoffmannseggii* Heinhold gehört hierher. Ferner eine *C. violaceo virens* Hoffg. 20. Aug. 1844. — eine hübsche

Form mit grünen, äusseren Hüllblättern, deren Spitzen innerlich purpurn punktirt; die inneren seitlichen Hüllblätter am Grunde purpurn, an der Spitze so gewellt auf gelbem Grunde. Seitenlappen der Lippe orange gelb mit roth. Mittellappen grün mit roth oder Mittellappen grün mit Purpurbinde. Das wäre also wohl *C. viridipurpurea* var. *Fryana*. Knw. Westc. Fl. Cab. 1843. III. 94. — *C. violascens* Hffgg. Hüllblätter grün, mit Purpur überlaufen, Lippe gelb, an der Spitze weiss, mit violetten Punkten. — *Cymbidium dependens* Lodd. B. Cab. 996. gehört sicher hierher, und nicht zu *C. Loddigesii*. — *C. livida* Hffgg. und *C. purpurascens* Hffgg. haben beide eine violett-röthliche, fast gleichmässige Färbung und die Lippenspitze ist etwas kürzer. Als *C. Russeliana* Lodd. besitze ich aus niederländischen Gärten eine ähnliche Form, nur dass die seitlichen Fortsätze der Lippe kürzer sind. — Zu grösserer Beschwerde versenden fremde Gärtner diese alte Pflanze neu aufgeputzt mit dem Namen *Sarcoglossum suaveolens*.

Huc: *Cirrhaea viridipurpurea* var. *Fryana* Floral Cab. III. 1840. N. 94:

Perigonii foliis externis viridiluteis, petalis rubris, labello apice et basi viridi, purpureo fusco striato, labelli lobis lateralibus et disculo aurantiaco.

Huc: *Cirrhaea Warreana* 1999, Lodd. — Huc ex ill. Lindley (saltem ad adnotat. L. Turnhamgreenii) factam. *C. fuscolutea* Lindley O. 142.

3. CIRRHAEA OBTUSATA Lindl. Bot. Reg. XXIII. 1837. 2005:

Foliis oblongo lanceolatis utrinque acuminatis, petalis sepalisque lineari-oblongis obtusiusculis planis, labelli lobo medio obovato aculo inflexo late unguiculato, lateralibus acuminatis.

Differs from *C. fuscolutea* by its much more obtuse petals and smaller flowers. J believe the form of the middle lobe of the lip to be essentially different in this species from all except *C. pallida* Lindl.

Sepala lutea rubro maculata. Petala et labellum alba, violacea maculata.

4. (var. praecedentis?) CIRRHAEA PALLIDA Lindl. B. Reg. XXIII. 1837. sub 2005:

Has most of the characters of *C. obtusata*, except that the sepals and petals are acuminate and the middle lobe of the labellum placed on a slender unguis. The real value of these distinctions must remain for future inquiry.

5. CIRRHAEA LODDIGESII Lindl. Bot. Reg. 1538.

1405. SARCOCHILUS RBr.

Prodr. 332.

(additis: 1477. *Chiloschista* Lindl. 1478. *Gunnia* Lindl. 1493. c. p. *Dendrocolla* Blume, *Ornithario* Lindl., *Pterocerate* Kuhl. v. Hass. *Orsidici* Rehb. fil.).

Lindl. Bot. Reg. XXII. (1336). 1832:

Perianthium patens. Sepala lateralia cum ungue labelli subtus connata. Petala conformia. Labellum calcaratum, cum ungue columnae continuum, calceiforme; lobo intermedio carnosio solido, lateralibus ascendentibus petaloideis. Columna brevissima, marginibus inflexis tenuibus, anthera bilocularis, valvis antherae inferioribus deflexis erosis. Pollinia caudicula lineari affixa glandula deltoidea.

Epiphyta acaulis, vel brevissime caulescens. Folia disticha, linearilanceolata, subcoriacea. Racemi axillares, erecti, 3—6 flori, secundi. Bractee breves, latae, ovatae. Flores mediocres.

I. Aphyllus.

1. SARCOCHILUS USNEOIDES Rehb. fil. Mss. Huc: *Chiloschista usneoides* Lindl. O. 219. Sert. Frontispic. fig. IV:

Wallich 1818 in many diff. places of Nepal on trees.

Root consists of numerous bundles of fleshy, long, glaucous, simple fibres. Of leaves no trace. Racemes numerous, arising from the crown of the root, i. e. from the centre of the radical fibres, 6—8" long, downy. Peduncle brownish, taper, slender, an inch long; furnished with a few alternate membranous bracts, which are ovate, amplexicaule, acute, deciduous, and densely clothed with herbaceous soft semitransparent hairs; finally passing into a flexuose rachis, which becomes clavate when old. Flowers stalked, alternate, the size and colour of Lily of the Valley, but scentless, drooping, placed on stalks $\frac{1}{2}$ " long, very slender, with a broad, ovate, subcordate and transparent acute deciduous bract at the base. Segments of the flower oblong, obtuse, spreading, the petals broader than the others and with the lateral sepals adhering by their whole base to a long foot, which quits the base of the column almost at a right angle. Labellum standing at the back of the flower, gibbous at the base and slightly saccate, very small, attached to the extreme point of the foot of the column, slightly tinged with pink, bearded inside, three-lobed at the apex; the lateral lobes linear, parallel, obtuse, that in the middle toothed and minute, or rather wanting, its place being supplied by two little revolute teeth. Column very short. Anther terminal, deciduous, ovate, twocelled. Pollenmasses 2, round 2 lobed at the back, waxy, smooth. Capsule 2 inches long, somewhat cylindrical, pink, curved.

Obs. The 4 lateral leaves of the perianth being inserted at the sides of the much elongated ascending base of the column, almost so that the sepals which are nearest the labellum cover very little of the margins of the petals, which occupy the middle of the column, may be said to be placed all in one line. The very base of the column is terminated by the labellum there only inserted.

Wight Ic. V. (1851.) N. 1741:

Malabar. Tree branches. April. Low herbaceous, hairy, leafless epiphyte, roots flattened, green as if to supply the absence of leaves by performing their functions. Spikes erect, flowers whitish or somewhat cream coloured. Lip curious. Lindley's species? Larger figure of the plate taken from dried specimens collected by myself, smaller from a drawing of Mrs. Jerdon, taken from a living plant, gathered J think in Wynoud and on the North W. slopes of the Neilgherries.

II. Foliosi.

B. Pedunculus incrassato teres bracteis planis.

1. SARCOCHILUS TERES Rehb. fl. Mss. *Dendrocolla teres* Bl. Bijdr. 289. *Aërides teres* L. O. 240. Huc: *Pteroceras* Van Hasselt Hassk. Pl. Jav. Rar. p. 128:
 Perigonii conniventis foliola libera, exteriora interioribus obovatis subaequalia, labellum vix perigonio longius, unguiculatum ecalcaratum, limbo convexo connivente basi alis binis erectis linearibus columnam amplectentibus anthera apici columnae cucullato inclusa, pollinia 4, caudicula nulla.

Pteroceras radicans Hassk. Cat. H. B. 43:

Pseudo parasitica caulescens, radicans, radicibus aëreis albidis, elongatis flexuosis, foliis ovato oblongis aut oblongis apice inaequalibus, 3''' longis, 3—4'' latis, inflorescentia elongato racemosa, pedunculo longissime cylindraceo, 3—4 unciali, bracteato, inter bracteas scrobiculato, bracteis imbricatis adpressis parvis rotundatis carnosis, pedicellis 3—5''' longis teretibus patentibus flavescens, perigonio extus stramineo intus punctis sanguineis notato; labello infra stramineo ad margines conniventes albido-roseo, alis stramineis purpureo punctatis, apice revoluta atropurpureo. (Haec ad Steud. Mss.)

Ornitharium striatulum Lindl. Paxt. Fl. G. I. p. 188. Xyl. 117:

Ornithochilus striatulus St. Calcutt.

Caulescens, foliis distichis. Flores spicati, resupinati, clausi, carnosi. Sepala lateralialia basi ima connata, cum labello parallela, dorsale paulo sejunctum. Petala conformia. Labellum liberum, unguiculatum, carnosum, a basi sagittata cuniculatum. Columna semiteres, brevis, stigmatate verticali. Pollinia 2, solida, caudicula obovata, glandula triangulari, rostello reflexo.

Sepala et petala obtusa, carnosa, lutea, maculis quibusdam internis. Labellum spongiosum, candidum, oblongum, rugosum, minutissime scabrum, apice appendice sphaerico cavo atropurpureo aucto, intra cuniculum leve.

Flowers as large as of *Odontoglossum Egertonianum*. Lip white with a few violet stains and a deep purple round knob at the end. Sent by Dr. McClelland of B. G. Calcutta. Habit of *Camarotis atropurpurea*. Leaves flat, fleshy, pale green, notched

at the end, five inches long, $1\frac{1}{2}$ broad, 6" high. After one flower-spike has grown eight or ten inches, another pushes from the under side of it, so that it produces two spikes from the same point. I have never seen it before. Certainly no *Ornithochilus*, whether that genus may be retained, or merged to *Aërides*. From *Arrhynchium*, *Camarotis* and the like its simple pollenmasses and unguiculate lip clearly separate it. It can be no *Micropera* because of its unguiculate lip, short rostell and nor do we find among the species to *Saccolabium* anything, that approaches it at all.

 . Bot. Reg. XXII. 186. 18332:
 Flores albi, labellum intus purpureo striato.
24. SARCOCHILUS OBTUSUS Rehb. fil. Mss. Huc: *Dendrocolla obtusa* Bl. Bijdr. 288. *Aërides obtusum* Lindl. O. 239.
25. SARCOCHILUS TRIDENTATUS Rehb. fil. Mss. Huc: *Cleisostoma tridentata* Lindl. B. Reg. XXIV. 1838. Misc. 46:

Foliis lineari lanceolatis subcarinatis apice oblique tridentatis, racemis horizontalibus paucifloris foliis brevioribus, sepalis lineari-oblongis rectiusculis, petalis linearibus falcatis, labello trilobo intus pubescente lacinia intermedia obsoleta obtusa, lateralibus ovatis acuminatis marginibus involutis, dente calcaris obtuso inflexo hirsuto, calcare pendulo, apice obtuso subventricoso.

Smallflowered epiphyte of no beauty, with the habit of a *Saccolabium*. It is a native of New Holland, from whence it was obtained by Loddiges. Flowers very small of a dull, dirty, reddish white, mixed with a little yellow. Pollenmasses are remarkable for having each a concave membrane, in the form of a watch glass, adhering

to them at the back. These undoubtedly are the back valves of the anther case, separate all round and adhere slightly to the apex of the caudicula, below the pollen masses.

26. SARCOCHILUS CROCEUS Lindl. B. Reg. 1846. t. 19. adn. Cf. Walp. Ann. III. 781.

28. SARCOCHILUS CALCEOLUS Lindl. Bot. Reg. 1846. t. 19. Cf. Walp. Ann. I. c.

29. SARCOCHILUS UNGUICULATUS Lindl. Bot. Reg. XXVI. 1840. Misc. 140:

Racemo 3—4 floro, labelli unguiculati trilobi ungue convexo lineari linea media exarata, lamina cava, lobis lateralibus semi-ovatis obtusis, intermedio supra trinervi subtus globoso apice papillaeformi.

A native of Manilla, where it was discovered by Mr. Cuming. The flowers are which light straw colour, the side lobes of the labellum white streaked with crimson, and the middle lobe rounded, fleshy, and dotted with crimson. It is a pretty species. Bateman imp.

30. SARCOCHILUS OLIVACEUS Lindl. Bot. Reg. XXV. 1839. Misc. 27:

Foliis oblongis membranaceis falcatis apice acutis integris, racemo flexuoso angulato 4—5 floro nutante, sepalis lineari obovatis obtusis, intermedio latiore petalisque conformibus minoribus columnae dorso adnatis, labelli cum columna producta articulati lobo medio minimo transverso rotundato lateralibus acuminatis; disco callis variis crassis rotundatis tuberculato.

New-Holland. Imp. by Loddiges. It is very nearly the same as *S. parviflorus* from which it principally differs in its leaves being broader and not emarginate at the point. The flowers are small and yellowish orange green.

31. SARCOCHILUS PARVIFLORUS Lindl. Bot. Reg. XXIV. 1838. Misc. 50:

Foliis oblongis undulatis chartaceis, apice acute et oblique bidentatis, racemis nutantibus quadrifloris, sepalis lineari-obovatis acutis, lateralibus basi dilatatis, petalis falcatis obtusis, labelli cum columna articulati lobo medio minimo transverso rotundato, disco callis variis crassis rotundatis tuberculato.

A small flowered epiphyte introduced from New-Holland by Mrs. Loddiges. It has no claim to beauty, but is interesting as a second species of the genus *Sarcochilus*. The flowers are green, with a few spots of dull purple in the sepals. The labellum is less green, beneath indeed almost white, banded with dull purple; articulated with the column, and covered over in the inside with various crowded tubercles, of which the 3 largest form a crescent next the apex of the lip.

32. SARCOCHILUS PICTUS Rehb. fl. Mss. Huc: *Gunnia picta* Lindl. Bot. Reg. XXIV. 1838. Misc. 77:

Labelli lobo intermedio minuto dentiformi, lateralibus oblongis dimidiatis rotundatis sacco cornuto puberulo aequalibus; disco utrinque bidentato, basi bidentato.

Little plant from the neighbourhood of Sidney by Mrs. Loddiges. It has small dingy purple flowers, with a white labellum, neatly streaked with purple. It differs from *Gunnia australis* in the flowers being much smaller, with a very dissimilar labellum.

33. SARCOCHILUS AUSTRALIS Rehb. fl. Mss. Huc: *Gunnia* Lindl. Bot. Reg. XX. 1835. sub 1699:

Perianthium ringens. Sepala herbacea, lateralia postica, subfalcata, erecta, ungui labelli lineari longe producto adnata. Petala herbacea,

sublanceolata, obtusa, ab ungue columnae omnino libera, cum sepalo altero distincto pendulo parallela. Labellum carnosum, ungue longe producto lineari erecto, cum basi columnae continuum, trilobum, antice cornutum, mucrone inflexo, disco tuberculatum. Columna nana, semiteres, aptera, pollinia 4, in paribus globosis coadunata; retinaculo lineari. Rostellum bifidum.

Herba epiphyta; radicibus longis tortuosis supra fruticum ramos repetentibus. Folia lanceolata, falcata, disticha, basi articulata. Racemus simplex, strictus, foliorum longitudine.

Gumia australis Lindl. l. c.:

Hab. in Insula Van Diemen, in sinu Emu: Backhouse (hab. s. spec. com. cel. Gun.).

Tota planta vix 2 pollices excedens. Sepala et petala luteo-viridia. Labellum verosimiliter album, vel leviter rubescens, lobis lateralibus oblongis obtusis; tuberculis 4, luteis, quorum 2 exteriores majores.

Huc monente ipso ill. auct. Fragm. phyt. Austral. I. p. 243: *Sarcochilus Barkleyanus* F. Müll.

34. SARCOCHILUS ADVERSUS Hook. fil. Bot. of New Zealand 241:

Caule brevissimo, foliis linearioblongis obtusis, racemis multifloris, floribus minimis, sepalis petalisque late oblongis obtusis, labello concavo, disco lineis incrassatis aucto apice calloso. Epidendrum adversum. Banks et Sol. Mss. et Ic.

S. parviflorus is a short stemmed herb, with very long fibrous aerial roots, running along the trunks of trees. Leaves three to five, distichous, shortly sheathing at the base, coriaceous, linear oblong, blunt, $1\frac{1}{2}$ — $2\frac{1}{2}$ inches long. Flowers very small, fleshy, rather crowded in axillary pedunculate racemes, which are shorter, than the leaves, white purple. Bractea membranous, shorter than the germen. Sepals broadly oblong, blunt, lower broadest, united below to the base of the lip. Petals smaller, oblong, blunt. Lip continuous with the base of column, very thick and fleshy, orbicular, very concave, margins recurved, blunt, with a thick, lobed callus at the lower end; disk concave, with thickened ridges. Column short. Anther two-celled. Pollens four, waxy, globular, closely united in pairs, seated on a flat broad caudicle, which is fixed by a broad gland to the stigma.

Northern Island. Opuragi. Banks and Solander. Bay of Islands and Wairarapa. Ederley, Colenso.

Obs. Sarcochili parviflori nomine ill. Hook. fil. plantam primum salutasse ex herbario Lindleyano intellexi. Jam lapsu quodam nomen in descriptione in Fl. Nov. Zel. remansit.

1406. **TRIGONIDIUM** Lindl.

Bot. Reg. 1837. XXIII. 1923.

Sepala aequalia, semiherbacea, in cyathum trigonum isocolem cohaerentia, apice patula, petala corollina, duplo minora, venosa. Labellum nanum, trilobum, cum columna articulatum, medio carnosum. Columna nana, libera, semiteres, anthera unilocularis, pollinia 4, cohaerentia, minoribus dorsalibus, in glandulam triangularem, stigma parvum triangulare tegentem insidentia. Herbae epiphytae americanae rhizomate repente florifero et pseudobulbifero. Folia coriacea. Pedunculi erecti uniflori vaginati.

A. Perigonium externum cyathiformi connivens.

1. TRIGONIDIUM LATIFOLIUM Lindl. Bot. Reg. 1837. XXIII. 1923:

Foliis obovato-oblongis, vaginis acuminatis suprema ovario longiore, sepalis lanceolatis acutiusculis, petalis acutis, (labello dorso nudo?), anthera glabra,

Epidendre à chainons. Descourtilz Brazil. drawings Nr. 33.

On the trees, that surround the foot of the mountain of La Bucanha and on the borders of the Parahyba, below the town of Regende. Jan. Descourtilz.

2. TRIGONIDIUM EGERTONIANUM Batem. in litt. Lindl. Bot. Reg. XXIV. 1838. Misc. 138 :

Pseudobulbis ovalibus compressis sulcatis diphyllis aggregatis, foliis ensiformibus pedunculis subaequalibus vel brevioribus, sepalis ovalilanceolatis acutis (lateralibus reflexis), petalis lineari-lanceolatis acutiusculis apice callosis, labello trilobo medio calloso petalis triplo brevioribus.

„A native of the Bay of Dulce in Honduras, where it was discovered by G. U. Skinner Esq., to whom I am indebted for its possession. It is a very distinct species of a most singular genus, and I have therefore not hesitated to name it after Sir P. de Grey Egerton Bart. It approaches nearest to *T. obtusum*, from which its acute petals and narrow leaves (frequently fully a foot and a half long) and clustered pseudobulbs abundantly distinguish it. Its flowers are of a pale liver-colour, dashed and veined with brown and from a resemblance with they have supposed to bear a „Dragon's mouth“ the plant has received that appellation from the inhabitants of Honduras. It is of the easiest cultivation.“

3. TRIGONIDIUM OBTUSUM Lindl. Bot. Reg. XXIII. 1837. 1923 :

Foliis lineari-lanceolatis, vaginis acutis, sepalis obovatis, petalis obtusis, labello dorso tuberculato, anthera glanduloso-pilosa.

Anthera glandulis piliformibus cristata. Sepala rubido luteola. Petala alba, roseo venosa, apice brunnea. Labellum album. Lobi laterales margine rubri, medius lobus antice flavus. Demerara Colley.

4. TRIGONIDIUM SEEMANNI Rchb. fil. in Seemann Herald. Bot. 214 :

Pedunculo prope pedali subflexuoso pluri (7) vaginato, vaginis arctis apicibus in basibus superioribus imbricantibus, sepalo summo a basi ligulato cuneato, dimidio superiori abrupte ovali acuto, sepalis lateralibus cuneato oblongis acutis, apice reflexis, tepalis ligulatis acutis, basi attenuatis, apice (ex lateribus involutis) cucullato incrassatis, quam sepala dimidio brevioribus, quintam illorum latitudinis partem aequantibus, labello ligulato trilobato, lobo medio subcordato acutiusculo, per totam paginam callosulo, lateribus suis posticis incisuras loborum lateralium tegente, lobis lateralibus retusissimis incisuras illis minutis efformatis, nervis labelli mediis longitudinaliter carinulato incrassatis, gynostemio postice apice acuto, anthera . . .

Sepalo supremo, tepalis ac labello recedit ab affinibus *T. obtuso* Lindl. ac *T. Egertoniano* Bat. Hujus tamen descriptio valde manca. Rara videtur, cum inter copiam Orchidearum centro-americanam, quam teneo, haud amplius occurrat. Panama 539.

5. TRIGONIDIUM SPATULATUM Lindl., Rchb. fil. Bpl. II. 380 :

Affine *T. Seemanni* tepalis apice in disco callosis, labelli callo per loborum lateralium medium lineari apice dilatato retuso, disco lobi medii carnoso.

Pseudobulbus ovatus anceps. Folium late ligulatum octopollicare. Pedunculus spithameus tenuis *Trigonidii acuminati*. Sepalum impar a basi ligulata ovatum acutum. Sepala lateralia oblongolanceolata acuta. Tepala tres quintas illorum longa lanceolata acuta sub apice in disco carnosa. Labellum angustum tepalorum dimidio aequale ligulatum, concavum, apice utrinque angulatum trilobum, lobus medius transversus semiovatus acutiusculus, apice reflexus. — Blätter so gross, wie die des *Tri-*

gonidium obtusum. — Neu-Granada: Provinz Rio Hacha: im Gebirgo. Schlim. — Das uns unbekannte *Trigonidium Egertonianum* Bat. hat sehr lange schmale Blätter.

6. *TRIGONIDIUM ACUMINATUM* Bateman in litt. Lindl. Bot. Reg. XXIV. 1838. Misc. 136:

Pseudobulbis ovatis acutis sulcatis monophyllis, foliis linearibus pedunculis longioribus, sepalis acuminatis apicibus recurvis, petalis ovalilanceolatis mucronatis, labello trilobo petalis duplo brevior. J. Bat.

„Found in Demerara by M. Colley and other collectors. It is a small though interesting species. The flowers are of a dull straw-colour externally but are most elegantly pencilled on the inside with a rich brown. The petals in this, as in all the other species, have each a dark-coloured callosity at their apex, which is placed in such a manner near the entrance of the triangular cup, which the sepals form, that the appearance of a pair of eyes peeping out is produced.“ J. B.

7. *TRIGONIDIUM TENUE* Lodd. cat. no. 582. Bot. Reg. 1839. XXV. Misc. 59:

Pseudobulbis ovalibus compressis monophyllis, folio ensiformi acutissimo scapo erecto tenui longiore, sepalis reflexis acuminatissimis, labello oblongo obtuso trilobo glabro apice reflexo medio appendice plano obovato emarginato adnato aucto.

A brownish purple species with a slender habit introduced from Demerara by Mrs. Lodd, with whom it flowered.

b. *Perigonium externum bilabiatum.*

8. *TRIGONIDIUM RINGENS* Lindl. Bot. Reg. XXVI. 1840. Misc. 122:

Pseudobulbis compressis subrotundis, foliis oblongis recurvis coriaceis nitidis, scapo filiformi stricto distanter vaginato foliorum longitudine, perianthio bilabiato, sepalo postico arcuato petalisque oblongis margine revolutis labium superius lateralibus oblongis apice obtuse carinatis inferius formantibus, labelli trilobi nani ciliati pubescentis lobis lateralibus dentiformibus, intermedio revoluti in medio lucido basi callo reniformi antice obsolete tridentato aucto, columna pubescente.

Forms dense patches of fine vigorous deep green pseudobulbs and leaves promising something much better, than the little insignificant scentless yellowish-green flower, which they produce. The latter stands singly at the end of a very slender erect scape, and distinctly divided into two lips. The labellum is very finely downy, ciliated at the edges and slightly bearded along four of the veins near its base on the upperside. The column is moreover downy, and has a small collection of minute shining hairs near its base. Introduced from Mexico by Hartweg, but had been previously discovered in shady places in the Barranca de Tioselo by Schiede whose Mss. descript together with a specimen has been obligingly comm. me by Prof. Schlechtendahl and is here subjoined.

Cf. Walp. Ann. III. 541. Cf. Lindl. in Paxt. Fl. G. III. p. 61. Gleaning 533.

1406₁: **AGANISIA** Lindl.

Bot. Reg: XXV. Misc. 65. p. 45.

Perianthium patens, aequale; sepalis lateralibus haud basi productis. Labellum liberum, mobile, indivisum, hypochilio parvo concavo, ab epichilio crista transversa glandulosa diviso. Columna erecta, semiteres, marginata, apice utrinque brachio acuto patulo aucta. Anthera cristata. Rostellum elongatum. Pollinia 4, per paria connata, caudicula lineari, glandula parva ovali. — Rhizoma repens. Pseudobulbosa. Pseudobulbi monophylli. Racemus erectus, radicalis, foliis brevior.

1. AGANISIA PULCHELLA Lindl. l. c. — Bot. Reg. XXVI. 1840. tab. 32:

Rhizoma repens, pennae anserinae crassitie, squamis vaginantibus arcte vestitum; pseudobulbis parvis acuminatis intra squamas latentibus. Folia solitaria, oblonga, membranacea, 5 costata, in petiolum angustata. Racemi radicales i. e. e squamis pseudobulbos fullientibus erecti, 3—6 flori, foliis breviores. Flores candidi, $1\frac{1}{4}$ unciam lati, sepalis petalisque subaequalibus, ovato oblongis acutis, patulis. Labellum cum columna articulatum; hypochilio concavo sanguineo maculato, epichilio latiore, ovato integro, medio luteo, basi crista lutescente glandulosa ab hypochilio diviso. Columna erecta, basi ne minime quidem producta, semiteres, apice brachii duobus patentibus incurvis aucta; rostello lineari producto. Pollinia 4, incumbentia nec collateralia ut olim dixi; caudicula lineari membranacea, glandula parva, subrotunda, tenera.

Demerara. Loddiges.

1406 $\frac{1}{2}$. ACACALLIS Lindl.

Folia I. Febr. 19. 1853.

Sepala patentia, petaloidea; lateralibus basi ima levissime producta connatis. Petala subaequalia, basi subobliqua. Labellum unguiculatum, sepalis longius, petaloideum; hypochilio (ungue) lineari, apice saccato, margine lobato; mesochilio brevi e facie sacci, 3-corni; epichilio transverso, basi concavo, juxta mesochilium verticaliter plicato. Columna brevis, subteres, antice marginata, cum labello continua, apice alata; stigma subrotundum, in marginem inferiorem bicallosum, superiore tripartito, laciniis lateralibus brevibus forcipatis, intermedia (rostello) subulata. Pollinia duo, cereacea, (pedicellata, biloba, emaciata, forte casu quodam); caudicula rhombea; glandula parva, subrotunda. Herba epiphyta, Americae tropicae, pseudobulbosa. Folia nervosa. Racemi erecti, pauciflori. Flores speciosi.

Allied to *Huntleya*, *Warrea* etc., but clearly distinguished by its long narrow hypochil, with a deep bag at the point, surrounded by a five-lobed reflexed border, and furnished in front with three projecting processes arising from the very base of the mesochil at its junction with the hypochil and just above the concave ribbed base of epichil. Mr. H. G. Reichenbach's *Paradisanthus*, with which I am unacquainted, would seem to be also a genus related to this

1. ACACALLIS CYANEA Lindl. l. c.:

Sepala et petala subrotunda, apiculata, basi cuneata. Hypochilii saccus margine acute 5-dentato auctus; mesochilii processus recti, subulati; epichilium transversum, subtrilobum, denticulatum, denticulatum basi late cuneatum, concavum, lobo medio minuto acuminato integerrimo. Columnae alae membranaceae; quadratae. Clinandrium dorso cornutum. Anthera membranacea, ecristata.

This is a very fine plant, with the habit of a *Maxillaria* of the racemose section, and with flowers as large as those of *Odontoglossum Pescatorei*. Mr. Spruce reports the sepals and petals to be light blue, paler within; the lip light bluish purple with pale veins; back and wings of column streaked with red. He adds, that the blue of the flower is almost perfectly pure. The leaves are three inches broad by fifteen inches long, with much the texture of a *Stanhopea*; at the base they gradually taper into a furrowed petiole three inches long. The pseudobulb is ovate, and one-leaved. The peduncle, including the close five-flowered raceme, is about a foot long.

Wild in Brazil; Barra of Rio Nigro, on trees by forest streams; Juli 1851; Spruce 1780 (v. s. sp.)

1406/3. **PARADISANTHUS** *Rehb. fl.*

v. Schild. B. Z. 1852, 930.

Perigonium patulum, carnosum-membranaceum. Phylla externa oblonga acuta, lateralia externa margine medio inferiori obtusangula, omnia ima basi connata, lateralia interna subaequalia angustiora, cum phyllis l. ext. subparallela, labellum cum gynostemio articulatum, trilobum, lobi laterales trianguli erecti, antrorsum falcuati, lobus medius ligulatus, subito in laminam subcordiformem expansus; urceolus eboraceus inter lobos labelli laterales accretos erectos quasi immersus, introrsus, sacculus in medio labello postice conico elevatum efformans, ostium pentagonum, margine basilari utrinque in lamellam quadratam, obliquam, in margine inferiori externe denticulatam productum; faux oblique descendens papillis puberula; transectione rectangule perducta obtusangula; gynostemium semiteres, supra medium rectangule antrorsum flexum, supra basin planum antice utrinque angulatum; androclinii limbus obtuse trilobus, rostellum retusum, trilobum; fovea stigmatica elliptica, transversa; anthera depresso-mitrata, obtuse apiculata, dissepimenta oblitterata, pollinia depresso-rhombea, hyalina, quaterna, per paria incumbentia, sessilia in glandula transversissime triangula, viscosa.

1. **PARADISANTHUS BAHIENSIS** *Rehb. fl. l. c.*:

Blüthe so gross, wie die der *Warrea cyanea*. Ich kann mich keiner lieblicheren Orchidee entsinnen. Das reine Milchweiss der Blüthen sticht wunderherrlich ab von den tief carmoisinrothen Querstreifen auf dem Grunde der Hüllblätter, der Säulen Grund ist vorn, und an der Seite ebenso gefärbt, während die Mündung des schief eingesetzt, oben offenen Elfenbeintrichters (s. v. v.) die schönsten von violett in lasurblau übergehenden Streifen und Punkte zeigt. Sie stammt von Bahia. (*Warrea bahiensis* Hort.). Dieser Name lässt einen Schluss auf die Tracht zu. — Ich halte diese herrliche Gattung für eine völlig isolirte. — In der so reichen Sammlung des Hrn. Senator Jenisch von Hrn. Kramer cultivirt.

Rehb. fl. Xenia Orch. Tab. 14, p. 30:

Paradisanthus genus Warreis subaffine, *Acacallidi* propinquum: labelli hypochilium brevissime unguiculatum, hypochilium eboraceum postice saccatum omnino oblique excavatum limbo antrorsum utrinque lamella dentata aucto, epichilium a basi ligulata cordiforme; gynostemium apterum curvum rostello angusto obscure trilobulo; androclinium trilobulum; anthera depresso mitrata postice obtuse apiculata; pollinia depresso pyriformia nunc prope rhombea per paria incumbentia sessilia in lamina latissima humillima triangula. — Mentum subnullum. Planta tenuior ebulbis internodiis brevissimis. Vaginae acutae paucae parvae a radicibus velatis abbreviatis hinc perforatae. Folia lanceolata acuta viridia subglauca gemina. Pedunculus angulatus teres apice laxe racemosus purpureus ex axilla vaginae e superioribus — nunc duo. Racemus pro pedunculo sat longus anthesi haud isochronica, floribus primis insumis jam dejectis anthesi florum summorum. Bractee squamiformes brevissimae. Ovaria pedicellata gracilia. Perigonium patulum molle ac carnosulum labelli hypochilio eboraceo; magnitudine prope illius *Warreae cyanae* Lindl. Sepala oblongo lanceolata acuta, lateralia margine inferiori obtusangula, labelli lineae mediae divaricati. Tepala lineari ligulata acuta basi inferiori obscure obtusangula cum sepalis subparallela. Labellum brevissime unguiculatum, saepius pendulum. Hypochilium postice subsaccatum corpus quadratum sistit per diametrum alteram foveatum limbo utroque laterali elevato antrorsum utrinque lamellato; lamella utraque quadrata obliqua, margine externo dentata. Fovea intus et laminae papillis papulosa. Epichilium a basi ligulata cordiforme. Gynostemium semiteres angulato curvulum; androclinii limbus obtuse trilobus; rostellum obscure sinuato trilobulum; fovea ovalis transversa. Anthera depresso mitrata postice obusata cum apiculo obtuso, antice acuta; unilocularis. Pol-

linia depresso pyriformia per paria sibi incumbentia, hyalina; sessilia in lamina transversa humillima utrinque acuminata antice medio acutangula. Perigonium lacteum vittis quibusdam purpureis pone basin internam extus etiam lucentibus more Odontoglossorum nonnullorum (e. g. Cervantesii La Ll. Lex.). Labellum aequaliter lacteum fovea tamen et lamellis praepositis lazulino punctulatis et striolalis. Gynostemium lacteum basi purpureum.

1407. **MAXILLARIA** Ruiz Pavon.

— Cf. Lindl. in Paxt, Fl. G. III. p. 69. —

1. **MAXILLARIA COLLEYI** Bat. in litt. Lindl. B. R. XXIV. 1838. Misc. 161:

Pseudobulbis sphaericis, pedunculis radicalibus multifloris, labello postico oblongo apice triangulari obtuso medio bidentato.

This species although no doubt new, is very near *M. squalens*, from which it differs in the form of the pseudobulbs and labellum. Its dingy flowers have a disagreeable smell, like that of an overripe melon.

Doleo, me plantam eandem iterum alio nomine salutasse, quae non recognoscenda fuit ex longe nimis brevi hac diagnosi. Comparatio cum *M. squalenti* haud bona.

MAXILLARIA REBELLIS Rehb. fl. in Van Houtt. Fl. des Serres IX. 102:

Foliis magnis oblongis acutis floribus illis *M. squalentis* plus duplo majoribus carnosis, mento valde producto, sepalo summo oblongo acuto margine undulato, tepalis subaequalibus angustioribus, labello angusto ligulato, apicem versus subdilatato, hinc quasi spatulato, medium versus cristula transversa obsolete tridentata onusto, gynostemio abbreviato, anthera conica mitram phrygicam simulante.

Couleur d'un brun rougeâtre avec des taches brunes. Labelle d'un pourpre noirâtre.

Rehb. fl. in Bonpl. III. 217:

Nach einem reichen und völlig frischen Exemplar aus dem Garten des Herrn Senator Jenisch, von Herrn Kramer cultivirt, Folgendes: Folium a basi cuneata oblongum acutum nervis tribus valde prominulis, pro folio plicato valde carnosum, subbipedale, medio sexpollicare. Racemus quinqueflorus pendulus, densissimus, subcapitatus. Bractee cucullatae disco subcarnosulae, ovariis pedicellatis prope pollicaribus atropurpureis longiores, ipsae pallide et lucide purpureae. Flos carnosus illi Maxillariae cucullatae Lindl. subaequalis. Mentum rectangulum magnum. Sepala oblonga obtusata, nunc paulo acuta. Tepala lato ligulata acuta. Labellum ligulatum ante apicem utrinque angulatum apice acutum a basi in medium sulcatum, medio abrupte unidentatum, fossula anteposita, limbo antico sulcato: utrinque vernixium. Gynostemium brevissimum. Anthera gracilis conica, basi anteriori obtuse acuta. Blüthe kupferröthlich mit zahlreichen schwarzpurpurnen Flecken innerseits. Lippe am Grunde beiderseits hellröthlich mit schwarzpurpurnen Flecken, ausserdem völlig schwarzpurpurn und schönglänzend. — Die jungen Triebe durch eine Reihe kurzer stumpfer hübsch zweizeiliger Schuppen ausgezeichnet.

2. **MAXILLARIA BRACHYPUS** Rehb. fl. in v. Schlechtl. B. Z. 1852. 731:

Pseudobulbis pyriformibus, folio solitario breve petiolato attenuato, oblongo obovato acuto, maximo, pedunculo brevissimo, basi dense et distiche squamato, superne pauciflora, flexuoso, bracteis ovatis acutis

scariosis maximis ovaria pedicellata abscondentibus; floribus vulgo positicis, perigonii phyllis externis ligulatis acutis, lateralibus internis subaequalibus cuneatis, labello angusto cuneato, dein in laminam ovatam acutiusculam repandulo-undulatam dilatato, lineis 2 elevatis in ungue labelli ceterum laevis. —

Blüthen etwas grösser, als die der *Maxillaria squalens* Hook. Guatemala. Wscwz.

3. MAXILLARIA CORRUGATA Lindl. Bot. Reg. XXX. 1844. Misc. 14:

Pseudobulbis ovatis subimbricatis, foliis lanceolatis solitariis breviter petiolatis, racemis paucifloris petiolo multo longioribus, bracteis minimis, sepalis petalisque obtusiusculis, labello oblongo utrinque emarginato (ideoque obsolete trilobo) ramis elevatis flexuosis corrugato, tuberculo mediano obtuse tricarinato.

Found by Linden between Maracaibo and Bogota and flowered just in Mr. Barkers collection. It has pale brownish purple flowers of no beauty; and a lip with numerous purple elevated zigzag veins on a pale yellow ground. The long tubercle in the middle, which in these plants is usually undivided, or merely 3-lobed at the extremity is here broken up into 3 distinct contiguous elevated ribs.

b. *Wagneri*: tuberculo mediano evanido. Huc:

Maxillaria Wagneri Rehb. fl. in v. Schldl. B. Z. 1852. 734:

Pseudobulbis —, foliis —, pedunculis pendulis paucifloris, bracteis lanceis acutis ovariorum pedicellatorum partem tertiam vix aequantibus, perigonii conniventis phyllis oblongis acutiusculis subaequalibus, labello unguiculato oblongo subpandurato, margine anteriori denticulato, venis omnibus antice lacinulas dentiformes gerentibus.

Blüthen braungelb. Caracas. Wagener.

Id. Bonpl. II. 17: Merida. Wagener l. c. II. 26. vaginae juniores atropurpureo punctatae. L. c. III. 67. Ocanna. Wagener!

4. MAXILLARIA ELONGATA Lindl. Paxt. Fl. G. III. p. 69. c. Xyl. 264:

Pseudobulbis cylindraceis elongatis diphyllis, foliis lanceolatis 3costatis circiter duplo longioribus, scapo erecto bivaginato, racemo denso oblongo, pseudobulbis aequali, bracteis setaceis ovario longioribus, sepalis petalisque linearibus acuminatis, labello ovato-oblongo carnosissimo utrinque lobato utraque facie dense verrucosa ad medium hypochilium usque.

Pallid flowers as large as these of *Maxillaria supina* with a purplish brown lip, singularly studded within and without with well defined distinct warts, combined with a short close raceme, and almost cylindrical pseudobulbs, tall, six inches long, mark this new species of *Maxillaria* clearly. The only species like it in the pseudobulbs is *M. pallidiflora*, a one leaved plant, with a different lip.

4. MAXILLARIA SCABRILINGUIS Lindl. Bot. Reg. XXX. 1844. Misc. 66. (*Cyrtopera scabrilinguis* LO. Nr. 3):

Pseudobulbis ovatis elongatis sulcatis, foliis basi angustatis scapo erecto multifloro longioribus, bracteis acutissimis ovario brevioribus, sepalis petalisque linearioblongis acutis lateralibus falcatis, labelli trilobi lobis lateralibus rotundatis, intermedio ovato carnosissimo subtereti obtuso longiore, utraque facie papillis densissimis versus callum oblongum tricoatum decrescentibus obsita, anthera pubescente.

By an error resulting from the examination of insufficient specimens, this plant, which is nearly allied to *M. squalens*, was referred to *Cyrtopera* in the „Gen. and Spec. of Orchid. Pl.“ It is a native of the neighbourhood of Loxa, where Mr. Hartweg found it, and has flowered in the Garden of Hort. Soc. The flowers are dull

purplish yellow. The labellum is remarkable for having all its end, inside and out, covered over with stiff short tubercules, terminated by a purple stain.

Lindl. Orchid. Lind. p. 19. 1846. Nr. 99:

An epiphyte and also growing on rocks, in Merida 5000'. Juni. Petals white, yellow. Nr. 99.

Rehb. fil. Bpl. II. 17:

Die Beschreibung der Lippenspitze ist falsch. Sie ist nicht stielrund, sondern strotzt von aufsitzenden Lamellen, die ihr ein stielrundes Ansehen geben. Pavons Exemplare stimmen völlig; auch Funck und Schlimm sammelten sie.

Huc: *Dendrobium carnosum* Presl ex Lindl. l. c.

6. MAXILLARIA STACHYBIORUM Rehb. fil. in v. Schl. B. Z. 673:

Pseudobulbis —, foliis oblongis petiolato attenuatis, acutis; pedunculis basi 2—3 laxe-vaginatiss, multifloris, folia subaequantibus, bracteis lineari-lanceis cuspidatis, ovaria pedicellata aequantibus, seu superantibus, floribus vulgo posticis in mentum valde cornutum productis, perigonii phyllis lanceolatis acutis, labello anguste ligulato elongato, imo apice trilobo, lobis lateralibus obtusatis, medio orbiculari plano, venis 5 centralibus elevatis.

Blüthen nur halb so gross, als die der merkwürdigen *M. elongata* Lindl. Die Art selbst nächst *M. bractescens* Lindl. Diese hat wenig grössere Blüthen, kurzes Kinn, sehr lange Deckblätter. Chiriqui. —

7. MAXILLARIA LEONTOGLOSSA Rehb. fil. Bonpl. III. 67:

aff. Maxillariae squalenti: bracteis squamaeformibus minutissimis, mento valde obtuso, floribus duplo majoribus, labello trilobi lobis lateralibus obtusangulis, lobo medio lato semiovalo utrinque papulis scaberimo, carinis ternis a basi in medium. — Adest pedunculus crassus superne racemosus. Sepala oblonga acuta, lateralia valde carinata. Tepala cuneato-ligulata acuta subbreviora. Labellum adhuc brevius, lobo medio valde incrassato. Gynostemium crassum humillimum. Rostellum semilunari exsectum.

Blüthen gelb mit rothen Punkten. März. 6000'. Erdorchidee. Ocanna, Wagener.

8. MAXILLARIA TRUXILLENIS Rehb. fil. Bonpl. II. 17:

Pseudobulbis oblongis apice angustatis, pedunculo spithamaeo, basi ampla vaginato, apice compacte racemoso, bracteis spathaceis acutis ovaria pedicellata subaequantibus, floribus posticis, mento maximo rectangulo, sepalis tepalisque triangulolanceolatis acutis, labello quarta tertiae parte breviori, oblongo, medio obtuse trilobo, lobo medio ligulato, utrinque densissime papilligero, hinc quasi teretiusculo, carina a basi usque in discum quadrisulcata venulis quibusdam in apice loborum lateralium papuligeris.

Nächst *M. squalens*, hat kürzere Pseudobulben, grössere weisse Blüthen mit purpurfleckeriger, längerer Lippe, grössere scheidige Deckblätter. — Von *M. bractescens* unterscheidet sie sich durch kürzere Deckblätter, dichte, kurze Inflorescenz; von *M. scabringuis* durch Farbe, dichte Inflorescenz, grosses Kinn, kleinere, stumpfere Seitenlappen der Lippe. Truxillo. Wagener.

9. MAXILLARIA BRACDESCENS Lindl. Bot. Reg. XXVIII. 1842. Misc. 92:

Pseudobulbis conicis elongatis sulcatis, foliis latis plicatis, scapo trigonato, racemo elongato paucifloro, bracteis linearibus acuminatis scariosis floribus longioribus, sepalis oblongo-lanceolatis margine revolutis, petalis conformibus minoribus, cornu brevi rotundato, labello trilobo

apice recurvo obtuso venis omnibus elevatis sinuosis rugosis, callo elevato rugoso apice subtrilobo.

Habit of *Maxillaria squalens*. The flowers are twice as large, from an inch to $1\frac{1}{2}$ "', of dull yellow, with a reddish brown lip. The scape bears 5—6 flowers and is $\frac{1}{2}$ " high. The very long and curious narrow bracts readily distinguish it. Sent to the Hort Soc. from Loxa by Mr. Hartweg. Art. 42.

10. MAXILLARIA SQUALENS Hook. B. M. N. S. III. 1829. 2955: Rehb. fl. Bonpl. II. 17. (*M. supina* Endl. Pöpp.). Caracas. 4500'. Wagener. Juni—August. Gemein.

11. MAXILLARIA DECOLOR Lindl. Bot. Reg. 1549:

Pseudobulbis oblongis compressis, foliis solitariis oblongo-lanceolatis plicatis utrinque acuminatis, scapo radicali multifloro vaginato foliis brevioribus, sepalis ovato-oblongis obtusis patentibus, petalis duplo minoribus conniventibus, labello postico obsolete trilobo obtuso cucullato, callis 5 elevatis parallelis aequilongis ultra medium procurrentibus.

B. Mag. 3984: Jamaica. Febr. Glasgow vere 1840. Perig. sulphureum, labello albedo. Huc ex Lindl. et Paxt. Fl. G. I. c.: *Dendrobium palmifolium* Sw. *Maxillaria palmifolia* Lindl.

12. MAXILLARIA PALLIDIFLORA Hook. B. M. 2806. Huc: *Maxillaria (Xylobium) sulfurina* Ch. Lem. in V. Houtt. IV. 3306. ex Rehb. in v. Schl. B. Z. 1852. 887. cf. Walp. Ann. III. 542.

Rehb. fl. Epl. II. 17. Caracas. 5000'. Nov. Wagener.

Huc: *Maxillaria (Xylobium) stenobulbon* Klotzsch Mss. Sem. H. Berol. 1853:

Pseudobulbis dense aggregatis cylindricis elongatis leviter striatis, apice in petiolum basi articulatam attenuatis; foliis oblongis acuminatis coriaceis glabris nitidis tricostatis arcuato recurvis, in petiolum antice sulcatam attenuatis; racemis basilaribus erectis 3—7 floris; pedunculis versus basin vaginis tribus viridifuscentibus membranaceis amplexicaulibus brevi acutis, infra apicem ampullaceis instructis; floribus pedicellatis, bractea longa lanceolata acuminata subdiaphana nervosa suffultis; perigonii foliolis pallide sulphureis unicostatis, exterioribus ima basi connatis, semipatentibus, margine recurvis, acutis, supremo recto lanceolato subito acuto, inferioribus late falcatis, basi in gibbum productis; interioribus late lanceolatis obtusis conniventibus parum brevioribus; labello postico albedo obsolete trilobo, superne reflexo, apice submarginato-truncato, basi cum pede gynostemii aurantiaco, callis quinque elevatis parallelis aequilongis, ultra medium corrugatis, margine recurvo-crenulatis instructo.

Pseudobulbi stricti, 6—7 pollices longi et pennae anserinae crassitudine. Folia 8—10 pollices longa, $1\frac{1}{2}$ —2 pollices lata. Petiolus 1— $1\frac{1}{2}$ pollicem longus. Racemi 6—7 pollices longi crassitudine pennae corvinae. Vaginae tot quot articulationes in pedunculo, plerumque tres, rarissime quatuor, dimidium pollicem longae, in inferiore parte scapo arcte appressae et in superiore parte inflatae. Bracteae 7 lineas longae, sesquilineam latae. Pedicelli 4 lineas longi. Germen triquetrum, acute angulatum, 5 lineas longum. Foliolum perigonii exterioris supremum 7 lineas longum, basi $2\frac{1}{2}$ lineas latum, inferiora 8 lineas longa, ad basin 4 lineas lata. Foliola interiora 6 lineas longa, versus basin 2 lineas lata. Labellum 6 longum, $3\frac{1}{2}$ lineas latum. Venezuela. Wagener. Floruit M. Octob. 1853 in horto Berolinensi.

13. MAXILLARIA FOVEATA Lindl. Bot. Reg. XXV. 1839:

Foliis lanceolatis undulatis plicatis racemo triplo longioribus, bracteis linearibus sphacelatis ovario longioribus, sepalis petalisque lineari-ob-

longis obtusiusculis, labello postico oblongo apice trilobo; lacinia media rotundata carnosa excavata, disco ter aut quinques sulcato.

Demerara, Loddiges, Near *M. squalens*, but the lip is different. The flowers are of a pale uniform straw colour. Faint, not unpleasant smell.

Rehb. fl. Bonpl. II. 17. Caracas. Wagerer.

14. MAXILLARIA CONCAVA Lindl. Bot. Reg. 1844. XXX. Misc. 102:

Acaulis, racemosa, pseudobulbis oblongis alte sulcatis, foliis geminis tricostatis nitidis in petiolum angustatis, bracteis setaceis, sepalis lateralibus falcatis acuminatis sub apice carinatis petalis duplo minoribus, obtusis apice plano convexis, labello oblongo obsolete trilobo apice carnoso concavo rotundato extus scabriusculo, tuberculo lineari apice obtuse tridentato.

At first sight this species might be mistaken for *bractescens*, but its flowers are smaller; the bracts very small and setaceous, and the lip of quite another form. It has little beauty, and was found in Guatemala by Mr. Hartweg, by whom it was sent to the Hort. Soc. 1841.

Paxt. Fl. G. II. p. 53. Nr. 312. c. ic. xyl.:

Flowers pale yellow. Lip almost truncate, concave, bluntly 3 toothed, with the middle lobe somewhat fleshy and tuberculated at the edge; marked with rose colour veins, with a long narrow ridge in the middle, three-lobed at the point. It is nearest *M. bracteata*, but its flowers are smaller, bracts very small and bristly and lip of quite another form.

15. MAXILLARIA HYACINTHINA Rehb. fl. Cf. Walp. Ann. III. 542. Regel Cat. Hort. Petrop. (*Maxill. affinis* H. Petrop.):

Pseudobulbi oblongi leviter compressi; foliis binis terminalibus coriaceis, oblongo-lanceolatis, acuminatis, vix plicatis, ad $1\frac{1}{2}$ pedem longis, 3—6 pollices latis. Racemus radicalis, spithamaeus, multiflorus; pedunculo vaginis 3—4 membranaceis acutis vestito. Bractee lineari-subulatae, germen superantes. Flores vix pollicem in diametro, pallido-flavi; sepalis patentibus, $\frac{1}{2}$ pollicem longis. lateralibus lato-lanceolatis acuminatis basi partem inferiorem mentiformem acutam floris formantibus, sepalo superiore lateralibus angustiore; petalis suberectis, sepalis minoribus, lanceolatis, acutiusculis; labello postico, cucullato, petalis paulo brevioribus, apice obsolete trilobo obtuso, supra callo lineari apice tricrenato lineisque roseis munito.

Flores Hyacinthi odore. *M. concava* Lindl. in Paxt. Fl. Gard. differt tantum pseudobulbis leviter sulcatis bracteisque brevioribus et sine dubio ad hanc speciem pertinet. Venezuela. Lansberg et Wagerer plantas vivas miserunt.

Obs. Cl. Lindley l. c. tres alias affert species.

Foliis distichis equitantibus lanceis acuminatis, ovario incurvo vulgo cum pedunculo angulato, sepalis triangulis, tepalis subaequalibus minoribus, labello ligulato pandurato, nunc paucicrenulato, longitudinaliter tripulvinato. *Dicrypta iridifolia* Bat.

Wächst bei Cubobas auf Cuba (Pöppig).

Huc: *Pleurothallis?* Valenzuelana. A. Rich. in Ramon de Sagra Cub. 234.

Ebulbis, acaulis, foliis distichis approximatis, ensiformibus, gladiatis lanceolatis, acutis, basi imbricato-vaginantibus, crassis, glaucescentibus 6—9 uncias longis, 4—6 lineas latis, pedunculis brevioribus, floribus axillaribus, rigidis, bracteis pluribus lanceolatis acutis, tenui-membranaceis obtectis; flore breviter pedicellato, apice pedunculi articulato, deciduo, amplitudine medio, (colore luteo?), sepalo superiore ovali lanceolato acuto, convexo, inferioribus basi productis, lanceolatis, acutis, paulo longioribus; internis (petalis) anguste lanceolatis acutis tenuioribus, et paulo brevioribus, labello basi producta gynostemii articulato erecto, trilobo, angusto; lobis lateralibus longis obtusis parum productis, intermedio crasso, linguaeformi acuto.

Parasitica in cortice arborum, in sylvis insulae Cubae? *Oberoniae* vultus.

— Folia plana. —

18. MAXILLARIA ACUMINATA Lindl. in Benth. Pl. Hartw. 155.

Rehb. fl. in v. Schl. B. Z. 1852. 857:

Acaulis, rhizomate repente radicante, pseudobulbis diphyllis, foliis linearilongis emarginatis, petiolo pluries longioribus, scapo flexuoso multivaginato foliis longiore, vaginis adpressis internodiorum, longitudine supremis ventricosis ovario longioribus, sepalis linearilanceolatis acuminatis, petalis linearibus acutis, labello obtuso basi bicalloso. Folia 4pollicaria. Sepala pollicaria. Clinandrium piloso glandulosum.

In montibus Loxa.

Rhizomate valido dense vaginato, vaginis triangulis acuminatis, carinatis, pseudobulbis oblongis ancipitibus, obscure costatis, diphyllis, inter se remotis, foliis ligulatis, basi valde attenuatis, apice bilobis, pedunculis flexuosis, dense vaginatis, vaginis ochreatis ancipitibus acutis, mento parvo, perigonii phyllis ligulatis, acutis, subaequalibus, phyllo supremo acuto, labello unguiculato, dilatato, limbo basilari elevato, antice retuso, obscure trilobo, gynostemio gracili, elevato, androclinio minutissime denticulato, rostello retuso, medio paulisper exciso.

Loxa 837. Hartweg!

Huc: *Lycaste acuminata* Rehb. fl. Bonpl. III. 216. (pollinarii causa).

19. MAXILLARIA ACIANTHA Rehb. fl. in v. Schl. B. Z. 1858. 858:

Rhizomate densissime vaginato, vaginis punctulatis, pseudobulbis oblongis, angustis, 9—10-costatis nitidis, laevibus, foliis lineari-ligulatis, apice bilobis, geminis in apicibus pseudobulborum, pedunculis rectis aggregatis dense et distiche et imbricatim vaginatis, vaginis triangularibus, carinatis, mento parvo, perigonii phyllis 5 subaequalibus, lanceolatis, acutis, quasi ex ebore confectis (totius hujus societatis 18. 19. 20. more — in siccis), phyllo summo acuto acuminato, labello angustissime rhombeo, limbato, canaliculato, callo a basi medium prope usque canaliculato, gynostemio clavato, rostello introrsum semilunari, exciso, androclinio minute ciliato marginato.

In allen Theilen 2—3 mal grösser, als *M. Friedrichsthali*. Blätter nur $\frac{1}{3}$ " breit, 8—10" lang. Costa Rica. J. de Warscewicz.

Lycaste aciantha Rehb. fl. Bonpl. III. 216. (*Maxillaria aciantha* Rehb. fl.):

Pedunculus a bractea et vaginis ancipitibus obtuse acutis vernixiis stipatus. Perigonium prope corneum, aurantiacum, extus pallidius, viridi aspersum, intus glutinosum. Sepalum dorsale carinatum, carina apice retuso praerupta. Sepala lateralia acuta. Tepala angustiora, marginibus ante apicem revoluta. Labellum sigmoideum, ligulatum, medio utriusque obtusangulo dilatatum, apice incrassatum, limbatum. Carina glutinosa a basi in discum usque ad genu flexurae ascendens. Foveola ante apicem marginatum glutinosa. Discus viridulus. Carina aurantiaca. Margo flavus atrovioleaceo guttatus. Gynostemium clavatum. Androclinium subperpendiculare; ciliatulo limbosum. Rostellum utrinque decurrens, medio dente triangulo bidentato. Anthera mitrata vertice carinata velutina. Pollinia quaterna linearia liberrima in caudicula lineari cornea. Glandula obtuse rhombea, apice bidentata.

20. MAXILLARIA FRIEDRICHSTHALII Rehb. fl. in v. Schl. B. Z. 1852. 858:

Rhizomate valido incurvo, dense vaginato, vaginis abbreviatis, microscopicis arphyllaceis, pseudobulbis oblongis, approximatis, compressis costato 7—8 carinatis, rugis inter costas transversis (an etiam in viva?), apice diphyllis, foliis ligulatis, cuneatis, apice bilobis, foliis suppositis fultientibus multo brevioribus, pedunculis aggregatis, abbreviatis, rectis seu curvulis, nunquam flexuosis, dense distiche vaginatis, vaginis ancipitibus, acutis, fusco-maculatis, imbricantibus, perigonio e vagina summa producto, curvulo, mento parvo, perigonii phyllis oblongis acutis, subaequalibus, summo tamen apice carinato, galeato, apice retuso, complicato, labello angustissime rhombeo, canaliculato, obtuso, carinula elongata a basi ad medium, gynostemio clavato, androclinio ciliato, marginato, profundissime angustissimeque exciso, hinc descendenti bilobo supra foveam stigmaticam.

Blätter 3—4 $\frac{1}{4}$ " lang, etwa $\frac{1}{2}$ " breit. Blüten etwas kleiner, als bei *M. acuminata*. „Huele de noche“ vocatur ab gratum, quem noctu spirat odorem.“ Guatemala. Prov. Chontales, in monte Aragua. Friedrichsthal.

21. MAXILLARIA ANATOMORUM Rehb. fl. Schl. Bot. Z. 1852. 935:

Pedunculis erectis, rarius vaginatis, vaginis apice acutis, summa vagina subspathacea, ovarium arcuatam subaequante, alabastro longissime rostrato, horizontali, flore horizontali, mento rectangulo mediocri, phyllo supremo lineari-ligulato acuto, acuminato, phyllis lateralibus externis subaequalibus, apicem versus magis adhuc attenuatis, phyllis lateralibus a basi lata triangulo linearibus acutis, brevioribus, angustioribus, labello medio trilobo, lobis lateralibus obtusangulis subobsoletis, lobo medio producto triangulo subacuto, callo triangulari depresso antrorso; inter lobos laterales, superficie ab illo callo basin usque pilis moniliformibus 3—4 celluliferis, candidis, fragilissimis, secedentibus, amyliigeris (!!!!!)

densissime obsitis', hinc furfuraceo, gynostemio semitereti, arcuato, androclinii membrana marginante brevissime denticulata, angulis anticis abbreviatis, introrsis, androclinio proclivi, stigmatis fovea supposita semilunata, curvatura rostellum excisum, muticum versus spectante, anthera depresso-mitrata, sc. basi tantum aperta, apiculata, basi excisa, polliniis depressis clavatis, postice brevioribus, glandula semilunata.

Blüthen blassgelblich, dreimal grösser, als bei *M. crocea*, *chlorantha* u. s. w. Der sogenannte Mehlstaub ist bisher nur bei *M. candida* G. Lodd. (a fine deciduous, mealiness) angegeben. (Diese muss unserer Art äusserst nahe stehen. Sie ist aber kleinblüthig, der Mittellappen der Lippe gezähnt). Säulenspitze violett.

Rehb. fil. Bpl. II. 15: Lippe gross, weiss mit Mehlstaub. Hüllblätter allmählich ganz fein zugespitzt. Blätter breit länglich, spannenlang, dünn pergamentartig. Caracas.

22. MAXILLARIA HISTIOLOGORUM Rehb. fil. v. Schl. B. Z. 1852. 936:

Pseudobulbis —, foliis oblongo-ligulatis basi cuneatis apice inaequali bilobis, pedunculis aggregatis gracilibus, dense vaginatis, vaginis acutis apice acuto dense imbricantibus, spatha summa apice acuta nunc apiculata, angusta, ovarium excedente, flore adscendente, mento brevi subrectangulo obtusato, perigonii phyllis ligulato-linearibus, acuminatis, l. i. a latiori basi magis attenuatis, subbrevioribus, labello p. ph. ext. quadruplo brevior, angusto, oblongato, medio trilobo, lobis lateralibus prope rectangulis, margine antico hinc dentatis, basi longitudinaliter antice plicatis, lobo medio liguliformi, crasso, viscoso(?) punctulato, elevatione callosa a basi ad medium usque ubi antrorsum triangula, gynostemio semitereti crasso prono antice utrinque alato marginulato, androclinio oblique descendente margine parce prominulo subdenticulato, rostellum productum, angulatum, introrsum exciso, lateribus trapezoideo paulisper descendente, medio androclinio ac rostellum superne carinato, postice nunc unidentulato, fovea stigmatica oblonga, haud parva, anthera incumbenti depresso-mitrata, apice (postice igitur) apiculato carinulata, uniloculari, polliniis pyriformi-depressis, posticis internis minoribus, glandula semilunata.

Blüthen scheinen weissgelb. Grössenverhältnisse wie bei voriger; Blätter aber viel länger und schmaler. Ueber die Substanz des Mittellappens der Lippe bin ich unklar. Brasilien.

23. MAXILLARIA VENUSTA Lindl. Rehb. fil. Bonpl. II. 280:

aff. *M. anatorum* Rehb. fil: floribus duplo majoribus, sepalis multo latioribus, labelli trilobi lobis lateralibus angulatis, lobo medio triangulo margine revolutum, callo triangulo, in disco ante sinus lorum lateralium, tota superficie furfuracea; rostellum obtuse bidentatum.

Blüthen gespreizt, die spitz ausgezogenen Hüllblätter auseinander gespannt, schneeweiss. Die Lippe gelb mit rothen Rändern, der Säule angedrückt; Rand des Androclinium fein gezähnt. — Blatt über fusslang, länglich, spitz, untres Drittheil ganz schmal, stielartig. Blütenstiel fusslang. Ocanna, 5 — 6000'. Januar. Nr. 1153. Schlim. — Pescatorea t. 38.

24. MAXILLARIA ALBATA Lindl. Orchid. Lindl. p. 19, N. 102. 1846:

Acaulis, scapigera, foliis oblongis acutis longe petiolatis scapis debilibus, flexuosis pluries longioribus, vaginis linearibus acutis suprema adpressa ovario longiore, sepalis petalisque linearibus, labello trilobo laciniis obtusis lateralibus divaricatis, intermedia oblonga submarginata callosa, appendice brevissima transversa lamellisque 2 brevibus pone basin.

„An epiphyte, with long compressed oval, blackish pseudobulbs. Flowers and lip pure white, very sweet. Forests of Jaji at the height of 8000 feet. June and July.“

N. 1469. Very near *Maxillaria splendens*, but that species, according to Pöppig, has an yellow lip, of a different form, and a fringed anther bed. Leaves two feet long. Sepals 2 inches long.

Rchb. fl. Bpl. II. 15: Merida 7000'. Januar. Lippe klein, lila. Wagerer.

25. *MAXILLARIA CANDIDA* G. Lodd. in litt. Bot. Reg. XXVII. 1841. Misc. 59:

Pedunculis radicalibus unifloris, sepalis petalisque linearibus acuminatis, labello oblongo obsolete trilobo medio ovato obtuso denticulato.

A little Brazilian plant of small beauty. Flowers are white and about as large as those of *Maxillaria ochroleuca*. It is distinguished readily by the whole inside of the lip being covered with a fine deciduous mealiness. Flowers at Hackney with Lodd.

26. *MAXILLARIA SPLENDENS* Pöpp. Endl. N. Gen. et Sp. I. 38. Tab. LXVI:

M. bulbis ovalibus, ancipitibus; foliis linearibus longissimis, basi attenuatis, apice oblique bidentatis; scapis fasciculatis, unifloris; labelli ovalis, apice trilobi lacinia terminali truncata, denticulata; sepalis angustis, acutissimis.

Herba acaulis, perennis, inter congeneres equidem non florum magnitudine sed eorum copia maxime lucens, tum in arborum vetustarum ramis, tum in quisquillis quibus solum sylvarum primaevarum tegitur reperta, caespites formans ex innumeris bulbis, squamis vaginisque constantes, foliis longissimis nutantibus obumbratos, scapis floridis saepe ultra quinquaginta ornatos. Rhizoma nullum. Radices numerosae, repentes, plurimae simplices, aliae ramulo uno alterove divisae, omnes teretes, subere cinereo argenteo, nitido, glabro tectae, pennae corvinae crassitie, digitum saepe longitudine excedentes. Squamae numerosae, inferiores saepe emarcidae et fibrosae novum plantae substernunt pulvinar, superiores erectae, adpressae, imbricatae, vaginantes interdum distichae, deltoideae, acutae, convexae, intus concavae et laevissimae, coriaceae, rigidae, sulcatae, striatae, glabrae. Bulbi uti in speciebus antea descriptis, nunc centrales monophylli aut nudi, nunc juniores in ambitu stirpis dispositi minus regulares, foliorum basin vaginantem et incrassatam simulantes, secundo vel tertio anno excrescentes, vetustioribus emortuis et in fibras solutis vel ab insectorum larvarumque agminibus devoratis novae progeniei centrum praebent, a succedente tandem generatione excipiendi. Bulbi vetusti centrales ovals, cylindrici, acuti, angulis vix multum elevatis, ancipites, virides, glabri, tres ad quatuor pollices alti, diametro longiore bipollicares, angustiore vix pollicares, vel in vertice nudi vel folium solitarium ferentes. Folia linearia apice oblique obtusata atque breviter bifida, lacinis duabus rotundatis latere inferiore interdum mucronatis, a medio inde valde attenuata, inferne ancipitia, plicata, vaginantia, lateralialia cum basi dilatata in bulbum mutanda, articulata, omnia plana, multinervia, coriacea, glabra, nitida, laete viridia, apice laxa. Scapi quaterni vel quini, fasciculati, intra sinum vaginarum bulbum circumdantium inferne reconditi, e basi bulbi provenientes, uniflori, erecti, flexuosi, articulati, teretes, bracteati, pedales. Vaginae et bractee remotae, haud imbricatae, cylindricae, haud multum ventricosae, apice articulum proximum haud attingentes, adpressae. Flores nunc resupinati nunc recti, ob flexuram terminalem scapi saepissime horizontales, pollices duos longi, sepalis angustissimis, nivei, immaculati, labello croceo. Sepala lanceolato linearia, acutissima, angustissima, subaequalia, nervosa membranacea: superiora tria erecta, haud conniventia, supremo parum convexo margine lateralialia interiora haud obvelante; infimis processui columnae adnatis, basi breviter saccatis, erectis, parum reflexis nec patulis, reliqua latitudine vix excedentibus. Labellum sepalis triplo brevius cum columnae processu anguloso connatum, ungue angusto, brevi donatum, lamina compresso concava, coriacea, intus nuda, dum vi explicatur ovali postice subtruncata, antice tenuissime denticulata. Columna labelli longitudine curvata, apice crassior, semiteres, antice plana, foveae antherae antice ultra stigma fornicatum prominente, margine posteriore breviter ciliata, stig-

mate marginato. Anthera galeaeformis, lateribus compressis medio concava, intus bitocularis. Pollinis massae quatuor cereaceae, bigeminae, altera majore et exteriori interiori minorem intra foveam in ipsius facie excavatam recipiente. Caudiculae elastice replicatae duae. Operculum reniformi triangulare, convexum, solum marginem glandulae globosae stigmatis superiorem obtegens.

Crescit inprimis in tractu montium a praedio Pampayaco meridiem versus sito. Floret Februario.

27. MAXILLARIA LONGISSIMA Lindl. Orch. Lind. 1846. Nr. 104. pg. 20:

Acaulis, scapigera, folio oblongo ligulato basi angustato, bractea acuta ovario longiore, sepalis longissime acuminatis, petalis conformibus, minoribus, labello oblongo subrotundo trilobo, laciniis rotundatis, intermedia oblonga, crispis, appendice pilosa apice ovata.

„Epiphyte, with oval flattened pseudobulbs. Flowers deep red. Forests of Merida, at the height of 6000'. Juli. N. 2215. The long narrow strap-shaped sepals are between three and four inches long.

28. MAXILLARIA GRANDIFLORA L. O. 147. Orch. Linden. p. 19:

„An epiphyte, with oval flattened pseudobulbs, petals white as snow, and a powdery yellow lip. Forests of Jaji, in the province of Merida, at the height of 5000 to 7000 feet; August.“ (Nr. 631.)

Rchb. fl. Bpl. II. 280. Ocanna. Juli, 5000'. Nr. 35. Schlim.

Rchb. fl. Bonpl. III. 67. Ocanna. 6000'. Blüthe weiss. Wagener.

29. MAXILLARIA LUTEO-ALBA Lindl. Orch. Lind. 1846. N. 106. p. 20:

Acaulis, scapigera, foliis oblongis obtusis basi complicatis, scapo sepalis oblongo linearibus, elongatis petalisque obtusis, labello trilobo basi concavo piloso margine undulato, laciniis obtusis intermedia obovata emarginata medio convexa, appendice ovato subcordato concavo.

„An epiphyte, with oval, obtuse compressed pseudobulbs, and a yellow flower spotted with white. Forests of Merida, at the height of 5000—6000'. June and Sept.“ Nr. 678. Leaves nearly two inches broad; sepals two and a half inches long; and three-eighths wide,

Rchb. fl. Bonpl. II. 18. 8000'. December. Wagener. Steht der *M. leptosepala* Hook. in ihren Merkmalen ausserordentlich nahe, nur die Seitenlappen der Lippe bieten einen etwas wesentlichen Anhaltspunkt. Dagegen sind Dimensionen und Farbe himmelweit verschieden und diese Pflanze gehört unter die prächtigsten Maxillarien. Aeusserst nahe steht *M. Batemani* Endl. Pöpp., welche ich noch nicht hinreichend untersucht habe.

Rchb. fl. Bonpl. III. 67. Ocanna. März. 5—6000'. Mit ganz schmalen Sepalen, wo sie höchst verschieden aussieht von der Hauptform. Wagener.

Rchb. fl. in Bonpl. II. 280. Ocanna. 6—7000'. Wälder. Januar. Schlim. N. 401. 402. Mai. Nr. 444. Diese Art ist unendlich wandelbar in der Gestalt ihrer Sepala.

30. MAXILLARIA BATEMANI Pöpp. Endl. Gen. et Sp. I. 38. Tab. LXV:

M. bulbis ovalibus, cylindricis; foliis linearibus, elongatis, basi longe attenuatis, apice bidentatis; scapis solitariis unifloris, labello subrotundo, concavo, apice bilobo, margine undulato, sepalis triplo brevioribus.

Herba acaulis, perennis; parasitica in arborum juniorum ramis a terra haud multum remotis, florum pulchritudine in sylvis istis densissimis lucens. Rhizoma nullum. Radices plurimae repentes, uudique divergentes, ramosae, teretes, uti reliquarum specierum e subere albo, crasso, glabro, filum lignosum, vestiente conflatae, penna corvina teneriores digitales aut breviores, infra bulborum basin in nodum vel acervum, rhizoma mentientem collectae, fibris squamulisque vetustis et emarcidis solutis, nigrescentibus interstinctae. Bulbi plures in variis evolutionis suae stadiis nunc per-

fecti, nunc foliorum basin vaginantem et incrassatam efficientes, squamis imbricatis, inaequalibus erectis, rarius laxis, deltoideis, acutis, coriaceis, nervosis, punctatis, laevissimis, nitidis, saepe laceris atque emortuis tandemque fibrillosis basi involvuntur; immaturi vel juniores magis in ambitu locati, teretes, saepe vaginantes, interiores solitarii, perfecti, cylindrico ovals, haud angulosi, nervoso striati, extus virides, glabri, pollices circiter duos longi, apice saepius nudi vel mono-rarius diphylly. Folia erecta, tandem laxa, pedes duos ad tres longa, pollices duos lata, longissime linearia, lamina apicem versus paullo latiore, sublanceolata, acumine brevi obtuso, bifido vel etiam integerrima, plana, nervosa, nervo primario subius carinato, secundariis numerosissimis percursa, coriacea rigida, pallidius viridia, a medio inde attenuata, inferne angustissima, semiteretia, antice canaliculata, ibique alterum folium vaginantia dum terminale bulbi, vel basi dilatata et incrassata, dum radicalia bulbos centrales vaginantia, ipsa futuri bulbi rudimenta exhibentia. Scapi modo congenerum consueto ex ima bulbi basi et inter ejusdem squamas basilares nati, duobus numquam plures, uniflori, folio triplo, vel quadruplo breviores, erecti, leviter flexuosi, articulati, teretes, bracteis alternis distichis imbricatis, cylindricis, acutis, mucronatis, ventricosus, nervoso striatis, punctulatis, membranaceis, pellucidis, purpurascenti viridibus, pollicem longis muniti. Flos terminalis erectus haud resupinatus, ultra duos pollices longus univarse colore sulphureo imbutus, sepala acutiuscula mucronata, omnia marginibus lateraliter revoluta, subcarnosa, nervis parallelis numerosis elevato striata; superiora tria erecta in galeam lanceolata, supremo convexo interioribus paulisper latiore; infima basi latissima rotundata, columnae basi productae adnata et saccum subrotundum ventricosum nec compressum formantia, oblique oblonga, reliquis sepalis latiora, a medio inde reflexa patula. Labellum sepalis triplo brevius adscendens, ungue brevissimo cum columnae processu connatum lamina concava, subrotunda, carnosa, intus nuda, extus profunde sulcata, margine laterali simpliciter emarginatum, apice breviter trilobum; lobis lateralibus semicircularibus integerrimis, terminali vel intermedio ovato, acuto, crenulato, undulato. Columna labelli longitudine, curvata semiteres, antice plana, apicem versus crassior, glabra, nuda, processu basilari versus labelli insertionem incrassato, superiore parte columnae ipsius vix multum brevior. Anthera conica obtusa, galeam haud male referens, dorsi carina obtusa, antice prominula, intus bilocularis. Pollinis massae quatuor inaequales.

Crescit ad arborum truncos in montibus Peruviae versus Pampayaco. Floret Novembre.

31. MAXILLARIA SETIGERA Lind. Bot. Reg. XXXI. 1845. Misc. 38:

Pseudobulbis folisque Oncidio ampliato similibus, scapis radicalibus cum floris squamis acuminatis subpaleaceis striatis suprema ovarii longitudine adpressa, sepalis lanceolatis mento obtuso, petalis linearibus paullo brevioribus apice abrupte setigeris, labello oblongo trilobo piloso lacinia media oblonga emarginata crispa lateralibus brevibus obtusis appendice ovata in medio, clinandrio fimbriato.

La Guayra. Leaves and pseudobulbs I have not seen. Flowers which grew single on scaly scapes, like *Maxillaria picta*, are pale yellow, slightly tinged with pink on the outside. The petals are almost exactly linear, terminating suddenly at the point in a fine bristle. The lip is for the most part white with a few scattered hairs over all its upper surface; the centre of the upper part is yellow, the sides of the lower part are streaked with crimson veins. The antherbed is bordered by a fine fringe. In many respects this approaches *Maxillaria splendens*, which however is easily known by its long grassy leaves.

Huc: *Maxillaria leptosepala* Hook. B. M. 4434:

Pseudobulbis ovato rotundatis ancipitibus compressis unifoliatis, folio lato lanceolato coriaceo obtuso inferne angustato, scapis radicalibus folio triplo brevioribus vaginatis, sepalis petalisque (brevibus) patentissimis

anguste lanceolatis acuminatis margine revolutis, labello obovato oblongo trilobo, lobis lateralibus obtusis, intermedio maximo revolutato obtuso marginibus dentato-fimbriatis disco pulvinato hirsuto.

Neu-Granada. Purdie.

Perigonium albidum; labellum antice flavum, lobi laterales purpurei.

32 MAXILLARIA CALLICHROMA Rehb. fil. in Bonpl. II. 16:

Pseudobulbis rotundatis parvis cum foliis fusco guttulatis; foliis oblongis acutis basi valde attenuatis, pedunculo dense vaginato, vaginis amplis paleaceis papillis nitentibus sparsis maculatis, ovario muriculato, perigonio patulo, sepalis lanceolatis acutis, lateralibus divaricatis, tepalis linearilanceolatis acutis subbrevioribus, labello trilobo tepalorum longitudinem haud omnino aequante, lobis lateralibus rotundatis, medio labello abrupte retusis, lobo medio porrecto oblongo obtusiusculo crispo, callo depresso obtusato a basi medium versus producto, ante lobi medii originem desinente, basi labelli sericeo-puberula, androclinio minutissime denticulato marginato, anthera vertice carinata.

Blüthen gelbbraun, Lippe weiss und gelb, Seitenlappen purpuradrig, Säule purpurn. Blüthe so gross, wie die der *M. leptosepala*, der diese Art sehr nahe steht. Ebenfalls scheint *M. setigera* sehr verwandt zu sein; diese soll aber an der Spitze Borsten tragende Tepalen haben. Es musste die relative Länge der Borsten angeführt angeführt werden. Ferner soll der Saum des Androclinium gewimpert sein. Endlich sollen die Pseudobulben und Blätter denen des *Oncidium ampliatum* gleichen; woran kein Gedanke. Caracas. 6000'. April. Wagener.

33. MAXILLARIA NIGRESCENS Lindl. Orch. Lind. 1846. N. 105. p. 20:

Acaulis scapigera, foliis oblongo-ligulatis acutis basi complicatis, vaginis imbricatis, inferioribus ovoidis, superioribus elongatis, summa ovario longiore, sepalis elongatis lato linearibus, petalis acuminatis, labello oblongo indiviso undulato apice pubescente, appendice rotundata.

„An epiphyte, with oval, compressed blackish pseudobulbs, deep blood red petals and a purple lip. Merida at the height from 5000—8000'. Jun.“ N. 628.

Leaves $1\frac{1}{2}$ " broad; sepals 1" long; scape about 4 inches long.

Rehb. fil. in Bpl. II. 280. Wälder Ocannas. Mai. 6—7000'. Nr. 1167. Schlim.

Rehb. fil. in Bpl. II. 15. 5000'. Blüthe im Hamburger bot. Garten. Eine muthmaasslich verschiedene Art mit einfach gespreizten Blütenhüllblättern sammelte Herr Wagener bei Hato Arriba 16. März 1849. Der Blütenstiel ist viel kürzer. Ich kenne diese nur nach einer Abbildung. Die ächte *M. nigrescens* hat nämlich die Eigenschaft, dass die Tepala nach vorn und unten umgebogen sind, was ihr ein höchst abenteuerliches Ansehen giebt.

Huc: *Maxillaria rubrofusca* Klotzsch Sem. Berol. 1853

Pseudobulbis oblongis, apice obliquis, ancipitibus, unifoliatis; foliis elongato-oblongis coriaceis rigidis unicastis, basi conduplicato-attenuatis, apice rotundato-submarginatis; scapo radicali unifloro bracteis vaginantibus amplexicaulibus brevi-acutis, inferne imbricatis, superne remotis, suprema gemma aequante instructo; perigonii foliolis fusco-purpureis lineari-lanceolatis subito acutis, margine recurvis, exterioribus longissimis deflexo-pendulis brevioribus; labello apice trilobo concavo atro-purpureo nitido, lobis apice crenato-dentatis, appendice linguaeformi atro adnato inter lacinias laterales costis elevatis duabus parallelis approximato; anthera fusca cristata.

Pseudobulbi $1\frac{1}{2}$ —2 poll. longi, vix pollicem lati. Folia pedem longa, 16 lineas lata. Scapi 4 pollices longi. Bractee pollicem longae. Perigonii foliola exteriora 18 lineas longa, 4 lineas ad basin lata, interiora subfalcata, 16 lineas longa et 3 lineas

lata. Gynostemium fusco-purpureum, arcuato-clavatum, intus concavum, 6 lineas longum. Labellum rigidum, apice subreflexum, 8 lineas longum, 5 lineas latum.

America centralis. De Warscewicz. Floruit in horto Berolinensi M. Oct. 1853.

34. MAXILLARIA PENTURA Lindl. Orch. Lind. 1846. p. 20:

Acaulis, scapigera, foliis lanceolato-ligulatis papyraceis acutissimis scapo vix longioribus, vaginis linearibus convolutis obtusis suprema ovario longiore, sepalis linearibus caudatis petalisque brevioribus acuminatissimis, labello oblongo undulato trilobo lacinia intermedia majore cochleata appendice acuta canaliculata.

„An epiphyte, with oval, compressed pseudobulbs, and a reddish flower. Forests of Merida, at the height of 6000'. Juli." Nr. — Scape 6' high; sepals 3 inches long; leaves $\frac{3}{4}$ " broad.

Rehb. fil. in Bpl. II. 15. Die Pflanze stimmt nicht ganz: die Scheiden sind nicht stumpf, wie angegeben, sondern spitz. Allein diese Begriffe verwechselt man in England häufig. Das Anhängsel findet sich schwer an der Lippe der getrockneten Pflanze, im Leben muss es stark markirt sein. Wagerer.

35. MAXILLARIA LONGIPES Lindl. Benth. Pl. Hartwg. p. 154. Aug. 1845.:

Acaulis foliis oblongis acutis petiolo duplo longioribus, scapis rectis petiolo paulo longioribus, vaginis apiculatis adpressis, suprema obtusa ovarii longitudine, sepalis angustis acuminatis obtusis*), labello oblongo trilobo obtuso medio sulcato.

Folium ultra pedale. Sepala fere bipollicaria. In montibus Loxa.

36. MAXILLARIA NUTANS Lindl. in Benth. Pl. Hartwg. p. 154. Aug. 1845:

Acaulis foliis erectis ovalibus petiolo canaliculato triplo longioribus scapo aequalibus, scapi vaginis acuminatis supremo*) ovarii longitudine, flore nutante, sepalis ovato-lanceolatis lateralibus valde productis, labello ovali obtuso utrinque emarginato apice carnoso intus pubescente tuberculo emarginato, anthera cristata.

In montes**) Chuquirabambae. Aug. Scapus pedalis.

37. MAXILLARIA PICTA Hook. B. M. 3151:

Bulbis ovatis 1—2phyllis, foliis linearilanceolatis, scapo radicali unifloro, petalis incurvo patentibus lineari-oblongis subaequalibus discoloribus maculatis, 2 inferioribus basi subproductis, labello oblongo incurvo trilobo disco elevato pubescente, lobis lateralibus incurvis, terminali subcordato acuto.

Received by Mrs. Arnold Harrison, from her brother in Brazil, where it was gathered in that spot, so fertile in vegetables of this family, the Organ Mountains. Dec. 32.

Labellum album violaceo punctatum. Perigonii phylla extus alba violaceo punctulata, intus flava rubro maculata; columna violacea.

Bot. Reg. XXI. 1836. 1892:

Pseudobulbis ovatis subsulcatis 1—2phyllis, foliis oblongo-lanceolatis planis, scapis erectis unifloris distanter vaginatis, foliis duplo brevioribus, sepalis petalisque lanceolatis (abrupte acutis) subconniventibus, labello trilobo medio unituberculato, lobis oblongis obtusis lateralibus brevioribus.

var. *brunnea*: sepalis extus aequaliter brunneis. Iluc:

Huc: *Maxillaria deflexa* Klotzsch Mss. in Sem. hort. Berol. 1852. p. 12:

Caule repente, subcarnoso, pseudobulboso; pseudobulbis elongatis, compressiusculis, costatis, diphyllis, foliis oblongolanceolatis, acutissimis, planis, unicostatis, basi conduplicato attenuatis, subrigidis, supra laete, subtus albidoviridibus; scapis unifloris axillaribus; bracteis tribus amplexicaulibus cucullatis, distantibus, membranaceis, fuscis, carinatis, acutissimis, a germine purpurascente remotis, perigonii foliolis exterioribus lanceolatis, subnerviis, acutissimis, galeatis, pallide flavidis, extus praesertim media parte et ad marginem rubescentibus, interioribus, brevioribus, angustioribus, acuminatis, conniventibus, ex albido luteis, labello trilobo, flavido, purpureo maculato, lobis lateralibus erectis rotundatis, intermedio ovato lanceolato, acuto, recurvato glabro, appendice inter lobos laterales linguaeformi adnata; gynostemio arcuato, glabro, lutescente labello duplo brevior, germine tereti. *Cymbidium marginatum* H. Berol. Caulis crassitudine pennae olorinae, squamis paleaceis.

Maxillaria punctulata Klotzsch Allg. Gartenz. 1851. p. 249:

Caulescens pseudobulbis oblongis, versus apicem attenuatis bifoliatis, bifariam imbricatis; squamis amplexicaulibus membranaceis, aridis, glabris densissime nervosis, sursum longioribus; foliis coriaceis unicostatis, ligulatis, acutis, subtortuosis, basi conduplicato attenuatis, pedunculis unifloris, infra pseudobulbos ex squamarum axillis enatis, foliis brevioribus, teretibus, 4—5 bracteatis; bracteis distantibus, amplexicaulibus, acutis, subcarinatis, membranaceis, fuscis, aridis, a germine remotis, perianthii foliolis oblongis, lanceolatis viridi lutescentibus, acutis, margine rubescentibus, exterioribus patentibus, interioribus duplo minoribus conniventibus, labello oblongo, trilobo, flavido margine purpureo guttato, centro laevi, supra basin subpulvino, lateralibus brevibus, intermedio obtuso, subrecurvo, anthera ovata, obtusa, rubescente, semibiloculari, puberula; glandula lunata, columna clavata, incurva, dorso

convexa, antice plana, basi productis. germine purpurascens: obtuse trigono, deorsum attenuato.

Pseudobulbi 3 pollices longi, compressiusculi, 8 lineas lati; folia 6—7 pollices longa, 12—14 lineas lata. Pedunculi 6 pollices longi, perianthii foliola extus pollicem longa, 3 lineas lata, interiora 8 lineas longa, 1½ lineas lata. Labellum 8 lineas longa. — Rio Janeiro.

Huc: *Maxillaria tricolor* Lindl. Lond. Journ. I. 1842. p. 189:

Pseudobulbis ovalibus, sulcatis, diphyllis, foliis oblongis coriaceis basi angustatis, scapis unifloris e squamis imbricatis, acutis, pseudobulbum novum vestientibus, sepalis ovato lanceolatis acuminatis petalis conformibus, labello carnoso trilobo cucullato laciniis rotundatis intermedio undulato, callo solitario in medio. —

On rocks in a wood at Rio Compaído. Sept. Gardner.

Flores albo-virescentes; sepalis petalisque purpureo-marginatis, labelli lobis apice apice pseudobulbisque atroviolaceis.

41. MAXILLARIA PENDULIFLORA Fenzl Van Houtt. Fl. des Serres X. 110:

Caudice rhizomatoso crasso flexuoso ramoso repente imbricato squamoso pseudobulbos remotos 1—3 pollicares e basi subovata oblongo lineares, ancipiti compressos, faciebus valide 3—4 costatos, diphyllis alente, foliis late linearilanceolatis acutis, enerviis, erecto recurvis, in petiolum plus minusve distinctum attenuatis, basi complicato compressis; scapis unifloris, in singulo ramo ut plurimum tribus flaccide pendulis, vaginatis, foliis brevioribus, purpureis; perigonii foliolis exterioribus pollicaribus, late linearibus acuminatis flavis, extus purpura ultra medium suffusis, postico ascendente porrecto subgaleato, lateralibus patentissime oblique recurvis, interioribus concoloribus flavis, columnae parallelis, subbrevioribus ac dimidio angustioribus, omnibus margine subrevolutis; labello flavo, foliolis externis triente brevioribus, oblongo-lanceolato, disco callo longitudinali lineari apice rotundato puberulo instructo, medio trilobo, lobis lateralibus parvulis ovatis rotundatis antice porrectis, terminali ovato-oblongo acuto apice canaliculato, recurvo subundulato, cum lateralibus ocellis marginalibus magnis umbrino purpureis, interruptis ac confluentibus elegantissime picto; columna dimidia labelli longitudine dilute viridi flavescente glabra; anthera mitraeformi incurvo apiculata.

42. MAXILLARIA MELEAGRIS Lindl. Bot. Reg. XXX. 1844. Misc. 9:

Caulescens pseudobulbis ovalibus ancipitibus, foliis solitariis angustis obtusis emarginatis undulatis, sepalis petalisque acuminatis, labelli oblongo lobo medio submarginato sub apice carinato lateralibus nanis duplo longiore, tuberculo transverso subcrenato basi tricostato.

A caulescent species of little beauty. Its flowers are spotted with purple upon a yellowish white ground; the lip is dark purple. The specimen is from Mss. Loddiges, who imported it from Oaxaca.

Obs. Me judice non est vere caulescens. Specimina bene nunc, ubi vetusta, caulem sublevant, sed plurima vere acaulia. Plantam vivam siccamque bene observavi. R. f.

43. MAXILLARIA CUCULLATA Lindl. Bot. Reg. XXVI. 1840. 12. B. M. 1842. 3945:

Pseudobulbis ovalibus compressis monophyllis, folio lato scapis longiore, vaginis imbricatis inflatis, bractea cucullata ovario longiore, sepalis ovatis acuminatis erectis, petalis conformibus paulo minoribus, labello oblongo carnoso trilobo petalorum longitudine, lobis lateralibus nanis intermedio elongato obtuso apice incrassato apiculato, callo disci spatulato lorum lateralium longitudine.

Equinoctial America, whence it is said to have been brought by Mr. Heuchman to the Duke of Devonshire. Habit and general appearance approaches to *Trigonidia*. It belongs to a rather large section of true *Maxillaria*, characterized by their peduncles being constantly one flowered densely clothed with scale-like sheathes, and proceeding immediately from the base of the pseudobulbs which lie upon the earth.

Perigonium brunneum, petala intus violacea, columna violacea, apice flava. Labellum violaceum.

44. *MAXILLARIA RHOMBEA* Lindl. Bot. Reg. XXVI. 1840 sub 12:

Acaulis, pseudobulbis ovalibus ancipitibus, foliis oblongis, vaginis acutis carinatis, bractea ovario aequali, sepalis petalisque acutis, labello subrhombico-trilobo, lacinia intermedia oblonga apiculata medio exarata lateralibus nanis rotundatis appendice plana retusa longioribus.

Mexico: Oaxaca at Teoxomulco. Karwinski.

Huc: *Maxillaria hematoglossa* Rich. et Gal. tab. 25. Annal. sc. nat. 1845. Jan. p. 24:

Pseudobulbis ovoideis compressis 1-phyllis; folio oblongo apice obtuse bilobo; scapo radicali 1-floro, vaginato; flore magno, inverso, sepalis luteis basi bilabiatis; labello brevi, intense purpureo, subtrilobo.

Mexico.

45. *MAXILLARIA CROCEA* Lindl. Bot. Reg. XXI. 1836. 1749:

Pseudobulbis oblongis compressis foliatis, foliis oblongis undulatis obtusis emarginatis late vaginantibus, scapis erectis unifloris laxe vaginatis foliis duplo brevioribus, sepalis petalisque anguste triangularibus apice elongatis abrupte acutis, labello obovato obtuso levissime trilobo apice carnosissimo supra medium unituberculato. — Sepala et petala flava, labellum subtus purpureum.

Rio Janeiro.

46. *MAXILLARIA OCHROLEUCA* Lodd. L. O. 143.

47. *MAXILLARIA CHLORANTHA* Lindl. Bot. Reg. XXIII. 1837. sub 1986:

Acaulis, pseudobulbis ovalibus compressis monophyllis, foliis ligulato-oblongis, obtusis lucidis basi in petiolum canaliculatum angustatis, sepalis patulis subaequalibus linearibus acutis lateralibus basi parum obliquis, petalis linearibus conniventibus, labelli trilobi oblongi lobis lateralibus nanis obtusis planis intermedio producto ovato carnosissimo granulato crispo, callo solitario ovato.

Nemerara. Lodd.

Flowers small, yellowish green, sweetscented.

Rehb. fl. Bonpl. II. 280. Pamplona: la Baja. Januar. 8000'. Nr. 1177. Schlim.

Rehb. fl. Bonpl. III. 67. Teoramas. April. Wagener.

48. *MAXILLARIA BRUNNEA* Lindl., Rehb. fl. in Bpl. II. 281:

Affinis *Maxillariae chloranthae* folio late ligulato basi cuneato pedali, tepalis linearibus obtusis, sepalis paulo brevioribus, labello cuneato apice trilobo tepalis subaequilongo, lobis lateralibus rotundatis; lobo medio ligulato carnosissimo medio exarato brevi, carina depressa apice acuta a basi anto lobum medium, gynostemio incluso pede labello subaequilongo.

Species haud egregia sat similis vulgari *Maxillariae chloranthae* Lindl., sed notis datis bene diversa visa. Sepala ligulata obtuse acuta. Bractea ovario aequalis (quae nota a cel. Lindl. magni, a me haud magni habita). Androclinium prope perpendicularare. — Blüten hellbraun. — Ocanna im Mai. Wälder. 7000'. Nr. 1161. Schlim.

49. *MAXILLARIA VIRGUNCULA* Rehb. fl. in Bpl. II. 16:

Pseudobulbis ovatis subancipitibus minutis, monophyllis, foliis ligulatis acutis basi angustatis, pedunculo gracillimo 2 — 3 parvivaginato,

bractea acuta ovarium subaequante, sepalis lanceotriangulis acuminatis, lateralibus ascendentibus, tepalis subaequalibus duplo minoribus, summo sepalo appositis, erectis, labello ligulato acuminato erecto,

Blüthe so gross, wie die der *Maxillaria melina*, Zipfel aber schmaler. Farbe rothbraun. Blätter 3—4 Zoll lang, in der Mitte ziemlich 1 Zoll breit. Caracas. 6000' Februar. Nur einmal beobachtet. Wagoner. — Rehb. fl. Xenia O. I. p. 24. Tab. 10. f. 2.

50. MAXILLARIA PULLA Lind., Rehb. fl. in Bpl. II. 280:

aff. *Maxillariae virgunculae* Rehb. fil.: foliis basi angustissime petiolato attenuatis lanceolatis acuminatis pergameneis, tepalis cuneato ovatis acuminatis, labello oblongo lanceolato, acuto, ante basin utrinque revoluta, callo ligulato carinato in basi.

Pseudobulbi obcordati lenticulares semipollicares; folia nunc spithamaea. Flores illis *Maxillariae virgunculae* pallide flaveoli nervis purpureis. Sepala lanceolata acuta. Gynostemium curvulum, apice obliquum more *Lycastis*, sed pollinis apparatus geneticus. — Blüthen rosa mit rothen Streifen. Ocanna. 6000'. Juli. Nr. 33. Schlim.

Rehb. fl. Bonpl. III. 67. Ocanna. Wagoner. 5000'. März. Dasselbst auch eine var. stenotepala: flore majori, tepalis lanceolatis acutis.

51. MAXILLARIA BREVISCAPA Pöpp. Endl. Nov. Gen. et Sp. I. 36. Tab. LXII:

Bulbis cylindricis; foliis linearilanceolatis, scapos unifloros duplo excedentibus; labello oblongo, basi cuneato, apice utrinque unidentato, lobo terminali ovato, denticulato, crista disci villosa; tepalis interioribus oblongolanceolatis.

Crescit in arboribus sylvestribus Peruviae versus Pampayaco in locis editioribus frequens. Floret Novembre.

52. MAXILLARIA ARGYROPHYLLA Pöpp. Endl. Nov. Gen. et Sp. I. 36:

Bulbis ancipitibus apice emarginatis; foliis oblongis, scapos unifloros quintuplo excedentibus, subtus argenteo fibrosis; labelli oblongi, obovati lobulo terminali obtuse quadrangulati, emarginato; sepalis interioribus lanceolatis.

Crescit iisdem cum praecedente locis, at multo frequentior. Floret Januario.

53. MAXILLARIA RINGENS Rehb. fl. MSS.:

Pedunculo multivaginato, vaginis nervosissimis scariosis obscure punctulatis, infimis abbreviatis, superioribus longioribus, summis apicibus ampliatis, apice ipso acutis, bractea ampla oblonga acuta scariosa ovarium aequante, mento parvo obtuso, sepalis ligulato acutis apice subito acuminato mucronatis, tepalis triangulo ligulatis acuminatis, paulo brevioribus, labello sepalis ter brevioribus, oblongo apice trifido, laciniis lateralibus antrorsis triangulis, lacinia media carnosae obtusangulae rhombeae limbo crenulata, superficie sulcata, hinc puberula abbreviata, callo ligulato sulcato antice acuto a basi usque ante basin laciniae anticae, anthera apiculata.

Affinis etiam *Maxillariae ochroleucaae*. Bene differre visa sepalis non acuminatis labellique lacinia antica valde abbreviata.

Oaxaca. Karwinski! Guatemala de Warsewicz!

54. MAXILLARIA COLORATA Rehb. fl. Mss.:

Pedunculo parvivaginato, vaginis arctis obtuse acutis sese haud attingentibus, ovario bractea apice ampliata longiori seu aequali, mento parvo, sepalo dorsali ligulato acuto, sepalis lateralibus subaequalibus incurvo deflexis, acutis, tepalis ligulato-linearibus acutis, labello perbrevis oblongo apice trilobo, lobis lateralibus obtusangulis antrorsis, lobo medio carnosae papuloso obtuso, callo abrupto semiquadrato in disco antico ante lobum anticum, columna paulo breviori, anthera dorso carinata.

Ex icone pseudobulbi rotundi (ancipites?), folium petiolato attenuatum oblongum, perigonium flavidum, extus cinnabario aspersum, intus flavum, labellum cinnabarium atropurpureo limbatum, maculis atropurpureis. Similis etiam *M. longipedi* Ldl. Peru. v. Warszewicz.

55. MAXILLARIA DESVAUXIANA Rehb. fil. Bonpl. III. 67:

aff. *M. Parkeri*: pseudobulbo monophyllo, folii coriacei bipedalis ligulati acuti petiolari basi octopollicari, pedunculis brevissimis dense acuto scariosoque magnivaginatibus, bractea squamis subaequali, flore erecto, labello late ligulato apice paulo emarginato utrinque sinuato obscure trilobo, carinula hippocrepica in centro, disco lobi medii rugulosi verrucoso. — Pseudobulbus videtur compressus ligulatus, apice vix humeratus. Folium prope tres pollices latum. Mentum prope obsoletum. Sepala oblonga apiculata. Tepala paulo latiora et breviora. Labellum his paulo brevius. Gynostemium clavatum. Androclinium postice margine semirovando elevato cinctum. Pollinia in glandula lunata.

Wir kennen diese Art längst aus Pariser Gärten, indem wir unsern Freunde Desvaux Blüthen verdanken, welche aus Cayenne stammen sollten. Sepalen ledergelb, Tepalen und Lippe kirschroth geädert und gefleckt. — Pericos. Wagerer.

56. MAXILLARIA PARKERI Hook. B. M. 2729. —

57. MAXILLARIA LORIFOLIA Rehb. fil. Bonpl. II. 92:

aff. *M. leptosepalae* et *callichromati*: sepalis oblongis acutis, tepalis acuminatis, labelli lobis lateralibus rectangulis, medio producto ligulato acute crenulato, callo ligulato apice acuto triangulo a basi puberula in discum.

Folium coriaceum ligulatum acutum bipedale. Pedunculus densissime vaginatus, vaginae super ortum amplae acutae. Perigonium (an semper?) clausum, mentum modicum. Sepala oblongo ligulata subito acuta; tepala angustiora apice attenuata acuminata, labellum cuneatum medio trilobum, lobi laterales rectanguli antice minute crenulati, lobus medius ligulatus acutiusculus, crenulatus, basi pilis planis pauciariculatis sericeus, callus apice elevato acutus a basi ascendens usque inter lobos laterales progrediens. Gynostemium curvulum semiteres, stigmatis fovea inferne limbata, anthera apice carinato cristata. Aus La Guayra von Herrn Senator Jenisch eingeführt, von Herrn Kramer cultivirt.

58. MAXILLARIA CURTIPIES Hook. Ic. IV. 1841. t. 384:

Pseudobulbo elliptico compresso laevissimo monophyllo, folio lato linearilanceolato acutiusculo enervio basi complicato, scapo radicali pseudobulbum aequantis squamis fuscis membranaceis vaginato unifloro, sepalis petalisque subconformibus oblongis unicoloribus, labello oblongo obscure trilobo intus nitidissime purpureofusco disco tuberculo lato elevato.

Mexico. Parkinson. Esq.

Drawn from the living plant. It is a small species offering little beauty. Ranks near *M. rufescens* Lindl. Pseudobulbs are small and singularly smooth on the base of the surface. The leaf somewhat coriaceous. From the base of the bulb there are on each side the rudiments of new plants, clothed like the greater part of the scape with brown sheathing scales. Flower rather small of a yellowish buff colour, destitute of fragrance, the outer or underside of the labellum is obscurely spotted with red the inside, as well as the front of the column is deep redbrown and glossy.

59. MAXILLARIA LYONII Lindl. Bot. Reg. XXXI. 1841. N. 26:

Acaulis, pseudobulbis ovatis compressis laevibus nec angulatis corrugatisve, foliis lineari-lanceolatis apice oblique emarginatis, floribus solitariis, sepalis petalisque oblongis, obtusis, striatis, labello oblongo retuso emarginato, infra apicem scabro tuberculo oblongo in medio prope basin.

Little species from Mexico. It has very narrow grassy leaves and ovate smooth glaucous pseudobulbs. Flowers are dull purplish brown, very slightly bordered with a yellow tint.

60 MAXILLARIA PORRECTA Lindl. Bot. Reg. 1838. XXIX. Misc. 173:

Foliis oblongo-lanceolatis trinerviis, pedunculo erecto unifloro vaginato, sepalis linearibus apice concavis obtusis lateralibus incurvis, petalis conformibus, labello angusto apice trilobo medio calloso pubescente, lobo medio convexo rotundato margine crispo revoluto.

Loddiges obtained it from Rio Janeiro. Flowers are about the size of those of *Maxillaria picta*, of a pale buff, with the sepals and petals tipped with dull red. Labellum is the same colour on the outside below the point.

61. MAXILLARIA LEPIDOTA Lindl. Ann. Nat. Hist. XV. 1845. p. 38:

Acaulis, foliis solitariis ligulatis acutissimis in petiolum angustatis, pedunculis unifloris acute vaginatis erectis dimidium folii aequantibus, sepalis elongatis linearibus acuminatis, petalis setaceo acuminatis duplo brevioribus, labello carnosobovato trilobo apice carinato et utrinque lepidoto lacinia intermedia ovata lateraliumque apice margine anteriore crenatis, tuberculo angusto vix medium labelli attingente.

Popayan (Hartweg).

62. MAXILLARIA MATHEWSII Lindl. in Benth. Pl. Hartweg. p. 155. Aug. 1845:

Pseudobulbis obovatis, foliis ensiformibus oblique emarginatis, scapis duplo longioribus, vaginis scapi angustis appressis, sepalis linearibus obtusiusculis, labelli oblongi obtusiusculi trilobi lobis lateralibus parvis rotundatis intermedio oblongo carnosissimo; callo oblongo medio canaliculato.

Peru. Mathews.

63. MAXILLARIA RUFESCENS Lindl. Bot. Reg. XXII. 1836. 1848. *M. fuscata* Hort.:

Pseudobulbis ovatis subtetragonis monophyllis, foliis lanceolatis utrinque emarginatis, scapis unifloris (prostratis) vaginis distantibus, sepalis petalisque oblongis conformibus obtusis, labello oblongo trilobo tuberculato laciniiis lateralibus minimis acutis intermedia elongata emarginata. Supra fol. XXI. 1802 in textu.

Perigonii phylla 3 externa flavo rufescentia, columna et labellum et petala flava, columna et labellum purpureo punctata. Trinidad.

Rehb. fl. Bonpl. II. 16. 6000'. November. Caracas. Wagerer. Diese Art trug bei Herrn Keferstein öfters Frucht, ohne sich zu öffnen. Es ist eine kleine Form, die Blüthe nur $\frac{1}{2}$ der gewöhnlichen Grösse.

Huc: *Maxillaria acutifolia* Lindl. Bot. Reg. XXV. 1839. Misc. 148;

Pseudobulbis angustis ovalibus compressis monophyllis, folio oblongo-lanceolato acuminato, pedunculis unifloris radicalibus vaginatis, bractea carinata ovario longiore, sepalis petalisque oblongis, labello lineari-oblongo retuso emarginato medio pubescente apice glabro utrinque versus basin lacinia brevi acuta incurva aucto.

A species resembling *M. rufescens*, and having brownish orange flowers with little beauty. In the collection of Loddiges from Demerara.

Huc: *Maxillaria articulata* Kl. l. c. (1838.):

Pseudobulbis caespitosis oblongis parvis compressis ancipitibus leviter costatis unifoliatis, squamis tribus foliaceis conduplicatis inaequalibus acutissimis primum involucreatis; foliis oblongis coriaceis acutis carinatis, apice recurvis, basi conduplicatim attenuatis; scapis solitariis basilaribus biarticulatis bibracteatis, articulis annulatim tumidis; bracteis dilute purpureis vaginato-inflatis, apice constrictis acutis, margine aridis, internodio brevioribus; floribus parvis solitariis e flavido-rutilis; foliolo superiore perigonii exterioris obovato mucronato convexo extus purpurascens, inferioribus e basi latiore oblongis brevi-acutis pallidioribus deflexis, interioribus erectis flavidis spathulatis mucronatis: labello oblongo exappendiculato trilobo flavido-purpureo punctato, lobis lateralibus brevissimis rotundatis; gynostemio elongato e viridi flavescens minutissime purpureo punctato; glandula purpurea anguste lunulata; germine cylindrico incurvo sulcato purpureo, bractea superiore duplo longiore.

Pseudobulbi pollicem longi, 8 lines lati et 5 lines crassi. Folia 4—5 pollices longa et 8—12 lines lata. Scapus sesquipollicaris purpurascens. Bracteae 3 lines longae. Foliolum perigonii exterioris superius 5 lines longum et 3 lines latum, inferiora et interiora 2 lines lata. Gynostemium 4 lines longum. Germen pollicem dimidium longum.

Venezuela. Wager. Floruit in horto Berolinensi M. Sept. 1853.

Obs. Forsan huc sequentes duae species pertinent, quas non novi.

64. ?MAXILLARIA GALEATA Scheidw. Berl. Gartenz. 1842, 309 :

Pseudobulbis ovatis compressis diphyllis, foliis ovato-oblongis, acutis, plicatis; scapis radicalibus unifloris; sepalo supremo petalisque lateralibus conniventibus subgaleatis, sepalis lateralibus patentibus, omnibus lanceolatis acutis, labelli trilobi lobo intermedio lingulato, lateralibus parvis acutis; anthera galeata loculorum valvulis membranaceis transversim dehiscentibus; pollinia 4, per paria in glandulam hyalinam transversam sessilia.

Scapus 2" longus, purpureus; bracteae quatuor ventricosae, acutae, margine purpureae. Flores purpurei, striato-punctati, labellum cum basi producta columnae articulatam, atropurpureum, basi dilute roseum.

Brasilia.

65. ?MAXILLARIA RUGOSA Scheidw. in Berl. Gartenz. 1843. p. 101 :

Pseudobulbis oblongis compressis sulcatis monophyllis vaginatis; foliis lanceolatis coriaceis rugosis apice obliquis, emarginatis mucronatis, basi plicatis, scapo unifloro vaginato erecto pseudobulbo longiore, scapi vaginis 6—8 ventricosis, marginalis, carinatis, acutis, sepalis lateralibus lanceolatis explanatis, supremo fornicato, petalis angustioribus conniventibus, labello trilobo, carnoso, lobis lateralibus integris, intermedio oblongo apice sulcato, in axi callo obcordato ad basin callo oblongo crassiore munita.

Brasilia. Affinis *M. galeatae* Scheidw.

66. MAXILLARIA LINDENIANA Rich. et Gal. tab. 261. Ann. sc. nat. 1845 p. 25. Jan.:

Pseudobulbis ovoideo-oblongis, 1-phyllis; foliis linearibus obtusis; scapo radicali vaginato; floribus roseis punctatis; labello intense purpureo trilobo, lobis lateralibus obtusis parvulis, intermedio majori carnoso.

Mexico.

67. MAXILLARIA SESSILIS Lind. in Benth. Pl. Hartwg. p. 155. Aug. 1845 :

Acaulis, pseudobulbis subrotundo-ovatis, foliis oblongis obtusis solitariis sessilibus scaporum longitudine, scapi vaginis 3—4 carinatis in-

flatis suprema ovario brevior, sepalis lanceolatis acutis, petalis linearibus acutis duplo brevioribus, labelli trilobi lobo medio oblongo apiculato unguiculato basi 5 sulcato lateralibus dilatatis incurvis apice dentatis lineis 3 elevatis in medio venisque utrinque cristatis.

Parva species. Scapi vix 4 pollicares. Sepala sesquipollicaria. — In Cordillera prope Loxa.

68. MAXILLARIA HETEROCLITA Pöpp. Endl. Nov. Gen. p. 37. Tab. LXIII:

Bulbo ovato, anguloso; foliis oblongo-lanceolatis, planis scapo uni-vel bifloro longioribus; labelli oblongolanceolati, trilobi lobis lateralibus cristato pinnatifidis; columna medio late alata, apice demum increscente.

Bulbi ovals, subangulosi, radicibus subfasciculatis, leviter tomentosus suffulti, magni, extus cinereo virides. Folia vaginantia. Scapi uni-vel biflori, ex ima bulbi basi, subradicales, articulati, iisdem, ac bulbi basis squamis inclusi. Perianthii foliola aequalia, lanceolata, superiora tria erecta, inferiora patula, omnia flavo et purpureo alterne striata. Labellum ungue brevi cum styli basi elastice articulatum, lamina ascendente triloba: lobis lateralibus erectis, columnae adpressis, margine pinnatifido dentatis; niveis: lobo terminali integerrimo, coeruleo. Columna intus valde pubescens medio utrinque marginis membranacei processu incrassato, triangulari aucta; margine foveae terminalis, antherae recipiendae aptae undulato, post antherae delapsam incrassato, supra stigma convoluto, in lobos duos triangulares, carnosos et adpressos tunc excrecente. Pollinis massae quatuor cereae, caudiculae communi deltoideae insidentes. — Icon ad plantam vivam loco natali confecta. Specimina inter paucissima herbarii nostri fuere, quae ab insectis penitus corrosa reperimus.

69. MAXILLARIA NÖTYLIOGLOSSA Rehb. fl. in Bonpl. II. 16.:

Rhizomate dense vaginato debili, pseudobulbis remotis oblongo-linearibus, compressis diphyllis, foliis lineariligulatis, apice retuso bilobis, pedunculis ex axilla vaginae vetustae solitariis, di-, trivaginis, vaginis compressis ancipitibus obtuse acutis contiguis, bractea subaequali spatheae ovarium paulo superante, sepalis lanceolatis apice subretusiusculo brevissime setaceo apiculatis, tepalis linearibus apice brevissime setaceis, tertia parte brevioribus, labello basi unguiculato, lamina triplo longiore angustato triangula basi hastata (labello igitur truellaeformi), callo ovali depresso antice angustato discum tertii basilaris in labello occupante, gynostemio clavato, anthera mitrata laevi.

Blüthe wenig kleiner; als die der *M. variabilis* Bat. (*revoluta* Hort.) gelbgrün. Trugknollen $1\frac{1}{2}$ Zoll lang, Blätter 2—3 Zoll lang, 3 Linien breit. Eine ähnliche Lippenform ist nur bei *M. hastulata* angegeben, die eben durch Lippe und zugespitzte Sepala, stielig verschmälerte Blätter u. s. w. verschieden ist. Caracas. 6000'. October. Wagener. — Rehb. fl. Xenia Orchidacea I. Tab. 10. II. 3. 4. p. 24.

70. MAXILLARIA MELINA Lindl. Orch. p. 20. N. 103. 1846:

Acaulis, scapigera, foliis oblongis acutis scapo longioribus, vaginis laxis carinatis acutissimis subfalcatiss suprema ovario subbreviore, sepalis petalisque ovato lanceolatis obtusiusculis, labello ovato obtuse acuminato, carnosio apice corrugato appendice subtrilobo, lamina intermedia retusa.

„An epiphyte with oval obtuse pseudobulbs and dirty yellow flowers. Forests of Merida at the height of 5600'. June. N. 641.“ Leaves one and half inch broad overrun with scaly masses. Scape 6" high. Sepals an inch long.

Rehb. fl. Bonpl. II. 16. Caracas. 5000'. November. Wagener.

71. MAXILLARIA HASTULATA Lindl. sp. Benth. Pl. Hartwg. p. 154. Aug. 1845:

Acaulis, foliis oblongis acutis petiolis duplo longioribus, scapis petiolis subaequalibus, vaginis adpressis suprema ovario multo longiore, se-

palis angustis acuminatis, labello oblongo cuspidato apice carnoso basi convoluto tum hastulato, appendice oblonga carnosa plana supra basin acuta. Flores fusci. Scapi 3—4 pollicares. Sepala pollicem longa.

In Cordillera prope Loxa.

72. MAXILLARIA LAEVLABRIS Lindl. Benth. Pl. Hartwg. p. 135. Aug. 1845:

Pseudobulbis ovatis, foliis oblongis mucronulatis scapis aequalibus, vaginis scapi laxis carinatis; sepalis ovato-lanceolatis, petalis linearibus, labello subrotundo-oblongo trilobo laevi: lobo medio rotundato, lateralibus acutis. Scapi 5 pollices alti.

Peru. (Non ab Hartwegio lecta).

73. MAXILLARIA EBURNEA Lindl. Sert. t. 40. N. 2:

Pseudobulbis ovatis sulcatis monophyllis, foliis lineari-oblongis acutis subcoriaceis in petiolum canaliculatum angustatis, scapo erecto multifloro vaginato longioribus, vaginis distantibus acutiusculis, sepalis explanatis lateralibus triangularibus, elongatis, supremo petalisque lanceolatis, labello ovato oblongo leviter crenulato, callo unico acuto per medium et duobus lateralibus squamatis multo minoribus, columna apice uncata cardine dentato.

Flowers 5 „from tip to tip of the lower sepals and of purest white. Leaves till 15' long, with channelled stalk into which they taper at their junction with the pseudobulbs; texture more papery than leathery. — Allied to *M. grandiflora*, which is said to have compressed two leaved pseudobulbs and a lip plaited transversely at the base.

Sandstone formation near Mount Meracaevi, 6000 feet, in great abundance on trunks and branches, about 30 miles in NNE direction from Cimeralda.

74. MAXILLARIA CROCEA Pöpp. Endl. Nov. Gen. 38. Tab. LXII. f. II.:

Bulbis anguloso cylindricis, foliis lineari-oblongis, scapos unifloros quadruplo excedentibus; labelli oblongi, trifidi laciniis lateralibus subfalcatis, brevissimis, terminali quadrata, truncata, undulata; sepalis interioribus ovalibus.

Pampayaco Peruviae Pöppig.

Obs. Planta statu misero in Herbario Vindobonensi adest. Egregia ob sepala valde ovata paulo acuta. Nonne Ornithidium?? Nomen jam adest, sed mutare nolui, cum planta adeo dubia. — R. f.

Species obscurissimae.

MAXILLARIA BRACHYGLOSSA Rich. et Gal. Ann. sc. nat. Jan. 1845. 24:

Pseudobulbis ovoideis oblongis apice diphyllis; foliis lanceolatis, acutis; scapo 1-floro radicali vaginato; flore purpurascente, sepalis ovalibus; labello minimo trilobo, lobis lateralibus obtusis, intermedio carnoso obtuso.

Mexico.

MAXILLARIA GALEOTTIANA Rich. et Gal. Ann. sc. nat. 1845. Jan. p. 24:

Pseudobulbis oblongis compressis, costatis, 2-phyllis, foliis elliptico-lanceolatis, obtusis; scapo radicali, brevissimo 1-floro vaginato; floribus magnis luteis punctatis, labello pallidiore cucullato-canaliculato trilobo, lobo intermedio oblongo, obtuse sinuoso.

Mexico.

MAXILLARIA BOOTHII Lindl. Bot. Reg. 1838. XXIV. Misc. 95:

Rhizomate repente, pseudobulbis ovalibus compressis diphyllis, foliis angustatis obtusis, flore terminali infra bracteas carinatas submembranaceas distantes basi incluso, sepalis petalisque conformibus erectis angustis acutis, labello oblongo obtuso margine membranaceo.

Guatemala by George Mr. Skinner Esq., introd. in 1835 by Captain Sutton, who added it to Sir Charles Lemons coll. at Carelew, where it flowered in May 1838. Scape oneflowered, about 2" high, thin and compressed and having two large, thin, sheathing, acuminate bracts. It issues from the centre of an upright, keel-shaped, narrow leaf, which is imbricated at the base, and forms a sort of sheath, that protects the flower until it is ready to expand. Pedicels 1" long, dull green, with brownish spots. Sepals greenish-yellow. Petals of the same colour, as the sepals, but conniving and about a third shorter with a blunter point. Labellum the length of the petals, slightly recurved, rounded at the point, and keeled below with the outer edge, very thin and more delicate, than the rest. Towards the base are 2 fleshy processes of a deep yellow.

Obs. Herbarium illustris Lindley sistit specimen *Epidendri auriti* Lindl. (*Dinematis pateacei* Lindl.). Additae sunt analyses cujusdam Maxillariae delineatae.

75. MAXILLARIA FUNEREA Lindl. Hook. Lond. Bot. Journ. 1842. I. p. 188:

Pseudobulbis oblongis sulcatis imbricatis diphyllis, foliis linearibus et lineari-lanceolatis strictis, floribus solitariis radicalibus, sepalis oblongis acutis, labello obovato nudo leviter trilobo, laciniis lateralibus dentiformibus, intermedia subcarnosa rotundata.

Hab. On dry rocks at Praga Vermelha. Gardener.

Species pusilla, floribus pseudobulbisque purpureofuscis. M. uncatæ (quæ nana Hook.) et aciculari affinis. Lindl.

76. MAXILLARIA PUMILA Hook. Bot. Mag. 3613. (N. S. XI):

Nana, caulibus brevibus squamosis pseudo-bulbiferis, bulbis aggregatis oblongis sulcatis, folio solitario lanceolato, pedunculis pseudobulbo brevioribus unifloris, petalis sepalisque erectis oblongis obtusis, labello erecto oblongo obscure trilobo disco calloso, lobo terminali bifido. Perigonium flaveolum et rubro violaceum.

Demerara. Glasgow 4. 5. Inverarity.

77. MAXILLARIA CRASSIFOLIA Rehb. fil. Bonpl. II. 16. *Heterotaxis crassifolia* Lindl. *Dicrypta Baueri* Lindl. Blüten brennender gelb, als bei der cultivirten Art, sonst in allen Einzelheiten gleich. Caracas. 5000'. Mai. Wagener.

78. MAXILLARIA VIOLACEOPUNCTATA Rehb. fil. Bonpl. III. 216:

Aff. Maxillariae crassifoliae Rehb. fil. (*Dicryptae Baueri* Lindl.) sepalis oblongis apiculatis (nec triangulis), tepalis lineariligulatis acuminatis, labelli lobo medio triangulo carnosio, lobis lateralibus semiovatis antice angulatis, linea tomentosa a basi usque ante basin lobi medii.

Blüthe so gross wie die einer mittlern Maxillaria Parkeri, zusammengeneigt. Sepalen und Tepalen hellgrün. Lippe und Säule ebenso, allein erstere mit zahlreichen violetten Querbändchen und letztere voll dergleichen Punkte. Anthere kegelförmig; an den beiden Vorderkanten besetzt mit leuchtenden Papillen. Pollinia auf kurzer Caudicula und zu dieser eine quermondförmige Glandula. Aus Demerara eingeführt von Herrn Senator Jenisch, cultivirt von Herrn Kramer.

79. MAXILLARIA DISCOLOR. Huc: *Dicrypta discolor* G. Lodd. Mss. in B. R. XXV. 91:

Foliis latis papyraceis subtus discoloribus, labello linguiformi linea media elevata villosa, antherae margine angulisque papillosis.

Messrs. Loddiges imported it from Demerara. It is remarkable for the deep purple colour of the underside of the leaves, and its lip has a thick villous line

running from the base almost to the apex. The flowers are orange coloured about the size of those of *D. Baueri*, and the species handsomer.

— *Folia ligulata carnosula sulcata.* —

80. MAXILLARIA CEPULA Rehb. fl. in Bonpl. III. 216:

aff. *M. pumilae* Hook. folio ligulato acuto canaliculato carnosulo quinque-pollicari, labello exacte cuneato antice trilobo, lobis lateralibus subquadratis microscopicè denticulatis, lobo medio producto ligulato disco velutino, lamella depressa a basi in discum. Pseudobulbus teres sulcatus. Flos illis *M. rufescentis* majoris subaequalis. Sepalum summum lanceolatum acutum. Sepala lateralia altiora. Tepala ligulata acuta. Gynostemium apice bene clavatum. Von Rio Janeiro.

l. c. p. 226: Pseudobulbi oblongo fusiformes, a vaginis latis triangulis basi nervosis fuscis distichis involucrati. Folia ligulato linearia acutata valde carnosula bina. Ovaria crassa a squamis obelata. Mentum obtusum parvum. Sepala lanceolata acuta fusca. Tepala paulo latiora obtusiora purpureoviolaceo guttata. Labellum ochraceum atropurpureo pictum, cuneato ovatum, medio obtuse trilobum; lobus medius minute denticulatus, carina a basi unguis usque ante stricturam lobi medii angusta, ligulata; discus lobi medii carnosulo rugosus. Gynostemium arcuatum gracile. Rostellum antice bilobum; fovea magna. Pollinia quaterna sessilia in caudicula subquadrata.

Huc pertinet sequens species, falsissima folii descriptione a nemine recognita, inde a me synonymi loco habita:

Maxillaria madida Lindl. Bot. Reg. XXIV. 1838. Misc. 74:

Caulescens, pseudobulbis ovatis, elongatis, subteretibus sulcatis diphyllis secus caulem imbricatis, foliis lanceolatis linearibusque acutis subplicatis canaliculatis, floribus solitariis intra spatham siccam squamosam subsessilibus, sepalis subparallelis acutis lateralibus, basi parum productis, petalis conformibus; labelli trilobi medio callosi lobis lateralibus inconspicuis, intermedio rotundato plano obtuso recurvo disco madido et discolore, columna clavata arcuata labello longiore.

One of the least showy of the genus: nearly related to *M. acicularis*, with some others in the possession of Messrs. Loddiges forms a well marked group. Flowers are a dull dirty yellow, spotted obscurely with yellowish brown. The labellum has a broad chocolate brown blotch at the end, where it is so shining as to look as if wetted; this circumstance has suggested the specific name. It is a native of Brazil.

81. MAXILLARIA UNCATA Lindl. Bot. Reg. XXIII. 1837. sub 1986:

Caulescens, pseudobulbis in axillis squamarum membranacearum iisque brevioribus teretibus sulcatis monophyllis, foliis linearibus canaliculatis obtusis, sepalis lateralibus basi maxime productis, petalis sepaloque supremo quadruplo majoribus, labello oblongo obtuso carnosulo margine crispo membranaceo basi angustato disco unicalloso, columna apice utrinque uncata.

Demerara. Coll. Lodd.

Huc: *Maxillaria nana* Hook. Ic. IV. 1841. t. 315:

Humilis, caule folioso, foliis lineari-lanceolatis subfalcatis rigidis, floribus solitariis, axillaribus (ochroleucis), columna superne antice bialata, labello oblongo trilobo lobo medio obtusissimo cum acuminulo, disco glandula aurantiaca.

Demerara. C. L. Parker. Esq.

Proliferous habit approaches *Scaphyglottis*: at the setting on of the leaves and of the flowers also there are copious membranaceous sheathing scales. The sepals and

petals are erect, cream coloured. The column is prolonged below the apex of the germen so as with the base of the labellum to form an obtuse spur. Pollenmasses 4, unequal, attached to a large, 2 toothed membranaceous gland.

— Subulifolia. —

82. MAXILLARIA ACICULARIS Herbert Bot. Reg. XXIII. 1837. sub 1986. — (B. M. 4374):

Subcaulescens, pseudobulbis subfusiformibus sulcatis diphyllis basi squamosis, foliis linearibus, acuminatis canaliculatis dorso convexis, pedunculis arctissime squamosis axillaribus unifloris, perianthio connivente, sepalis petalisque ovatis acutis, petalis obtusioribus, labello indiviso oblongo obtuso disco illinito, callo lineari apice rotundato integro.

Brazil: coll. of the Hon. and Rev. W. Herbert.

Flowers purplish chocolate. J only know this from a drawing by Mr. Herbert. The structure of the flowers requires to be reexamined. The pollinia I have not seen at all.

83. MAXILLARIA SUBULATA L. O. 147.

Caulescentes.

Obs. Pro Maxillaria caulescente illam tantum habeo, quae semper et a prima evolutione pollet caule bene erecto seu ascendente. Forsan omnes „acaules“ nunc occurrunt „caulescentes“, praesertim ubi truncos adscendunt. Inde *Maxillariam Meleagridem* Lindl. ab ipso cl. auctore ad „caulescentes“ relatum, in „acalibus“ collocavi. Ipsa *M. marginata* Fenzl. saepe „subcaulescens“ occurrit. Rehb. fil.

† Caulescentes pseudobulbiferae.

84. MAXILLARIA STENOPHYLLA Rehb. fil. in Bonpl. II. 17:

Caule gracili dense foliato, vaginis abbreviatis, laminis linearibus apice bilobis, pseudobulbis lineariellipticis apice diphyllis, pedunculo solitario apice vaginato, vaginis imbricantibus acutis, internodio dein nudo, bractea vaginaeformi obtuse acuta, ovarii tertiam aequante, sepalis oblongis acutis, tepalis angustioribus basi dilatatis acutis, subaequilongis, labello ligulato, medio obscure obtuseque trilobo, apice retuso, callo lineari a basi ad medium discum, androclinio postice acuto.

Blüthen so gross, wie die einer kleinen *M. variabilis* Bat., blässgelb. Sepala und Lippe mit kleinen rothen Flecken inwendig bespritzt. Blätter 2—3 Zoll lang, 2—3 Linien breit. Caracas. 5000'. Wagener.

85. MAXILLARIA PASTENSIS Rehb. fil. in Bonpl. III. 239:

Aff. *M. stenophyllae* vaginis valde arphophyllaceis, pseudobulbis rarissimis ovatoligulatis, foliis abbreviatis lineariligulatis bilobis nitidis, gynostemio brevissimo; labello ovali basin versus utrinque sinuato, callo tumido depresso lato a basi usque ad sinus.

Caulis ultra spithamaeus arcte vestitus vaginis egregie rugulosis margine membranaceis. Folia valde nitida, sesquipollicaria, egregie biloba. Flores illis *M. variabilis* Bat. aequales. Pedunculus tenuis vagina una in basi; bractea cucullata membranacea, dorso carinata, apiculata, ovario duplo brevior. Sepala oblonga apice angustata. Tepala ovalia apice obtusa; in sicca planta valde nervosa. Gynostemium clavatum breve. Woods near Pasto. Septbr. 1845. 4951 Jamieson.

86. MAXILLARIA INFAUSTA Rehb. fil. in Bonpl. III. 216:

Affinis *M. stenophyllae* (pseudobulbis nullis?), foliis latioribus, sepalis oblongis, tepalis ovatis, labello latiori utrinque ante medium unilobo, antice retuso, callo tricarinato brevi pone sinus, gynostemio brevissimo.

Praesto est caulis spithamaeus. Vaginae grosse sulcatogyrosae praesertim infimae. Folia ligulata bipollicaria, tertiam pollicis vix lata, apice biloba; folia infima vix pollicaria. Ovaria longe exserta bracteam cucullatam ter—quater superantia. Perigonium breve, ochraceum? illo Maxillariae variabilis minus. Maxillaria stenophylla pollet perigonii sepalis tepalisque longioribus, gynostemio gracili. Peru: Chachapoyas, Matthews. (Herb. Boiss.)

87. MAXILLARIA CHRISTOBALENSIS Rehb. fl. v. Schl. B. Z. 1852. 857:

Caulibus validis, a foliorum vaginis distichis vaginatis, ramulis (pseudobulbis) in axilla vulgo duodecimae vaginae sessilibus, diphyllis, foliis linearibus apice inaequalibus, floribus solitariis in axillis vaginarum, pedunculis 1—2 vaginatis, mento parvo, perigonii phyllis externis oblongis acutis, lateralibus internis ligulatis retusis cum apiculo, labello a basi cuneata angusta dilatato, trilobo, lobis lateralibus obtusatis erectis, lobo medio producto retuso, callo oblongo inter lobos laterales, gynostemio clavato, antice utrinque angulato, postice minutissime denticulato.

Blüthen so gross, wie bei *M. variabilis*, scheinend braun. — Maxillaria — 1359. Peruv. suband. Cerro de San Christobal prope Cuchero. Septbr. 1819. Pöppig.

88. MAXILLARIA TENUIFOLIA Lindl. Bot. Reg. XXIII. sub 1986. XXV. Tab. 8:

Caulescens, pseudobulbis ovato-oblongis compressis monophyllis squamulis longioribus, foliis linearilanceolatis acutis recurvis, pedunculis axillaribus solitariis basi squamatis, ovario denudato arcuato, floribus cernuis, sepalis ovato-lanceolatis, margine revolutis subaequalibus reflexis, lateralibus basi subaequalibus, petalis ovatis obtusis conniventibus, labello oblongo indiviso, apice ovato reflexo infra apicem utrinque contracto, callo disci oblongo integerrimo.

Mexico, found near Vera Cruz by Mr. Hartweg.

Perigonium flavum purpureo lavatum ac guttatum.

89. MAXILLARIA MACLEEI Bateman in litt. Bot. Reg. XXVI. 1840. Misc. 155:

Subcaulescens, pseudobulbis confertis oblongis monophyllis subcompressis, foliis aciculatis, pedunculis axillaribus solitariis basi squamatis, floribus rectis, sepalis ovato-lanceolatis acutis conniventibus, petalis multo brevioribus acutis paululum recurvis, labello oblongo indiviso margine plano apice haud reflexo, callo disci oblongo integro.

Pseudobulbs a true oblong, instead of tapering as do those of *M. tenuifolia*. Leaves of *M. M.* $\frac{1}{2}$ the length of the leaves of *M. tenuifolia*; sepals and petals perfectly plane, the edges recurved [in *M. tenuifolia*, sepals turned backwards in *M. tenuifolia* and petals connivent; in *M. M.* exactly the reverse. The lip moreover of the latter is not recurved. Sepals and petals of *M. Macleei* internally of a uniform rich reddish brown, and its lip whitish, with intense maroon spots, while in *M. tenuifolia* there is a considerable admixture of yellow, both in sepals, petals and lip. Mr. Skinner found it in Guatemala. Called after his worthy partner, Mr. Klee.

90. MAXILLARIA ELATIOR Rehb. fl. *Dicrypta elatior* Rehb. fl. in Linnæa 1843. p. 403:

Foliis lanceolatis obtusis vaginantibus distichis, floribus solitariis axillaribus, ovario pedunculum aequante, sepalis petalisque minoribus oblongis obtuse acutis, labello ligulato apice angustato basi obscure discato.

Die bis fusslangen Blätter anscheinend unterseits violett gefärbt. Die Blüten, augenscheinlich im Leben gelb, sind um die Hälfte grösser, als die der *Dicrypta Baueri* Lindl. Die Säule ist schlank, etwas gekrümmt, von der Länge der Lippe. 4 längliche seitlich abgeflachte Pollenkörper, zu zweien auf einander liegend. — Die Anthere sah ich nicht. — Die Pflanze unterscheidet sich durch schmalere Blätter, geringe und plötzliche Zuspitzung der länglichen Kelchblätter, die fast wulstlose

Lippe von *Dicrypta Baueri* Lindl. *Dicrypta densifolia* Pöpp. et Endl. weicht vorzüglich ab durch die an der Basis gesackten, äusseren, seitlichen Kelchblätter. *Dicrypta discolor* Lodd. hat eine auf der Mittellinie der Lippe verlaufende Haarlinie.

Huc: *Maxillaria triangularis* Lindl. Bot. Reg. 1845. XXXI. Misc. p. 9:

Caulescens, pseudobulbis ovalibus ancipitibus utrinque corrugato sulcatis, foliis ligulatis apice obliquis, floribus solitariis axillaribus ebracteatis, sepalis subaequalibus patentissimis margine in formam triangularem recurvis, lateralibus paulo majoribus, petalis conformibus minoribus erectis, labello oblongo ciliato puberulo cum columna parallelo emarginato concavo medio verruca solitaria polita aucto, anthera conico scabra.

In the village of Quezaltenango in Guatemala Hartweg. Its leaves are very much larger than in *tenuifolia* (10 by 1¼ inches), the flowers are formed singly in the axils of the imperfect leaves, which precede the appearance of the perfect leaves and terminal pseudobulbs of such plants. They are of a rich cinnamon brown gaily mottled with crimson flecks. The sepals which spread widely apart, are folded back at their edges into a triangular form.

Cf. Rehb. fl. Bonpl. II. 16. Est „flor del Canele“ Mexicanorum.

91. MAXILLARIA PANTHERINA Rehb. fl. in Bonpl. III. 237:

Affinis *M. triangulari* Lindl. multo minor, foliis oblongis abbreviatis, labello cuneato apice retuso, subcarnoso, medio gibbere retuso signato; gynostemio clavato.

Caulis strictus vaginis distichis lanceis arctis arphyllaceis apice hinc purpureis vestitus. Pseudobulbi distantes ligulati duos pollices longi, dimidium pollicem lati. Folia non nisi in ipsis pseudobulbis, ac in folio stipanti unico seu duobus, oblonga, apicem versus uti basi attenuata, apice retusa cum apiculo nunc valde insigni, subpergamenea, quatuor ad quinque pollices longa, plus unum lata. Flores in axillis omnium vaginarum surculi juvenis Lockhartiam ludentis; omnes clausi in specimine, quod praesto est, illis *Maxillariae variabilis* Bat. (= *revolutae* Klotzsch) paulo majores illo statu. Pedunculi vaginas paulo excedentes vaginis distichis onusti. Bractea cucullata dorsum alabastris attingens. Perigonium videtur sanguineum; sepala oblongo-triangularia. Tepala ligulata obtuse acuta. Gynostemium gracile. — Maxillariam platypetalam nisi Ruizianam tamen Lindleyanam non novi, quae nonnullis nobis quadrare videtur. Cum tamen cel. auctor procurrentem dicat simillimam platypetalae, haec longe certe distat. Forests of the Andes at 6000'. 1849. 761. Jamieson!

92. MAXILLARIA FLORIBUNDA Lindl. in Benth. Pl. Hartweg. p. 154. Aug. 1845:

Caulis erecto ramoso prolifero, foliis ovato-oblongis acutis petiolis duplo longioribus, scapis numerosis aequalibus, vaginis scapi adpressis, acuminatis, suprema ovario longiore, sepalis acuminatissimis, labello oblongo trilobo callo oblongo excavato in medio, laciniis obtusis, intermedia carnosa longiore.

Folia 4—8" longa. Scapi tripollicares. Sepala fere 3" longa. Rami annotini imbricati. — In montibus Chuquirabambae.

93. MAXILLARIA MERIDENSIS Lindl. Orch. Lind. p. 19. N. 100. 1846:

Caulescens ebulbis; vaginis foliorum scabris, foliis lineari-lanceolatis acutissimis, floribus axillaribus subsessilibus, bractea suprema flore duplo brevior, petalis acuminatis, labelli oblongi trilobi laciniis lateralibus brevibus, intermedia tereti carnosa, appendice ovata concava.

„On trees at the grounds near Merida, at the height of 6000' above the sea. July. Flowers yellow.“ Nr. —)

94. MAXILLARIA HERALDICA Rehb. fl. in v, Schl. B. Z. 1852. 763:

Caulibus validis dense squamatis, squamis basi a radicibus adventitiis pendulis appressis perforatis, pseudobulbis oblongis ancipitibus diphyllis, foliis lineari-ligulatis, apice bilobis, floribus in foliis inferioribus ramulorum axillaribus, pedunculis trisquamatis, mento abbreviato, perigonii carnosissimi phyllis externis oblongis, acutis, internis subaequalibus minoribus, brevioribus, labello obsolete trilobo, lobis lateribus obtusangulis, medio producto, obtuso, callo pandurato seu oblongo ab ima labelli parte medium versus, gynostemio humili, androclinio valde immarginato, postice tamen papillis quibusdam ciliato-coronato, anthera conico-mitrata, glandula lineari-lanceolata.

Blüthen gelb, die seitlichen äusseren Hüllblätter tragen auf der unteren Hälfte eine rothe nach aussen in drei dicke Linien ausgehende Zeichnung. Daher der Name: drei Balken auf goldnem Grunde. Lippe rothbraun, Spitze gelb. So gross wie die der *Dicrypta Baueri* Lindl. Stängel spannenhoch. Aus Guatemala von Herrn Kammerath Frege eingeführt.

95. MAXILLARIA SPILOTANTHA Rehb. fl. Bonpl. II. 17:

Caule gracili elongato, foliis lineariligulatis apice attenuato bilobis, sex pollices longis, medio pollicem dimidiatum latis, pseudobulbis oblongis ancipitibus raris, pedunculis gracilentis solitariis, vaginis 2 membranaceis acuminatis vix imbricantibus vestitis, bractea subaequali dimidium ovarium elongatum haud aequante, sepalis oblongis acutis, tepalis subaequalibus quinta parte brevioribus, labello a basi angusta cuneato ligulato-lineari, medio utrinque undulato constricto, dimidio anteriori obscure pandurato, apice obtuse retuso, callo lineari obtuso a basi ad medium discum, gynostemio clavato, margine androclinii elevato oblique descendente, subtiliter denticulato, anthera dorso carinata.

Blüthen so gross, wie die der *M. variabilis* Bat., schwefelgelb, Lippe scharlachroth gelleckt. Caracas 5000'. Juni. Wagener.

96. MAXILLARIA GUAREIMENSIS Rehb. fl. Bonpl. II. 16:

Caulibus erectis, validis, vaginis foliorum distichis, ob laminas amissas retusis nitidis, fulvis, coriaceis membranaceomarginatis, pseudobulbis ovalibus compressis raris, foliis ligulatis oblique bilobis ceterum integerrimis, 6 pollices longis, prope pollicem latis, pedunculis exsertis, solitariis plurisquamatis, squamis vaginantibus, carinatis, acutis, imbricantibus, sepalis oblongis acutis, tepalis subbrevioribus, latioribus, labello angusto, obscure panduriformi retuso carnosio, callo lineariligulato a basi ad medium, gynostemio crasso, limbo carinato obliquo, androclinii fundo elevato.

Blüthen schwefelgelb, so gross, wie die der *M. crassifolia*. Die glänzenden, wie lackirten Fruchtknoten zeichnen die Art sehr aus. Caracas. Wagener.

Var. purpureovinosa. Rehb. fl. Bonpl. III. 217. Blüthe dunkelrothweinfarbig mit kleinen dunkeln Flecken. Herr Geitner führte diese Form aus Caracas ein.

97. MAXILLARIA DENSIFOLIA Rehb. fl. Bonpl. II. 16. (*Dicrypta densifolia* Endl. Pöpp. N. Gen. et Sp. I. p. 39. Tab. LXVIII:

Caule erecto calamum aquilinum crasso, vaginis retusis micantibus vestito, foliis ligulato loratis apice paulo (nec adeo ut in icone) attenuatis, inaequalibus, altero latere acutis, ultra pedalibus, duos prope pollices latis, pedunculis prope tripollicaribus, basi abscondite distiche imbricato squamatis, squamis lanceis acutis, superne 1—2 vaginatis, ovario nitidissimo cylindrico bractea sua longiore, mento rectangulo, sepalis oblongis apiculatis, tepalis subaequalibus, labello ligulato, medio

dilatato, nervis 3 mediis basi elevatis, callo obtusangulo in disco, gynostemio crassissimo.

Beide Arten entwickeln ihre Blüten aus wesentlichen Beisprossen, welche hoch über der Achsel (selbst seitlich derselben) des zugehörigen Blattes sich finden.

98. MAXILLARIA ALBA L. O. 143. (*Dendrobium album* Hook. Ex. 142.)

99. MAXILLARIA PLATYPETALA R. P. Syst. 221. Lindl. in Hook. B. J. I. 13:

Camino Real, on banks, at the elevation of almost 6000', upon the western declivity of the Andes, Colonel Hall.

100. MAXILLARIA PROCURRENS Lindl. in Ann. nat. hist. XV. 1845. p. 383:

Caulescens, pseudobulbis obovatis compressis diphyllis, foliis ligulatis subsessilibus, pedunculis solitariis squamoso-imbricatis, pseudobulbis longioribus, sepalis petalisque ovatis acutis, labello oblongo obtuso indiviso juxta basin callo oblongo aucto.

Popayan (Hartweg).

Very like *M. platypetala*.

Rchb. fil. in Bonpl. III. 216:

Caulis primarius curvato ascendens; portiones inter pseudobulbos bene abbreviatae a vaginis nitide brunneis arcte vestitae. Pseudobulbi oblongi ancipites diphylli; vaginae fullientes non nisi infimae sub pseudobulbo laminigerae; juniores purpureo irroratae videntur. Folia ligulata, basi latiora, apice sensim quidem attenuata, sed bene latiora, quam in *Maxillaria saxatili* Rchb. fil.; imo apice biloba fere quadripollicaria, duas tertias pollicis supra basin lata. Pedunculi rari uti in *Maxillaria saxatili* a vaginis distichis acutis carinatis vestiti, bractea tamen ampla ovarium aequante. Sepala oblonga acuta, Tepala paulo latiora. Labellum ovatum, brevius, latius, quam in *M. saxatili* Rchb. fil., ante basin utrinque plicatoundulatum, callo baseos breviori, trisulcato. Gynostemium gracile, clavatum. Color atropurpureus? Juxta specimen Hartwegianum.

101. MAXILLARIA SAXATILIS Rchb. fil. in Bonpl. III. 216:

Affinis *platypetalae* Rz. Pav. et *procurrenti* Lindl.! pseudobulbis distantibus, foliis lineari-ligulatis apice coarctatis inaequalibus, labello ligulato medio valde obscure trilobo, microscopicè denticulato antice retuso, callo tumido a basi in imedum.

Caulis calamum anatinum crassus. Vaginae arcte distichae ob laminas dejectas retusae brunneae nitidae membranaceomarginatae ultra lineam longitudinalem fuscam. Folia pergamenea lineariligulata, quadri—quinquepollicaria, dimidium pollicem lata apice attenuata, inaequalia, subbiloba cum mucronulo. Pseudobulbi rari oblongi ancipites diphylli (ex cicatricibus). Pedunculi rari vaginis ancipitibus onusti. Ovarium longe exsertum. Perigonium illi *Maxillariae tenuifoliae* aequale. Mentum modicum. Sepala oblonga acuta; lateralia basi ima connata hinc quasi saccum referentia. Tepala breviora, paulo latiora. Labellum supra descriptum; ubi siccum quasi subvelutium ob cellulas acutiusculas. Gynostemium gracile clavatum. — Color ochraceus? Peru. Prov. of Chachapoyas. Rocks' (Certe Matthews?) (Herb. Boiss.)

102. MAXILLARIA PAMPLONENSIS Lindl., Rchb. fil. in Bonpl. II. 281:

Affinis *Maxillariae platypetalae* Rz. Pav. et *procurrenti* Lindl.! pseudobulbis ovatis distantibus, diphyllis, foliis lineariligulatis apice obtuse et inaequaliter bilobis, labello medio trilobo minutissime serrulato, callo ante basin depresso, lobo medio antice valde carnosus.

Rhizoma scandens vaginis distichis nervosis apice ob laminas dejectas retusis tectum. Rami novelli foliis distichis nunc brevilaminatis insignes. Flores solitarii in foliis evolutis axillares. Mentum modicum. Sepala oblonga apiculata. Tepala late cuneata acuta. Gynostemii clavati androclinium velutino limbatum: discus androclinii carinatus: anthera velutina. — Blüten innerlich goldgelb, äusserlich roth. Blüten wenig grösser, aber fleischiger, als die der *Maxillaria variabilis* Bat. Diese besitzt spitze Scheiden ohne Blattplatten, schmale einblättrige Pseudobulben u. s. w. Pamplona: la Baja. 8000'. Januar. Nr. 1175. Schlim.

103. MAXILLARIA PRAETEXTA Rehb. fl. Bonpl. II. 16:

Caule abbreviato, pseudobulbos ellipticos ancipites imbricantes gerente, summis pseudobulbis foliigeris, foliis oblongoligulatis, basi paulo attenuatis, apice attenuato bilobulis, pseudobulborum vaginis arpo-phyllaceis, pedunculis solitariis abbreviatis pollicaribus, vaginis distichis paleaceis acuminato falcatis vestito, bractea subaequali duplo ampliori ovarium aequante, sepalis lanceolatis acutis, tepalis paulo brevioribus subaequalibus, labello ima basi vix lineam longo lineari unguiculato, dein statim pandurato acuto, callo lineari apice bilobo in basi unguis, ipsa lamina nuda, gynostemii androclinio margine brevissime tricorni Ornithidiorum more.

Blüthen so gross, wie die der *M. melina*, grüngelb, Lippe purpurn eingefasst vor dem Rande, Blätter bis über 2 Zoll lang, in der Mitte $\frac{2}{3}$ Zoll breit. Carabobo. 5000'. Februar. Wagerer. — Rehb. fl. Xenia I. p. 23. Taf. X. I. 2.

104. MAXILLARIA ACERVATA Rehb. fl. in Bonpl. III. 217:

Affinis *M. variabili* Bat., ramis primariis abbreviatis, pseudobulbis ligulatis ancipitibus congestis, foliis lineariligulatis apice retuso bilobo emarginatis, labello pandurato ante basin callo triangulo depresso aucto.

Caules tri—quadripollicares dense vaginati. Vaginae asperulae. Pseudobulbi pollicares, sicci tres lineas lati. Flores illis *Maxillariae variabilis* Bat. aequales, Mentum modicum. Sepala triangula. Tepala linearia acuta. Gynostemium clavatum. Perigonium virens. Labellum purpureum apice flavum. Gynostemium purpureo punctatum. Ad Surrungnes in Costarica. Oersted.

105. MAXILLARIA PONERANTHA Rehb. fl. Bonpl. II. 17:

Caule stricto, subgracili, polyphylo, vaginis abbreviatis, laminis oblongis inaequalibus bilobis, abbreviatis, pseudobulbis ovatis ancipitibus diphyllis, pedunculis solitariis basi bivaginitis, vaginis acutis, imbricantibus, bractea subaequali ovarii pedicellati nec dimidium aequante, obtusiuscule acuta, sepalo summo ligulato acuto, lateralibus triangulis acutiusculis majoribus, tepalis ligulatis acutis sepalo summo aequalibus, labello lineariligulato medio obscure et obtuse trilobo, apice retuso bilobo, gynostemio gracili postice acuto.

Blätter kaum 1 Zoll lang, $\frac{1}{2}$ Zoll breit. Pseudobulben einen Zoll lang, auch etwas mehr. Blüthe wenig kleiner als bei voriger Art, gelb mit rothen Fleckchen. Caracas. Warscewicz.

106. MAXILLARIA VARIABILIS Bat. Bot. Reg. XXIII. 1837: sub 1986:

Caulescens, pseudobulbis ovalibus compressis squamis membranaceis longioribus monophyllis, foliis lineariligulatis obtusis emarginatis planiusculis, floribus axillaribus solitariis, sepalis linearilongis acutis, petalis subaequalibus, lateralibus basi parum productis, labello oblongo retuso carnosio basi membranaceo venoso medio utrinque contracto, callo disci parvo ovato obtuso integerrimo, columna clavata, anthera pubescente.

Mexico, in various collections. Flowers small, deep purple. Known in the gardens under the names of *M. atropurpurea* and *M. concinna*. Near *M. platypetala*.

Huc: *Maxillaria Henchmanni* B. M. 3614. (XI. N. S.).

Pusilla, caulibus elongatis squamosis pseudobulbiferis, pseudobulbis ovali-oblongis compressis laevibus, folio solitario lineari-ligulato, pedunculis unifloris pseudobulbo longioribus, petalis sepalisque erectis oblongis acutis, labello erecto oblongo obscure trilobo, lobo terminali integerrimo.

Comm. by Mr. Henchmann from the Clapton Nursery. It was imported from Mexico by that gentleman.

Perigonium brunneoviolaceum.

MAXILLARIA VARIABILIS Bat. var. UNPUNCTATA Lindl. Bot. Reg. XXIV. 1838. Misc. 26:

Caule ascendente, squamato, pseudobulbis ovalibus compressis monophyllis, foliis ligulatis obtusis apice oblique emarginatis, floribus solitariis, pedicellis pseudobulborum longitudine, sepalis lineari-oblongis acutis subaequalibus, lateralibus basi parum productis, petalis conformibus paulo brevioribus, labello oblongo retuso obsolete trilobo apice carnosus; glandula succulenta sanguinea obtusa in medio.

Received by the Horticultural Society in March 1837, by Sir Charles Lemon, Bart. in whose collection it flowered in January 1838.

Flowers deep yellow, shaded with a faint greenish tinge. Labellum three-lobed, the middle one about the length of the petals, but a good deal broader with a roundish spatulate recurved point, slightly indented in the centre; lateral lobes very small, their edges curved outwards and having in the hollow between them, which is of a brownish yellow, a roundish oblong reddish tubercle, extending towards the base of the column, which is marked with several deep red spots. The plant was sent to the Hort. Soc. of London from Mexico, by Mr. Hartweg, their collector in that country and was found in the neighbourhood of Vera Cruz. I have also had it from the very rich coll. of Thomas Harris Esq. of Kingsbury. It is scarcely more than a yellow flowered var. of *Max. variabilis*.

Huc: *Maxillaria angustifolia* Hook. Ic. IV. 1841. 348:

Pseudobulbis proligeris oblongis laevibus vetustis subsulcatis, pedunculis bulbo longioribus unifloris, sepalis petalisque conformibus oblongis, labello oblongo obscure trilobo disco tuberculo oblongo, lobo medio ovato.

Mexico. Parkinson Esq.

Sent by Mr. Parkinson to Woburn 1838. The pseudobulbs rise one above another in a proliferous manner and are more or less sheathed with membranous brownish scales. The singleflowered peduncles spring solitary from the base of each pseudobulb. The perianth is of a tawny yellow colour, the labellum of a deeper tint.

Huc: *Maxillaria revoluta* Klotzsch Berl. Allg. Gartenz. 1852. p. 186:

Caulibus squamosis pseudobulbiferis, pseudobulbis oblongis compressis laevibus, apice unifoliatis, folio lineari-ligulato erecto subtortuoso uncostato, apice obtuse emarginato, basi conduplicatim attenuato, pedunculis unifloris pseudobulbo duplo longioribus; flore vitellino, perigonii foliolis exterioribus oblongis erectis brevissime acutis, marginibus lateralibus brevi recurvis, interioribus brevioribus, apice revolutis, labello erecto obtuso subtrilobo, lobo antico supra puberulo, lateralibus brevibus erectis late rotundatis, appendice linguaeformi atropurpurea adnata ad basin inter lacinias laterales; gynostemio erecto brevi semitereti virescente glabro, dorso obtuso; germine longissimo tereti striato.

107. MAXILLARIA PURPURATA Rehb. fl. Mss. Huc: *Camaridium purpuratum* Lindl. Orch. Lind. p. 22:

Foliis distichis linearibus coriaceis obtusis emarginatis inaequalibus, floribus solitariis axillaribus foliis parum brevioribus bracteis multo longioribus, sepalis petalisque oblongis, labello ovato obtuso utrinque emarginato callo maximo oblongo disci verrucisque plurimis minimis circumstantibus.

„An epiphyte with white flowers and a purple lip, from the province of Merida, at the height of 5000'. Juni.“ Nr. 635. Near *C. arbuscula*, but the leaves are longer and slenderer, the flowers stand far above the bracts and the lip is quite different in its callus and minute surrounding warts.

Obs. Nescio num huc pertineat, seu ad sequentes. Pseudobulbos non habeo.

++ Caules ebulbes.

* Caulis robustus brevis compactus foliis bene carnosos coriaceis.

108. MAXILLARIA ALPESTRIS Lindl. in Benth. Hartwg. 154. Aug. 1845:

Acaulis ebulbis, foliis distichis densissimis ovalibus patentibus sessilibus, scapis foliis aequalibus vaginis acutissimis suprema ovarii longitudine, sepalis angustis acutissimis, labello ovali obtuso utrinque emarginato intus apthoso, linea angusta sulcata elevata in medio.

Folia sesquipollicaria. Sepala vix pollicaria. Habitat inter Lichenes in montibus Loxa rarissima.

** Caulis gracilis elongatus foliis pergameneo-papyraceis optime distichis.

109. MAXILLARIA GRAMINIFOLIA Rehb. fl. Mss. Huc: *Camaridium graminifolium* Rehb. fl. Linn. XXII. 857. Cf. Walp. Ann. III. 544.

Isochilus graminifolium Humb. B. Kth. — Lindl. Bot. Reg. XXVII. 184. sub 1:

Vaginis imbricatis, foliis distichis lineari-lanceolatis acutissimis, floribus solitariis bractea acuminata, pedunculo brevioris, sepalis aristatis, petalis conformibus duplo brevioribus, labello lineari oblongo utrinque emarginato basi callo magno duro oblongo, columna petalis duplo brevioris.

When not in flower undistinguishable from *Isochilus grandiflorum*. It is well figured in Humb. Bonpl's work, excepting the analysis, in which the form of the labellum is inaccurate, and the presence of a hard oblong callus, called a purple stain in the disk by Mr. Kunth is overlooked. Peru, Mathews. 1064. Trunks of trees near Lloa: Jamieson. (Herb. propr. et Hooker).

En nova diagnosis juxta typos:

Caule vaginis emarcidis striatis tecto, superne fasciculato ramoso, foliis linearilanceis acuminatis apice inaequalibus seu bidentatis limbo minute sub lente scabridis, floribus parvulis ex vaginis vetustis, bractea acuminata ovarium aequante seu superante, mento subnullo, sepalis lanceis acuminatis, tepalis paulo brevioribus, labello elliptico subacuto, lateribus anticis repandulo ac paulo attenuato, callo oblongo lato in dimidio inferiore (sicco) toto nigro, androcliniis limbis lateralibus de fundo elevato descendentibus.

In declivitate Andium Popayanensium, nemoribus opacissimis inhorrescentium, juxta villam La Erre, ad radices Paramida Puruguay, alt. 1064 hexap. florens Novembri. Humboldt!

110. MAXILLARIA MATTHEWSII:

Caule vaginis emarcidis lucidis striatis tecto superne (an semper?) simplici, foliis linearibus acuminatis valde brevibus apice sub lente minute scabridis, floribus quam in praecedente majoribus, bracteis obtusatis ovario pedicellato bene brevioribus, subaequalibus, labello late oblongo apice retuso cum apiculo parvo, utroque latere medio auriculato praeter callum oblongum a basi in medium discolore, portione postica viridi, antica flava, columna utrinque angulo antico acutangula.

„*Isochilus graminifolium* Hb. B. K.“ Lindl. Bot. Reg. XXVII. 184. sub 1. ex p. Peruvia 1064. Matthews! (Herb. propr.).

111. MAXILLARIA POLYPHYLLA.

Caule vaginis emarcidis reticulatis tecto, hinc a basi ramoso, foliis linearilanceolatis, apice inaequali apiculatis aristatisve microscopice scabridis, floribus illis praecedentis aequalibus, bracteis oblongis acuminatis dimidio ovario pedicellato aequalibus, pluribus in axillis foliorum, aliis in axillis vaginarum jam aphyllarum. mento subnullo, sepalis oblongis acuminatis, tepalis ovatis acutis, labello oblongo apice retusiusculo apiculato, utroque latere emarginato, praeter baseos callum oblongum tumidum concolori flavo, columna utroque angulo superiori obtusangula.

„*Isochilus graminifolium* Hb. B. K.“ Lindl. B. Reg. XXVII. 184 sub 1 ex p. Pichincha Jamieson! (Herb. propr.).

112. MAXILLARIA LANCIFOLIA:

Caule vaginis punctulato striatis tecto, a basi (semper?) simplici, foliis linearilanceis apice inaequali acuminatis, minute scabridis, floribus illis praecedentium aequalibus, mento subnullo, bracteis acuminatis, ovaria pedicellata excedentibus, sepalis triangulo acuminatis, tepalis subaequalibus subbrevioribus, labello hexangulo, latiuscule oblongo, apice breve triangulo, basi breve obtriangulo, lateribus medianis elongatis sinuato, callo oblongo lato antice emarginato, marginibus lobulato a basi apicem versus, toto labello apice excepto obscure atroviridi (sicco!), columnae angulis anticis obtusatis.

Camaridium lancifolium Rehb. fl. Linnaea XXII, p. 857. Walp. Ann. III. 544. Merida. 6500' fleurs blanches. Label violet. Funck und Schlim. 731! (Hab. sic.)

113. MAXILLARIA CASSAPENSIS:

Caule vaginis striatis punctulatisque vaginato, sursum ramoso, foliis lanceolatis acutis apice inaequali apiculatis, microscopice scabridis, floribus illis praecedentium bene majoribus, bracteis acuminatis ovaria pedicellata subaequantibus, mento conspicuo, sepalis oblongotriangulis acuminatis, tepalis subaequalibus, subbrevioribus, labello trilobo, lobis lateralibus obtusangulis seu retuso obtusangulis, lobo antico oblongo acutiusculo seu late rhombeo, callo oblongo a basi in discum, dimidio labelli postico obscuro (atroviolaceo?), antico flavido, columnae angulis anticis bene obtusatis.

Peruvia in rupium fissuris ad Cassapi et Cucbero. Septb. 1828. Pöpp. I (Hab. sic.)

Hac in specie optime et saepius vidi apparatus pollinicum, omnino cum illo reliquarum Maxillariorum; quadrantem.

114. MAXILLARIA LUTEORUBRA:

Caule vaginis nervosis ac subtiliter transverse striolatis tecto, a basi hinc ramoso, foliis lanceolatis apice inaequali acuminatis limbo minute scaberulis, floribus illis praecedentis majoribus, bracteis oblongo-lanceolatis obtuse acutis ovario pedicellato dimidio brevioribus seu idem

superantibus, mento conspicuo, sepalis triangulis acuminatis, tepalis paulo brevioribus, labello trilobulo, lobis lateralibus elongatis ante medium obtusangulis, hinc repandulis, lobo antico oblongo seu transverse triangulo lateribus obtusangulo antice acuto, tota portione postica ultra basin lobi anteriori obscura (atroviolacea?) medio vernixia (ac incrassato callosa?), in basi lobi medii rugis transversis striolata.

Isochilus grandiflorum Lindl. Bot. Reg. XXVII, 1841, sub 1:

Vaginis imbricatis, foliis distichis linearilanceolatis acutissimis, floribus solitariis axillaribus, bractea acuminata sepalorum dimidio aequali, sepalis acuminatissimis, petalis duplo brevioribus conformibus, labello linearioblongo utrinque emarginato basi nudo, columna petalis parum brevior.

Very like *I. graminifolium*, but the flowers are 4 times as large, independently of the distinctions included in the foregoing characters. Good specimens exist in the Royal Herb. of Munich coll. in Peru by Hänke, but I find nothing like in the Reliq. Baenk.

Huc: *Camaridium luteo rubrum* Lindl. Orch. Lind. 1846, N. 114, p. 22:

Caule simplici, foliis distichis lanceolatis apiculatis, floribus solitariis, bracteis ovario brevioribus, sepalis acuminatis, petalis acutis, labello oblongo obtuso undulato emarginato medio constricto, callo magno in discum.

„Epiphyte. Forests in the neighbourhood of Merida, at the height of 5500'. Sept. Flowers yellow, with a deep red lip.“ Nr. 633. This species is very near *C. brevifolium*, but its leaves are longer and narrower, its flowers are smaller, and extend considerably beyond the bracts. The lip also appears to be more distinctly three-lobed and wavy.

Obs. Utrumque typum bene inspexi. Specimen Lindenianum ipse habeo. Specimina sub hoc nomine a Musaeo Berolinensi distributa sub 1072 seu 1073 a Moritzio lecta, (nunc cum *Maxillaria brevifolia* commixta) mihi dubia. Huc essent referenda, sed labellum reperio emarginatum ut in *Maxillaria longibracteata*. Specimina haud bona, unde res haud liquet. Rehb. fil.

115. MAXILLARIA LONGIBRACTEATA. Huc: *Camaridium longibracteatum* Lindl. Benth. Pl. Hartw. p. 154 (Aug. 1845):

Foliis ovato-oblongis apiculatis, vaginis pedunculorum acuminatissimis suprema ovarii longitudine, sepalis acuminatis, petalis lanceolatis apice revolutis, labello oblongo medio constricto axi calloso apice emarginato. Caules sesquipedales, folia tripollicaria. Sepala semipollicaria.

In Cordillera prope Loxa.

116. MAXILLARIA BREVIFOLIA:

Caule simplici seu ramoso vaginis nervosis ac rugulosis (arphyl-laceis) vestito, sursum dense folioso, foliis lineariligulatis apice inaequali apiculatis, limbo puberulis, valde abbreviatis, floribus illis praecedentium aequalibus, bracteis oblongolanceis acuminatis ovarii pedicellatis praecedentium aequalibus, mento bene evoluto, sepalis ligulato triangulis acuminatis, tepalis paulo brevioribus, labello ligulato medio trilobo, lobis lateralibus obtusangulis haud productis, lobo medio ligulato obtuse acuto, callo magno ligulato tumido a basi in discum, portione inferiore obscura (atroviolacea?), antica pallida (flavida?)

Huc: *Camaridium brevifolium* Lindl. Benth. Pl. Hartw. p. 154. Aug. 1845:

„Foliis oblongis acutissimis canaliculatis, vaginis pedunculi angustis acuminatis, sepalis petalisque acuminatissimis, labello oblongo medio

constricto axi calloso apice obtuso. Caules sesquipedales vel minores. Folia sesquipollicaria et ultra. Sepala semipollicaria.

In montibus Loxa."

1407/4. c. **CAMARIDIUM** Lindl.

Bot. Reg. X. 1824. 844.

Perigonium resupinatum explanatum sepalis liberis. Labellum liberum sessile cucullatum trilobum. Columna teres. Gynizus fornicatus. Pollinia parallela, compressa, filo sub anthesi nullo.

Distinguished from *Ornithidium* by not having the labellum united with the base of the column, nor a connivent perianth, nor a fleshy disc to the labellum.

1. **CAMARIDIUM OCHROLEUCUM** Lindl. l. c. *Cymbidium ochroleucum* L. O. 168. Huc: *Ornithidium album* Hook. Bot. M. 3306:

Floribus sessilibus, perianthii laciniis oblongis obtusis (albis), labello trilobo medio obtuso disco glanduloso, glandula rugosa basi setosa.

Trinidad.

Huc mihi videtur pertinere, sed non eadem planta:

MAXILLARIA LUTESCENS Scheidw. Allg. Gartenz. 1839. 145:

Caule folioso apice bulbifero, pseudobulbis oblongis ancipitibus, rugosis, monophyllis, foliis ensiformilanceolatis, apice obliquis, emarginatis, basi conduplicatis, carinatis, coriaceis, floribus axillaribus, fasciculatis, pedunculis vaginatis, unifloris pseudobulbis aequalibus, bracteis vaginisque membranaceis amplis, sepalis conniventibus, linearilanceolatis, margine revolulis, acutis, lateralibus basi connatis, petalis parum minoribus angustioribus, labello sepalis duplo breviori cucullato trilobato, lobis lateralibus verticalibus, obtusis, intermedio longiore carnosio recurvo hispido, margine crispato, callo magno piloso; columna clavata, arcuata, anthera membranacea, triangulari cristata, uniloculari, polliniis 4 inaequalibus parallele dispositis, glandula lunata. — Flores ochroleuci odorati. Trinidad.

Folia sex pollices longa, unum lata. Flores in basi pseudobulbi, utrinque quaterni, pseudobulbis longiores. Pedunculi 4—5 squamati. Sepala et tepala a basi in medium flava, basi subalbida. Labelli lobi laterales albidoflavi, purpureo limbati, lobus anticus aurantiacus. Callus pilosus purpureo striolatus. Columna subtiliter striolata.

2. **CAMARIDIUM ALATUM** Lindl. in Benth. Pl. Hartw. p. 153:

Folhis ovalibus obtusis integris, labello oblongo obtuse trilobo intus piloso, apice carnosio, columna dorso carinata, capsulae triangularis angulis alatis.

C. ochroleuco habitu simile, sed labello et ructibus omnino diversum. In arboribus nec non in terram in montibus. Loxa.

3. **CAMARIDIUM ARBUSCULA** Lindl. in Benth. Pl. Hartw. p. 153.

Caule rigido erecto, foliis linearibus rigidis emarginatis, pedunculis bivaginatibus, sepalis ovalibus, petalis oblongis obtusis, labello oblongo obsolete trilobo emarginato medio convexo. Folia vix 2 pollicaria.

In montibus Loxa.

Obs. Totum genus me iudice nullum praebet characterem et erit quando delendum, seu pro specie 1. retinendum, quae forsitan arcitiorem characterem praebet

Camaridia reliqua Lindleyana sub Maxillariis reperienda sunt. Speciem tertiam vidi in herbario Ill. Lindley. Sed nil habeo, nisi analysis ill. Lindley. Forsan est Maxillaria mea arbuscula Bonpl. 1856. IV. 213, sed vix crediderim, nam notassem. Tamen ex icone Lindleyana mea flos tantum recedit androclinio ciliato ac labelli apice non emarginato et mento humiliori. Rehb. fl.

1407/1. **STENIA** Lindl.

Bot. Reg. XXIII. 1837. sub f. 1991. XXIV. 1838. t. 30.

Perianthium explanatum subaequale, sepalis lateralibus basi obliquis. Labellum cum basi columnae continuum (indivisum) concavum, disco appendiculatum. Columna semiteres, basi producta, apice rotundata mutica. Anthera bilocularis. Pollinia 4, linearia, geminata, basi sejuncta, dorsalia minima; caudicula subquadrata acuta pubescens. Herba acaulis, ebulbis. Folia oblonga, basi angustata, apice recurva. Flores solitarii radicales, basi ovarii bracteolati.

1. **STENIA PALLIDA** Lindl. Bot. Reg. l. c.:

Caulis nullus, nec rhizoma conspicuum, nec pseudobulbus. Folia 2—5, oblonga, acuta, avenia, basi paulo angustata et carinata, e squamis spathaceis brunneis vaginantibus erumpentia, textura rigido-chartacea. Scapi radicales prostrati, uniflori, apice bracteis duabus oppositis ovatis instructi, ovario breviores, saltem haud longiores. Perianthium explanatum, pallide citrinum, diametro sesquialtiali et ultra; sepalis petalisque aequalibus ovatis, lineatis, acutis. Labellum saccatum, integrum, carnosum, ovatum, cum pede producto columnae continuum, pallide citrinum, rubro punctatum, crista transversa dentata. Columna semiteres, clinandrio proclivi, facie pubescens. Pollinia 4, linearia, obtusa, dorsalia minima, caudiculae brevi villosae adnata, glandulae rhomboideae cartilagineae medio insertae.

Demerara imp. by Mr. Barker of Birmingham. It differs from Maxillaria in the labellum not being articulated with the foot of the column, a distinction the importance of which there is at present no cause to suspect. In general app. it is like Maxillaria Rollisoni.

Rehb. fl. Bonpl. II. 15. Caracae, 6000'. August bis October. Selten. Wagener.

1407/3. **CHRYSOCYCNIS** Lind. Rehb. fl.

Bonpl. II. 280.

Affinis Trigonidio Lindl., diversa labello carnosio anguste ligulato naviculari, basi inferiori sulcato, apice acuto inflexo, basi utrinque auricula rotunda divaricata aucto; gynostemio gracili arcuato superne clavato; polliniis Trigonidii sessilibus in caudicula teretiuscula basi in glandulam hippocrepicam exeunte.

1. **CHRYSOCYCNIS SCHLIMII** Lind., Rehb. fl. in Bonpl. II. 280:

Caulescens: caulis validus calamum aequinum crassus squamis vestitus hinc pseudobulbosus. Pseudobulbi ancipites ovati (sicci rugulosi). Folia oblonga acuta brevissime petiolata superne vernixia nervulis transversis (in sicco) arphyllacea, inferne violacea. Pedunculi in squamis fullientibus axillares, tenues, paucivaginati. Flores majores, illos Trigonidii obtusi aequantes. Perigonium patens. Sepalum summum oblongum acutum fornicatum; sepala lateralia oblonga, acuta, latere externo extrorsum curvata; deflexa. „Perigonium flavum brunneo aspersum. Labellum rubroflavum. Gynostemium albidum viridi striatum.“

Ocanna in Wäldern. August. 8000'. Nr. 26. Schlim.

Rehb. fl. III. 67. (calami lapsu: *Chrysocycnis Trigonidii* Lind. Rehb. fl.) Alto de San Pedro 7000'. Epiphyt. Wagener.

1407/4. **CHEIRADENIA** Lindl.

Fol. I. Febr. 21. 1853:

Sepala herbacea, patentia; lateralibus pedi producto columnae adnatis; petala conformia, labellum indivisum, planum, cum pede columnae articulatam; linea mediana elevata, lamella intramarginali digitata. Columna brevis, semiteres, mutica, pede longo lineari. Stigma circulare. Pollinia 2, solida in caudiculam ovalem sessilia; glandula?. — Herba epiphyta, Guayanensis, muscicola, acaulis. Folia membranacea, nervosa. Pedunculi filiformes, pauciflori, parce vaginati. Flores parvi, herbacei.

The adhesion of the lateral sepals to the extended foot of the column, the spurless lip, and other characters seem to refer this to the Maxillarideous herd, as well as the stemless bulbless habit. Its true station would seem to be near my Zygopetalum gramineum, which is by no means the plant so called by Mr. H. G. Reichenbach, and those Warreas which form the same author's genus Warczewiczella. But the solid undivided pollen-masses, peculiar lip and habit, are essentially different.

1. **CHEIRADENIA CUSPIDATA** Lindl.

A stemless bulbless plant, from three to four inches high. Leaves a few, radical, obovate, membranous, slightly ribbed, spreading, drawn to a fine slender recurved point. Peduncle filiform, with two or three spreading distant acuminate vaginæ, bearing one to three drooping flowers at the point. Sepals and petals ovate, acute. Lip membranous, obovate, very obscurely three-lobed, with an elevated line along the middle, and a thin intramarginal lamina, divided into five equidistant teeth. There are no flowers upon my specimens of Leprieur's 114, but I think it is the same as 108, which I have examined. My thanks are due for both to the Administration of the Museum of Natural History at Paris.

Wild in French-Guyana.

1407/5. **CHAUBARDIA** Rehb. fl.

v. Schl. und Mohl B. Z. 1852. 671.

Perigonii membranacei phylla 5 lanceolata, acuta, externa margines internorum vix imbricantia, lateralia ima basi connata. Labellum a crista gynostemii basin anteriorem descendente per raphen phyllorum lateralium externorum dilatatum in laminam utrinque extrorsum obtusam subcorneam excavatulam nervis quinque cristularum instar elevatis; dein explanatum in laminam valde membranaceam, omnino cum parte basilari non articulatam, trilobam; lobi laterales divaricati, semifalcati, parvi, lobus medius obtuse rhombeus, longe maximus; cristae illae baseos laterales externae simulatque descendentes hanc in laminam erectae, auctae, dentiformes, quasi bifidae duas in laminas altera interna oblonga apice libero acutiuscula, erecta, altera lateralis, dentiformis, prostrata; cristulae similes pusillae in lobis lateralibus dentiformibus supinae. Gynostemium breve, crassum, lateribus et dorso obtusissimum, papillosum. Androclinium triangulum submarginatum, rostellum retusum. Alae duae obtuse triangulae, carnosae, angulo libero in basi inferiori descendentes, ab angulis androclinii anticis involutae (?ex sicco), ad gynostemii medium, dein margines anteriores carinati; basi ima connati cum basi phyllorum lateralium internorum, carina a media basi in cristam excurrans per raphen phyllorum lateralium externorum, pro labelli basi recipienda. Stigmatis fovea transversa, linearis, miuta; sub rostello abscondita. Anthera —. — Epiphyta ebulbis, habitu

Kefersteiniarum, foliis oblongo lanceolatis cuneatis, acuminatis, membranaceis. Pedunculi capillares, uniflori, flores illos *Cyrtoperæ Woodfordi* non aequantes.

Genus ob labellum cum gynostemio haud articulatum, tamen non apus, *Steniae* quodammodo affine visum dicavi ill. Chaubard de flora europæa meritissimo.

1410. **TRICHOCENTRUM** Pöpp. Endl.

Nov. Gen. et Sp. Pl. II. 2. — Lindl. Bot. Reg. XXVI. 1951. haec:

Perianthium patens, liberum, aequale. Labellum sessile cum basi columnæ connatum, planum, bilobum, basi lamellosum. Columna nana, semiteres, crassa, utrinque alata. Anthera bilocularis, mutica, pollinia 2, complicata; caudicula cuneata; glandula minuta. — Herbae epiphytae americanae acaules, foliis planis (aut nullis?); floribus radicalibus.

A. Folia equitantia.

1. TRICHOCENTRUM IRIDIFOLIUM G. Lodd. in litt. Lindl. Bot. Reg. 1838. XXIV. Misc. 178:

Foliis distichis linearilanceolatis carnosis, labello ovali obtuso indiviso basi bilamellato, columnæ alis parvis obtusis integris.

A small species with pale yellow flowers having the lip delicately streaked with darker yellow. It was imported by Messrs. Loddiges from Demerara.

2. TRICHOCENTRUM PLECTROPHORA Rehb. fil. Mss. Iluc: *Plectrophora iridifolia* Focke Tidsch. Wis. Nat. Wetsch. I. 1848. 212:

Perianthium connivens, sepala lineari oblonga carinata, in acumine attenuata, patula; lateralialia in calcar tubulosum rectum subcompressum attenuata 2 cent. longum decurrentia, 17 mill. longa, 5 lata. Petala majora, oblongo obovata, apice rotundata, minutissime apiculata, plana, labello incumbentia, 2 cent. longa. Labellum magnum, orbiculatum, cucullatum basi acutum, columnam involvens, vitellino aurantiaco striatum striis elevatis apice furcatis, disco bilamellato, lamellis basin versus elevatioribus apice divergentibus. Columna nana, in ovarium resupinata, clinandrio biaurito, anthera globosa bilocularis, subcarnosa albida, pollinia 2 oblongo obovata, compressa, in caudicula erecta, flava. Caudicula linearis, pollinia versus cuneata, dilatata. Glandula minuta ovalis. Ovarium triquetrum triatatum. Flores lutei. Herba epiphyta habitu *Oncidii iridifolii*. Folia disticha, ensiformia, equitantia, subcarnosa, demum pseudobulbum formantia. Pedunculus foliis brevior 1—2 florus, axillaris.

Aprili. Surinam ad Boven Commewijne.

B. Folia plana.

a. Calcar nullum.

3. TRICHOCENTRUM CANDIDUM Lindl. Bot. Reg. 1843. Misc. 18:

Bracteis ovatis acutis, sepalis petalisque ovatis acutis, labello oblongo emarginato basi obsolete bidentato ecalcarato, gibboso, columnæ alis ovatis acutis, anthera villosa.

Guatemala.

b. Calcar manifestum.

4. TRICHOCENTRUM RECURVUM Lindl. Bot. Beg. XXIX. (1843.) Misc. 17:

Bracteis distichis cucullatis ovatis acutis, sepalis petalisque ovatis acutis, labello oblongo basi purpureo bidentato, caldari recurvo ovarii longitudine, columnae alis cuneatis denticulatis, anthera pubescente.

A Guyana plant, imported by Messrs. Loddiges. It resembles *Trigonidium* in habit, but is smaller. The lip is white, with a deep purple spot at its base; afterwards it changes to pure yellow. The spur is long, and curved backwards and upwards, so as to arch over the back of the flower.

5. TRICHOCENTRUM FUSCUM Lindl. Bot. Reg. XXVII. (1835). 1951:

Foliis oblongis acutis oblique tortis racemo longioribus; labello glabro bilobo basi bilamellato venis quibusdam callosis, alis columnae serratis.

Acoidium fuscum Lindl. in Hort.

Mexico introd. by Mr. Knight of the Kings Road, Chelsea.

Labellum album purpura pictum calcare viridi, perigonium viridirebellum.

6. TRICHOCENTRUM PINELI Lindl. Gard. Chronicle 1854. 772:

Columnae alis truncatis denticulatis, labelli oblongi emarginati callis 2 linearibus oblique truncatis parallelis glabris dentibusque totidem iuxta basin hirsutis, calcare pedicello subaequali apice uncinato.

Veitch. We have it in a wild specimen with a coloured drawing from our friend, the Chevalier Pineli, who found it near Rio. It is much like *T. fuscum*, but the wings of the column, the callous lines on the lip, and the peculiar spur, readily distinguish it. In Brazil the sepals and petals are cinnamon brown, the lip white with crimson freckles near the base, and the leaves are spotted with red; as in *Oncidium Papilio*, the live specimen was paler in all respects.

7. TRICHOCENTRUM PURPUREUM Lindl. Gard. Chron. 1854. 772.:

Columnae alis dolabriformibus denticulatis, labelli obovato oblongi emarginati callis 2 linearibus obtusis adjecto minore utrinque iuxta apicem dentibusque totidem iuxta basin glabris, calcare ovarii longiore crasso obtuso sub-falcato.

Veitch. The dull olive green sepals and petals of *T. fuscum*, but its lip is purple and its thick curved spur is peculiar. Like all others it is a stemless fleshy leaved epiphyte with little radical one- or twoflowered scapes. Said native of Demarara.

8. TRICHOCENTRUM TENUIFLORUM Lindl. Paxt. Fl. G. I. p. 12:

Foliis —, sepalis linearibus acutis, petalis conformibus obtusis, labello obovato, emarginato, subundulato, basi angustato, lamellis totam basin occupantibus, columnae alis semicordatis acutis.

Differs by its narrow sepals and petals of the small flowers and its almost linear obovate lip with a pair of plates occupying the whole of the base. Bahia. Flowers small, dingy brown, and white.

9. TRICHOCENTRUM MACULATUM Lindl. Orchid. Lind. 1846. p. 21. Nr. 127:

Foliis linearioblongis carnosius obtusis, bractea cucullata, sepalis petalisque oblongis obtusis, labello obovato bilobo obtusissimo medio bilineato, calcare longissimo, columnae alis carnosius truncatis dentatis.

„An epiphyte with very thick fleshy leaves, spotted with red. Flowers large with a very long spur; petals white, spotted with purple. Lip with a yellow crest. New-Granada, in the province of Rio Hacha, at the height of 4500', on old trees, on the border of the river San Antonio, in the Sierra Nevada of Sta Martha. Febr. 1844 N. 1066.“

Rehb. fil. Bonpl. H. 250. Ocanna, Juli. Nr. 41. Schlim Blüthen grösser. als bei der ursprünglichen Form. Die Kiele gehen bei *T. pulchrum* Pöpp. Endl. bis auf VI.

die Mitte der Lippe, während sie hier am Grunde sich finden: dies ist ziemlich der einzige Unterschied, den wir finden.

l. c. III. 67: Ocanna. März. 4050. Wagener.

10. TRICHOCENTRUM PULCHRUM Pöpp. Endl. II. 11. Tab. CXV:

Perianthii resupinati sepala patentia, aequalia, libera. Labellum obovatum, sessile cum columnae margine anteriore connatum, basi in calcar longum attenuatum. Columna brevis, ob nexum cum labello cyathiformis, margine superiore utrinque longe ciliata. Anthera postica, ad medium pilosa, bilocularis Pollinis cereacei massae duae, caudicula communi bifida, operculo glandulae stigmati rostrato.

Herba perennis, acaulis, speciosa, adhaeret arborum truncis radicibus parvis, filiformibus, teretibus, simplicibus, extus suberosis, intus carnosis, succulentis, albidis, digitum longis. Rhizoma nullum, sed squamae nonnullae vaginantes, truncatae, rigidae, laeves, nitidae, cinnamomeae, foliorum basin amplectentes floremque emittentes omni stirpis aetate persistunt. Folia pauca, duo vel tria, basi incrassata, cava, lamina oblonga, obtuse acuta, interdum mucronata, plana, uninervi, nervo supra impresso, subtus tenuiter carinato percursa, carnosio coriacea, obscure viridia, nitida, laevigata, pollices quatuor longa, pollicem unum lata. Flores radicales ima basi iisdem quibus folia circumdantur squamis cineta, vaginis duabus vel tribus in acumen lanceolatum desinentibus, semipollicaribus inferne inclusi, sessiles. Ovarium erectum leviter flexuosum, basin versus sensim tenuius, quadrangulare, angulis acutis, haud marginatis, tres fere pollices longum. Perianthium aperto campanulatum, magnum, colore candido et sanguineo varium, horizontale. Sepala libera, patentissima, invicem aequalia, ovali elliptica, sessilia, acutiuscula, dorso convexa, superiora haud carinata sola basi marginibus sibi incumbentia, tenuiter membranacea, disco multinervia, marginem versus costato venosa; supremum reliquis parum latius, magis concavum, dorso carinatum; inferiora labello haud supposita. Labellum erectum, obovatum, basi cuneatum, apice emarginatum, antice duplicato crenatum, membranaceum, lamellis carnosis adpersum, disco concavo, laevissimo, incrassato, margine calloso et anguloso superne valde prominente undique circumdato praeditum, lateribus reflexum, basi antice ope callorum disci marginalium cum columna concretum, in calcar cylindricum, longe attenuatum, acutissimum, vacuum, foramine pervium, ovarium fere adaequans elongatum. Columna labello fere triplo brevior, cum ovario continua, per margines anteriores labello adnata, inde cyathum fingens, in marginibus laterilibus horizontalibus ciliarum carnosarum planarum, aequalium serie simplici cristata, postice excavata pro anthera verticali, ovata, hemisphaerica, latere posteriore ad medium usque pube pilosa rigide obsessa, intus biloculari. Massae pollinis geminae cereaceae, caudiculae communi bifidae insidentes, nec sulcatae, neque bilobae. Operculum glandulam stigmati cum caudicula jungens ovale, convexum, rostratum.

Crescit rarissime, semel tantum lectum, in arborum vetustarum truncis Peruviae orientalis ad praedium Pampayaco. Floret Julio.

Species exclusa.

TRICHOCENTRUM ? FUNALE Lindl. Bot. Reg. XXIII. 1837. sub 1950 = *Angrecum fumate* Lindl.

1411. **BIFRENARIA** Lindl.

Bot. Reg. XXV. 1843. Misc. 67:

Sepala patula, libera, subaequalia; lateralia cum basi producta columnae connata. Petala sepalis duplo minora. Labellum cum pede columnae articulatum, cucullatum. Columna brevis, semiteres. Anthera subcristata Pollinia 4, per paria incumbentia, caudiculis duabus dis-

linctis, glandula oblonga. Herbae epiphytae, pseudobulbosae. Folia terminalia, subsolitaria, plicata, cartilaginea. Pedunculi radicales, 1 flori, vel racemosi, saepius elongati.

I. Folia plana.

a. Uniflorae (raro bi-, imo triflorae).

1. BIFRENARIA ATROPURPUREA Bot. Reg. XXIX. 1843. sub Misc. 67. — Lindl. Orch. Nr. 1. *Maxillaria atropurpurea* Lodd. Bot. Cab. 1877;

Pseudobulbis ovatis obtusis, 4gonis, foliis oblongo-lanceolatis plicatis solitariis, racemis radicalibus 3-floris pseudobulbis paulo longioribus, labelli lobis lateralibus brevioribus divergentibus, intermedio transverso subtrilobo revoluto, suberoso, callo in medio antice tridentato.

Brazil.

Flowers dark purple, very sweet scented.

2. BIFRENARIA PARVULA Rchb. fil. Mss. Huc: *Maxillaria parvula* Hook. Exot. Fl. t. 217. (1827). Huc porro pertinebit — me saltem iudice — planta, de qua egit ill. Lindley in Bot. Reg. 1841. XXVII. Misc. 142:

MAXILLARIA PURPURASCENS Kun. et West.

Pseudobulbis ovatis vel conicis sulcatis, foliis duobus, lineari-lanceolatis, apiculatis, floribus solitariis, glabris, sepalis aequalibus lanceolatis, apiculatis, supremo connivente, lateralibus labello parallelis, petalis conniventibus, linearibus sepalis brevioribus, labello trilobato, margine purpureo-maculato, glabro, disco carnosio anthera pubescente. Phytologist p. 8.

„Flowers smooth, internally yellow, externally purple. — Caudiculae two, glandula transverse, crescent-shaped. Pollenmasses two, each of which is divided into two distinct parts. This species possesses a creeping-rhizoma, pp. In size and form the flowers nearly resemble these of barbata, but are solitary and of a different colour. *Maxillaria aureofulva*, barbata, and purpurascens possess double caudiculae (as is the case also in the genus *Bifrenaria*) and their inflorescence in other respects differs so much from that of any other species of *Maxillaria* with which I am acquainted, that they may be considered as forming a very distinct group of the genus“. Fred. Westcott. Introduced for the Birmingham Hort. Soc. by W. Fry Esq. 1840. The plant I have not seen and do not recognize.

3. BIFRENARIA HARRISONIAE Rchb. fil. Bonplandia III. 217. *Maxillaria Harrisoniae* Lindl. Bot. Reg. 897.

Maxillaria Harrisoniae albiflora Bot. Reg. XXVII. 1841. Misc. 68:

A delicate white var. of this beautiful epiphyte has been imported by Messrs. Loddiges. Sepals and petals are a clear cream colour, just tinged with violet at the tip of the former. The lip is the same as in the original variety, but somewhat paler.

Regel Gartenflora V. 52. (var. alba). — Paxton Flower Garden III. Xyl. 277. — Hook. Lond. Journ. I. p. 189. On moist shady rocks, at Praya Vermelha. Aug. Gardner 127. Huc:

Maxillaria pubigera Klotzsch in Otto und Dietr. Allg. Gartenztg. 1855. 106:

Pseudobulbis brevibus ovatis tetragonis arido-vaginatiss, apice atrofusco-annulatis monophyllis; foliis lato-oblongis triplinerviis coriaceo-rigidis, apice recurvato-acutis, basi in petiolum antice sulcatum attenuatis; racemo bifloro basilari fusciscente bracteato; bracteis aridis membranaceis amplexicaulis acutis subcarinatis; perianthii foliolis magnis gynostemio adnatis latis obtusiusculis, exterioribus rubescentibus, apice cucullatis, inferioribus in calcar emarginatum decurrentibus, interioribus pallidioribus, apice recurvato-subacutis; labello trilobo, extus

albido glabro, lobis lateralibus subconvolutis flavidis purpureo-venosis, intus margineque pilosis, antice emarginato-rotundatis, intermedio ligulato reflexo apiculato-cucullato rubro-venoso piloso callo disci flavido-pubescente obtuse-tridentato; gynostemio albido curvato antice plano puberulo; anthera uniloculari subcristata albida; polliniis complanatis quatuor; glandula albida sublunata.

4. BIFRENARIA INODORA Lindl. Bot. Reg. XXIX. 1843. Misc. 63:

Pseudobulbis tetragonis, folio oblongo acuto plicato margine crispo, basi in petiolum brevem canaliculatum angustato, pedunculis unifloris, pseudobulbis brevioribus, sepalis oblongis obtusis, cornu elongato clavato, petalis subconformibus paulo undulatis, labello trilobo cucullato, lobis rotundatis undulatis subdentatis, intermedio piloso callo disci cuneato carnosio emarginato.

„Rio 1839 to Lemons coll. at Carelew, flowered in April 1843. Habit, appearance of *Maxillaria tetragona*, so near, as to have been mistaken for it, but on flowering it proved to be widely different from that species, and much handsomer, although scentless. Sepals dull green, slightly tinged with red. Petals of the same colour, but rather shorter. Labellum trilobed, outwardly of purplish-red colour, but inwardly more pale and delicate towards the base, where it tapers and forms a sort of pouch. The 2 lateral lobes are erect and of a pale brownish-red, marked with dark coloured veins. Middle lobe is roundish oblong, recurved and undulated at the margin. Outside it is smooth, but the inner surface is thickly covered with pale soft hairs. In the centre of it there is an elevated process. Column $\frac{1}{2}$ the length of the labellum. Flowers as large as these of *Maxillaria Harrisoniae*.

Bot. Reg. XXX. 1843. sub Misc. 67: Flowers green, with a bright violet lip.

5. BIFRENARIA WAGENERI Rehb. fl. Bonpl. II. 17:

Pseudobulbis rotundis cepiformibus, foliis oblongolanceis, pedunculis pendulis gracilibus trivaginatibus, vaginis acutis valde abbreviatis, bractea subaequali ovario subpedicellato duplo breviori, sepalis oblongis acutis subaequalibus, lateralibus basi in calcar teretiusculum ovario aequilongum connatum productis, labello unguiculato, gynostemii basi adnato, flabelliformi, apice retusiusculo trilobo, lobis lateralibus obtuse triangulis, lobo medio retusiusculo apiculato, omnibus denticulatis crispatis, gynostemium clavatum involventibus, callo lineari apice tridentato croceo a basi ultra medium.

Blüthen von der Grösse derer der *Helcia sanguinolenta*. Ich habe die Pollenmassen nicht gesehen; das gespornte Kinn, die Lippenform, die Beschaffenheit der Leiste lassen mich ohne allen Zweifel auf eine *Bifrenaria* schliessen. Hülle rothbraun, innen blässer, Lippe weiss, rosig angehaucht. Caracas. Wagener.

b. Racemosae.

† Labellum trilobum.

6. BIFRENARIA RACEMOSA Lindl. Bot. Reg. XXIX. 1843. sub Misc. 67:

Maxillaria racemosa Hook. B. Mag. t. 2789. Lodd. B. Cab. t. 1318:

Pseudobulbis ovatis compressis tetragonis monophyllis, foliis oblongo lanceolatis tricostatis, scapis gracilibus strictis multifloris brevioribus, sepalis oblongis acutis, lateralibus basi valde elongatis, petalis linearibus, spatulatis triplo minoribus, labello oblongo cucullato, indiviso undulato emarginato in axi calloso, columna pubescente.

Brazil.

Flowers pale, dirty straw-colour, with a white lip, slightly speckled with pale crimson. It is well fig. in B. C.; the representation in B. M. appears to have been taken from a withered specimen. — Bot. Reg. XX. 1835, 1566.

Huc: *Bifrenaria melanopoda* Klotzsch in Otto u. Dietr. Allg. Gtz. 1855. p. 105:

Pseudobulbis parvis brevi-ovatis tetragonis monophyllis aggregatis; foliis oblongis arcuato-recurvatis acutis papyraceo-rigidis saturate-viridibus, basi attenuato-conduplicatis; racemis paucifloris radicalibus pendulis pseudobulbo paulo longioribus; floribus albidis parvis rubescenti-venosis; labello integro flabelliformi subconvoluto, apice inciso-fimbriato, intus sparsim crinito, infra apicem tuberculatum-callosa; columna pubescente.

7. BIFRENARIA VITELLINA Lindl. B. R. XXIX. 1843. sub Misc. 67:

Maxillaria vitellina Lindl. in B. R. 1838. Misc. 116. 1839. t. 12. *Maxillaria barbata* Westcott in Phytologist p. 7.

Pseudobulbis ovatis obtuse angulatis monophyllis, foliis lanceolatis in petiolum canaliculatum angustatis, racemo cernuo foliorum longitudine, labelli cuneati trilobis lobis lateralibus acutis antice crenulatis, intermedio bilobo rotundato cordato crenulato, tuberculo disci trilobo obtusissimo, ungue pubescente.

Brazil.

Flowers bright yellow, with a purple spot in the middle of the labellum.

Bot. Reg. XXV. 1839. 12:

Allied to *M. racemosa*, which differs in having an undivided labellum, a hairy column, and in many other circumstances. Brazil: exact locality unknown. Imp. Lodiges 1838.

Huc Lindl. Bot. Reg. XXVII. 1841. Misc. 141:

Maxillaria barbata Knw. Westc. Phyt. 7:

Pseudobulbis aequaliter quadrangularibus, corrugatis, vaginatis, foliis ovatis, costatis, acutis; floribus racemosis; sepalis inaequalibus, petalis majoribus, lateralibus explanatis, apice subinvolutis; labello cucullato, trilobato, barbato, margine crispo, apice gibboso, disco carnosio.

„Flowers about 8, yellow, disposed in a raceme. Labellum bearded, cucullate, three-lobed, and having a fleshy excrescence on the disk; darker in colour, than the sepals and petals and marked in the centre and on the lateral lobes with a dark purple spot. Clinandrium entire. Caudiculae two, distinct. Gland transverse. Pollenmasses compressed, sulcate. Anther case one-celled and minutely pubescent like the column.“

„This species in habit, in the form of the pseudobulbs and in the foliage, is very similar to *Max. tetragona*, but the flowers are altogether different, and bear resemblance to these of *Maxillaria aureo-fulva* Hook. fig. in the Floral Cab. 11. pl. 83“ l. c.

This plant appears to be identical with *M. vitellina*. With respect to its supposed double caudiculae I must however observe that they are no more than the elastic centre which holds the pollenmasses of all O. pl. Vand to their common caudicula, and that they are very different from those truly double caudiculae properly so called, which exist in *Bifrenaria*.

8. BIFRENARIA LEUCORRHODA Rehb. fl. in Otto Hamb. Gtz. 1859. p. 54.

Huc: *Bifrenaria vitellina* Lindl., var. *leucorrhodia* Rehb. fl. Bonpl. III. 217:

Grandiflora, candida, labelli venis roseis. — Cultur des Herrn Garteninspectors Otto im Hamburger Bot. Garten.

9. BIFRENARIA AUREOFULVA Lindl. Bot. Reg. 1843. XXX. sub Misc. 67: Huc:

Maxillaria aureo-fulva Hook. Bot. Mag. B. 3629. (N. S. XII.):

Pseudobulbis rotundato-ovatis 3—4angulatis rugosis monophyllis, folio elliptico-oblongo striato petiolato acuto, scapo radicali, folio longiori, floribus racemosis, sepalis oblongis acuminatis, lateralibus basi in calcar spurium obtusum connatis, petalis labelloque conformibus. Perigonium rubrum, apicibus phyllorum flavis.

M. Alcard received it from Rio.

Bot. Reg. 1843. XXX. sub Misc. 67: *Bifrenaria aureofulva* Lindl. (*M. aureofulva* Knowles and Westcott Floral Cabin. t. 83. *M. stenopetala* Knowles and Westcott Fl. C. 2. p. 112?)

Pseudobulbis rotundato-ovatis angulatis rugosis monophyllis, foliis oblongo-lanceolatis costatis acutis scapo radicali multifloro brevioribus, floribus longe pedicellatis, sepalis lanceolatis acuminatis, lateralibus apice reflexis, petalis striatis linearilanceolatis acuminatis, labello unguiculato trilobo in medio striato; lobis lateralibus acutis intermedio lanceolato lanceolato acuminato,

Brazil. — Very pretty. Flowers orange colour. It is the „Epid. Limodore“ of Descourtilz, and was found by that traveller in great abundance upon fallen trees encumbering the sandy plain through which the great public road passes from Bananal to Ilha Grande.

Bot. Reg. XXVI. 1840. Misc. 43: gynizo subrotundo margine superiore crasso. Organ Mountains. From the observation of the authors of the Floral Cabinet it has the technical characters of *Bifrenaria*.

Huc: *Maxillaria stenopetala* Kowl. et West. Fl. C. II. 1838. p. 112:

Pseudobulbis angulatis rugosis, foliis ovato-lanceolatis costatis, scapo radicali multifloro, floribus longe pedicellatis apice reflexis, sepalis lanceolatis acuminatis, petalis striatis linearilanceolatis acuminatis, labello unguiculato, trilobo, in medio striato, lobis lateralibus acutis, lobo intermedio lanceolato acuminato, gynizo subrotundo margine superiore crasso.

Flowers orange, petals and labellum striped with a darker colour. Organ Mount. Oct. 1851.

† † Labellum trifidum.

10. BIFRENARIA AURANTIACA Lindl. B. Reg. XXII. (1836). 1875:

Pseudobulbis subrotundis compressis diphyllis, foliis oblongis plicatis racemi erecti longitudine, petalis erectis, labelli lobis lateralibus semicordatis, intermedio transverso ovali subundulato basi calloso, columna pubescente.

Demerara. — Bot. Mag. 3597. — Bot. Reg. XXX. (1843) sub Misc. 67: *Pseudobulbs* and leaves beneath spotted crimson.

II. Folia subulata.

11. BIFRENARIA HADWENII Lindl. Paxt. Fl. G. II. p. 67. N. 332. (*Scuticaria Hadwenii* Hort.):

Floribus solitariis, sepalis petalisque undulatis acuminatis, labello cucullato marginato subrepando intus pubescente crista tridentata,

Sent by Mr. De Becca of Rio. Habit is distinct from *Scuticaria Steelii* having leaves or stems not more than 12—14 inches long, which gives appearance of a *Brassavola*. From what I learn, flowers are solitary and on long stems like the one sent. — Probably allied to *B. inodora*. 3" diam exp. Sepals convex, those at the side slightly extended into a chin. Petals similar, converging over the column, which is quite smooth. Dull nankeen colour with broken brown bars. Lip much paler, with broken rose coloured streaks, rounded at the point and turned inward at the base, so as to

resemble a slipper. When flattened out: rhomboidal outline. On upper side it is hairy and bears in centre a conspicuous 3toothed fleshy appendage. Pollenmasses in two pairs, each placed upon a short strap, which connects it with a very narrow crescent shaped gland.

Hook Bot. Mag. 4629. Van Houtte Flore des Serres VII. 731. (Eadem icon). Lem. III. Hortie. 232.

1411 b. **SCUTICARIA** Lindl.

B. Reg. XXIX. 1843. p. 14.

Flores ringentes antice in mentum rotundatum producti, expansi. Labellum continuum, membranaceum, trilobum, medio tuberculatum. Columna semiteres. Pollinia 4, per paria in glandulam utrinque acuminatam medio dilatam sessilia, extus angulata. Rhizoma articulatum, ramosum, ebulbe. Folia flagelliformia.

1. SCUTICARIA STEELII Lindl. Bot. Reg. 1. c. Huc: *Maxillaria Steelii* Hook B.M. 3573:

Pseudobulbis oblongis annulatis monophyllis, folio longissimo hinc canaliculato, scapo radicali brevi unifloro, perianthio connivente, labello basi intus glandula oblonga, lateribus inflexis, lobo intermedio obtusissime bifido.

Comm. from the stove of John Moss Esq. Otterspool, near Liverpool, together with a drawing by Miss Moss, from which the accompanying figure was made. It was introduced in July of last year (36) by Matthew Steele Esq. from Demerara. With the flower of *Maxillaria* it has a foliage quite at variance with any described species of the genus, attaining a height of two and even 3 feet, and proves a most valuable addition to our Epiphytes.

Perianthium flavum, purpureo adpersum.

Bot. Reg. XXIII. 1837. 1986:

Caule pendulo nano ramoso squamato, ramulis monophyllis, foliis longissimis flagelliformibus canaliculatis, floribus solitariis axillaribus, sepalis petalisque obtusiusculis, labello trilobo, lobis lateralibus erectis rotundatis, intermedii bilobi laciniis rotundatis subcuneatis divergentibus callo baseos elevato apice obtuse tridentato.

Folia 3—4 pedes longa, apice subulata. Flores flavi, maculis irregularibus tigrini; labellum potius interrupte venosum, quam maculatum. Columna semiteres. Pollinia 4, in glandulam transversam utrinque aristatam sessilia, per paria distincta glandulae agglutinata. *Maxillaria flagellifera* Lindl. in hortis.

1411 c. **KOELLENSTEINIA** Rehb. *fil.*

Bonpl. II. 17.

Perigonium herbaceum patulum, mentum valde breve. Sepala oblongo-lanceolata acuta. Labellum unguiculatum, statim dilatatum in laminam ambitu quadratam, basi rotundata cordatam sinibus angustis lateralibus et emarginatura apicis (Cyrtopodii more) quadrilobam, lobi laterales rhombeo trianguli erecti, antici subaequales, longiores, unguis ad medium usque incrassatus, callo incrassationis ibi abrupte emarginato resciso, callus alter inter utrumque lobum basilarem postice medio bidens, inferne cavitatem sub se occultatam gerens, lateribus et antice laminae labelli omnino adnatus. Gynostemium breve subcurvatum, anguli antici

ac androclinium lato alato marginati, limbus circa androclinium trilobus, lobi laterales oblique rhombi, lobulus medius triangulus, membrana summo androclinio non adnata, sed apposita, inferius tantum cum gynostemio connata. Rostellum trilobum erectum, lobi laterales obtusi, medius dentiformis, stigmatis fovea inaequaliter transverse panduraeformis. Anthera mitraeformis apiculata depressa recumbens in androclinio horizontali. Pollinia duo oblongolinea, a latere interno alte biloba, sessilia in caudiculae oblongae medio longitudinaliter carinatae disco; glandula adnata.

1. KOELLENSTEINIA KELLNERIANA Rehb. fil. Bonpl. II. 17:

Ein in Scheide axillärer, schlanker, über fushoher Blüthenstiel trägt unten ein paar kurze Schuppen, oben eine Traube Blüten, so gross wie die der Warrea tricolor. Hülle grün, Lippe weiss mit Purpurquerbändern. Schwiele weiss, Säule weiss und purpurn. Ueber fushohe längliche spitze stielig verschmälerte Blätter. Trugknollige Anschwellung der alten Zweigglieder. Blüthe riecht wie manche Stapelien. Truxillo. 7000'. December. Wagener. Ich habe auch Exemplare von Neu-Granada erhalten. — Diese durch Kappenflügelung und Lippe ausgezeichnete Gattung ist dem Andenken des verstorbenen kais. östr. Hauptmanns Kellner von Köllenstein, eines eifrigen Pflanzenfreundes und Pflanzensammlers, gewidmet. *Zygopetalum tricolor* Lindl. muss sehr nahe stehen. Die karge Beschreibung sagt „foliis gramineis.“ — Rehb. fil. Xenia Orchid. I. 64. Tab. 24. III. 10—18.

Rehb. fil. Bonpl. II. 281. Ocanna. July. 5000'. Nr. 730. Schlim.

2. KOELLENSTEINIA TRICOLOR Rehb. fil. Mss. Huc: *Zygopetalon tricolor* Lindl. Bot. Reg. 1846. t. 64. adn. Walp. Ann. I. 787.

3. KOELLENSTEINIA GRAMINEA Rehb. fil. Huc: *Maxillaria graminea* Lindl. Bot. Reg. XXI. 1836. sub 1802:

Pseudobulbis nullis, foliis gramineis recurvis, perianthio campanulato, sepalis oblongis obtusis lateralibus paululum connatis, petalis angustioribus, labello cum pede longo producto columnae articulado trilobo; lobis lateralibus semiovatis acutis ascendentibus, intermedio majori reniformi tuberculo disci magno. carnosio truncato postice bilobo.

Blossoms pale yellow, with the segments a little banded with purple near the base. A small and inconspicuous species.

Demarara imp. Lowe.

141¹/₂. **STENOCORYNE** Lindl.

Bot. Reg. XXIX. 1843. Misc. 68.

Flores ringentes clausi, longe cornuti. Sepala basi longissime producta et connata. Petala conformia. Labellum longissime unguiculatum, trilobum, disco callosum. Pollinia per paria connata, inaequalia, semiglobosa; caudiculis 2, glandulisque totidem ovalibus.

Herbae epiphytae pseudobulbosae. Folia cartilaginea, solitaria. Flores racemosi, radicales.

1. STENOCORYNE LONGICORNIS Lindl. Bot. Reg. XXIX. 1843. Misc. 53:

Pseudobulbis elongatis tetragonis, foliis oblongo-lanceolatis subplicatis nitidis, racemo laxo multifloro, sepalis lateralibus ovatis acutis, petalis ovatis acutis, labello longe unguiculato spathulato apice trilobo laciniis rotundatis, media pubescente disco elevato calloso.

Demerara.

Flowers racemose, orange, spotted with brown.

Bot. Reg. XXIV. 1838. Misc. 177: *Bifrenaria longicornis* Lindl.

If this plant is really to be referred to *Bifrenaria*, it will be necessary to modify the character of that genus very considerably; for the lateral sepals are extended into a long slender clavate spur, and there are 2 glands as well as 2 caudiculae to the pollen masses. Its relationship to *B. aurantiaca* is however such as to make one unwilling to separate it at present. The flowers are orange spotted with brown and in a raceme like that of the species just mentioned. Messrs. Lodd. imported it from Demerara.

114½. **COLAX** Lindl.

Bot. Reg. XXIX. 1843. Misc. 65.

Flores subglobosi, vix ringentes, in mentum breve producti. Sepala et petala subaequalia. Labellum unguiculatum, trilobum, inappendiculatum, planiusculum (vix cucullatum). Columna paulo elongata semiteres, clinandrio marginato. Anthera carnosa, cristata. Pollinia 4, in paribus globosis colligata, caudiculae obovatae membranaceae adnata; glandula nulla, rostello fisso.

Herbae pseudobulbosae; folia terminalia et radicalia, plicata. Pedunculi radicales erecti, uniflori, vaginati. Flores virescentes.

Closed, scarcely ringent flower of *Promenaea* and *Warrea*, but a caudicula quite unlike any thing at present known among their race.

1. COLAX JUGOSUS Lindl. Bot. Reg. XXIX. 1843. sub Misc. 65. (Huc: *Maxillaria jugosa* Lindl. Bot. Reg. 1841. Misc. 104):

Sepalis oblongis incurvis, obtusis, petalis conformibus concavis basi angustatis, labelli sigmoidei oblongi unguiculati pilosi jugosi lobis lateralibus nanis obtusis, intermedio semi-circulari, columna apice lobata bisulca villosissima.

Brazil.

Near *C. placanthera*, from which it differs in having the flower of a globose figure, with much less linear sepals and concave oblong petals narrowed to the base. These parts are of a rich cream colour, speckled with crimson. The lip has quite a different form, being semicircular at the tip, deeply furrowed and closely covered with short hair. The column has 2 deep furrows in front almost buried in hairs.

Huc: Rehb. fil. in Bonpl. III. 226. Pedunculus apice biflorus teres. Vagina et bracteae amplae herbaceae oblongo lanceae. Ovarium bractea brevius eboraceum album. Mentum medicum. Sepala oblonga acutiuscula candida eboracea; supremum latius. Tepala cuneata oblonga alba guttulis atropurpureis frequentibus marmorata. Labelli unguis cum lamina introrsum curvata angulatus; lobi laterales semiovati obtusi erecti medio incrassati, callo in basi lobi medii hastato semiovato descendente, quadrisulcato, superficie basilari minute velutina, punctuli et guttulae multi, lazulini, seriati in basi viridiuscula; discus lobi medii lazulino guttatus. Gynostemium semiteres, candidum, superne atropurpureo punctulatum, antice bis canaliculatum, bene villosum, superne clavatum, ampliatum; anguli antici extrorsi semiovati ancipites; androclinium immersum, limbo crasso ancipiti erecto. Anthera depressa quadrata, medio foveata. — Garten des Herrn Senator Jenisch, cultivirt von Herrn Kramer. Rehb. fil. Xenia I. p. 107. Tab. 41.

2. COLAX VIRIDIS Rehb. fil. Huc: *Colax viridis* Lindl. Bot. Reg. XXIX. 1843. sub Misc. 65. (*Maxillaria viridis* Lindl. Bot. Reg. 1510.)

Flowers green, with a dingy violet lip. That it differs from *C. placanthera*, in the manner stated under that species, I know from having preserved the specimen from which the figure in the Bot. Reg. was taken, which figure well represents the

peculiar rounded form of the sepals. I believe it is no longer in our gardens; for *C. placantha* is usually cultivated under its name.

Huc: *Maxillaria placantha* Hook. Bot. Reg. XXVII. 1841. Misc. 103: „anthera plana acuta.“

Huc: *Colax placantha* Lindl. Bot. Reg. XXIX. 1843. sub Misc. 65:

Sepalis lineari-oblongis obtusis intus secus medium seriatim maculatis, petalis angustioribus omnino conformibus maculatis, labelli angusti trilobi minute pubescentis laevis lacininiis lateralibus acutis nanis, intermedia dilatata rotundata cuneata, columna apice lobata versus basin bisulca pubescente.

Brazil.

I was certainly wrong in referring this plant to *C. viridis*, from which it differs in its sepals and petals being much narrower, the flowers less green, the lip larger, and of a different form in its upper lobe.

Rchb. fl. in v. Schl. B. Z. 1852. 669: *Colax*. Hr. Garteninspector Bouché zeigte mir im Neuschöneberger Garten Exemplare von *Colax placantha* Lindl. und *Colax viridis* Lindl. Er hatte sie von derselben Mutterpflanze, mithin fallen beide Arten zusammen. Hierher gehört noch *Maxillaria cyanocheile* Hffg.!

3. COLAX MODESTIOR Rchb. fl. in Otto Hamb. Gartzg. 1860. 14.

1412. BATEMANIA Lindl.

Bot. Reg. XX. (1835.) 1714.

Flores ringentes; sepala patentia, lateralia unguiculata, basi aequalia, petala sepalis latiora, basi obliqua, pedi producto columnae adnata; labellum cum columna articulatam trilobum, cucullatum; columna semiteres, basi elongata, clinandrio marginato; anthera parva, bilocularis; membranacea; pollinia 2, postice biloba, glandula triangulari, caudicula nulla.

1. BATEMANIA COLLEYI Lindl. Bot. Reg. I. c.:

Epiphyta. Pseudobulbi ovati subtetragoni, lucidi, olivacei, subcorrugati, ovi gallinacei magnitudine. Folia 2—3 obovato oblonga, plicata, basi angustata. Racemus radicalis, pendulus, semipedalis, laxe 5—10 florus. Bractee rhombeae, striatae, cucullatae, inflatae. Flores pedicellati, ovario pedicello brevioribus. Sepala et petala pollicem longa, intus fusco purpurea, extus viridi vitta notata, apice quoque viridia. Sepalum posterius oblongum obtusiusculum; lateralia spatulata, divergentia, petalis paulo longiora; petala a basi triangulari oblonga, sepalo supremo latiora. Labellum oblongum, ultra medium disci tridentatum, album, intus lutescens, extus levissime rubescens, lobis rotundatis, serrulatis, lateralibus intermedio-subcuneato brevioribus. Anthera membranacea, depressa, quadrata, bilocularis. Rostellum subulatum. Clinandrium marginatum, dentatum. Stigma rima parva transversa.

B. M. 3818: Sent by Fraser from Demerara to the Glasgow B. G. having first been detected by Mr. Colley, Mr. Batemans collector in the same country.

2. BATEMANIA FIMBRIATA Lindl., Rchb. fl. Bonpl. II. 280:

Labello oblongo acuto ante basin utrinque angulato, toto margine serrulato, carinis septem in basi elevatis, androclinii cucullo lacero. — *Galeottia fimbriata* Linden Cat.

Eine schöne Art mit grossen Blüten, deren Färbung an die des *Cymbidium giganteum* erinnert, nur sind die Farben brennender. Sepala und Tepala lanzettlich, fein zugespitzt. — Zygopetalum grenzt durch *Z. rostratum* Hook. an diese Gattung. — Wälder Ocannas. 4—5000'. Nr. 42. Schlim.

3. BATEMANIA GRANDIFLORA Rehb. fl. Bonplandia 1856. IV. 323. Huc: *Galeottia* A. Rich. Ann. sc. nat. 1845. Jan. p. 25:

Flores resupinati. Sepala exteriora libera, lanceolata, acutissima, patentia, aequalia, interna paulo minora subcarnosa, basi lata; labellum brevissime unguiculatum, basi gynostemii productae articulatum, subcon-
cavum, trilobum, lobo medio majori fimbriato, apice longe acuminato; gynostemium arcuatum, margine membranaceum, alis truncatis, denticulatis; anthera operculiformis 2-locularis. Stigma concavum, rostellum acutum, glandula ovali antice attenuata; pollinia 4 per paria superposita, compressa, caudicula.

G. grandiflora Rich. et Gal. l. c. et tab. 27.

4. BATEMANIA MELEAGRIS Rehb. fl. Bonpl. III. 217. Batemaniae genus Zygo-
petalo Sect. Zygosepalo valde affine. Hoc recedit glandula profunde biloboemar-
ginata.

Huc: *Huntleya Batem.* B. Reg. XXIII. 1857. sub fol. 1991:

Perianthium explanatum, subaequale, sepalis lateralibus basi involutis vix obliquis. Labellum planum unguiculatum, rhomboideum, patens, basi longe fimbriatum, cum basi libera producta columnae articulatum. Anthera bilocularis mutica. Pollinia 4. Herbae caulescentes. Folia ligu-
lata, disticha. Flores axillares (solitarii).

Huntleya Meleagris Lindl. Floribus longe pedunculatis. In Brasilia. Epidendre
fritillé Descourtiz Ic. Orch. Bras. ined. t. 8.

Planta Vandae omnino facie. Folia pedalia, flabellatim disticha. Pedunculi cum ovario 5 pollices longi. Flores diametro 3—4 pollicari, medio candidi, ultra medium
Fritillariae Meleagridis aspectu et colore vinoso. Labellum ovato-rhomboideum, acu-
tum. Columna apice virens.

Bot. Reg. XXIV. 1838. Misc. 20: flowers with Rollissons. Flowers 3" across. Pale
yellowish white, with a brownish purple tint towards the upper part of sepals and
petals. Lip of the same pale colour as the base of the petals. Across the end of
the lip is stretched a broad yellow-fringed crest, which is very remarkable.

Bot. Reg. XXV. 1839. 14: Sepalis petalisque ovatis acuminatis tessellatis, labello
subconformi unguiculato concavo, crista baseos fimbriata, columnae cucullo crenato.

The only specimens I have seen flowered with Messrs. Rollissons July 1838. Its
blossoms are much yellower and less tessellated with purple, than in the Brazilian
drawing from which the species was first described. The whole surface of the
flowers has quite the appearance of being glazed. This charming plant is found in
gloomy damp woods on the banks of Rio di Pirapitinga, in the district of Bananal. It
is scentless, flowers in June. Descourtiz. — Mr. Rollisson assures me, that he re-
ceived it from the same country, as that which produced the *Zygopetalum cochleare*
Bot. Reg. 1857. etc. Cf. *Zygopetalum cochleare*.

5. BATEMANIA BEAUMONTII Rehb. fl. Walp. Ann. III. 544. Lindl. Paxt. Fl. G. I.
Ic. 12. Nr. 11. Diagn. cf. Walp. l. c.:

That it is a *Galeottia*, there is no doubt; "an obscure genus founded by Mr. A.
Richard upon a Mexican plant unknown in gardens, and which may possibly be found
not distinct from *Batemaniana*. The only difference, indeed, which we see, in the pre-
sent instance, is that this *Galeottia* has a large ovate gland and short caudicle, while
Bat. has a large ovate gland and no caudicula. — *Stenia Beaumontii* A. Rich. Cat.
Hort. Pesc. — Bahia. Morel. Flowers 2 in a stalk, dull green and brown, with a
pale lila lip.

Gardn. Chronicle 1850, p. 41: the genus is extremely near *Batemaniana*, and per-
haps not really distinct.

Rehb. fil. in Schl. B. Z. 1852. p. 670: Eine Batemanian; es ist ganz genau in allen Organen derselbe Plan befolgt, nur hat diese höher entwickelte Art eine längere Caudicula.

1415. **GOVENIA** Lindl.

Lodd. B. Cab. 1709.

1. GOVENIA UTRICULATA Lindl. B. Reg. XXV. 1839. Misc. 66. Bot. Mag. 4151:

Pseudobulbo ovato vagina ampla membranacea striata pellucida oblongo-attenuata incluso, foliis binis lato oblongis acuminatis plicatis basi attenuatis, racemo elongato multifloro, sepalis petalisque curvatis acuminatis, labello oblongo ovato acuto.

Cymbidium utriculatum Sw. LO. 170. Jamaica. Macfadyen. Purdie. Leaves two, 1 foot and more long. Scape radical, 1—1½' long, erect, terete. Raceme 6—8'. Sepals and petals white, lip with three red spots at the apex.

Huc citata ab ipso cl. Lindl.:

Govenia lagenophora Lindl. B. R. XXV. 1839. Misc. 66:

Pseudobulbo ovato vagina lagenaeformi utriculata incluso, petiolis quadrigonis, racemo longissimo multifloro, labello ovato obtuso omnino glabro, sepalis petalisque obtusis.

Mr. John Rogers Esq. Jun. imported it from Mexico.

2. GOVENIA LILIACEA Lindl. B. Reg. XXI. 1836. sub 1795. B. R. XXIV. (1838). t. 13

Labello ovato basi ima cucullato, spica oblonga, scapo univaginato; bracteis oblongis cucullatis, foliis obovatolanceolatis plicatis, radicalibus scapo brevioribus, radice tuberosa.

Maxillaria liliacea La Llave et Lexarza nov. veg. descr. 12. 1' high, Mexico Imp. by George Barker Esq. — The colour of the flowers is not a good or pure white, but they are delicately streaked upon the petals with lines of rather pale purple.

From *G. superba* it differs not only in colours, but in the form of the label, which is not at all cordate, or channelled along the middle. The first notice we have of the existence of this species is from Hernandez, who in the Madrid edit. of his work calls it by the name of: „Iztactepetzacuxochitl Icohueyo.“ It was many years afterwards described and named more scientifically by Paul de la Llave and John Lexarza in their Nov. Veg. Descr. These authors state, that it is met with near Valladolid in Mexico, under the shade of trees or sometimes growing over their roots, and flowering the summer months: its vernacular name is Azuzena del Monte.

Lindl. in Benth. Pl. Hartwg. 1842. p. 93: In praeruptis. Guatemala nec non Cuesta de Mexico. Mexico. Hartweg. — Knw, et Westc. Fl. Cab. II. 68.

3. GOVENIA PAUCIFLORA Lindl. Ann. Nat. Hist. X. 1842. 184:

Foliis binis oblongis scapo paulo brevioribus, racemo 7—8floro, bracteis lanceolatis membranaceis pedicellis brevioribus, sepalis oblongis acutis, petalis labelloque intus laevi ovato lanceolatis, anthera mucrone recurvo.

Mexico. Near Jesus del Oro. Karwinski in lib. reg. Monac.

A very remarkable species with short oblong, acute leaves, and a fewflowered scape not much longer than themselves. The whole plant is little more than a foot high.

4. GOVENIA MUTICA Rehb. fil. in v. Schld. B. Z. 1852. 836:

Foliis late oblongis utrinque attenuatis, apice acutis, pedunculo validissimo, trivaginato, vaginis amplis, laxis, acutis, racemo multifloro, bracteis oblongis, acutis basi angustatis, ovaria pedicellata superantibus, perigonii phyllo summo lanceolato, acuto, p. lateralibus externis lanceolatis, acutis, semilunatis, lateralibus internis semilunatis apiculatis la-

helo panduraeformi, apiculato (apiculo reflexo), phylla l. e. haud aequante, gynostemio apicem versus utrinque obtusangulo alato, anthera mutica.

Blüthen so gross, wie bei *G. Gardneri* Hook., wohl weiss. Zaquapan in Mexico. Leibold.

5. GOVENIA DELICIOSA Rehb. fl. in v. Schl. B. Z. 1852. 836:

Foliis oblongis acutis basi cuneatis, pedunculo valido bivaginato vulgo non aequalibus, racemo multifloro, bracteis oblongis, acutis, ovaria pedicellata non aequantibus, apice obscuris, perigonii phyllo summo lineari-lanceolato acuto, basi utrinque obtuse humerato, plica utrinque in margine medio elevatula, phyllis lateralibus externis subaequilongis, gynostemio gracili, labellum vix aequante, margine membranaceo superne paululum obtuse angulato, antherae apiculo subobsoleto, sc. brevissimo antrorso.

Blüthen weiss, etwa so gross, wie bei *Govenia Gardneri*, 1—2 Fuss hoch. Mirador. Heller! Mexico. Schiedel

Obs. Huc sequens planta omnino non recognoscenda ob antheram neglectam inserenda videtur. In herbario Galeottii *Goveniae* liliaceae Lindl. specimina reperio:

Govenia alba Rich. et Gal. Ann. sc. nat. 1845. Jan. p. 25. Foliis binis petiolatis elliptico-oblongis acutis, pedibus; floribus albis parvulis; labello unguiculato sepalis dimidio brevioribus, ovali, acuto. Mexico.

6. GOVENIA GARDNERI Hook. B. M. 3660. (XII. N. S. 39):

Foliis elliptico-lanceolatis membranaceis plicatis solitariis vel binis petiolatis, petiolis scapoque vaginatis, petalis sepaloque superiori concavis conniventibus galeam formantibus, petalis lateralibus porrectis, labello lato oblongo recurvato apiculato medio bituberculato, apice glandulifero.

Orchidea. Gardn. Pl. exs. Bras. n. 670.

Perigonium albido luteolum, labellum brunneo adpersum.

Organ Mountains Brasiliae Gardner. Flowered at Glasgow B. G. in Octob. 1839.

Bot. Reg. XXV. 1839. Misc. 51:

Scapo obtuse tetragono medio vaginato, racemo elongato floribus post anthesin refractis, bracteis oblongis herbaceis, ovarii dimidii longitudine, sepalis petalisque ovatis obtusiusculis, labello ovato acuto nudo apice maculis 5 marginalibus notato, lineis duabus convexis convergentibus in medio, antherae cornu brevi inflexo.

Fig. of B. M. seems to have been taken from a specimen out of health, for the colour of the flowers and their markings are by no means such as I find them in a specimen now before me, for which I have to thank my friend John Miers. The flowers are pure white, the petals are delicately spotted with violet dots inside; the lip is downy at the base, and yellowish-green except at the point, where it is white, with five small equidistant spots, of which the 3 in the middle are bright orange colour, and the 2 side ones, which are much more indistinct, dull purple. Mr. Miers tells me, that he found it flowering in the month of Febr. on the Organ Mountains, at 2 distant intervals from 3000—3500 feet above the level of the sea; at the lower one in an exposed situation on a bank, at the higher, in a wood upon a quantity of rich mould in the hollow of a decaying tree.

7. GOVENIA CAPITATA Lindl. Bot. Reg. XXI. 1836. sub 1795:

Labello ovato obtuso, racemo capitato, bracteis oblongis obtusiusculis, foliis oblongis acuminatis basi angustatis scapo multo brevioribus.

Mexico.

Mexico. Atotovilco el Chico, in a cool climate. Karwinski (Herb. Mon.). Leaves oblong-lanceolate tapering to each end, especially to the point, a foot long, about 5 inches wide, very like these of *Govenia superba* except that they are smaller. Stem 5' high terminated by a short and very dense headed raceme of large flowers, to each of which is an oblong obtuse bract not quite so long as the ovary. The raceme is 4 inches long, and as much broad at the base. In the form of the flowers it resembles *Gov. superba* very much, but they are 3 times as large; the sepals are an inch and half long, and the other parts in proportion. The lip has an ovate form, but is not cordate at its base; it is not quite half so long, as the sepals, and is marked towards its end with largish, round, very dark dots. The colour of the flowers cannot be ascertained, probably pale, and uniform; pale yellow?

Lindl. in Benth. Pl. Hartw. p. 72: Rancho del Ojo de Agrida Mexici. Hartweg.

8. *GOVENIA ANDRIEUXII* Rehb. fil. in v. Schl. B. Z. 1852. 835:

Foliis oblongis, acuminatis, pedunculo valido univaginato, apice racemoso, racemo denso, brevi, bracteis oblongis acuto-acuminatis, ovaria pedicellata haud aequantibus, perigonii phyllo summo oblongo cuneato acuto, phyllis lateralibus externis oblongis, curvatis, divaricatis, labello haud dimidio longioribus, phyllis lateralibus internis cuneatis oblongo dilatatis acutis, labello a basi sensim lato-cuneato, dilatato, latius subquadrato, antice acuto, plica elevata transversa utrinque versus basin, gynostemio incurvo, aequaliter membranaceo marginato, antherae apiculo...

Blüthen halb so gross, als die der *Govenia capitata* Lindl. „Dendrobium (flore dilute flavo, nigro maculato). In monte San Felipe. Julio.“ G. Andrieux. Pl. Mexic. exsicc. Nr. 88. Wie bei *Govenia capitata* Lindl. zeigen sich purpurne Flecke auf der Spitze der Lippe, allein sie gehen nicht so weit nach der Mitte.

l. c. p. 937: antherae apiculo subulato, incurvo, abbreviato.

9. *GOVENIA SUPERBA* Lindl. Bot. Reg. XXI. 1836. 1795:

Labello ovato cordato, spica cylindracea, bracteis acuminatis, foliis oblongis acuminatis basi angustatis scapo aequalibus.

G. superba Lindl. Lodd. Bot. Cab. 1709. LO. 153.

Caulis cum foliis 5pedalis. Folia 3pedalia et ultra, basi vaginis purpurascensibus vestita. Racemus 1 — 1½ pedalis, cylindraceus, floribus onustus. Sepala 7" longa, lateralibus semi-oblonga. Petala oblique rhomboidea acuminata. Labellum 3 lineas tantum longum, lividum, unguiculatum, cordatum, ovatum, obtusum, supra canaliculatum.

Azuzena amarilla.

Mexico near Valladolid. Lexarza, La Llave.

10. *GOVENIA FASCIATA* Lindl. Bot. Reg. XXIX. 1843. Misc. 107:

Foliis latis ovalibus acutis, spica laxa, bracteis ovario aequalibus abrupte acutis, sepalis angustis acutis, petalis (obovato lanceolatis duplo) latoribus, labello oblongo subquadrato, apiculato, intus laevi, antherae mucrone inflexo.

„Mexico“. Mr. Linden sent to Mr. Rucker.

Pretty, having clear yellow flowers, whose sepals and petals are beautifully marked by fine broken bands of crimson. The long bracts, thin narrow spike of flowers and oblong, not ovate lip of flowers are the marks, by which it is best recognized.

Not Mexican: it is among Mr. Linden's Merida plants: 644, 654. Both found by that most industrious collector in Venezuela, in damp forests, at the height of 5000' ab. the sea, and are distinguished from each other in his memorandum by the flowers of one having the markings more broken into specks and spots, than the other, Gathered 1842. Long bracts! thin, narrow spike of flowers and oblong, not ovate lip are marks. Leaves 1' long, 3" wide.

Lindl. Orchid. Lind. 1846. p. 18: „An epiphyte from damp forests in the vicinity of Merida, at the height of 5000'. Flowers in May. Flowers yellow, in one variety striped with red, in the other dotted with red.“ Linden N. 644. 654.

Obs. Eadem videtur planta sequens:

GOVENIA TINGENS Endl. Pöppig Nov. Gen. et Sp. — Rchb. fil. in v. Schl. B. Z. 1852. 835:

Foliis cuneatis, oblongis, acutis, pedunculo valido 1—2 vaginato, apice racemoso, racemo multifloro, demum laxo, bracteae oblongis, apiculatis, seu acutis, ovariis pedicellatis brevioribus, perigonii phyllo summo oblongo cuneato acuto, phyllis lateralibus externis oblongis, acutis, incurvis, labello vix longioribus, lateralibus internis subaequalibus latioribus, paulo longioribus; labello a basi gynostemii subito dilatato, triangulo, lateribus obtusatis, humeratis, apice longitudinaliter biplicato (plicis baseos nullis), gynostemio incurvo, alato-marginato, ala apicem versus obtusangule producta, antherae apiculo uncinato, abbreviato.

1. **CYCNOCHES LODDIGESII** L. O. I. c. — Lodd. Bot. Cab. 2000. B. M. 4215. B. R. XXI (1835). 742:

Sepala viridia apice fusca, et obscure maculata, mox rufescentia; supremum lineari oblongum, arcuatum, tres pollices longum; lateralialia duos pollices longa a basi connata, ovato oblonga, subundulata, pendula. Petala ejusdem coloris cum sepalis, sed minus conspicue maculata, oblongo-lanceolata, inaequilatera, decurva, 2½'' longa. Labellum patentissimum, cum columna continuum, angusto oblongum, convexum, carnosum, medio album, apicem versus tenuius, sordide lutescens, undique maculis latis inaequalibus sanguineis notatum; ungue brevi alato maculoso, alis lutescentibus; disco convexo album. Columna gracilis, arcuata, utrinque clavata, dimidio inferiori atropurpureo, superiore complanato virescente purpureo maculoso. Anthera cito decidua. Clinandrium postice bicorne, cornubus falcatis supra antheram incurvis.

Paxt. Fl. G. III. p. 6. Sports by producing smaller broadlipped flowers without scent and with very short cucullate clubshaped column.

var. *leucochilum* Hook B. M. 3855: labello immaculato.

2. CYCNOCHES VENTRICOSUM Bat. Orch. Max. Guat. Tab. 5:

Sepalis petalisque lanceolatis acumine reflexis, labello integro ventricosum acuminato basi calloso, ungue brevi; columna arcuata sepalo supremo duplo brevior.

Guatemala. Istapa. Skinner.

Leaves lanceolate 5—6. Stem 1'. After flowering season leaves fall off, stem becomes shorter and more swollen, and is then deeply marked by longitudinal lines, as well as by horizontal contractions at the points from whence the leaves fall. From the axils of the upper leaves: racemes, 2—more, at the same time sometimes, but more usually in succession; each of these bears about 5 flowers, which open simultaneously lasting about 3 days. Raceme first horizontal. Sepals lanceolate. Petals curved downwards, of a light green colour, as are also sepals. Lip white, connected with the column by a short claw, which presents a black callosity.

b. SEXUS? WARSCEWICZII Rehb. fl. Huc: *Cynoches Warscewiczii* Rehb. fl. in Schl. B. Z. 1852. 754.

Perigonii phyllis oblongis erectis, lateralibus omnibus curvatis, labello abbreviato, lato unguiculato, dein oblongo acuto, carnosissimo, margine membranaceo, callo baseos crassissimo antice rotundato, Bolleae violaceae more intruso, gynostemio abbreviato, semitereti, crasso, incurvo, utrinque pone foveam stigmaticam auriculato alato, androclinio postice bilobulo, lobulis lateralibus rotundato-triangularibus, abbreviatis, dente interjecto, processu rostellari producto oblongo.

Nächst *Cynoches chlorochilon* Klotzsch, aber durch die kurze dicke Säule völlig abweichend. Ob auch eine der wunderbaren dimorphischen Formen, welche in dieser Gattung spuken? — Chiriqui.

3. CYCNOCHES CHLOROCHILON Klotzsch in Otto u. Dietr. Allg. Gartzg. 1838. p. 225. (21. Juli 1838). Lindl. Sert. (1838) Tab. 16:

Racemo subtrifloro suberecto, sepalis ovalibus, petalis paulo majoribus falcatis, labello subsessili obovato acuto convexo basi concavo: callo clavato transverso obtuso triangulari.

Demerara. Lodd. — Maracaybo. Moritz sent 1836 to Berlin.

Differs from *C. ventricosum*: flowers larger, raceme shorter and less graceful, sepals and petals broader and not so acute, especially in the form of the lip, which is nearly sessile, obovate, and acute, not ovate, and acuminate, green, not white, with the broad green callosity at the base far larger and differently formed. Raceme springs from the upper part of the stem, bears usually 3 flowers of a uniform, yellowish green colour, 3" diam., nodding by their weight. Lateral sepals oblong, narrowed to the point, not acuminate, a little longer than the labellum, at the back of which they are slightly falcate with their concave edge next the lip, towards which they are turned; so that the flower has its parts expanded in 2 opposite directions; the lateral sepals, petals, lip upwards, and the intermediate sepal downwards. The lip stands erect at the back of the flowers, about 2½" long, 1¼" wide in the broadest part; texture firm and fleshy, colours deep green at the base, and a yellowish green every where else; in form it is widest and very convex a little above the middle, from which it is regularly ovate as far as the point; below the middle it narrows, and becomes concave with thick, broad, elevated edges and at the base it is contracted into a very short thick fleshy unguis; above the unguis, and across it, is seated a thick, green, somewhat triangular, but rounded callosity, scarcely a quarter of an inch deep. The column is about an inch and ¾, long, very slender, green, wide at the base, tapering through the greater part of its length and flattened out at the apex, where it terminates in 3 narrow fleshy teeth curved over the back of the

anther, the middle one being the narrowest; it bends away from the lip so gracefully, that the 2 taken together almost describe the segments of a circle.

Rehb. fl. Bonpl. II. 9. Caracas 4000'. Juli. Wagerer.

† † Labellum in appendices solutum.

4. CYCNOCHES PENTADACTYLON Lindl. Bot. Reg. XXIX. 43. 22. Misc. 26 :

Racemo brevi stricto, sepalis petalisque lanceolatis reflexis, supremo incurvo, labelli unguiculati margine revoluta dorso adnato, hypochilio cornu recto incurvo aucto, metachilio quadrilobo medio foveato laciniis 2 posticis obtusis carnosiss, incurvis, anticis subulatis, apiculo linguiformi acuto laevi.

„Brasilia.“ Veitch.

Its lip is quite remarkable having 5 finger-like lobes and no more instead of the lateral comb-like fringes of *C. maculatum*.

5. CYCNOCHES AUREUM Lindl. Paxt. Fl. G. III. Tab. 75. (1852):

Racemo longo pendulo compacto, sepalis lanceolatis planis, petalis conformibus ab apice revolutis, labello brevi unguiculato apice ovato acuto disci rotundati margine in processibus brevibus arcuatis apice furcatis soluto, 2 basilaribus majoribus discretis rectis, columna labelli longitudine.

Whole coloured, pale clear yellow. — Am. central. — Lem. III. 264.

6. CYCNOCHES DIANA REHB. fl. in v. Schl. B. Z. 1852. 636.

Perigonii phyllis oblongis acutis, cuneatis, subaequalibus, labelli unguiculati lamina cochleari basi utrinque cornu semilunato aucta, margine lobulata, lobulis denticulatis, lamina brevi lancea, nunc recurva, antrorsa sub margine elevato apicis; gynostemio gracillimo, filiformi, apice clavato, androclinio postice falcis geminis semilunatis antrorsis onusto.

Blüthenhülle carmoisin, mit braunen Punkten, Lippe weiss. Säule grün. Aehre vielblüthig, hängend, in der Achsel alter Schuppen des kleinen walzigen Stammes. Säule sehr viel länger als Lippe. Blüthen etwa so gross, wie die des *Cycnoches Egertonianum*, viel kleiner als die des *C. aureum* Lindl. — Mittelamerika. v. Wsczw.

7. CYCNOCHES EGERTONIANUM Bat. O. Mex. Guat. Fl. 40 :

Foliis vaginantibus undulatis lanceolatis acuminatis racemis multifloris nutantibus brevioribus; sepalis petalisque subaequalibus ovatis acutis, labello columna continuo obovato margine incurvo, digitis clavalis utrinque instructo, epichilio lineari membranaceo digitis vix longiore.

Flowers chocolate colour inside, greenish outside, ground colour of the lip green, flogers tinged with purple. Column dark purple.

Guatemala. Skinner.

Bot. Reg. 1846. Tab. 46. „*C. Egertonianum* Lindl.“ *C. stelliferum* Lodd. (fl. pallide virentibus). Oaxaca.

8. CYCNOCHES MACULATUM Lindl. Bot. Reg. XXVI. (1840). Misc. 8:

Racemo longissimo multifloro, labello linearilanceolato, hypochilio lineari, metachilio basi cornuto glandulis utrinque teretibus elongatis genueflexis pinnatifide marginato, epichilio lanceolato membranaceo acuto margine incurvo.

Long pendulous, many flowered racemes of dull yellowish-brown flowers spotted with brown.

Lindl. Sert. Tb. 33: Mexico. Barker imp. La Guayra, — Long slender stems from the sides of which spring forth 4 long racemes, each having about 30 flowers. Leaves of Catasetum. Racemes $1\frac{1}{2}$ ' at the base with numerous thin leafy scales. Flower - stalks rectangular with the axis. Each flower when expanded measures nearly 3" from tip to tip of divisions; yellowish ground colour on which are distributed numerous rich brown blotches. Sepals and petals lanceolate, wavy, spreading in a starry but rather one-sided manner. Labellum continuous with the foot of the column, upon which it seems as if inserted; general form linear-lanceolate. In the middle white, divided at the edge on each side into about 5 round fleshy crooked fingers spotted with purple; between the front pair of which is placed a straight fleshy horn directed backwards, greener than any of the fingers, the upper end is thin, lanceolate, acuminate, white with 3 purple spots, of which one is near the point, and the others lower down and nearly equidistant from themselves and the margin. Column very long, quite taper at the base, enlarged into a thick knob at the apex, purple, spotted with a lighter shade of the same, at the back of the anther it is extended into a lobed horn, below which the anther is inserted upon a filament. Caudic. very long, upon a large round fleshy gland. Rchb. fil. Bonpl. II. 9. Caracas. Wagerer.

B. Species una melius nota.

CYNOCHES VENTRICOSUM Bat. l. c.

a. genuinum. *C. ventricosum* Bat. Orch. Mex. Guat. 5.

b. Egertonianum. *C. Egertonianum* Bat. l. c. 40. Cf. Bot. Reg. XXIX. 1843. Misc. 117. (usque ad: „seeds.“ ibi ex Bateman l. c.):

„Among Mr. Skinner's earliest Guatemala collection attention was particularly directed to the specimens of a plant, which to the habit of a *Cynoches* joined the long pendulous stems of a *Gongora* and for the possession of which in a living state, no small anxiety was entertained. Some plants were speedily transmitted by Mr. Skinner, but these on flowering, proved to be merely the old *C. ventricosum*. A mistake was of course suspected, and Mr. Skinner, being again applied to, sent over a fresh supply of plants, for the authenticity of which he vouched; but these were scarcely settled in the stove, when flowers of *C. ventricosum* were again produced. Mr. Skinner being importuned for the third time, and being then on the point of returning to this country, determined to take one of the plants under his special protection during voyage, which, flowering on the passage, seemed to preclude the possibility of further confusion or disappointment. The specimens produced at sea were exhibited and the plant itself placed in the stove at Knypersley, where it commenced growing with the utmost vigour. The season of flowering soon arrived, but brought with it a recurrence of the former scene of astonishment and vexation, for the blossoms, instead of those of the coveted novelty, were not distinguishable from the old *C. ventricosum*.] These were still hanging to the stem, when the inexplicable plant sent forth a spike of a totally different character, and which was, in fact, precisely similar to the specimens gathered in Guatemala, and to those produced on the voyage. It is, at present, impossible to attempt any explanation of so strange a phenomenon especially on the supposition, that the two forms of flowers are analogous to the ♂ and ♀ blossoms of other tribes, for *C. ventricosum* alone not unfrequently perfects seeds.“ — The plant here alluded to is a *Cynoches*, which at one time bears large green flowers, in a short spike, with broad flat sepals and petals and a convex white ovate undivided labellum, and at another produces small blackish simple flowers in a very long drooping spike, with narrow sepals and petals rolled back upon the stalk, and a circular purple labellum with the edge broken up into many fingers, a lancet-shaped appendage at the point, and a kind of horn springing from the middle. These things are so totally different, that notwithstanding the strange sportings represented at fol. 1951 of this work, and the unquestionable autho-

rity of Mr. Bateman, there were many persons, well skilled in the habits of Orchidaceae, who felt convinced, that some mistake had been made, and that in reality it was impossible, that such totally different flowers could have been borne by one and the same plant. — Mr. Robert Steyner Holford Esq. of Westonbirt near Tetbury in Gloucestershire sent a flowerspike bearing flowers of *Cycnoches ventricosum* and *Egertonianum* intermixed. — Cf. Lindl. l. c. Xyl.

Obs. Forsan etiam *C. pentadactylon* Lindl. huc pertinet. Cf. Paxt. Fl. G.: „In the garden of Mr. Klenrick of West Bromwich this produced two flowers of *C. Egertonianum* among the usual flowers to itself. Sept. 11. 1852.

Sepals whitish on the outside and faintly spotted with claret colour on the inner. Petals broader, than sepals, with blotches of a clear reddish chestnut colour. Petals with blotches of clear reddish chestnut hue. Lip yellowish green, dark brown, approaching to black within.

Rehb. fil. Bonpl. 19. Caracas. 4500'. October. Wagener.

3. CATASETUM OERSTEDII Rehb. fil. Bonpl. III. 218:

Aff. *C. macrocarpo* Rich. labelli sacco exacte conico, ostii oblongi margine fimbriato, lamina praeupta intus sub medio antico exciso inermi.

Diese Art war uns längst bekannt, allein nach ungenügendem Materiale. Zunächst lagen vor ein paar Blüten und Skizzen von v. Warscewicz, dann ein schönes von Kopenhagen gefertigtes Abbild. Es blühte dort im botanischen Garten im August 1850, in von Dr. Oersted aus Nicaragua heimgebrachten Exemplaren. Blüten so gross, wie die eines mittleren *Catasetum macrocarpum* Rich., grünlich mit Purpurflecken, Lippe reich purpurfleckig. Sepalen, Tepalen, Säule wie bei *Catasetum macrocarpum* Rich. — *Catasetum serratum* Lindl. hat eine weite Mündung und kurze „Cirrhi“; hier ist die Mündung eng und die „Cirrhi“ sind länger als die Säule. Aus Herrn Pescatore's Garten von La Celle, cultivirt von Hrn. Lüddemann, neuerlich auch aus Berliner Gärten erhalten. — Herr Dr. Oersted sammelte die Art in Nicaragua.

4. CATASETUM VIRIDIFLAVUM Hook. B. Mag. 4017. (1843.):

Foliis oblongis acutis, sepalis patentibus petalisque ovatis acutis concavis, labello subconico-saccato cucullato, ore contracto integro ciliato, anthera columnaque acuminatis.

It was discovered by Mr. Barclay (while employed as Government Botanist on the Pacific side of South America, in H. M. Surveying Ship Sulphur) in Central America

and sent thence to the Royal B. G. at Kew, where it flowered in the Orchid. house in summer 1842.

Perigonium viride. Labellum intus flavo pictum.

Huc: Regel Gartenflora V. 121.

Huc: *C. serratum* Lindl. cf. Walp. Ann. I. 780.

5. CATASETUM GLOBIFLORUM Hook. B. M. 3942:

Spicælongata multiflora, perianthio globoso, sepalis petalisque subconformibus ovalis acutis concavis arctissime imbricatis, labello hemisphærico globoso, ore contracto oblongo inferne dilatato, columnæ longitudine denticulato, columnæ brevis setis rectiusculis.

From Brazil: Dr. Gogarty, now a resident practitioner at Rio, sent this beautiful plant to the Glasnevin Garden. Mr. Moore informs me, that one specimen produced no less than fifteen of these singular flowers.

Perigonium brunneum, viridi marginatum et adpersum. Labellum viride, intus et margine extus violaceo rubroque maculatum.

Bot. Reg. XXVIII. 1842. Misc. 48:

Very much like *C. Hookeri* and perhaps a variety of it. The sepals and petals are olive brown, and, closely applied to a glaucous, globular labell, the greater part of which is uncovered.

6. CATASETUM LURIDUM L. O. 156. Lindl. Bot. Reg. XX. 1835. 1667:

Caulibus defoliatis angustis sulcatis, perianthio subgloboso parum maculato, sepalis petalisque oblongis apice rotundatis, labello cucullato carnosum mutico apice paulo producto truncato, racemo brevi nutante.

Caules deflorati angusti, cinerei, sulcati, 3—5 uncias longi.

Folia plicata, subundulata, acuminata. Racemus vix pedalis, apice nutans, pauciflorus, bracteis breviter canaliculatis obtusis. Perianthium globosum sepalis petalisque herbaceis, oblongis, apice rotundatis maculis quibusdam pallidis notatis. Labellum carnosum, cucullatum, lutescens, antice truncato submarginatum, marginibus atropurpureis maculatis nec ciliatis, nec dentatis, nec inflexis. Columna bicirrhosa generis.

Bahia etc. Brazil.

7. CATASETUM OCHRACEUM Lindl. Bot. Reg. XXX. 1844. Misc. 55:

Sepalis petalisque ovalis secundis, labello cucullato integerrimo laevi, apice in rostrum breve latum obtusum carnosum contracto, cirrhis brevibus.

In the way of *C. luridum* with deep yellow ochre-coloured flowers. The lip is hooded, but contracted at the point into a kind of beak, thick at the edges and short. Hartweg sent it, to the Hort. Soc., from the Hacienda del Hospicio, in the prov. of Bogota.

8. CATASETUM PURUM C. G. Nees und Sinning Pl. in hort. Bonn. nutrit. tab. 1. Huc *C. semiapertum* Hook. Ex. Fl. III. 213. — B. Mag. 3398. — Lindl. B. Reg. XX. (1835). 1708 (*Catasetum semiapertum* Hook):

Foliis oblongo-lanceolatis undulatis racemo compacto longioribus, perianthio subpatente secundo: laciniis lanceolatis, labello apice incurvo cucullato marginibus ciliato denticulatis.

Habitus, pseudobulbi et folia *C. tridentati*. Flores diversissimi, odorati, herbacei, immaculati, sepalis petalisque anguste lanceolatis, saepius dependentibus ob labellum posticum. Labellum subcompressum, carnosum, lobo apicis rotundato incurvo, lateralibus cilia tenui, denticulata tamen, marginatis.

Brazil.

Bot. Reg. XXX. 1844. Misc. 40:

Foliis oblongo-lanceolatis multiplicatis racemo compacto longioribus, perianthiis subpatentibus, labello galeato apice incurvo; lateribus denticulatis.

Flowers small, green, whole coloured.

9. CATASETUM HOOKERI Lindl. Bot. Reg. 840. Coll. Bot. tab. 40:

Racemo foliis trinervibus altiore, labelli lobo medio incurvo retuso; lateralibus erectis dentatis, sepalis ovalibus acutis nervosis in globum conniventibus.

Obs. Equidem plantam non noveram, nec unquam intellexi ex descriptione Lindleyana. In specimine libri citati, Coll. Bot., quod Dresdae exstat in Bibliotheca regis Frederici Augusti, tabulam 40 non reperi. Ex cl. Lindl. (Bot. Reg. XXX. Misc. pag. 34.) *Catasetum globiflorum* Hook., pulchre illustratum in Bot. Mag. 68. 3942. esset prope idem: „Much like *C. Hookeri*, and perhaps a variety of it.“ Inde mihi numquam in mentem venit, hanc cum *C. semiaperto* criticam. Inde ipsissimam plantam ipse denuo sub nomine *C. tristis* descripsi. Ceterum moneo, me iconem *Cataseti puri* authenticam non vidisse.

Huc: *Catasetum triste* Rehb. fl. Bonpl. III. 218: *C. Hookeri* b, *triste* Rehb. fl. Mss.:

aff. *C. semiaperto* Hook. labello depresso, calceiformi, trilobo, lobis lateralibus basi altissime semicordata gynostemium humile amplexantibus, omnino integerrimis, lobo medio abbreviato erecto humillime transverse subquadrato, medio emarginato sinum panduratum inter lobos laterales a basi claudente, androclinii apice brevissimo.

Racemus quinqueflorus. Bractee squamaeformes minutae. Sepala oblonga apiculata. Tepala subaequalia basi cuneata, medio dilatata. Gynostemii brevissimi triangulum anticum in androclinio atrosanguineum. Aus Mexico von Herrn Consul Schiller eingeführt.

Obs. *Catasetum Milleri* Loddig. Cf. Bot. Reg. XXIV. 1838. Misc. 149:

Under this name given is compliment to Dr. Miller of H. M. ship Victory, a most zealous collector of rare plants, Mr. Loddiges has distinguished a *Catasetum* from Brazil, with a stem 2' high, and dull purple spotted flowers with a half green lip, but otherwise very like *C. semiapertum*.

10? CATASETUM VIOLASCENS Rehb. fl. v. Warscew. Bonpl. II. 97:

aff. *C. Russeliano* racemo secundo, sepalis tepalisque lanceolatis acutis, labello trilobo, lobis basalibus rotundatis erectis supra calcar conico saccatum, lobo medio ligulato acuto, toto limbo denticulato.

Blüthen verwaschen violett, Lippe innerlich gelb. Cordilleren bei Huancabamba. v. Warscewicz.

11. CATASETUM ATRATUM Lindl. Bot. Reg. 1838. XXIV. Misc. 114:

Racemo decurvo, sepalis petalisque patentibus ovatis acutis, labello carnoso cucullato margine tenui pectinato apice rotundato deflexo crasso denticulato.

A curious dark-flowered species obtained from Brazil by Mr. Loddiges.

Bot. Reg. 1838. XXIV. T. 63: Had this been known when the now abolished genus *Myanthus* was proposed, that error would not have been committed, for the species is neither exactly a *Myanthus*, nor exactly a *Catasetum*.

Bot. Reg. XXX. 1844. Misc. 40: Flowers deep green outside; sepals rich purple inside; petals spotted with the same colour; lip dull green; fringed, with a yellow recurved flap at the end.

12. CATASETUM PLANICEPS Lindl. Bot. Reg. 1843. XXIX. 9:

Sepalis petalisque ovatis conniventibus, labello carnoso galeato rotundato, compresso, apiculato indiviso margine serrato.

Spanish Main. Loddiges.

Huc: *Catasetum recurvatum* Lk. Kl. Otto Ic. pr. II. 105. t. 42. Guiana: Orinoco Villa Upató.

13. CATASETUM PORIFERUM Lindl. Bot. Reg. 1838. XXIV. Misc. 164:

Labello plano cordato ovato truncato crenato, lobo apicis elevato carnoso, ovato, medio nectarifero dente baseos ovato incurvo, columna cirrhosa.

Demerara. Schomburgk. Loddiges. General appearance, growth of *Catasetum deltoideum* like which its flowers are richly spotted with deep purple broken fasciae, closely arranged upon a clear green ground. The difference between these two species resides in the lip, which in the present is dull green, nearly flat, deeply cordate, truncate at the apex, with an obscurely crenated margin, at its base is an elevated yellow tipped broad tooth, and at its apex an ovate, yellow, fleshy, elevated lobe, in the middle of which is a pore secreting honey. The sepals are oblong, the petals narrow lanceolate, the column just as in *C. deltoideum*.

14. CATASETUM CALLOSUM Lindl. Bot. Reg. 1840. XXVI. Misc. 183:

Petalis concoloribus lineari-lanceolatis, sepalo dorsali conformi suppositis, labello ovato-oblongo obtuso basin versus saccato supra saccum callo magno (aurantiaco) instructo margine obsolete crenato, columnae acuminatae cirrhis vix ultra callum extensis.

Habit of *Catasetum tridentatum* var. *floribundum*, flowers quite diff. Petals and sepals of a dull reddish brown, without spots; the column is of the same colour, which may perhaps be best compared to that of old spoiled port wine. Lip green, flat, with a yellow tubercle near the base above the hollow, and a stain of the same colour near the apex. La Guayra (no 553) Loddiges.

Huc: *C. Lansbergii* Lindl. Paxt. Fl. G. I. 156. (Rchb. fl. in Walp. Ann. I. 782):

A terrestrial stove Orchid from Caracas, with a long ovate raceme, of 14—20 green and purple flowers. Leyden. Very nearly the same as *C. callosum*, from which it differs in the flowers being green, spotted with purple, and whole coloured. It can scarcely be a distinct species.

Catasetum callosum var. *crenatum* Regel Gartenfl. V. 275.

Rchb. fl. Bonpl. II. 19. Caracas. 4500—5000. Juli bis November. Wägener.

15. CATASETUM TRULLA Lindl. Bot. Reg. 1840. XXVI. Misc. 176. XXVII. Tab. 34:

Sepalis petalisque patentibus ovalibus planis, labello late ovato acuminato obtuso subcordato concavo fimbriato apice laevi, columna brevi cirrhata.

Flowers about 30 in a spike, with a brown stain upon the lip. Very distinct. Comm. by Mr. Rigby of the Stanhope Nursery, old Brompton.

Perigonium viride, labellum medio brunneum basi albidum.

Trop. America.

Huc: *Cypripedium Socco* Fl. Flum. IX. 65.

16. CATASETUM FIMBRIATUM Lindl. Paxt. Fl. G. I. 124. Xyl. 84. (*Myanthus fimbriatus* Morr. Ann. Gand. 231):

Racemo cernuo multifloro, sepalis petalisque linearibus acuminatis, lateribus longioribus, labello plano cordato membranaceo dentato vel basi saccato conico, dente prominente in discum.

Habit of *Catasetum cernuum*. It is said to have obtained an extra gold medal at the national Hort. Exhib. at Brussels 1848, when „pendant trois jours plus de 100000 yeux se fixèrent sur cette étrange et admirable gynandre, dont le parfum embaumait la salle“. — In this country people would have hardly remarked it.

Two varieties: green and white; rose and yellow.

17. CATASETUM TRIODON Rehb. fl. in Otto Hamb. Gartenztg. 1857. 313.

18. CATASETUM DELTOIDEUM Lindl. B. Reg. XXVII. 1840. Misc. 157. Huc: *Myanthus deltoideus* Lindl. B. Reg. 1896:

Labello imberbi sagittato triangulari, angulis posticis rotundatis apice dilatato calloso margine recurvo basi tuberculato.

British Guiana. — Hook, Bot. Mag. 3923. Sepala et tepala viridia brunneo guttata. Labellum disco viride, violaceo maculatum, lobi laterales violacei.

19. CATASETUM LANCIFERUM Lindl. Bot. Reg. XXVII. 1841. 5. fig. 5:

Petalis maculatis linearilanceolatis sepalo dorsali conformi suppositis, labello subcordato ovato fimbriato basin versus saccato sub sacco cornu tripartito instructo, sub apice lamina lineari-lanceolata aucto, columnae cirrhis vix columna longioribus.

A Brazilian species, for which I am indebted to the Hon. and Very Rev. Wm. Herbert. Coll. by Gardner in Brazil. Var. of *barbatum*, but very different in its lip.

Sepalum supremum et tepala rosea, sepala lateralia violacea, columna albidovirens, labellum albidum, medio flavum.

Bot. Reg. XXX. 1844. Misc. 40. Very like *C. cristatum*, but the margin only of the lip is broken up into fringes; and at the point is a broad lancet-shaped spine.

20. CATASETUM (MYANTHUS) CORNUTUM Lindl. Bot. Reg. XXVI. Misc. 182. XXVII. 5. fig. 2:

Petalis maculatis lineari-lanceolatis, sepalo dorsali conformi suppositis, labello subcordato ovato basin versus saccato supra saccum cornu valido inflexo instructo, processibus teretibus rigidis fimbriato, basi dentato, columnae acuminatae cirrhis cornu labelli attingentibus.

Demerara. With the habit of *Catasetum barbatum*, 16 and more flowers in a raceme of dull green, richly spotted with deep blackish purple. The lip is light green, spotted with the same dark colour; above the base it is hollowed out; above the hollow it is furnished with a strong inflexed white horn, which rises from a somewhat rugged base; and the margin is broken up into slender stiff processes, which are evidently an incomplete state of the fringes found on the lip of *Catasetum cristatum*, *barbatum*.

21. CATASETUM CRISTATUM Lindl. Bot. Reg. t. 966. B. R. XXX. Misc. 40:

Foliis oblongo lanceolatis, perianthiis explanatis, sepalo supremo petalisque conniventibus, labello fimbriato cristatoque expanso cristae pilis crassis lucidis compressis obtusissimis emarginatisque simplicibus.

Brazil.

Both this and the last (*barbatum*) have a strong smell of Tarragon; they are probably varieties from each other.

Monstrous State. — Has been found to sport into *C. tridentatum*; see B. R. 1951.

22. CATASETUM BARBATUM Lindl. B. Reg. XXX. 1841. Misc. 44:

Petalis versus apicem serratis, labelli infra medium saccati margine pilis tenuibus succulentis albis longe fimbriato apice anguste attenuato recurvo supra ad basin spina tripartita, infra apicem spina magna dentata porrecta, cristae pilis opacis subulatis apice saepe bifidis per paria tria quatuorve basi connatis.

Brazil. Demerara.

Sepals and petals narrow, green, blotched with purple. Lip green or pink, with narrow delicate fibres arising from its margin. No doubt the supposed species quoted above are mere varieties of the same natural form.

Huc: *Myanthus barbatus* Lindl. B. Reg. 4778. *Myanthus barbatus* v. *labello albo* Hook. B. Mag. 3514. — *Catasetum spinosum* Lindl. B. Reg. XXIV. Misc. 136. *Myanthus spinosus* Hook. B. Mag. 3802.

var. *proboscideum* Lindl. Bot. Reg. 1841. XXVII, 5. f. 3: I confess my inability upon a formal examination of it, to distinguish it specifically from *C. barbatum*. It is a different looking plant, owing to the beard of the lip being green and not pink.

Huc: *Catasetum proboscideum* Lindl. Bot. Reg. 1839. XXV. 140:

Labello deflexo multifido; laciniis filiformibus laceris; columna apice proboscidiiformi: cirrhis deflexis columna longioribus.

Georg Wailes Esq. of New-Castle, who received it from Mr. Gardner, marked „Nr. 2, new, found growing on a small species of Palm, near Sertao“. The plant is nearly related to *Catasetum cornutum* and *barbatum*, from which its deeply lacerated lip, and the longer proboscis of the column, seem to distinguish it; it may however be a mere var. of the latter species, like *C. trifidum* in growth.

23. CATASETUM CERNUUM. Huc: *Myanthus cernuus* Lindl. Bot. Reg. XX. 1835. 1721:

Racemis elongatis cernuis, multifloris, sepalis petalisque lanceolatis convergentibus, labello transverso plano alte trifido, lacinia intermedia minore.

Brazil. Trinidad.

Flowers green with a few purple spots.

Huc: *Catasetum trifidum* Hook. Bot. Mag. 3262:

Floribus maculatis, petalis duobus cum sepalo supremo conniventibus, labello patentissimo plano trifido, segmentis lateralibus acuminatis, intermedio crasso obtuso brevioribus.

Perigonium viride, brunneo punctulatum.

Glasgow Bot. Grd. is indebted to Mr. Lockhart for that species, who sent the living plant from Trinidad.

24. CATASETUM BICOLOR Klotzsch in Otto und Dietrich Gartenz, 1854. 337:

Pseudobulbis fusiformibus articulatis foliosis; foliis amplexicaulibus elongatis acuminatis plicatis cum vaginae attenuatae apice articulatis; racemo laxifloro pendulo basilari brevipedunculato pallide-viridi; pedicellis germinibusque sanguineo-purpureis nitidis patentibus; perigonii foliis pallide purpurascensibus angustis acutis, exterioribus campanulatis incurvis, extus convexis, intus concavis, interioribus latoribus lanceolatis divaricatim subrecurvis planis; labello cyathiformi galeato parvo nudo, extus candido, intus versus marginem roseo-punctato trilobo, lobis lateralibus elongatis obtusiusculis erectis, medio profunde-

tridentato, dentibus erectis acutis; columna pallide purpurea rostrata, basi bicirrhosa; anthera lutea.

Rchb. fl. Bonpl. III. 218:

Flore Cataseti callosi, labello tamen minuto conico saccato ante basin utrinque revoluta, limbo inaequaliter quinquedentato; ima basi utriusque antrorsum unicornuto.

Blüthenhülle rothbraun mit Stich ins Olivengrüne. Lippe $\frac{1}{2}$ Zoll lang, weiss, purpurn gesäumt; am Grunde und innerseits auf den obern Zähnen fein purpurn querstreifig. Auch die zwei kleineren, nach vorn gerichteten Hörnchen am Grunde der Lippe purpurn bandirt. Wir erhielten diese kleine Curiosität gleichzeitig mit dem Hrn. Autor und erkannten sie ebenfalls als neu. Sollte sie — worauf man bei fast jedem Catasetum gefasst sein muss — eine Form einer bekannten Art sein, so könnte sie sich als Hemmungsbildung mit kappiger Lippe des *Catasetum trifidum* Hook. (*Myanthus cernuus* Bot. Reg. 1121) erweisen. Die Lippe hat ähnliche Elemente. Von Hrn. v. Warszewicz 1853 eingesendet.

25. CATASETUM NASO Lindl. Bot. Reg. XXIX. 1843. Misc. 111:

Spica brevi erecta, sepalis oblongo lanceolatis complicatis petalisque lanceolatis ascendentibus aequalibus, labello hemisphaerico apice abrupte in appendicem carnosam ovatam obtusam producta, marginibus basi tenuibus laceris amplexicolumnibus, linea intramarginali carnosa inflexa connivente aperturam cordiformem efficiente, columna bicirrhosa.

Caracas. Linden. Received by Rucker.

Alabastrum might be mistaken for *C. tridentatum*. Sepals and petals very pale dull green outside, are slightly pink inside, richly spotted in irregular bars, with a deep crimson purple. Lip viewed from the side has a hemispherical form, green, except at the base, where it is extended into a black-purple lacerated margin embracing the column, and at the point, where it is extended into a long flat horn or nose. Seen in front it is wholly of the same rich black purple and looks as if it were a solid hemisphere pierced in the middle with a large heart-shaped hole, but this appearance is owing to a thick fleshy rim, which rises from within the true edges of the lip, and directing itself inwards horizontally with an uneven outline, at last touches in front of the column, and produces the appearance of a junction. Flowers have no smell.

26. CATASETUM SANGUINEUM Lindl. Paxt. Fl. G. II. p. 168. n. 445. Xyl. 225.

Sepalis petalisque oblongis acutis secundis, labello carnosio subrotundo rostrato serrato et lacero basi fimbriato fovea alta triangulari in medio.

„Pseudobulbs 6—7". Light glaucous leaves. Flowers in a close raceme not at all handsome. Differs from *Catasetum saccatum* in having much smaller flowers, with sepals and petals turned upwards, the lip more lacerated, than fringed, except quite at the base, and the opening of the pouch triangular without ribs instead of being crescent-shaped with very conspicuous elevations on the side and next the base, — *Myanthus sanguineus* Linden. Greenish flowers, speckled with brown or dull red.

Pescatorea t. 14. — Huc: Hook. B. M. LXXX. 4792. „*Catasetum Naso* var.“

27. CATASETUM SACCATUM Lindl. Bot. Reg. XXVI. 1840. Misc. 179:

Sepalis lanceolatis patentibus dorsali petalisque fornicatis, labello subrotundo abrupte acuminato fimbriato medio saccato; ostio contracto reniformi postice dentato, columna cirrhata.

Most extraordinary! It has very large flowers, with rich purple spotted sepals and petals, and a bright yellow lip covered closely with crimson dots. The latter is

pierced in the middle by a narrow aperture, which leads into a conical chamber or bag, which is not observed till the back of the lip is turned up. Lodd. obtained it from Guayana.

Lindl. *Sert. Orchidaceum* 1841. tab. 41: Foliage as in others. Flower stems 12—15' high, 7—8 flowered. Flowers full 4" diam: at first erect, bent down towards the point. Sepals lanceolate equal, spreading, inside deep purple, spotted with yellow, outside tinged with yellow. Petals of the same form and nearly the same size, but are thinner in texture, more spotted with yellow, and at first form an arch over the column, but after the flower has been for some time expanded, they spread back even more than the dorsal sepal. The lip is of a most irregular form and rich yellow, thickly sprinkled with crimson dots; in form it is roundish ovate, with a contraction on each side, and a gradual tapering to the point; all round it is bordered by long fringes; in the middle is a callous perforation, kidney shaped in front, slightly lobed and warted at the back; this perforation opens into a small bag-shaped chamber, which projects below the underside of the lip. At first the lip is flat; but it soon turns back at the point, so that at last it is bent in the middle at almost a right angle and hides the conical chamber already described.

Huc: *Catasetum (Myanthus) incurvum* Klotzsch in Otto und Dietrich Allg. Gartzg. 1854. 178:

Pseudobulbis magnis cylindricis fusiformibus articulatis, foliis . . . , racemo paucifloro pseudobulbum paululum superante, perigonii foliolis exterioribus patentibus incurvis virescentibus fuscis anguste lanceolatis acuminatis, margine involutis, interioribus brevioribus viridi purpurascensibus strictis erectis, margine recurvis; labello saccato ovato acuminato flavoviridi, infra apicem obsolete bilobo, antice purpureo maculato, marginibus lateralibus acute dentatis magis deflexis; columnae cirrhivix columna longioribus.

Peru. Warscewicz. Matthieu.

Es leidet keinen Zweifel, dass die Blütenform, namentlich die Form des Labeliums, so sehr von der aller übrigen Arten abweicht, dass die Aufstellung einer neuen Species, die im System zwischen *Catasetum saccatum* und *Catasetum callosum* zu stehen kommt, durchaus gerechtfertigt erscheint.

Huc: *Catasetum incurvum* Klotzsch Gard. Chronicle 1855. 4. c. Xyl.:

Whether it is a monster, as it well may be, or merely a gigantic form of *C. saccatum* itself, we are unable to say. No one indeed in the present state of knowledge can pretend to form a positive opinion as to what are natural, what monstrous, what permanent, what accidental states of the genus *Catasetum*. The best service that can in the meanwhile be rendered to science, is to publish figures of the flowers of as many forms, larvae, species, or whatever they may prove to be as appear to be different from each other.

Lord Bishop of Winchester. v. Warscewicz.

28. CATASETUM TABULARE Lindl. Bot. Reg. XXX. 1840. Misc. 40. pag. 35:

Vegetatione, sepalis petalisque omnino C. laminati, labello oblongo antice concavo basi cornuto fimbriato extus sub apice lineis serrulatis elevatis striato secus medium crista tabulari lata transversa corrugata antice dentata aucto.

Granada.

This is very like the Guatemala *C. laminatum*, but the structure of the lip is different. In place of the thin knife-like crest of that species, there is a broad raised oblong fleshy table of a yellowish brown colour, closely wrinkled across and broken up into asperities, which, at the front of the table where it forms a kind of cliff above the lip are extended into strong teeth. On the outside of the lip near the point

the veins are raised and somewhat toothed. The colour and size of the flowers are much the same as in *C. laminatum*.

29. CATASETUM LAMINATUM Lindl. Ann. Nat. Hist. IV. 1840. 384. Bot. Reg. XXX. 1844. Misc. 40:

Labello lanceolato basi saccato apice marginibusque incurvo basin versus fimbriato, per axin lamella unica carnosa alta integra vel denticulata, basi biloba instructo, columna cirrhata.

Mexico.

Flowers spread open, large, purple, or greenish spotted with that colour. Lip sometimes pure white, sometimes speckled with purple, with a deep plate running along its middle from end to end.

Lindl. Sert. (1840) tab. 38:

Var. 1. maculatum: labello, columna petalisque purpureo-fusco maculatis.

Var. 2. eburneum: labello eburneo columna petalisque immaculatis.

Inflorescence: nodding, many flowered raceme, proceeding from the base of the pseudobulb. Sepals narrowly lanceolate and acuminate, of a greenish purple colour, which varies in intensity in different specimens; the uppermost is pressed close to the petals, the two side ones are turned back till they touch each other. Petals are thin, pale pink, stained with dull purple, rather broader than the upper sepal, with which they are parallel, so as to form a kind of arch over the column, but not touching it; sometimes however they separate and fall backwards towards the lateral sepals or simply spread away from the column: such was the case in the original of the drawing so that it has at one time parts of the abolished genus *Myanthus* and at another a disposition peculiar to itself. Lip of a new form to this genus. Lanceolate outline hollowed at its base into a deep pouch; edges and point curved inwards along the margin, towards the base it is bordered by a fine fringe of slender hairs. From the front edge of the pouch to nearly the apex is carried a fleshy plate, planted perpendicularly upon the lip and from 4—5 lines deep, which, next the pouch, divides into 2 lobes, but otherwise is perfectly entire except on the upper edge, which in some varieties is unequally toothed. Colour in the figured pale greenish pink, spotted with dull but deep purple, in a plant of Horticultural Society Garden ivory white eventually changing to cream colour. Column is spotted in the variety, with a spotted lip, nearly plain in that with the white lip. Found but by Karwinski and Hartweg near Oaxaca.

Lindl. in Benth. Pl. Hartweg. 72: in montibus Tuquila Mexici. Hartweg.

Catasetum laminatum var. *eburneum*: Bot. Reg. XXVII. (1841) 5, fig. 4.

II. *Monachanthus*: columna ecirrhata, saepe antice angulata.

(*Monachanthus* Lindl. Bot. Reg. 1538.)

30. CATASETUM RUSSELIANUM Hook. Bot. Mag. 3777. (N. S. XIII.) 1840:

Pseudobulbo elliptico magno, foliis lato lanceolatis, racemo amplo, labello submembranaceo antice inflato ore contracto margine anteriore producto undulato fimbriato disco membrana cristato, columna nuda (ecirrhosa).

Woburn Abbey: sent on the day of the death of the possessor of that beautiful Garden.—Guatemala 38. Skinner.

Perianthium viride labello albovirente.

31. CATASETUM LONGIFOLIUM Lindl. Bot. Reg. XXV. 1839. Misc. 154:

Foliis longissimis gramineis, racemo cylindraceo pendulo multifloro, sepalis ovatis subrotundis petalorum conformium dorso applicitis, labello urceolari a tergo incurvo limbo truncato apiculato intus cereaceo glabro margine fimbriato.

Demerara. Henry Gloster. It is known as „the long leaved Catasetum, which never flowers.“ It has however at last yielded to the good management of Valentine Morris Esq. of the Retreat, Battersea, where it has produced its blossoms abundantly. The flowers are bright orange, a little bordered with violet, and appear in a drooping raceme, over which they are closely packed for the length of a foot or more; they are extremely beautiful and the species is beyond all comparison the handsomest of the genus.

Lindl. Sert. tab. 31: „In the Camuni Creek, a tributary of the river Demerara; afterwards frequently at the low and marshy ground of the rivers Wironi and Wicki, tributaries of the river Berbice, where the Mauritia Palm is so numerous, that it occupies large tracts exclusively. 6—8' leaves. Macusi call it Massamug Warraus Ohitryon.“ Schomburgk. — Leaves weak, 3ribbed, grassy, hang down from the Palms. Raceme 1' foot long, from the base of the pseudobulbs, 20—30 flowered. Sepals and petals shaped and coloured alike; roundish, tapering at the point, where they are stained with purple, otherwise green. Sepals twisted in such a manner, as to be placed exactly at the back of the petals. Labellum very fleshy, cupshaped, rather bag-shaped, curved backwards at its end, firm, fleshy, about 1" diam. at the brim, deep orange running into crimson at the edge, a little rugged on the outside, smooth and waxy in the inside. Column very short, slightly extended in front into two short horns but destitute of cirrhi; at the back it terminates in a rounded manner at the line of origin of the anther. Huc: B. M. 3819.

32. CATASETUM DISCOLOR Lindl. B. Reg. XXX. 1844. pg. 34:

Racemo laxo multifloro, labello hemisphaerico marginibus planis medio fimbriatis.

Flowers in a loose erect raceme, dull pale purple, with the inside of the lip yellow. *Monachanthus discolor* Lindl. Bot. Reg. 1735. *Monachanthus discolor* β . *viridiflorus* Hook. Bot. Mag. 3601. Idem γ . *Bushnani* Hook. l. c. fig. A. *M. Bushnani* Hook. B. M. 3832. — *Monachanthus fimbriatus* Gardn. B. M. 3708: labello longissime fimbriato intus pubescente. — Dry sandy banks beneath the shade and some low shrubs, beyond the village of Apitucas, about two miles from Pernambuco.

33. CATASETUM ROSEOALBUM Hook. B. M. t. 3796. (*Monachanthus roseoalbus*; it might with greater propriety be called *Catasetum* sect. *Monachanthus*):

Labello triangulari acutissimo concavo hemisphaerico (non ventricoso) intus pubescente margine basi longissime ciliato. Para.

Obs. A cl. Lindley in B. Reg. XXX. l. c. sub *C. discolori* citatur. Retinui ob variam labelli basin et maxime ob tepala serrulata. Rehb. fil.

34. CATASETUM WARSCIEWICZII Lindl. Paxt. Fl. G. I. 45. n. 74. c. Xyl. 29. Cf. Walp. III. 545. As a species it is perfectly distinct from all others. The flowers, which grow in close pendulous racemes, consist of roundish ovate sepals and petals, and a helmeted lip, which spreads in two diverging fringed halves. They are pale green with bright emerald green veins and though not gaudy, are extremely petty. Fragrant.

35. CATASETUM FULIGINOSUM Lindl. Bot. Reg. XXVII. 1841. Misc. 168:

C. tridentati vultu, sepalis petalisque oblongis acutis reflexis, labello cucullato carnosissimo integerrimo vel minute serrulato patente, columna brevi ecirrhosa apice in setam producta, anthera parva (effoeta?).

Flowers at Sion in the possession of His Grace the Duke of Northumberland. Habit of *C. tridentatum*, but its flowers are in a dense erect raceme, and of a deep green colour, spotted with a dull blackish purple so as to look as if they were soiled with soot. Sepals and petals are spotted, oblong, acute and reflexed, so as to hang downwards. The lip on the other hand is fleshy, hooded, stained with pale purple, and either entire at the margin, or very slightly serrated; but it does not cover over the column as is usual in the hooded *Cataseta*, on the contrary it spreads away at almost right angles. The column itself is short, deep green, and produced at the point into a straight bristle in front of which is placed a small and imperfect anther. In this mesquine genus it is impossible to say, what is a species and what is not. Judging from the evidence we possess concerning *C. tridentatum*, *cristatum*, and *viride*, we should suspect it to be a male form of *C. atratum*, or some such species. That however must remain for future enquiry.

36. *MONACHANTHUS VIRIDIS* Lindl. B. Reg. XXI. 1836. 1752 :

Racemo multifloro, labello oblongo cuspidato margine laevi, sepalis petalisque rigidis ovatis.

Flores carnosae herbaceae, labelli margine vitellino. Sepala ovata, acuta, rigida. petalis parallela. Petala conformia, sed latiora et maculis quibusdam purpureis obscuris notata. Labellum posticum ventricosum, carnosum, 1½ pollices longum, ore oblique laevi cuspidato. Columna brevis, ovata, carnosae, mutica. Planta facie omnino *C. tridentati*, quo foliis et caule tantum convenit ut floribus ablatis eandem diceret.

Brazil upon the trees of Corcovado.

Huc: *Cypripedium colthurnum* (Vellozo) Arrab. Flum. IX. 63.

De heteranthis *Catasetis*.

Jam anno 1852 in dissertatione „de pollinis Orchidearum generi“ casus quosdam atulicæ de heteranthis *Catasetis*. Tamen nullo modo garrulorum istorum instar rem explicare ausus sum.

Res primum innotuit cl. Lindley: Bot. Reg. XII. fol. 966. 1826. Aprili: „The unimportance of the peculiarity, which exists in the labellum (namely its flattened, or fringed, and crested state) is manifested in a singular manner by a curious monster of this plant, which we have observed on an individual in the Horticultural Society's garden. Among flowers of the ordinary structure two or three were observed, in which the labellum was precisely of the same nature as that of *Catasetum tridentatum*; that is to say, destitute of the crested appendage, and perfectly galeate and naked.

Lindl. Bot. Reg. XXIII. 1951* (1837): Racemus floribus 16; quorum 7 *Myanthis cristati*, reliqui *Monachanthi*. „*Monachanthi* et *Myanthis* proles biformis.“ „The monster sent by his Grace the Duke of Devonshire was produced on a plant of *Myanthis cristatus*, which also produced a perfect spike of *Myanthis cristatus* at the same time; the same plant has flowered twice before, but did not sport: a high state of cultivation appears to favour the production of monsters of this kind. There are more than twenty plants of *Myanthis barbatus* at Chatsworth, which are almost all different in colour, but none of them have yet sported; there are also at least twenty plants of *Monachanthus discolor*, which keep true. Mr. Hillhouse (a gentleman residing a Demerara), has informed the Duke of Devonshire, that a flower spike of *Catasetum* often has on it several distinct kinds of flowers.“

To make the reader more distinctly aware of the changes that the flowers of this specimen exhibit, I will describe one of those of the species in its ordinary state. It has narrow, ovate, lanceolate, green sepals, of which the two lateral ones are placed obliquely on each side of the lip; the petals are narrow, spotted with red, and placed almost in front of the upper sepal; the lip is a narrow, flattish, fleshy

body, having a sacco conical depression (fig. 4c.) in its middle, a large, curved, white, fleshy horn (fig. 4) projecting forwards from its base, and a row of stiff, fleshy teeth standing up all round the edge. The column has a long horn rising up from its back, and forming a narrow bed for the anther, while two other horns or cirrhi (fig. 4 a.) hanging downwards over the lip.

In other flowers, which may be said to exhibit the extreme of difference, the sepals and petals are all equally spotless, of the same short, ovate, obtuse figure, and spread equally round the column; the lip is a fleshy hood-like, or helmet-like, greenish yellow body, a little turned back at the point, entirely without sac, horns or marginal teeth and standing erect, so as to overshadow the column. The column itself has an exceedingly short horn at the back, and no cirrhi in front. I think I may safely say, that until these two sorts of flowers had been seen on the racemes, no Oedipus could have guessed them to belong to either the same species or even genus. — The way in which they pass into each other is sufficiently curious, as far as regards the lip. All the fringe like teeth of this organ disappear, except a few at the base on one side (fig. 3. a), the curved horn shortens (fig. 3 b.), and the remainder contracts about the sac, which widens and deepens till the commencement of a helmet is shadowed out. In another case all the fringes disappear except a few minute bristles (fig. 1. a.), the lateral cirrhi are not formed, the curved horn is wanting, and the helmet-like form in the lip is completed. All these transitions were perfectly shewn in these in the Duke of Devonshire's specimen, and have been faithfully copied by Miss Drake. On the same specimen was also a case of a flower with two lips, as is represented at fig. 2. — The necessary consequence of this is, that the supposed genera *Myanthus* and *Monachanthus* must be restored to *Catasetum*, and I have no doubt now, although no proof has been seen of it, that *Mormodes* must share the same fate. But which of the species have their masks on, and which shew their real faces I certainly will not at present presume to guess. — Mr. Schomburgk has lately sent to the Linnaean Society, from Demerara, a specimen of another *Monachanthus*, sporting to a crested *Myanthus*, of which, I presume, some account will in due time be published. And I am acquainted with the following example of this tendency in a very different genus. — In August 1836, Mr. Willmer, of Oldfield, near Birmingham, sent me a specimen of a *Cynoches*, which had broad petals, a short column, hooded and dilated at the apex, and a broad roundish lip, gibbous at the base, and with its stalk much shorter than the column. It was, however, destitute of scent, while *Cynoches Loddigesii* has, as is well known, a delicious odour of Vanilla. I had no doubt of its being a distinct species, and called it *C. cucullata*. But in the autumn of 1836, in the garden of the Horticultural Society, a plant of *Cynoches* produced from the opposite sides of the same stem two racemes; those of one raceme were the wellknown fragrant flowers of *Cynoches Loddigesii*, and of the other the scentless flowers of the new *C. cucullata*.

Hook. Ic. H. Tab. CLXXVII. (1837.) *Catasetum cristatum* var. *monstruosum* :

In regard to the present singular monstrosity some information respecting it was many months back comm. to me by Dr. Schomburgk from Demerara and the specimen was sent to Dr. Brown in London. Shortly after my friend and former pupil, Dr. Nimono favoured me with the plant here figured, preserved in spirits. In the meanwhile a fine specimen flowered at Sion House, which Prof. Lindley figured in Bot. Reg.

Lindl. Bot. Reg. XXIV. 1838. sub Tab. 63: *Catasetum* :

There is a circumstance observed by Mr. Schomburgk in a connection with them, which is very curious and deserves to be recorded. In a letter I received from him some time since, he says, alluding to *Monachanthus* „are you aware, that *Catasetum* and *Myanthus* are not seed-bearing, but that *Monachanthus* bears seed abundantly?“ I do not know, what conclusion to draw from this statement, but it would be a most curious fact, if, as Mr. S. observations would appear to imply, the species of *Catasetum* and *Myanthus* should prove to be sterile states of *Monachanthus*.

Lindl. Bot. Reg. XXVII. 1840. Misc. 157: *Catasetum deltoideum* Lindl.

A new case of this kind of variations previously unheard of and unsuspected in the vegetable kingdom, has been observed by Mr. Dunsford, who has brought me a scape of *Catasetum deltoideum* fig. at 1896 of this work in a similar state of alteration. The scape itself has become 3 times as stout as usual, the length of the raceme is much reduced, the sepals and petals retain their form and colour; but the labellum instead of being arrow-headed, flat, deep purple, toothed at the base, and placed in front of the flower, has become of exactly the same form as that of *Monachanthus viridis*, hooded, undivided, and of a dull greenish colour tinged with dull purple. The column too, has in like manner lost its cirrhi, has shortened, and its lengthened beak has also disappeared.

Obs. Ad haec addo, monstrosa *Cataseta* me saepius vidisse. Ipse possideo pulchrum specimen *Cataseti* Oerstedii mixtis floribus *Monachanthi*. Labella hujus non adeo saccato galeata, uti vulgo solent, sed dilatato saccata, subretusa. — Pulchrum specimen vivum obtinui ex Wildpark bei Potsdam anno 1857 et teneo siccum ac depictum. Racemus biflorus alterum florem tenet *Cataseti* sanguinei paulo monstrosum; alterum *Monachanthi*. Hic tamen etiam labelli limbo pulchre replicato, apiculato, basi serrulato, sacco basi dilatato recedit. — *Cataseti* callosi flores plurimum ludunt et typos valde diversos offerunt. Rehb. fil.

Obs. 1. *Catasetum Pescatoreanum* Lindl. sp. n. Gard. Chron. 1850. p. 162. Quid?

Obs. 2. Moneo in specimine libri Bot. Reg. universitatis Lipsiensis, iconem prolis biformis *Monachanthi* et *Myanthis* cristati non numero 1951*, sed numero 1947 esse signatam.

Obs. 3. Quid sit „*Catasetum viride*,“ quod ill. Lindley affert sub *Cataseto* fuliginoso (cf. p. nostram 575, lin. antepenultimam), nescio. Forsan *Monachanthus viridis*? Rehb. fil.

MORMODES Lindl.

Nat. Syst. Bot. 2. 446. — Bot. Reg. XXII. (1836). 1864. — Bot. Reg. XXIX. (1843.) Nota sub 33.

Sepalum superius fornicatum angustum; lateralia conformia reflexa. Petala latiora conformia, erecta. Labellum sellaeforme, ascendens, trilobatum, subcuneatum, apiculatum, cum columna articulatam. Columna semiteres, mutica; gynizus longe angustus; clinandrium postice acuminatum. Pollinia 4, per paria connata caudiculae crassae affixa, glandulae carnosae crassae adhaerenti.

Habitus *Cataseti*.

1. MORMODES LUXATUM Lindl. Bot. Reg. 1842. XXVIII. Misc. 66. — Bot. Reg. 1843 t. 33:

Foliis longissimis angustis subtus glaucis, racemo oblongo pluries longioribus, sepalis ovato-lanceolatis petalisque oblongis concavis margine subscariosis carnosus incurvis, labello hemisphaerico concavo obsolete trilobo apiculato, supra columnam cucullato, polliniorum caudicula apice cornuto tuberculata.

Mexico.

Flowers large, as much as 3½ inches in diam.; pale lemon colour, powerfully aromatic.

2. MORMODES AROMATICUM Lindl. Bot. Reg. XXVII. (1841.) Misc. 162. XXIX. (1843) 56:

Racemo brevi erecto, sepalis petalisque subrotundo ovatis acutis secundis concavis, labello anguste cuneato convexo lacinia intermedia triangulari acuminata cucullata. Mexico.

This has flowers with a pale pinkish ground sown thickly with dull wine red specks, and a powerful odor like that of aromatic vinegar. It differs from the *M. pardinum* in the small size of its flowers, and the very dissimilar form of the lip and floral envelopes.

Perigonium viridiflavum, atropurpureo guttatum.

Bot. Reg. XXVII. 1841. 162: Columnae dorso subulato.

I can hardly say, whether this is really distinct from *M. pardinum*, not having a specimen at hand for comparison.

3. MORMODES BUCCINATOR Lindl. in Bot. Reg. XXVI. 1840. Misc. 9:

Racemo stricto oblongo, sepalis lineari-oblongis, lateralibus reflexis, dorsali petalisque ovato lanceolatis erectis, labello unguiculato carnosissimo subrotundo cuneato apiculato utrinque emarginato lateribus in buccinae formam revolutis. Mexico.

Flowers pale green, with an ivory white lip, whose sides are so rolled back as to give it the appearance of a trumpet. The column is twisted some times to the right, sometimes to the left. The habit and general appearance of the flowers, except in colour, that of *M. atropurpureum*.

Bot. Reg. XXVII. 1841. Misc. 191: Mr. Lodd. obtained a variety from La Guayra, which with all the form of the original, has the flowers dull orange spotted with brown. Looks at first sight something like *M. aromaticum*.

L. Paxt. Fl. G. II. p. 59. N. 325: When this was first published nothing was known of its native country. At a later period it was said to be Mexican, upon some bad garden authority. We find it however with brown flowers among Schlims Venezuela plants; N. 67, gathered at San Cristobal at 2500 above the sea.

Huc: *Mormodes lentiginosa* Hook. Bot. Mag. 4455:

Pseudobulbis oblongis, foliis lanceolatis, striatis, scapo radicali racemoso, floribus remotis pendulis punctis infra fuscis irroratis, sepalis arcte reflexis oblongis acutis marginibus revolutis, petalis conformibus, labelli obovati lateribus revolutis, columna oblique torta apice acuminata. Central-America.

Huc: *Mormodes flavidum* Klotzsch Allg. Berl. Gztg. 1852. 10. April.

Pseudobulbis elongatis, articulatis, marginatis, versus apicem articulatum foliosis, racemo paucifloro, pedunculato, pseudobulbo altiore, floribus flavidis, erectis, pedicellatis, bracteis oblongis obtusis, aridis albicantibus instructis, perigonii foliolis lanceolato linearibus, acutis, flavidis, tribus exterioribus arcte reflexis, binis interioribus erectis, labello albido luteo, erecto incurvo, obovato, apiculato, integerrimo, lateribus deflexis, columna oblique torta acuminata. Warscewicz.

Huc: *Mormodes vitellina* Klotzsch Allg. Gartenztg. 1853. 294:

Pseudobulbis oblongis compressiusculis subincurvis sursum attenuatis, foliis striatis membranaceis oblongis acuminatis basi conduplicatis attenuatis 5nerviis, racemo 5pollicari 4—5floro, bracteis lanceolatis acutis sessilibus alutaceis membranaceis; perianthii foliolis vitellinoviridulis, exterioribus lanceolatis acutis angustioribus patenti incurvis, internis ovatis acutis semicirculatim incurvis, labello vitellino unguiculato late obcordato trapeziformi semicirculatim incurvo apiculato, marginibus lateralibus revolutis antice superneque minus apertis, inferne convolutis, columna oblique torta acuminata e flavido albescenti.

Caracas. Wagerer. Matthieu.

Huc: *Mormodes Wagneriana* Klotzsch Allg. Gartenztg. 1853. 147:

Pseudobulbis oblongis incurvis sursum attenuatoacutis, vaginis foliorum amplis im-

bricatis aridis membranaceis albidis fusciscenti marginatis, "deinde" evanescentibus vestitis; foliis . . . ; racemo subbrevis robusto, 2—3floro, basi incrassato; bracteis brevi ovatis subacutis albidis, inferioribus vaginatis, floribus e roseo sordide albidis erectis, perianthii foliolis patentibus incurvis sordide virescentibus cucullato acutis, externis lanceolatis angustioribus; labello late obcordato candido apiculato, versus basin attenuato, dilute roseo, apiculo et lateribus usque ad medium deflexis, anteriori recto truncato; columna oblique torta dilute rosea acuta. Caracas. Wagener.

Huc: *Mormodes brachystachya* Klotzsch Sem. H. Berol. 1852. p. 13:

Pseudobulbis oblongis sursum attenuatis, vaginis foliorum amplis semipellucidis membranaceis imbricatis aridis pallidis fuscomarginatis deinde evanescentibus vestitis; foliis . . . ; racemo brevi, robusto, 2—3floro; bracteis ovatis acutis roseis; floribus flavidoluteis, erectis, perianthii foliolis virescentiluteis apice subroseis cucullato acutis arcuatim incurvis, margine plus minusve recurvis, exterioribus obovato-lanceolatis angustioribus dorso carinatis, interioribus ovatis, apice obsolete carinatis; labello late obcordato, aureo, versus basin attenuato pallescenti, marginibus lateralibus revolutis, anteriori recto undulato; columna oblique torta, pallide lutescente, acuminata.

Venezuela. Wagener.

Huc: *Mormodes marmorca* Klotzsch Allg. Gtz. 1853. 290:

Pseudobulbis oblongis strictis subcompressiusculis sursum attenuatis; foliis oblongis membranaceis undulatis acuminatis quinquenerviis subplicatis, inferne attenuato-conduplicatis; racemis 6pollicaribus 4—5floris; bracteis ovatis acutis rubescentibus; perianthii foliolis rutilis lilacinopunctatis primum virescentibus, exterioribus oblongis acutis angustioribus reflexo incurvis, interioribus latioribus acutis semicirculatim incurvis, labello unguiculato latissime orbiculato reflexo apiculato carneo-albicante, supra sparsim et pallide rubro, punctato, subtus, praesertim in centro, saturate rubropunctato semicirculatim incurvo, marginibus late reflexis, inferne convolutis; columna carnea lilacino punctulata oblique torta acuminata.

Caracas. Wagener. Matthieu.

Huc: *Mormodes leucochila* Klotzsch Allg. Gtz. 1853. 289:

Pseudobulbis oblongis subcompressiusculis crassis, sursum attenuatis, vaginis foliorum amplis membranaceis imbricatis aridis e viridi albicanibus deinde evanescentibus vestitis; foliis striatis oblongis acuminatis membranaceis tricostatis tortilibus, basi attenuato conduplicatis, racemo quadripollicari 4—5floro; bracteis ovatis obtusiusculis sessilibus pallide viridibus, margine pellucidis; perigonii foliolis albido-viridibus, exterioribus angustioribus, obtusatis cucullatis brevissime acutis, magis recurvo inflexis, interioribus latioribus acutis incurvis; labello late obcordato unguiculato semicirculatim incurvo carnosio, coriaceo, brevi apiculato primum alutaceo, dein candido, marginibus lateralibus recte inflexis antice subtusque magis apertis; columna oblique torta candida acuminata.

Caracas. Wagener. Matthieu.

Rehb. fil. Bonpl. II. 19. Caracas. 4000'. November. Wagener. Blüten gelb, oder grünhüllig mit weisser Lippe, oder strohgelb mit rothen Punkten, oder grünlich, oder rotbraun: ich finde keine Unterscheidungsmerkmale für diese Dinge, von denen ich eine Anzahl wilde und zahllose cultivirte Inflorescenzen vorhatte.

Rehb. fil. in Bonpl. II. 381. Merida; San Cristobal. 4000'. Nr. 1193. Schlim.

4. MORMODES IGNEUM Lindl. Paxt. Fl. G. III. 93:

Racemo elongato multifloro, sepalis reflexis petalisque ascendentibus lanceolatis acutissimis planis, labello unguiculato carnosio apiculato lateralibus revolutis ambitu transverse elliptico vix angulato.

From Warszewicz's sales.

A stiff stalk, about a foot high bore a dozen large fleshy flowers, of which the sepals and petals were alike chocolate — coloured, the lip a rich fiery orange brown. There was no streaking or spotting in any part of the surface. The sepals were flat, linear-lanceolate, very sharp, and spread flat out, even turning backward after a time; the petals, on the contrary, were erect, somewhat broader. The lip, a tough, fleshy body, when spread out had an elliptical outline with the major axis transverse, and the edge extended into a triangular point on one side; in its natural condition it was rolled back, and folded so as to look as if angular, though not really so.

B. and C. accompanied it. B. had dingy red flowers, marked with lines of dots; and C. had dark lake flowers, speckled irregularly with red., but not dotted; their lips were thinner, smaller and had a decidedly angular outline. The two others kinds, not now figured, were the same in habit, but neither had any dots; one had faint stripes along the sepals and petals, which were dirty pink, and the lip was a dull green, the other had a much yellower flower; in both sepals and petals were as in B. and C., but the lip was much larger, thinner, still more angular. Distinct species? new? varieties of some species already known? There grows in the temperated parts of the snow-capped mountain ridge of Santa Martha, especially on the branches of an *Erythrina* a *Mormodes* of which travellers speak as being most remarkable for the infinite var. of its colours. A striped state of it having flowered at Syon, Sir W. Hooker published it as *M. Cartoni*. Of that plant we entertain no doubt B—C are varieties. The main fig., so resplendent in colour and striking in dimensions, seems to differ in its broader and more fleshy sepals and petals and in its thicker more leathery lip, which has little of the angularity, which belongs to *M. Cartoni*; we therefore distinguish it under the name of *M. igneum*, as for the other var. above alluded to, and not figured, they probably belong to *M. flavidum* of Klotzsch. It is not improbable, that all these things are one and the same species and, if so, the *M. lentiginosum* of B. M. 4455 will have to be added; for beyond colour the plant seems to have nothing to distinguish it except the total absence of all angularity in the lip. The same principles, which justify the separation of that plant equally authorize the distinction of *Cartoni*, *igneum*, *flavidum*, and also the separation of a small species with rather more membranous pallid flowers etc. Cf. *M. convolutum*.

Lem. Jardl. Fl. IV. 330. („an potius *M. Hookeri* Ch. Lem. var. *mera*?“)

5. MORMODES SPECIOSUM Linden Paxt. Fl. G. III. 174. Nr. 655:

Sepalis petalisque lanceolatis, labelli tripartiti glabri laciniis laterali-
quas ovatis obtusis, intermedia acuminata multo brevioribus.

N. Granada. Ocanna. 4800'. Aug. 52. Schlim.

Flowers 3" diam., deep golden yellow, speckled all over even to the lip with rich cinnamon red. Points of lip are deep purple.

6. MORMODES CARTONI Hook. B. M. 4214. Cf. Walp. Ann. III. 783. — Lindl. Orch. Lind, pag. 23:

„Flowers extremely variable. Found on *Erythrin*as, in the temperate regions of Sierra Nevada, of St. Martha. Sepals are flesh coloured; lip fleshy rose.“ The same plant was found by Mr. Funck at Minca near St. Martha in the prov. of Rio Hacha at the height of 4000'. (N. →)

7. MORMODES HOOKERI Ch. Lem. Jardl. Fl. Misc. I. 116. 15. Maj. [1851.] (Huc: *Mormodes atropurpurea* Hook. B. M. 4577:

Pseudobulbis oblongis squamis amplis imbricatis pallidis fuscomarginatis vaginatis, foliis — —, floribus pendulis unicoloribus, sepalis petalisque arcte reflexis ovatolanceolatis marginibus revolutis, labelli late obcordati velutini in stipitem basi attenuati lateribus revolutis, columna oblique torta breviter acuminata.

Panama, Warscewicz. — *M. barbatum* Lindl. Paxt. Fl. G. II. p. 56. gleaning 320. Jun. 1851.

8. MORMODES COLOSSUS Rehb. fil. in v. Schl. B. Z. 1852. p. 636:

Pedunculo pedali, rarifloro, floribus maximis, perigonii phyllis oblongo-lanceolatis, acuminatis (acuminibus apice flexis), labello brevissime unguiculato, dein rhombeo, angulis lateralibus obtusatis, angulo antico longe producto, acuminato; gynostemio abbreviato cuspidato.

Diese ist den übrigen Mormodes-Arten gegenüber ein Riese: sind doch die Blüten so gross, als die eines sehr üppigen *Cynoches chlorochilon* Klotzsch. Die Blütenhülle ist rothbräunlich, der Blütenstiel schwarzroth. Der Stamm spindelförmig, sehr dick, bis 8" hoch. Blätter sah ich nicht. Die Säule ist schief nach links geneigt, die Lippenränder sind herabgeschlagen und dabei steht die vordere Lippenplatte lothrecht. — Es ist überflüssig, die Art mit den anderen zu vergleichen; keine hat eine derartige Lippe. Mittelamerika. Warscewicz.

Huc descriptio falsissima ob labellum planum:

Mormodes macranthum Lindl. Paxt. Fl. G. III. sub 93:

Racemo laxo multifloro, sepalis petalisque anguste lanceolatis acuminatis patentibus, labello unguiculato ovato lanceolato acuminato plano.

Central-Amerika. 7000' ab. level of sea. 18" circumf.

9. MORMODES CONVOLUTUM Lindl. Paxt. Fl. G. III. sub 93:

Sepalis petalisque linearibus, reflexis, labello tereti convoluto unguiculato, apiculato, incurvo laevi, ambitu hastato angulis abbreviatis et igitur truellaeformi.

S. Martha.

Flowers the smallest yet known in the genus, dull yellow, spotless. A small species with rather more membranous pallid flowers, also from S. Martha, and now in our gardens, the lip of which is rolled up into a slender pipe, but which when flattened has much the form of a sharp trowel.

10. MORMODES WENDLANDI Rehb. fil. Mss.:

Sepalis tepalisque lanceolatis acuminatis, labelli ungue laminae triangularae acuminatae subaequali utrinque dente parvo antrorso juxta angulum lateralem praeditae.

Pedunculus ultra pedalis racemosus. Bractee ovatae ovariis pedicellatis quaterquinquies breviores. Pedicelli brunneo multipunctati. Ovaria viridia. Sepala ac tepala sublaltiora lanceolata, acuminata, flaveola, lineis cinnamomeis nunc interruptis notata. Labellum a basi unguiculari rhombeo dilatatum, transversum, utrinque dente obtusangulo auctum, antice in cuspidem extensum, foveola impressa pone centrum; luteum, lineis punctorum atropurpureorum notatum. Gynostemium vertice cuspidatum; androclinium cucullatum, rostellum crassum retusum; fovea oblonga, fundo oblonga, fundo longitudinaliter sulcata. Ex America centrali misit amiciss. Wendland fil.

11. MORMODES ATROPURPUREUM Lindl. Bot. Reg. XXII. 1836. tab. 1861:

Racemo oblongo denso, sepalis lineariblongis aequalibus reflexis basibus lateralium paulo obliquis, petalis ovatis erectis supra columnam conniventibus, labello replicato retrorsum arcuato cuneato trilobo; lobis lateralibus deflexis venosis intermedio carnosiore cuspidato subtrilobo.

Spanish Main. Flowers deep purple, on a close erect raceme.

12. MORMODES OCANNAE Lind. et Rehb. fil. Mss.:
